within foreshadows to it what is necessary for its preservation. Immediately upon acquiring the free use of its limbs it sets about cleansing the hive, preparing food for the larvæ, starting queen-cells, if queenless, exercising its wings in playspells, gathering honey, protecting its hive by stinging, building comb, and on the eleventh day, perhaps sooner, gathering pollen and propolis. It has now acquired a taste for food partly indigestible, and can not subsist without an occasional cleansing flight. It has passed through the stage of habit development into that of decline — it is fully matured. Its habits continue to the end, though less conspicuous. The habits of the queen bee, which hatches from 16 to 18 days after the laying of the egg, and of the drone, which spends 24 days in the cell, are made, in some cases, to coincide with those of the worker. Thus we see the young worker bee taking its playspell, which in its old age is changed to a cleansing flight, after 12 o'clock, the time of day when the sun's rays have warmed the atmosphere, and rendered it the most safe to leave the hive. So with the queen; after 12 o'clock she leaves the hive to meet the drone; and after 12 o'clock, when not pressed by her motherly duties, she leaves on her cleansing flight. The drone is allowed more limit, but chooses the warmer part of the day for his flight. The necessity of a cleansing flight once recognized, the apiarist will see the necessity of protection for bees while taking the flight, and also of conditions that are calculated to lead them to fly. Probably this necessity of a cleansing flight would not exist were bees confined exclusively to digestible food; but as long as they have access to pollen, the indigestible part remaining will act mechanically upon their systems, and force an action of the bowels when, if the conditions do not favor a cleansing flight, disease will follow as a result of their confinement to the hive.

#### FAVORABLE SITE FOR AN APIARY.

Grounds descending to the south should be chosen, near a never-failing source of water supply. Nothing whatever should be left to shade the ground, and its surface should be made smooth. Under these conditions nothing will interfere with the labors of the apiarist; the concentrated rays of the sun will dry the grounds rapidly, and surface water will flow off quickly. The atmosphere near the ground will become warmer than on a level surface, and the bees will be encouraged to fly during the heat of the day. For the protection of the bees, should no natural protection exist, a tight board fence should be built on the west, north, and east sides. The hives should be set facing the south, to receive the full force of the sun's rays upon the entrances during the hottest time of the day in winter, when the workers leave the hive. They should lean a little to the south; this will cause the water to flow from the entrance, and make it easier for the bees to remove waste material and dead bees. We exclude all shade, that the bees may have the full benefit of the sunshine throughout the whole year, and exercise the habit of flying from the hive whenever the weather is suitable. No bees but diseased ones leave the hives at unsuitable hours, and these are better out of the hive than in it. We do not allow any thing among the hives to obstruct the circulation of the air, because it will become heated in centers, and the combs melt down, when, if the circulation is not obstructed, they will stand a heat of 110° with safety. We have reached these conclusions by years of experience, and found safety in the sunshine, when

combs in hives set between trees would soften and break down.

#### THE HIVE AND FRAME.

In handling this subject, one necessarily passes over dangerous ground; for does not each one have the best hive, as he does the best dog and the best religion? I will be courteous here, friend Root, and I will be discreet; for I am dealing with matters of opinion and of experience only, and others have experiences and opinions. It seems to me that a hive should be large enough to contain a brood-nest of sufficient size to allow the queen room to gratify all her desires for increase, and to contain all the honey that a strong stock of bees can gather while it is evaporating sufficiently to be extracted, and some larger for the convenience of the apiarist, who may be delayed about his work. Certainly if bees gather honey in proportion to the numbers in the hive, the greater the number in the hive, the more honey will be gathered; and the longer they have room to put honey in, the more honey they will collect. Our experience is, that strong stocks of bees gather from three to four pounds of honey a day when there is a good flow of honey; occasionally more. Honey does not become sufficiently ripened to be in suitable condition to extract under 8 or 10 days, and the apiarist frequently meets with delay for a few days, during which time the bees must have room to store honey, or they can not work. A queen, during the best of the season, will lay eggs enough to fill, except near the frame, twelve frames of comb a foot square. Some pollen will be gathered, and placed around the space occupied by the brood. At the above rate, for the bees to gather honey, and allowing two days' delay for the apiarist, we shall require ten more frames a foot square, allowing that they hold 4½ lbs. each, possibly more, if there is an unusual flow of honey. A hive of two stories, containing 12 frames each, is of suitable size, but too high for a windy country. One containing 18 frames below, and small frames or boxes above, will not be low over, and is of sufficient size.

#### SIZE OF HIVES.

For ten successive years we have used hives holding from 9 to 18 frames, a foot square, in the lower part, and small frames or boxes above. Invariably our yield of honey, both comb and extracted, has been proportionate to the size of the hive, two large hives yielding about as much as we got from three small ones. At all times, when wishing to handle the combs, we could drive the bees from the end where we wished to work, and they found room elsewhere, and the combs could be replaced, and the bees not crushed. In the small hives they could not be kept out of the way, and some were killed in handling the combs. To the above advantages we must add that of wintering better in the large hives. The fourth hive from the east end of the north row [see page 238 of our last number] is a Langstroth hive of 8 frames. To test the advantages of this hive, if any, we have kept bees in it for the last two years. In yield of honey it compares reasonably well with other hives of the same size — no better, probably no worse. It has the objection of the small hives, mentioned above. The bees can not be kept out of the way of the frames, and necessarily get crushed more or less. The frames are inconvenient to handle, and the combs break out worse than from the American frame. A frame 10 inches deep and 14 long would be a convenient size to handle. A hive 23 inches long by 15 wide and two stories high would

hold 32 frames, if placed 17-16 inches apart from center to center. Such a hive would not blow over, unless very light, and probably not then.

JEROME WILTSE.

Falls City, Richardson Co., Neb., April, 1883.

I agree with you pretty nearly, friend W., in all that you have said; but may I suggest that you prefer your other hives to Langstroth, because you are accustomed to them? It seems to me that if all your hives were Langstroth, with only one of some other size, very likely you would find that one, whatever it was, more trouble to handle than the ones you are accustomed to handle day after day. Our chaff hives would furnish all the room, I presume, that you would care for; and for getting the requisite room in the Simplicity hive, I would suggest using them three or four stories high, which we often do. I never heard of the wind blowing them over when three or four stories high, and there would surely be no danger after the bees had got the upper story pretty well filled with honey, as they are almost sure to do during the honey season.

### SOME LESSONS FROM EXPERIENCE.

#### SUCCESSFUL WINTERING ON STORES, PARTLY GRAPE SUGAR.

THE season of 1882 was on the whole an unfavorable one in this part of the country. There was no honey to be gathered in May; and white clover in June, and linden in July, yielded about half a crop. After that, little honey was gathered. But as there was enough of honey and pollen to stimulate breeding, and the combs were not filled with honey, they were filled with brood. Thus it happened that, when September came, the hives were crowded with bees, and what honey had been stored in July was nearly used up. Where natural swarming was allowed, the swarms were numerous, and generally large, and the old-style bee-keepers were jubilant. But now every man of them has his finger in his mouth. Their bees nearly all starved to death. I know of only two living colonies within two miles of this place. But I am more "lucky." It came in this way: When, about the middle of September, I found my bees without honey, and not gathering any, I fed them up for winter.

#### WHAT SHALL WE FEED FOR WINTERING?

Grape sugar will not do. It is cheap, but it soon solidifies in the combs, and the bees can not use it without water. Extracted honey will not do. It costs too much; and if it is ripe, and not heated and thinned with water, it will candy in the combs, though it be sealed up, when cold weather comes. Then, unless the bees have a supply of water, they will get dysentery, and die. Pure white sugar will do. As granulated sugar can usually be bought by the barrel for something less than 10 cts. per pound, and 8 lbs. of sugar and 5 lbs. of water will make more than a gallon of syrup, it makes a good and cheap food. But any kind of sugar made into syrup, has a tendency to part with the water and return to sugar again, as every one has seen who has tried to use on the table a molasses made from sugar. As others had tried it and succeeded well in wintering, I decided in favor of granulated sugar. But I hap-

pened to have over from former years a quantity of that much-reviled article, grape sugar, and I did not like to throw it away; and as I knew that 20 or 40 per cent of grape sugar, added to the granulated sugar, would keep it from parting with the watery particles, and from granulating again, I decided on using them together. I fed up all my colonies with this syrup in September. About one-half of it was sealed up by the 1st of November; the rest of it remained liquid. The bees had their last flight the 12th of November. Those wintered on their summer stands did not get another flight until the 1st of March, or for 109 days. Those put in the cellar were not returned to their stands, and did not have a flight until the 5th of April, nearly 5 months, or 141 days. Every colony came out strong and healthy, with few dead bees, and no signs of dysentery. I give this experience for what it is worth.

#### HOW TO FEED — A VERY SIMPLE FEEDER.

I had on hand several dozen of Mason quart jars. I cut thin cotton cloth into pieces about 5 inches square. After filling the jars I put over each a piece of cloth, and over this I put the gum ring which belongs to the jar. I laid strips of wood, about ½ inch thick, 2 inches apart on the comb-frames, and turned down, on these strips, from one to eight jars of syrup, according to the need of the colony. I put a second story on to cover the jars, and left them for a few days until the syrup was all stored away in the combs. In this way I could give each colony all it needed at one time, and finish up the whole business of feeding for winter in one day. Before feeding, all combs which are not needed in the hive in winter should be removed, and the combs which are left should be properly spaced. Of all the feeders which I have tried I find none so convenient as the Mason jars with their gum rings.

#### HOW TO INTRODUCE QUEENS.

I have tried nearly all the plans which I have seen recommended, and have found no one as good in my hands as that of immediate introduction with smoke. Friend Root, after reading about your success in turning so many queens into the entrance of the hives late one Saturday night, I tried that plan of letting the queens run into the hive late in the evening. It was generally successful. But occasionally it failed. After that, I tried blowing in considerable smoke after the queen, and was uniformly successful. Last summer I was trying to get first-rate queens into all my colonies, and consequently had a good many to introduce. As soon as I removed the queen to be supplanted, I shut up the hive and puffed in at the entrance enough smoke to alarm the whole colony, and make them fill themselves with honey. I then turned the queen to be introduced in at the entrance, and puffed in enough smoke after her to make it impossible for the bees to smell any thing but smoke. I did not lose one queen introduced in this way. On the other hand, I always found these queens, a day or two afterward, on the combs, and laying as if in their old hive. The only exception was in the case of a colony which had been queenless for some days. But when one queen is taken, and another given at the same time, if the bees are well smoked they never seem to know of the change. When honey is coming in plentifully, this method can be practiced any time in the day; but if there is a scarcity of honey, there is danger of robbing, unless it is done in the evening. When honey is scarce, some robbers will usually follow the

operator as he goes from hive to hive. After a colony is thoroughly smoked, the bees seem to be unable for some time to distinguish strange bees from their own. Several times last summer I had to go to the relief of colonies to whom I had introduced new queens; and while there was great excitement about the hive, I found the robbers coming and going without molestation. But if the colonies are smoked, and the queens introduced in the evening there will not be much time left for robbing; and by the next morning the bees will be able to distinguish their own, and be ready for battle. But after smoking a colony, it is perhaps always best to contract the entrance for a few days.

Milroy, Pa., Apr. 25, 1883. JOHN W. WHITE.

Thank you, friend W. Your experience with granulated sugar and grape sugar combined seems to have been quite favorable; and although I am pretty well satisfied that bees will often winter well on the mixture, I hardly think I would advise it, inasmuch as we have had some quite unfavorable reports from those who did use it, as nearly as I can remember, in just about the way you have done.—In regard to introducing queens, I really believe you have struck on something valuable, although the plan you have given, of using smoke, is not new. Your idea of performing the operation just at dusk seems to me as quite an important item. If I understand it, to sum it up in a few words, it would be about this: Go to your hive any time in the evening after the bees have stopped flying. Remove the old queen, smoke the colony until the bees have filled themselves with honey, let your new queen run into the entrance. Smoke them again, and it is done. From what experience I have had in the matter, I am inclined to think that queens lost by this method would be so few that the time saved (in connection with the fact of having a laying queen in the hive again in a few hours) would amply pay for all loss. If the operation were performed when honey was coming in rapidly, perhaps it would not be necessary to wait until just before dusk, as mentioned.

#### FRIEND POND'S EXPERIMENTS ON WINTER PROTECTION.

FOREST-LEAVES VERSUS CHAFF.

I HAVE for a number of years been experimenting with double and single walled hives, using the Langstroth frame almost wholly, yet having the American also, in order to compare results with a deep and shallow frame. So far as frames are concerned, the American has been thrown aside, for the reason that I have not had as good success with it as with the L. I have used chaff, sawdust, and cut straw for filling in double-walled hives, and also used no filling whatever; and the opinion I have now formed is, that a perfect dead-air space in a double-walled hive is as safe as if the same space were filled with chaff, or any other substance. My theory is, that there being no better non-conductor of heat than *dead air*, any substance that we may use to fill the space between the walls of the hive is worse than useless. If I am correct in my premise, viz., that there is no better non-conductor than *dead air*, then my conclusion is not only logically but practically correct. When I say *dead-air* space, I

mean exactly that; and my plan of forming this dead-air space is as follows: I take, in the first place, a box, say 5 or 6 inches longer and wider inside than a Simplicity is outside in its dimensions, and about 2 inches deeper than the Simplicity hive. On this box I nail a tight double bottom, with 3-inch space, with entrance as usual in front end. On the inside of this bottom-board I nail cleats 1 inch square, just long and wide enough to allow a Simplicity hive to go inside of them, and down snug to the bottom-board, leaving a bridge  $\frac{3}{4}$  inch high in front end for entrance. This fastens the inside hive firmly enough to the outside one for all practical purposes. I now fit pieces of  $\frac{1}{4}$ -inch stuff tightly between the outside of the inner hive and the inside of the outer, which serves to brace the inner hive strongly in position. When I prepare my bees for winter in this hive, I put on a half-story, cover the frames with a fine burlap mat, and fill over it with a cushion filled with forest-leaves, say 7 or 8 inches thick. I also put cushions of the same against the outside of the inner hive, thus completely closing in the 4 sides and top with these cushions of leaves. I rabbit the top of the outside hive on the inside, and make a cover rabbeted on the inside that will fit over all tightly, boring a  $1\frac{1}{2}$ -inch hole in each end of this outer cover to allow the moisture to escape. When this outer cover is put on, I consider the hive as well fixed for winter as it is possible to fix it, after giving about 4 inches space for entrance. There is nothing to conduct heat out from a hive, or frost into it, except bottom-board and the pieces of  $\frac{1}{4}$ -inch-stuff, and these latter are so high up that there can be no damage done by them as a conductor.

I use inside the inner hive a  $1\frac{1}{2}$ -inch air-tight unfilled division-board on each side, for further protection. I may not be correct in my ideas; but 3 or 4 years of practice with the best of results has certainly convinced me that I am, and in the future I shall adopt just this plan. A nucleus put up on 3 frames last fall came through all right (in fact, every colony did also) this last winter; and when opened for the first time, about April 1st, had plenty of stores, and both sides of the middle frame nearly filled with brood, and some drone-cells capped with all the rest.

My bees, with the exception of one hive, have not spotted the snow this winter, and I have had no dwindling at all. The above speaks well, I think, for dead air space, and especially for the much-decried bad-wintering standard Langstroth frame.

J. E. POND, JR.

Foxboro, Norfolk Co., Mass., April 30, 1883.

Why, friend Pond, is not that a little queer, to lay so much stress on the dead-air space, and then tell us that you filled the space with forest-leaves? I have been for some time thinking that perhaps our chaff packing was not sufficiently porous, and that something like coarse shavings, or forest-leaves, or even empty sections in the upper story might give better results than our too warm chaff cushions. Very likely, dry forest-leaves will give just about the desired quantity of air. This will be better than no protection at all, and yet it would amount to nearly the thing as the old box hives cracked from top to bottom, that have been quoted so constantly year after year. I have told you of my experiment that satisfied myself,

at least, that bees would not, as a rule, winter well with no protection over the combs. After this we adopted the soft loose chaff; but during the severe winter, many times this seemed to give too little ventilation for heavy colonies. Now, if we use forest-leaves, I think we shall have it about right. I am inclined to think I should prefer them, however, put loosely into the hive instead of in sacks of burlap; but as they would be very inconvenient to handle in this shape, perhaps the loose burlap cushions filled with forest-leaves will be about what is needed.

### SOME GOOD SUGGESTIONS FROM FRIEND EWING.

#### LET THE BUYER TEST THE QUEEN.

THERE has been a great deal said in all the bee papers and books about the trade in queens. The scientific bee-men have condemned the dollar-queen trade in unmeasured terms, and many of the practical breeders have enlisted on the same side; but in spite of all this opposition in high quarters, the great judge, public opinion, has steadily given the decision in favor of them. Now, to dispose of this subject, and prevent the apprehended danger of degeneracy in the stock by this trade in untested queens, why not make every buyer his own tester? Both the queen-breeder and purchaser would be the gainer by such arrangement. About the only test in the matter is to ascertain whether the queen is purely mated. Beyond this there is no safeguard against a dishonest breeder. He can, if he will, force queens, and produce short-lived, tender weaklings. The buyer has to trust to the honesty and skill, in breeding, of the seller. Where the whole country has become Italianized by extensive breeders, there is not one queen in six—probably not one in ten—that is not purely mated. If the queen-breeder has only to wait till his young queens are fertilized, and then ship, he can afford to sell them for a dollar; or if his stock is extra, and has a very high reputation, it will command more. In place of keeping his queens for probably a year to test them, suppose he ship them, as soon as fertilized, to the purchaser, and allow him to test the queen. If she proves a fine bee, he is the gainer by getting a young queen in all her prime, and both parties are gainers. If the queen prove to be a hybrid, unfertile, or is lacking in any of the qualities that constitute a tested queen, let the buyer mail her back to the breeder at the buyer's risk, or at the risk of the breeder, as they may agree, and have another queen shipped. By adopting this plan, all queens would be virtually warranted, and yet sold at the lowest figures, and the worthless queens be weeded out.

#### BEEES FLYING 90 MILES AN HOUR.

In March GLEANINGS, Doollittle's theory of bees flying 90 miles an hour is again alluded to. A moment's reflection will show the fallacy of such a test of speed. The cars were running at a speed of 30 miles an hour when the bees were released, and kept up with the train, flying in circles over it, making three times the speed of the cars. The train rushing through the air causes a vacuum, which is immediately filled by pressure of the atmosphere from the rear, the side, and from above; the bees held in this vacuum will be kept above the cars with

scarcely an effort, and can circle in the vacuum as they are borne forward by the pressure of the atmosphere from behind; and if the train ran a hundred miles an hour they could easily retain their position directly over it. In fact, they would be held there while they kept on wing in small circles, with no power to escape.

#### STENOGRAPHIC WRITING.

Making GLEANINGS is harder and more exacting work than running those 400 colonies of bees, the factory, lunch-table, and all thrown in; and I know whereof I speak; but you say in March No. that you can not afford a short-hand writer to assist in this accumulating work. With all due deference to your opinion, I don't think you can afford to do without one. With a stenographer you could do three times the amount of work that you can perform with your own hand, and with infinitely less exhausting labor. Holding the unbroken thought on the pen's point is the great labor as well as the great art in book-making and correspondence. One of your smart girls would learn in six weeks or two months, by taking a careful daily lesson, to take down in stenographic characters a slow dictation; and with a little further practice she would be able to write as fast as you would wish to dictate carefully. And while you were reading, and preparing comments for another letter or article, she could have her notes copied for the press, and read them to you. By this labor-saving method you could prepare copy in one-third the time, and with more satisfaction. It would be like laying aside the hand-saw and jack-plane for the buzz-saw and machinery in hive-making.

My bees are lively and strong, with scarcely a corporal's guard of mortality to the hive this winter, and have been carrying in pollen every warm day this month. The box-hive and log-gum men are generally tearful.

E. E. EWING.

Highlands, N. C., March 24, 1883.

I believe, friend E., that people generally agree with you in regard to letting each man test his own queens. That is, those who purchase prefer to do their own testing. The plan of warranting queens has not given very good satisfaction. It seems to me that the best way is to sell the queen for so much, and let that end the matter. If the purchaser does not find the goods up to what he expected, he probably won't trade with that man very much more, and in this way dishonest breeders soon kill out their trade. This rule, I believe, follows with all kinds of merchandise. Or, in other words, dishonesty proves to be a very poor policy. One who has for years sent out a good grade of queens at one dollar each, finds he is full of business, and there are now great numbers of queen-breeders who are building up a nice business, and accumulating a nice property by selling queens at one dollar each, without any warrant more than I have given above.—I agree with you, that there must be some mistake about bees flying 90 miles an hour, or, at least, so it seems to me. In riding in a buggy I have often kept up with bees, and without driving fast either, when they were going to and from a buckwheat field that lay in the direction that I was driving. I would suggest, they flew from 10 to 15 miles an hour—probably the former rate when they were coming in with

a load, and the latter when they were going after a load.—I agree with you in regard to the short hand writing. Practice has demonstrated exactly what you have stated above. I would now almost as soon think of dispensing with almost any of our modern improvements in the way of saving time and hard labor, as to dispense with this one great help in my labors. Our stenographer criticises you a little in regard to the time taken to acquire it. She thinks it would be hardly possible for even "a smart girl" to learn so as to take down even slow dictation, by daily lessons for six weeks.

### COMBINED CASE AND CRATE.

HEDDON'S EXPERIENCE ON SEVERAL POINTS.

**A**T the first advent of sections, I one day asked myself, "Why can we not have one receptacle that will answer the double purpose of storing on the hives, and shipping to market?" Many were the hours I spent studying this problem, and then gave it up as impracticable. My mind was next called to the subject by seeing a cut and advertisement of a case for the same purpose, in one of your circulars. I examined it closely, and, from my experience, studied the matter over again thoroughly, again abandoning the idea. In Feb. GLEANINGS, page 59, friend Walker comes forward with the same old idea. I have studied the article closely, have one of friend Walker's sections, and still I can not accept his arguments as valid, or his section as a good one. Said section has not the strength of good, all dove-tailed work. The style of the projections, as illustrated on page 61, makes a very homely section, and one more difficult to manipulate in and out of its case. I am radically opposed to any thing tending backward toward the old dauby slip-shod system; and from conversation with honey merchants in our larger cities, I am convinced that nothing presents a more distasteful appearance than propolis sticking to the sections. Any receptacle that can be anywise comfortably manipulated on the hives, will cost much more than a new clean shipping-crate, and not answer the purpose nearly as well. Our sections, when crated, will stand any jarring that the same will in the case in which it was stored. I have had only two cases of honey broken, since I can recollect, and they were promptly paid for by the railroad company.

Mr. Walker speaks of so placing the slats that they exclude the queen from ascending into the surplus department, and Mr. Myers, on page 116, March No., thinks "Friend Heddon uses strong language regarding his queen-excluding honey-board." I do not call mine a queen-excluding honey-board, and I have laughed, when reading, at the ideas some have, that wooden slates can be so adjusted as to strain out the coarser bees in a reliable manner. My honey-board is simply so arranged that it discourages the queen from going above.

In the use of some 600 28-section cases last season, I remember of only 5 or 6 sections being entered by queens, though in a great season for breeding. My experience teaches me that the zinc queen-excluding honey-board is impracticable and useless. Further, that there is no labor that we perform in our business, that pays a greater dividend than that of neatly cleaning our sections, and recasing them in a

new clean crate. A nice attractive section at \$10.00 per 1000 is cheaper in the end than poorly made homely ones, as a gift.

### GETTING BEES OUT OF THE HONEY-BOXES, ETC.

On page 115, friend Myers tells us how perfectly the Doolittle plan of getting bees out of boxes will work. I used to use a double-walled wintering room (with walls 1 ft. thick), in which to receive my honey, till the bees left the boxes. The sides of the building (counting both stories) were 16 ft. high. The only light came from a small revolving sash. The outside was boarded up and down, and battened with  $\frac{3}{8}$  bats. Over this window I tacked wire screen, making it fast at ends and bottom, but extending it up the bats some 2 or 3 feet, it lying off from the boards  $\frac{3}{8}$  of an inch. As bees have a tendency upward, those retiring from the boxes passed out readily. Success seemed mine.

### EDUCATED BEES.

Soon, however, they learned the way back. I then extended the flue upward to the top of the building, some 12 ft. above the window, by the use of burlap tacked on above, and the same as the wire cloth. The exit of the bees was as complete as before, "and now let's see you find the way back." But they did it, descending the whole 12 ft. with the bravery of an old country chimney-sweep, and that, too, bees that had never practiced with the wire cloth alone, before the burlap extension was adjusted. A second trial of the same fixture proved that, for memory and business habits, the bee has no living equal. With our present tiering-up method we smoke nearly every bee down out of the supers, before removing from the hives. The few that remain fly on a window, and are revolved outdoors. Robbing is thus absolutely impossible.

JAMES HEDDON.

Dowagiac, Mich., Apr. 4, 1888.

Your ideas are good, friend Heddon; but are you not overlooking the fact that these pound cases and crates are very extensively used all over the country, and that tons of honey have been marketed in them to the satisfaction of all parties concerned? You remember, too, that friend Walker told us how readily his honey sold, and states that he has already made a practical success of it. I know there are objections, as well as good points, in both ways of putting up honey; but friend Walker's plan has the merit of being very much less expensive in both time and money, if I am correct.—Your educated bees are about what I expected we should find if we adopted Doolittle's plan to any great extent. However, the plan may answer in the majority of cases, or until the bees "get the hang of it."

### WHY SHOULD BEE-KEEPING BE RESTRICTED?

OR, WHY SHOULD ANY ONE BE DISCOURAGED FROM ENGAGING IN IT?

**B**RO. HEDDON, in an article begun in March GLEANINGS, and concluded in the April No., gives voice to the idea that no one should keep bees in any locality where some one else has started an apiary first, and intimates quite forcibly that the supply dealers have injured the occupation of bee-keeping by selfishly urging parties to engage in it, presumably that more sales of goods might be

made. Now, I like Bro. Heddon tiptop, and I know that he likes me too; but I do think that a little grain of selfishness lies at the foundation of his courteous strictures. In order to sugar-coat his little pill, and with an evident desire to divert suspicion (a suspicion, too, which it is evident troubles him), he says he can not be accused of selfish motives, because he is a supply dealer as well as a honey-producer. True, he asserts that he has no opposition at the present time; but the success that has followed his labors at Dowagiac, as shown by him in his reports, may induce some one, if urged strongly by some supply dealer who is not also a honey-producer, to enter into competition with him, and occupy a portion of the field now foraged by his bees alone. The great danger that he seems to fear is overstocking. Bro. Heddon is a practical bee-keeper of many years' experience; he possesses a vigorous and well-trained mind, and is a logical as well as copious writer; he understands the science of bee culture well; and as proof thereof he has made a success of the business; but with all these excellent qualities at his command, it strikes me rather forcibly that his fear warps his judgment, and causes him to imagine trouble where none exists. Of course, I know nothing of the possibilities of honey secretion in the West, save so far as I have read reports from bee-keepers in its various sections; but I do not believe it will be possible to overstock that portion of the country with bees in this or the next generation. There has been a great hue and cry in regard to this subject ever since I first began to keep bees; but I have yet to learn of the first man who has been forced to relinquish the business simply because too many bees were kept in his locality. If the opinions that I have heard expressed were in any danger of becoming facts, bee-keeping, instead of attaining the high position that it now occupies would long ago have sunk into utter insignificance. As the flight-range of the honey-bee is limited to a circumference whose diameter is about 8 miles to an individual colony, it is possible that some particular localities may become overstocked; I say possible; but there is no probability that such will be the case for many long years, if ever. The flowers secrete and exude their nectar in such a manner that, if a single colony of full strength, and ordinarily vigorous, can gather abundant stores, hundreds of colonies can do the same in the same locality, if working under the same conditions. We all know that a colony must be powerful just when nectar is being secreted, to be of any value; and we also know that this nectar is being secreted continuously; and unless it is gathered then and there, it is absolutely and for ever lost. If a locality is wholly unsuitable for keeping bees, a single colony would overstock it; that is, they would be unable to obtain a living from it; but such localities are exceedingly scarce, and avoided by bee-keepers as they would a pestilence.

Let us look for a moment at Germany. Mr. Wagner has informed us that in Munich, Ehrenfels had 1000 swarms at three separate establishments, but so near together that he could visit them all in a half-hour's ride (six miles in half an hour is a pretty good rate for a horse to travel). He says, that in Russia and Hungary, apiaries numbering from 2000 to 5000 colonies are very frequent, and not far removed from each other.

If any desire to follow up this matter of proofs further, I will refer them to the article on over-

stocking, in Rev. L. L. Langstroth's "Hive and Honey-Bee," third edition, where they will find the matter fully discussed. There is no doubt but that the poorest districts in New England are equally productive of honey as those of Munich, Russia, and Hungary, already mentioned; and if this is true of poor sterile New England, where the sheep have their noses sharpened in order to pull the forage out from among the rocks, what shall we say of the fertile prairies of the West, where no rocks, not even pebbles, are found, and where abundant foliage and flowers are indigenous to the soil? If honey were secreted on the same principle that grass grows, overstocking would easily be accomplished. A flock of sheep will soon graze down all the forage in a given locality, and it takes a long period of time for the grass to again grow; but the flowers are constantly secreting honey, while in bloom; and if the drop of nectar is taken, it will require but a moment or two to replenish it; if not taken, it is lost for ever.

Prudence should be used in all our operations; but that extreme prudence which is constantly looking for dangers where there is no probability of their existing, is simply cowardice; and we, in the use of proper prudence in relation to this matter of overstocking, must bear in mind that, while so vast an area of land of the utmost fertility, unoccupied save by the luxuriant foliage which covers it, still exists within the vast bounds of the United States, there is no danger of overstocking the whole country; and, also, that while the flowers in the unoccupied portions of the country secrete their honied sweets in the same proportion, and in the same manner that they now do, no one need feel concerned, no matter how many colonies he keeps, on account of encouragement given to parties to newly engage in bee culture.

J. E. POND, JR.

Foxboro', Mass., April 6, 1883.

Very good, friend P.; but why didn't you in your "wind-up" advise all who feared trouble from overstocking to "go to Texas" and raise horsemint honey?

## FLORIDA.

BY REV. JAS. H. WHITE.

MULTITUDE of anxious inquirers are turning their eyes to this fair "South Land," with the thought of seeking here a home. Probably to-day no part of the earth is so earnestly inquired about by so many people as Florida. Beemen, if possible, are more earnest than the general mass. Not only do they want to know about "bees in Florida," but about every thing that concerns a man who is seeking a new home. Some months ago I wrote for GLEANINGS an article entitled "Our Bees," that brought me inquiries from most of the Northern States in abundance. All who sent stamps for reply have been answered, and I now purpose to answer the same questions through the columns of GLEANINGS for the benefit of its readers who are looking this way, and thinking of a home where snow and ice never come, and where bees need no "wintering." By the way, all that part of bee literature that relates to wintering is of no value here.

### INDIAN RIVER.

Who has not heard of this beautiful sheet of water? Indian-River oranges and Indian-River pine-apples are names familiar to many ears, for these

fruits have a national reputation. For three summers the present writer has shipped these delicious pine-apples to Providence, R. I., and the result is, the more they have the more they want.

But Indian River is not a river at all, but an arm of the sea; a rather long arm, to be sure, but an arm nevertheless. One correspondent asked if it emptied into the Gulf of Mexico or the Atlantic Ocean. Much of the time it does not empty anywhere, for the evaporation from its surface more than exhausts the inflow from the land, and the excess of evaporation has to be counterbalanced by an inflow from the Atlantic through its two inlets — Indian-River Inlet and Jupiter Inlet. On most maps, Jupiter is marked "closed," but it is open now, and has been for the last five years. In round numbers, Indian River is 140 miles long. One hundred miles from its northern extremity is Indian-River Inlet; and 40 miles further south, and near its southern extremity, is Jupiter Inlet, in latitude 26° 50'. Twelve miles below Jupiter is Lake-Worth Inlet, which is the entrance to Lake Worth. But Lake Worth is not connected with Indian River. Near the inlets the river rises and falls with the ebb and flow of the tide; but this tidal influence is not felt at all in its northern half, where the water moves only in obedience to the wind. Oysters of the finest quality abound in the tidal regions, and the finest fish throughout its whole length. Nearly the whole of Indian River is in Brevard County, only a small part being in Dade. A little north of the 28th parallel the river widens and divides into the East and West Channels. In this widening, Merritt's Island is located; and on this is our "Island Home." Of the two channels, the east one is called Banana River, and the west one Indian River. The island is about 35 miles long and 7 wide at its widest place. At this point, Indian River west of us is 1¼ miles wide, and Banana River on the east is about 1½ miles wide. Through its entire length, Indian River is nearly parallel to the ocean beach, and separated from the ocean by a strip of land whose general width is from ½ to 1½ miles wide; but at Cape Canaveral it widens out to five miles. The trend of the coast in this vicinity is N. N. W., and S. S. E.; and off the cape the Gulf Stream is about 15 miles distant, while at Jupiter it is only about a mile from the coast. There are two small steamers on our river, with the expectation that we shall have a larger one. Sail boats are abundant, and we often see the white wings of ten or more at a single view. The river is our highway, the sail boat our carriage, and the winds our roadsters.

In the multitude of inquiries about Florida that I have received, there is both great diversity and great uniformity. The diversity has appeared in a multitudinous list of subjects. I have answered as many as 40 questions in a single letter. But nearly all inquire about

#### HEALTH,

the soil, and the price of land. This is as it should be. Health is of the first importance in the selection of a home. Many a man — or, rather, brute — should have the brand of "murderer" upon his forehead for taking his family into a sickly region because he thought he could make more money there than elsewhere. And yet many reach the same end through carelessness that others have done through greed of gain. As I understand them, the facts of the case can be stated in a single sentence. Florida, in point of health, will compare favorably with any

other State in the Union; and this eastern coast, from St. Augustine to Biscayne Bay, will compare favorably with the most healthful places in the world. St. Augustine, for more than 100 years, has had such a reputation. Before coming here I had lived in ten different States, and have now spent seven summers and eight winters here, so that, with a fair stock of common sense, I ought to be able to speak understandingly.

Like other States, Florida has localities where sickness at times more or less prevails; but this coast region is remarkably exempt from every thing of the kind. This is also largely true of the Atlantic coast as far north as the trade-winds extend. Within a short time three physicians have been here looking for places for summer homes. They all said that this Indian-River country is unquestionably the most healthful part of Florida. Two of them have places near DeLand, in Volusia Co.; the other one has a valuable grove near Ocala, in Marion County.

There are several climatic conditions upon which this healthfulness depends. 1. Pure air. Much of the year we have easterly winds. These have no malaria in their breath. They come pure from the ocean, with no malarial region intervening. As these winds pass over the State toward the west coast, especially during the hot months, each succeeding mile contributes its quota of noxious vapors; but there are local modifying influences that make the central and western parts of the State comparatively healthful also. The principal of these is, our rainy season is during the hot months. The rain comes in brief showers, with bright clear weather between. Newly fallen water is not malarious. These frequent showers purify the air, and raise the water in lakes and streams, thus covering the muddy margins with newly fallen water, and thereby reducing the malarial emanations to their minimum. And this is the secret of the extreme healthfulness of Florida as compared with many sub-tropical regions.

2. An even temperature is another healthful element in our climatic conditions. Our usual thermal range is from 40° to 90°; our extreme range from 30 to 95. The extreme range of Riverside, in Southern California, is from 23 to 110°, and that of Sacramento, Cal., from 20 to 112°. It may be objected, that our climate is monotonous. I answer, such monotony is both enjoyable and healthful. I know what diversity is, as I have endured all the gradations of cold, from freezing to 79° below, and the gradations of heat, from freezing to 143° above, making a total range of 224 degrees. Our even temperature results from two causes. 1. Remoteness from snow-covered mountain-peaks. 2. Nearness to large bodies of water of a high winter and low summer temperature. The Gulf Stream, just at our elbow on the east, is a great thermal equalizer. There is but a slight variation between its summer and winter temperature; hence the wind from the ocean is but a little warmer in the summer than in winter. East and N. E. winds have always had a bad reputation; but in South Florida they are well-behaved and respectable; even our N. E. storms are never cold, for they come down the Gulf Stream a thousand miles or more.

Some writers tell us of an inshore polar current passing down the coast between the Gulf Stream and the land; but all such statements are entirely false; no such current exists south of Cape Cod.

This is clearly shown by the water temperatures taken at the Signal-Service stations along the coast. The decrease in the water temperature from Norfolk, Va., to New York, a difference in latitude of about 3 degrees, is no greater than from New York to Boston, Mass., with a difference of only one degree in latitude.

JAS. H. WHITE.

Island Home, Brevard Co., Fla.

### FROM THE BOX-ELDERS.

KEEPING THE BEES IN THE CELLAR UNTIL POLLEN COMES, ETC.

**C**ATCHING our friend Duster on the street one day the latter part of March, we remarked to him that it was a very beautiful day, and that his bees would have a fine frolic in this glorious sunshine.

"Yes, it is a delightful day, and the bees that are out of doors will undoubtedly have a nice fly; but my bees are not out yet," said Mr. Duster. "This soft flood of sun-warmed air that floats about us today tempts me to break one of my favorite rules in bee-keeping. It is this: if they will keep still, I will. I shall not put them out of my cellar so long as they keep quiet, or until pollen comes."

"But I thought, Mr. Duster, you used to put them out the first warm days in March, and not return them again to the cellar—feed them rye and oat meal by the bushel—give them something to warm up their bowels, warm honey for instance, and sugar-water sweetened to their tastes, and I was about to say a small tasty button-hole bouquet each as a further inducement for them to breed up early and be ready for work, and so on."

"Yes, yes; we all have our callow days, young man; but we all don't know it, which is just as well, perhaps, for some of us" (and I thought Mr. D. emphasized the *all* and *us* rather testily), "for there are those who seem to think they know it all—never change, and consequently never learn anything. I quit this practice of early stimulating years ago; yet in some seasons it worked well; but this was the exception and not the rule with me in this locality."

"You have never given your views," said I to Mr. D., "in any of our talks on

#### VENTILATION."

"Well, I began to think this ventilation fiend will never down. I am about like all the rest, I suppose. I have my views, and good, strong, stiff ones too; so I'll have at the fiend, and take his head off at the first stroke by saying, I do not believe in upward ventilation at all; that is, speaking of it, or using the word, as we do in lower ventilation. Let me illustrate! If I make mats of unbroken straw, and after placing small sticks on the frames, and putting on the upper story, I press this mat down upon the frames snugly and tightly all around so that no bee can come up—no current of air even, then besides I fill the top story with fine soft leaves like the box-elder, I say a hive prepared this way has no upward ventilation. D'y'e see? I say again, prepare a hive with *any* material that complies with this condition of things, and you have one without upward ventilation. D'y'e 'hitch on'?"

"But, Mr. Duster, does not the air come up through the mat and leaves with the moisture?"

#### MR. DUSTER WARMS UP.

"I say, no, not perceptibly to any human sense; not in sufficient quantities to call it ventilation.

Why, what do you suppose I have been pressing that mat down all around so carefully and snugly for, and then putting a whole bushel basket full of leaves on top of that, and— and punching them down with my two fists until there is a— a corn on every knuckle I've got, perhaps—hey? Whatever you use to stop the air from passing up, should be an absorbent—not a ventilator of air, but an absorbent of moisture, and I don't care how closely it is pressed in—the closer the better, only so it absorbs freely. I believe if our bees were surrounded in their hives by some material that would take up all inside moisture readily and quickly, that the thickness of our hives would hardly enter into our calculations as regards their safety in wintering."

Here Mr. Duster took another shunt.

"Now, suppose we take a Simplicity hive, for example, and prepare it for wintering out of doors by taking out frames at the sides and crowding the bees on to the center combs as much as possible; then slip in a straw mat at each side, close up to the combs; place the large mat the size of the hive on top of all, and bend down this mat over the side mats; fill the top of the hive with fine soft leaves, and sides too, if there is any vacancy; and now *tell* me," said Mr. Duster, almost with a yell, "what do you want a great big awkward double chaff hive for, eh? I do not believe it is the *thickness* of the hive that gives bees the needed protection for wintering, but, rather, its freeness from moisture.

"Now, I prepare my hives much in the way I have told you, and then put them in the cellar, as I would the best hive that ever was made, for these three reasons: First, to save the stores, which it always will, and is a very important item; second, to keep the bees and brood comfortable and warm through the changing spring weather after being put out of doors; and third, to keep the hives free from all moisture. This last reason, when accomplished, solves the problem, in my opinion," said Mr. Duster, with great emphasis, "of all our bee diseases, and likewise our troubles in wintering.

"I know, young man, I have been giving it pretty strong—a full yard, and good width; but that's my way of doing business when I feel sure of what I am talking about; and although we have wandered from the ventilation question somewhat, yet these other matters seem more or less connected with it.

"Talking of straw mats reminds me that we do not hear from friend Muth as much about them as we used to eight or ten years ago; but I will venture to say that he is using them still, and that he nor any other person who has used them ever laid them aside because they were dissatisfied with them; that is the best recommendation I know how to give them.

"But to return to the ventilation question. No; I don't believe in upward ventilation. I think it is all wrong," said Mr. Duster emphatically.

"Well, what about

#### DOWNWARD VENTILATION?"

"I believe that all the air the bees need should be taken at the bottom of the hive; but I do not think there is much *downward* ventilation about it; but we will not quarrel about terms. I think it should be ample, summer and winter; and yet there is a limit beyond which good common sense should teach us not to go. Let me illustrate: Many years ago I saw a row of hives with cleats nailed on their sides, and hung between posts driven into the ground at each corner of the hive, and on which were nailed strips of boards—the cleats on the

hives resting on these strips, and sustaining the hives a foot or so from the ground. There was no alighting-board, no bottom-board whatever. In fact, several of them had comb hanging down six or eight inches below the bottom of the hive, and yet this man's bees wintered. One would almost suppose from this that you could not give too much air at the bottom. While I think, as I have said before, that it is from the bottom of the hive that the bees should receive all needed air and chance for ventilation, yet, because I have succeeded in wintering my cow in some old cold rickety stable, and bringing her through alive just by the skin of her teeth, in spite of wind or weather, is no good reason that it was the best way, and that I should always winter her so. No; there is a reasonable limit, and our judgment in the matter must decide what it shall be."

R. H. MELLEN.

Amboy-on-Inlet, Ill., April 2, 1883.

Friend M., next time you see Mr. Duster, tell him that we think it not unlikely he may be obliged to change his opinion once more before he dies. Please notice that he lays great stress on the importance of having bees *dry*. Well, now, our latest developments seem to indicate that we don't want bees dry. Do you not remember how much has been said about the advantages of water for bees, even in the winter?

#### NOTES AND QUERIES FROM EVER-GREEN APIARY.

##### THE HILL DEVICE, ETC.

**M**Y experience again the past winter confirms the importance of placing over each hive the Hill device. It does away, in my opinion, the old way of boring an unsightly hole through each comb, to give the bees a winter passage. I think if we had a nice round-bottom basket, a bit larger than an ordinary wash-basin, and about as deep, to invert over the bees, it might improve the Hill device.

##### OUR BASSWOOD HONEY CROP—A CAUTION.

Friend Hasty, will you please just hurry up a little on developing that *short-tube* clover? The way the goodly linden timber in these parts is being destroyed of late, is staring us in the face. It seems that everybody who owns any linn-trees are bent on their extermination. No doubt they little realize, "t'is the goose that lays us the golden egg." By the way, friend Root, if laws are enacted to protect game, fish, etc., for the general welfare of the human race, would not a general uprising, by way of petitions from bee-men to our State Legislatures secure protection to the linden timber? Does not nearly every man, woman, and child in America love basswood honey as much as fish or quails? But under the present practice, what is the future prospect of that splendid honey supply?

##### FOOT-POWER SAWS.

I want to tell everybody who thinks of getting up a foot-power buzz-saw, to try a wheel of an old worn-out Buckeye mower for a drive-wheel. I hit on a combination (partly friend Hutchinson's) by using an old mower-wheel 36 in., by nicely fitting the shaft in babbitt-metal boxing, that almost runs off with itself. You see, there is a great weight to the rim; and besides, there is a heavy cog-wheel near the outer rim that helps to give velocity. The old wheel cost only \$1.50.

##### BEEES FOR HONEY.

I want to send this season to queen-breeders in widely separate localities for a few queens, to begin more thoroughly to breed honey-gathering stock. If I had faith or credulity in the Darwinian theory of the law of natural selection, I would begin to set about to develop off the fine point of the sting of our honey-bee. If I could believe that the whale has developed from the cow, and that the boa-constrictor has developed off his legs, I should think the other could be done in a few thousand years.

D. E. BRUBAKER.

Maxwell, Story Co., Ia., April, 1883.

I too, friend B., feel greatly troubled about the way our basswood forests are going, but I don't see how the remedy you suggest is going to avail. Every man has a right to do as he pleases with his basswood-trees, or the fish in his fish-ponds, as it seems to me, and this in spite of any legislation. I have thought seriously of refusing to buy basswood; but then, again, I can't see how this would help the matter very much. Farmers have basswood-trees, and, of course, sell them to the highest bidders. The only hope I can see is in inducing people to plant basswood for both honey and lumber. You know we have made a start in that direction. Since you mention it, I have a strong notion to go down and take a look at our basswood orchard to-day. We have just had a fine rain, and the trees are just in their first leaf; and the sight of 4000 trees at such a time is beautiful, you can well imagine. The way things are going now, I confess that the greater part of us will very soon have to go without basswood honey.

#### REPORT FROM ONE OF OUR CHICAGO HONEY-MEN.

##### ALSO SOME HINTS IN REGARD TO HONEY PACKAGES.

**I** SOLD, of comb-honey crop of 1882, up to the first of January, 1883, nearly 120,000 lbs.; since January 1st to April 1st, sales have been slow, and yet 70,000 lbs. has been disposed of. There is perhaps a few tons of dark and buckwheat comb honey on this market that will not be consumed before the new crop comes into market. There has been three pounds of comb honey crop of 1882 offered in this market, to one of the crop of 1881.

Extracted honey has aggregated in sales 140,000 lbs. There is perhaps a good deal to carry over yet on the market. Prices since the first of December, 1882, have gradually declined until the present date. At this late hour, holders are anxious to sell; hence prices vary very much. Honey has been offered in almost every conceivable shape and style of package. But that which meets with the most demand is the one-pound section; next the 1½-pound section, or frame; and packages containing 25 to 40 lbs. are preferred. One-pound frames of comb honey are as small as this market calls for at present, and none larger than 1½-lb. will be taken to any extent, when the smaller can be had.

Extracted honey should be furnished in packages ranging from 10 to 350 lbs.; the smaller packages should be tin; the larger, iron-bound casks and kegs.

R. A. BURNETT.

Chicago, Ill., April 2, 1883.

## Heads of Grain, From Different Fields.

TEXAS, ETC.

OUR winter has been unusually cold. Our 20 colonies stood out all winter with no more protection than in the summer; lost one weak colony. The first pollen brought in which we noticed was Jan. 27. We have 7 new swarms to date; first swarm came out Mar. 29th. We have 60 single Simplicity hives painted red, green, and yellow. We ordered 50 from P. L. Viallon, of Louisiana, being nearer home, and less freight. Our bees are making honey now rapidly. Both orders for goods from you came promptly, and all tight. Thanks for metal-cornered frame. It is good, and we will order after a while.

CARNES & FALKNER.

Gonzales, Tex., Apr. 18, 1883.

### IS GRANULATED HONEY ALWAYS PURE?

Are not Geo. Grimm, yourself, and, in fact, we bee-men in general, a little fast in stating to the public, as on page 202, that granulated, or "candied" honey is certainly pure? It is my humble opinion that a large per cent of the adulterated honey of the market to-day is granulated hard. The way I came to know so much about adulterating honey is this: Three years ago this spring my bees and pocket were very light in stores, so I sent to Davenport for 50 lbs. of grape sugar; cooked it up with extracted honey, I think about equal parts of each. In about two or three days it was as nice looking candy as I ever saw to feed. I will say here, that I have never had any grape sugar since, and never want any, as I don't think it pays, even to feed in spring. But all that candy wanted to make it delicious (?) honey was a little more water. Honey has been shipped to our market, and sold at an insignificant figure, that looked and tasted (to me) very suspicious. I had our chemical professor of Cornell College inquire what would be the cost of a chemical analysis of a sample of honey. The reply was, "\$25.00." As I understand that pure honey contains a per cent of grape sugar, and some grades more than others, I presume that adulteration of this kind would be very hard to prove. What we want is either a simple and reliable test, or else a responsible chemist who will analyze samples at a reasonable price. Can not Prof. Cook, or some one, give us more light?

"BEE-TRAPS."

To those who have trouble in getting bees out of a box, hive, or room, without letting others in. Make a "funnel" of wire cloth. Have the small end just about large enough for a bee to pass, and tack the large end over the exit-hole, and I don't believe there is a bee in the United States that will learn to get in. I have one near the top of each window in my honey-room. I often carry in combs with bees on them, which pass out of the windows without further attention on my part.

OLIVER FOSTER.

Mt. Vernon, Linn Co., Iowa.

### BRIGHT ANTICIPATION.

I am starting in the bee enterprise this year for the first time, with 15 colonies, all hybrids, and very lively, with both ends too. They began gathering pollen the 12th and a little honey on the 18th. Perhaps you think you will have me in Blasted Hopes

this fall, but you will not. With those 15 colonies I am going to make 30, and no more, for which I have made 30 L. hives; with those 30 I am going to take off 200 lbs. each. Do you hear me? This is the best honey country in Illinois. White clover is spread over the face of the earth here like the mantles of snow in the winter; lots of fine timber for honey. Well, you will hear from our "shanty" this fall. We are going to get rich in a year or two; then we will go to Europe and find out how the bees carry the egg from the worker-cell to the new-made queen-cell, and how many bees are employed in the construction of the new cell. Gas is out.

Alta, Ill., April 20, 1883.

A. M. CLARK.

### ELECTRIC LIGHT AND QUEEN-REARING.

It seems that the problem of controlling the queens mated by the drones becomes solved by the aid of electric light. A German newspaper says: "A certain Mr. Gravenhorst, of Brunswick, a prominent bee-keeper, brought his colonies with virgin queens into large, sufficiently warm rooms, which were lighted with electric light. The bees flew around with perfect ease; they did not fly against windows or walls, and so get killed, as no light from outside shone into the room. He raised, in that way, purely mated queens on a small scale."

REV. SAMUEL KUESTHARDT.

Fair Haven, Mich., March 8, 1883.

I rather think it is a newspaper "yarn," friend K.; but I may be mistaken. Friend Gravenhorst is the best of authority, if there is no mistake about it.

### CALIFORNIA, AND HONEY IN CALIFORNIA.

I spent the winter in California, but not in a section where many bees are kept, for I was told that bees near the coast, or around the bay of San Francisco, do not thrive well. I saw but one lot of 30 hives; and as I did not see the owner, I got no information about them. My stopping-place was the city of Oakland, and bees could be seen working on the flowering shrubs until the first of January; after that it was chilly till March 1st.

I visited the establishment of Messrs. Stearns & Smith, honey dealers, of San Francisco. They are gentlemen, and gave me all the information asked for. I saw several grades of honey, both comb and extracted. The sage honey looks very nearly like our white clover, except it has a reddish cast; but the flavor is not, to my taste, equal to the clover. The dark, or fall honey, is very dark, and not very good.

### CALIFORNIA SECTIONS.

The sections used here, or all that I saw, were of one size, about 5 inches square,  $1\frac{1}{4}$  inches wide, all nailed; lumber not even planed. The bottom-piece of each section was half-inch square, and nailed in diamond shape, even with the bottom of end-pieces, and, in my humble judgment, are very much behind the times.

Stearns & Smith told me the honey crop for several years had been a small one. Overstocking, he thought, was the principal cause, in connection with sheep-grazing, as they will destroy much of the sage.

Honey at the retail shops sold for 20c. for a well-filled section. The people here will not buy candied honey, and they think it a manufactured article. Stearns & Smith had a large lot of it, and would be glad to sell for 5c. The canning factories purchase it, melt and can it, and ship it to the Old World.

Our bees have come out through this long winter in fine shape, and good average strength. We commenced the winter with 60, and have 59, losing but one—chaff packed. J. BUTLER.

Jackson, Mich., March 22, 1888.

Thanks, friend B. The section you mention is the old Harbison section. Judging from the number of 1-lb. sections we have sent to California, I should think there ought to be a few there somewhere.

#### SYRIO-ITALIANS.

I think a cross between the Italian and Holy-Land bees the "coming bee." We all know the hybrids are the best, and when we can get hybrids as beautiful and gentle as albinos, and as good honey-gatherers as the dark imported Italians, we ought to be satisfied. A cross between the Italians and Holy-Land bees will do all this.

#### IS QUEEN-REARING NECESSARILY BAD FOR WINTERING?

I see that you and friend Good attribute your losses to queen-rearing. I do not think that was the cause. Of course, old bees will die; but you did not manage rightly; if you did not have young bees in your queen-rearing nuclei, why did you not let your young queens fill their combs with eggs before selling them? Wait till you see sealed brood, then there will be no danger of selling unfertile queens. And especially toward the end of the season, let them fill their two combs chock full; feed them if they will not do it without, and then three nuclei will make a rousing swarm, and two more heavy combs of honey from other stocks will prepare them for winter when united.

#### SMOTHERING, ETC.

This is the plan I follow, and we have not lost any the last two years. We used to lose them when our doubled-up swarms were all old bees; we lost one swarm this winter, the strongest swarm we had. The bees had not been used for queen-rearing either; they smothered; they were in a chaff hive, and an ice storm closed the entrance. Our bees gathered natural pollen for the first, day before yesterday.

ILA MICHENER.

Low Banks, Monck Co., Ont., Can., Apr. 16, 1888.

Our bees were fed, friend M., and they raised brood in the fall too; but I presume not to the extent they ought to have done. We shall try again another winter, and hope to do better.

#### REFUSED ADMITTANCE.

I am entitled to a space among the Blasted Hoppers. I had 22 stands last fall. I put 6 in a cellar; 3 died; the rest I left on the summer stands; lost 5 of them this spring; lost 2 by robbers. This leaves me to start with 12 this spring, but I will try not to give up hopes yet. A. R. HUNTER.

Adyeville, Ind., April 15, 1888.

Can't let you in, friend H. You have too many bees left; and besides, you haven't got the right sort of spirit for a "Blasted Hoper."

#### SAFE WINTERING WITH FOREST-LEAVES.

Having now "come safely through the woods," I can consistently send in my report. The past winter has been the most steadily severe of any for the last seventeen years, the thermometer ranging close to zero (sometimes a little below) nearly the whole time. I wintered my bees on their summer stands in standard L. frames, and they had no op-

portunity to fly from the middle of Nov. till Feb. 17th. In preparing for winter I left seven frames in all hives except one that had but three. I put a two-inch division-board on each side of each hive, covered the frames with a sheet of burlap, and filled an upper story with forest-leaves, giving an entrance of about 4 inches for the bees to fly in or out as they chose; they all came safely through, and today are in as good shape and condition as I ever saw bees at this time, and this, too, notwithstanding they were kept on that much-decried shallow standard L. frame.

My belief, gained by seventeen years' experience, is, that with proper precautions in the way of upward ventilation, the L. frame is as safe to winter in as any other; and I prefer to take my experience as my own guide, rather than all the theories that have ever been disclosed; and from my own experience I think I am fully warranted in advising all, and beginners especially, to choose the standard L. frame, no matter what theoretical objections may be made to it. J. E. POND, JR.

Foxboro, Mass., May 3, 1888.

#### STOPPING UPWARD VENTILATION, ETC.

I have lost 4 swarms out of 12, but have learned a good lesson; that is, I did not spread enough heat-confining substance, such as paper or enameled cloth, over the frames under the cushion. I had only one thickness of woolen cloth on, and a chaff cushion on the ones I lost; but where they had a number of sheets of paper, as did one of them, they came out in splendid order. And another, where I left the summer cloth on, and spread on three woolen cloths and a cushion, they came out far better than all others, and only about half a pint of dead bees; but these were in a chaff hive. I kept all the entrances open only about  $\frac{3}{4}$  of an inch. I also found that the ones that were covered entirely with snow were in better shape than when they were exposed; so in a long run I shall not lose, for I shall learn from such losses. I take lots of pleasure with my bees, and find that by kindness, and yet firmness, they grow more gentle, and they do show so many cunning ways that I don't see how any one can live and not have one swarm at least. I am exceedingly pleased with GLEANINGS. I can read it all night with pleasure and profit.

I have always worked and planned to the best of my ability, and have often been told that I could get a living on a rock; but I rather live on a hive.

E. P. CHURCHILL.

North Auburn, Me., April 16, 1888.

Friend C., you may be right in thinking your bees had too much upward ventilation, but so many say they have had experience almost in the contrary way, that I am somewhat loth to agree with you. Is it possible that bees sometimes require much ventilation, and when, in a different state of health, do not require it?

#### HONEY VINEGAR.

Tell Mr. R. I. Fox, 1 pound of honey and 3 gallons of water will make good vinegar in six weeks. We have made it. Put the honey in water, and put it in a warm place. One teacupful of good apple-cider vinegar will make it fit for use sooner. We got the recipe from the *Rural New Yorker* years ago. I think you are right about not keeping our light under a bushel. I won't for one. HUGH WHITE, JR.

Broad Run, Va., April 24, 1888.

## HOW FAR MAY A SWARM GO? FURTHER FACTS.

In your remarks to J. C. Turner, in the May No., you say that "a swarm of bees seldom travels faster than a man can run, do they? say five or six miles per hour. To go 30 miles they would have to fly five or six hours at one continual stretch." In this I think you are mistaken on two points. When a swarm of bees first starts off it generally goes faster than a man can run far. I have seen men who could put five miles an hour behind them, and call it walking; a run would be at least double that, or 10 miles per hour; and as to the continual stretch, did you never know of a swarm of bees clustering after having made considerable flight? Last year a swarm of bees passed over me. I noticed that it was going very slowly, and therefore I followed it. They soon clustered in a large tree; it was then about 5 o'clock in the evening. I made preparations and cut the tree down about sunset, and succeeded in saving the bees. This swarm had evidently taken up for the night, and would no doubt have continued its flight next day. Now, as bees can carry honey enough to last them several days, with this sort of management how far is it possible for them to go? I think 18 or 30 miles either should not surprise us.

I knew of another instance where a swarm was followed  $3\frac{1}{2}$  miles, passing over various persons, and the last one said the bees were still going "like a whirlwind."  
W. H. GREER.

Paris, Henry Co., Tenn., May 7, 1883.

Thank you, friend G. I suppose bees *could* fly 18 miles, or twice that distance, if they wanted to. The point to me was, that it seemed rather improbable that they would want to go so far, especially when loaded down with honey, as you very truthfully suggest they usually are. Now, who can give us more facts in the case? How far have a swarm of bees been really known to go? Let us have some more facts that will, if possible, settle the matter without much chance of mistake.

## GRANULATED SUGAR.

I wish to add my testimony in favor of granulated sugar for wintering. I went into winter quarters with 9 full colonies and one three-frame nucleus, all fed on granulated-sugar syrup, as bees did not gather half enough to keep them; 8 colonies were packed in chaff on their summer stands; one was kept in the house, and the nucleus was buried in a slant. All came through in good condition, with but slight signs of dysentery on the part of two or three.

## WINTERING IN CLAMPS.

The one in clamp wintered nicest of all. It was buried 146 days. The combs were dry and clean, and not a particle of mold about them. The piece of ground I buried them in is wet and spouty, so I expected they would die, but was agreeably disappointed after all.

## MICE IN CLAMPS.

One feature of the clamp I don't like, and that is, the mice. They got into mine and cut out about a third of a comb. I tried poisoning, but did not succeed in killing them all. I found several dead ones when I opened it. They were tree mice, or the white-bellied kind, and ground-moles. No house mice were about it. Nearly all the bees in this neighborhood died of starvation the past winter. Some have lost all. It was not bad honey, but a scarcity of good.  
F. S. MCCLELLAND.

New Brighton, Pa., May 1883.

## THE BOY'S BEE-FEEDER; AN IMPROVEMENT SUGGESTED.

Let me suggest what I think will be an improvement on the boy's bee-feeder, described in Our Homes for May. Let him make another box, without top or bottom, of thin wood,  $\frac{3}{8}$  in. smaller each way than the box holding the feed, and just as high as the outside box. Now let him nail a  $\frac{3}{8}$ -in. strip up and down on each side of this box, to keep it in its place when set down into the feed-box. Now, you see that when the wire cloth comes down upon the upper edge of this box, no bees can get over into the sea of feed in the middle of the feed-box and be drowned, and the feed will run under the lower edge of the box, and the bees can take it safely in the narrow space between the two boxes till it is all gone. If the boy will accept this amendment, I think his boy's feeder will beat any man's feeder that I know of, for top feeding. You see, dear Novice, that this arrangement involves the principles of my improved Shuck-Gray feeder, which you described in the last July GLEANINGS, and which you said was "hardly new." Look out, Novice, and don't get into the habit of saying too flippantly, "Oh! that is old." When you classify all your old books and papers to be ready for friend Flick and "sich," just for the curiosity of it tell us the spot where that idea was described before.

## GLEANINGS.

Now a word on another subject. I see internal evidence in GLEANINGS that you are "walking under the stairs" a good deal about making it a semi-monthly or weekly, and perhaps it would not be unacceptable to you to know the sentiments of your readers about the change. I for one say, *don't do it*. We all look forward to the coming of GLEANINGS with "great expectations;" and when it comes, we read it through from one end to the other, "ads" and all; but if it should get to coming once a week or so, we might get to treating it as we do the daily paper, or the present weekly bee-papers—just glance them over to see if there is probably any thing new in them, and then lay them aside. To bee-keepers, GLEANINGS, as it is, is one of the great indispensable blessings of life, and we can not afford to risk any changes in such things. It is now inimitable—ahead of all competition; it ought to suit every reasonable man. Let well enough alone. J. HASBROUCK.

Bound Brook, N. J., May 4, 1883.

Thank you, friend H. I didn't mean to intimate that the boy's bee-feeder was new, but I gave it because it illustrated how it helped him, and the point in Home Papers as well. If I am not mistaken, floats are generally used on feeders of that class. Doubtless your plan is an improvement. I always dislike movable floats.—What you say has much truth in it in regard to GLEANINGS; but how about the multitudes who are sending in good communications like your own, which are kept out solely for want of space? I don't know but almost as much matter, and matter equally valuable, is left out of GLEANINGS every month, just because it won't contain it all. Is that well?

## A "PIECE" ABOUT FLIES.

Now comes up another trouble; viz., *flies!* House flies they are, too, but they don't in this climate confine themselves to the house alone. They are around the bee-hives, amongst the bees; and although a bee will pounce upon one, capture him, fly away off,

and drop him, yet I believe the fly beats the bee back to the hive; leastwise, I don't find that they grow anywise "beautifully less." Our climate and soil seem peculiarly prone to the production of this pestiferous plague. They worry me dreadfully. I even hate the sight of them, and they grow so fearfully intimate with one, too! I have exterminated billions of millions of them with a patent "fly-paper;" but as 6 more seem to come in the place of one destroyed, and as this fly-paper is quite costly, 50 cents per dozen sheets, I come to you, or some of your readers, to know what one may do to cheaply get rid of the "varmints." My wife says when she was a girl she knew a family who gathered and boiled a weed, which, when sweetened, the flies ate ravenously and died immediately. She has forgotten this weed, its name, and even appearance. Wouldn't Professor Beal come to our rescue, and tell us something of this valuable weed or plant? This may seem frivolous; but let me tell you it is a serious subject to us, down in this sandy, warm climate, where the flies rear themselves all out of doors by the shipload. If something can not be done, I am either going to emigrate, or swear a terrible vengeance against flies, and devote the best thought for the remainder of my life toward some method of rapidly destroying these infernal marauders. "Sherman's march to the sea" is not a circumstance to this fearful and tormenting incubus. Please help us.

Every time we get into trouble, my better half says, "Well, write and ask Mr. Root what to do."

R. C. TAYLOR.

Wilmington, N. C., May 8, 1883.

I am very much obliged indeed, friend T., to your wife for her great confidence in my ability to help through all ills that flesh is heir to; but I am really afraid that she will be disappointed this time. The idea did suggest itself to me to advise you to move off to where flies did not so congregate; but on second thought, I am inclined to think that such advice would not be just in accordance with my previous teachings. It is my impression, friend T., that there is something in your vicinity that breeds flies of this class, and that your first work would be to stop the production of such undesirable insects. After having seen to this point carefully, I would go on waging the war of extermination. I presume our readers will give you a score of fly-traps, and, very likely, some fly-poison that won't poison bees can be suggested. How is it, friends? what can you do for friend T. and his good wife?

#### DOES IT PAY TO OBLIGE BEES TO GO 4 TO 6 MILES FOR STORES?

There is something wrong somewhere when bee-men write about bees going from four to six miles from choice. My experience is different. Mr. W. D. Hoskins has the second story of a Simplicity hive full of sections; and April 15th, at least 40 of the 1-lb. sections were filled, and bees swarmed—Italians and blacks. Now, the difference between the said apiary and the one belonging to myself is only 1½ miles. Here is what I got: No honey in the hives, bees turning the drones "out to grass," I reckon, and they tore down all queen-cells, and are standing on the alighting-board waiting for me, I suppose, to set mile-posts so they can tell how far they are from home when one goes after honey to the woods. Well, Mr. Hoskins lives close by the woods, and I

live 1½ or 2 miles from there in the prairie. I lost 13 colonies last year, and some the year before, and now I am going to sell my farm and shall move to the natural home of the bee, and then—look out!

JOHN W. ROSS.

Velasco, Brazoria Co., Texas, April 25, 1883.

I think you are in the right, friend R. I would much rather have the bees within a mile of the stores, any way.

#### SETTING BEES OUT OF THE CELLAR.

After reading friend Doolittle's remarks on setting bees out of the cellar (page 250), and your comments on the same, I should like to give you my method, if you will accept of it. All I do is to number both hive and stand; arrange stands so they will be ten in a row, say, and for one hundred colonies, ten rows. Now, when you are carrying a hive out of the cellar, look at the number on it; if it should be, say, 25, go to the third row in the yard, and the fifth stand, and you have the exact place the colony stood the year before, which, I think, is quite important. But suppose, as in Doolittle's plan, you should set No. 25 out anywhere, perhaps on stand No. 5. Now set No. 5 out on any other stand in the yard, and you will find No. 25 will draw from No. 5 a considerable — at least, so I find it; but the way I manage, you can set all or a part out at once, and have no possible trouble.

#### SWARMS GOING OFF WITHOUT CLUSTERING.

On page 243 you ask if any of us have ever seen a first swarm come out and go right off. Ten years ago, I believe, I was watching the only colony I had, expecting a swarm to issue, and about 9 o'clock it did issue, and never stopped to say good-morning either. The timber was about one mile distant in the direction they went. Last season I had a second swarm leave without clustering.

#### ALSIKE, AND HOW TO SAVE THE SEED.

I should like to trouble you or some of your readers a little further. I have three acres of alsike; it looks splendid, and I should like to save the seed, but don't know how to manage it. Some say, pasture it till June 10th; others say, mow it early for hay, and cut second crop for seed; and still others say, don't touch it until it is ripe. But there is no one about here who really knows how. Will some one tell me how to manage it so as to get the flow of honey from it in the best time for me, and also save the seed?

C. M. GOODSPEED.

Thorn Hill, Onon. Co., N. Y., May 7, 1883.

If you want to save the seed from your alsike clover, friend G., you must not cut it off or pasture it; but if you want hay and honey, and don't care for the seed, you can cut off the first crop just before or while in bloom, and it will blossom a second time, but will give no seed. Pasturing it off will answer much the same as cutting it off. The seed is always saved from the first crop of blossoms; and in order to get seed, you will need to let it stand until the crop is pretty much spoiled for hay. For further particulars, see A B C book.

#### STINGS.

I believe most of my bees are hybrids, some being brighter than others, and surely the nicest and brightest are the crossiest I have; and right here let me say I want some one like yourself to tell how you can handle such without veil, gloves, smoker, and every crevice about your clothing perfectly

tight. Why, dear me! they sting right through some heavy gloves I wear, leaving the sting in the gloves, and then pull around, trying their best to *again* sting, occasionally hitting a seam in the glove, and making one think there is a bee inside the glove. Now, I admit these gloves are cumbersome, and miserably in the way; but I for one (a *beginner*, though) can't tolerate these stings; so I'm forced to pull on these detestable gloves, then a pair of old stocking-legs, etc., and you may know the convenience with which I handle frames. It may be I'll get over this glove "biz," but I'm sure it will be after I see the bees cease so viciously stinging them.

#### A SUBSTITUTE FOR WIRED FRAMES SUGGESTED.

Instead of wiring, I put in the middle of the frame a cross-bar of wood, or, as I nail my frames, I just use an end-bar in the middle. This makes either end about a square, or  $9\frac{1}{2} \times 9\frac{1}{2}$ . The bees will secure combs to sides, and I can't see how the weight of such size can give way, or frame sag in the least. If needs be, these middle pieces can be a little short, and the bottom-bar weaker than top-bar; the short middle-bar will draw the bottom-bar a little crowning, and I think we have a stout nice frame. What sayest thou? J. B. MARSH.

Centre, Ala., April, 1883.

It may be because your bees are hybrids that you have so much trouble with stings; but I think it is because you have not yet got the "hang" of the business. I think you will find times when you can open your hives and handle your bees without the need of gloves, or "stocking-legs," as you speak of. Watch some experienced hand, and see how he manages, and you will very soon learn to get along by the use of smoke, without any gloves or veil either.—Your substitute for the wire frame will answer in a measure, but by no means takes the place of wiring. Your wooden bar will come right in the center of the brood, and your *fdn.* will sag about as badly as without the bar, although the comb will be less liable to get broken out of the frame. We have demonstrated, by many experiments, that the wires need to be about the distance apart we put them.

#### THE CORN-SHELLER BUZZ-SAW, AGAIN.

We tried the corn-sheller buzz-saw arrangement, but it took too much "wind" to turn it. We put the belt on the balance-wheel of the sheller and on the saw-pulley. We ran the saw about 600 revolutions per minute. By the way, the saw is homemade, and it may not saw as easily as your "Simons" saws. We have it hitched to our oil-well engine now, but it does not seem to saw as fast as we think it should, and I wanted to ask you a few questions.

#### SOME QUESTIONS ABOUT BUZZ-SAWS.

1. How many revolutions should a saw make per minute to do the best and most work? 2. What is the fewest number of saws we would need to have to make frames, provided we slotted both ends of end-pieces alike, same as you make the tops of end-pieces now? 3. What sized saw do you prefer for ripping frame stuff, and how fast should a saw run through inch pine lumber? 4. How many teeth should a saw have to the inch, for ripping? and should a cross-cut have more or less? Our mandrel is a  $\frac{3}{4}$ -in. iron bolt turned true *by hand*, and run in zinc boxes. The saw, I made of an old hand-saw.

#### FOUNDATION MADE ON PLASTER PLATES.

I should like a foundation mill, but wax is rather scarce here, and I will try to make the plaster plates do another year. The great objection to them is, it is so disagreeable making, and it takes so much heating the wax, as there is always a sheet of wax on the back of them as well as the face.

Bees have wintered well here. I let one starve, with honey in the hive—a swarm that came out Aug. 23, 1882.

JAS. SOMERVILLE, 9.

Brady's Bend, Pa., Mar. 31, 1883.

It is a little difficult to answer your questions, friend S., because you have not given us the diameter of your saws. While a five-inch saw might make 5000 or 6000 revolutions per minute, one 10 inches in diameter would not need to run over 3500, to give the same speed on the diameter where the teeth are. Also, much depends on the kind of work that is to be done, the kind of lumber to be sawed, etc. For dovetailing the ends of frame stuff, you want about four grooving-saws. The whole matter is fully described in the A B C book. For making frames, we prefer saws 8 and 10 inches in diameter, with the points of the teeth about one inch apart, and such a saw should rip frame stuff at the rate of, say, about one yard per second. Small saws, say five or six inches in diameter, usually have teeth about half an inch apart. Cut-off saws usually have about twice as many teeth to the inch as the rip-saws; for fine work, even more than that.

#### IMPORTANCE OF A CLEANSING FLIGHT IN THE SPRING.

I got a colony of black bees from my brother-in-law, he having 30 all black, and in winter hives, in a bee-house open to the south. This was in March, 1881, about the 15th; they were all seemingly in good condition. I brought mine home, and set them on a summer stand. The second day after, the sun shone very warm, and I took the cap off, and they had a good fly. The next day being warm, I repeated it; they were seemingly strong, though they spotted the snow a good deal. They lived through, while my brother-in-law lost *all* of his. What I want to know is, was it because I gave mine that airing and flying that saved them? My brother-in-law's were not packed, but simply set in a house open to the south. I went into winter quarters last fall with four colonies packed in chaff, and one in a sheltered nook. They have come through all right. On the 12th they were carrying pollen by the basket full.

JAS. BEATON.

Highgate, Kent Co., Ont., Can., April 16, 1883.

Thanks for your report, friend B. Although we have always been pretty well satisfied that it was an advantage for bees to have a good cleansing flight, such as you describe, in early spring, yet we have never before had positive evidence of the benefit of it, such as you give. No doubt but that it was the cleansing flight that saved your bees, and I think it was quite an advantage to have them have such a fly two days in succession. Mr. Langstroth stated, a good many years ago, that it would doubtless pay to remove the top of the hives and let the bees all come out, and have a good fly when a pleasant day afforded a good opportunity, after a long-protracted cold spell.

FROM THE FRIEND WHO DECLINES TO "SERVE" IN BLASTED HOPE. SEE P. 196, APRIL NO.

I received your postal, with five dollars credited. I am surprised that truthfulness about bee-keeping is so rare that it is to be paid for when found. Well, I don't want the five dollars any way. I made a mistake about having only one Italian queen. I introduced a queen last fall (October, I think), and looked into the hive two days after, when I found her on the bottom-board; and a less majestic and more woe-begone and frazzled-out looking queen you never saw. Well, sir, she didn't lay an egg through the fall and winter; and shortly after I sent your last communication, I passed the hive, when, presto! every bee was an Italian, so I had two. I divided them when they began to show symptoms of swarming, and so have four. I have saved eight swarms—lost two. Don't forget to send me your photo. I think I can utilize it to scare moths away from my apiary. I'll try, and report. W. P. LAUGHTER.

Edna, Jackson Co., Texas, April 14, 1883.

Well, now, friend L., I think that is a little too bad that you are going to use my picture to scare moths away. Am I such an enemy to moths that the bare sight of my picture will cause them to all "get up and dust," just by having it hung in the apiary? It seems to me that you are getting into a better mood than you were when you wrote last. Now, just keep us posted in regard to those four Italian colonies, and may be we shall have you in the Smilery ere long. We send the picture.

FROM 1 TO 8, AND 275 LBS. OF HONEY.

I am like those two A B C scholars in Kansas—a bee-keeper on a small scale. I commenced with one stand of pure Italian bees, presented to me by friend Fox. He also made me a present of one of your A B C books, and by the valuable information gained from it I increased from one to eight stands, and extracted 275 lbs. of honey, and I must say I am perfectly delighted with the bees, and the study of the science of bee culture, and the different opinions presented through GLEANINGS monthly.

Now a few thoughts about the bee industry that has sprung up here, and who brought it about. Friend Fox is entitled to all of the credit; he has created a great interest in bee culture; so much so that we have from the big fish to the little minnow. I tell you, friend Fox is a "whale" among them. Yes, friend Root, he has quit the use of tobacco, so you see that he is a pure man. Pray God that the good work may go on, for there are still more to follow. C. M. CARR.

Maysfield, Milam Co., Tex., March 25, 1883.

Thank you, friend C.; but isn't that a rather doubtful compliment you pay your friend, when you call him a "whale"? I am rejoiced to know that you agree with me in the tobacco matter, and that you seem to have caught the spirit of the work.

DO FIRST SWARMS EVER GO OFF WITHOUT CLUSTERING?

I have just finished reading Old Foggy's article on page 242. He seems to believe that, because he never saw a natural swarm come out of the hive, and leave without clustering (or settling), that such a circumstance never occurred. Well, I will give my experience in the matter. About July 1st, 1880, I was at work right by my bee-yard, when I saw a

swarm start to come out of their hive. I went up to the hive while the bees were yet coming out (as was my custom), and laid a bunch of grass on top of the hive, so that I could readily go to it after the swarm was hived, to get the number of it to enter on my record (the swarm that came out was a large one, and there is no mistake about its being a first swarm). They circled around, as bees under the circumstances usually do, for about five minutes, when they gathered in a body and took a bee line for the woods, without clustering or alighting at all. I followed them until they got entirely out of my sight and hearing, and kept on the line some time longer, but never found them. O. E. COOLEY.  
Ridgeway, Iowa, May 9, 1883.

A SUCCESS WITH ARTIFICIAL PASTURAGE.

I took my bees from cellar a few days since, and found them nearly as heavy as when put in, Nov. 25; 109 hives; one light, 6 quite light, the rest from middling to heavy. April 12 and 14 we carried out 107 hives, all alive. A few days after, we found two minus—one without honey, the other with plenty. Our honey is all buckwheat, as they got but little else here last season. I sowed about 40 acres last year, and 45 the year before. It is still cold; freezes hard at night. No pollen yet. Alders are ready, and poplar soon will be. It will take a week for willows yet. E. G. HOLCOMB.

Brasher Iron Works, N. Y., Apr. 23, 1883.

BURYING BEES.

The loss in wintering has been very heavy—probably about two-thirds, some losing all they had, others wintering all they had with small loss, and, in some instances, without any. One man packed in chaff all he had, except two, which were very poor, one of them being the bees saved from a bee-tree, a queen being given them, and a few sections of honey fastened into some frames. The two weak colonies were buried entirely beneath the surface of the ground. First a hole was dug some larger than the hives; two 2 x 4 scantling were laid down, and some straw put in. The hives were put in straw placed around them; some boards placed on top of the hives, and then covered a foot deep with earth. The chaff-packed bees perished in mid winter; the ones that were buried were taken out the 15th of April in fair condition. This I know to be a fact, as I went four miles to see the result of this novel experiment in wintering, and helped take them out and carry them to their summer stands.

SUCCESS IN CHAFF PACKING.

I will also tell you how a man succeeded in wintering all his bees by chaff packing. The bees were placed on a platform about 12 inches from the ground; a box was placed around the hive so as to receive about six inches of chaff around the sides, and from 12 to 14 inches on top of the bees, a thin piece of burlap only being between the chaff and bees. A board cover was then put on, sufficient to exclude the rain. The entrances were then contracted to about  $\frac{1}{4}$  the size used in summer. It will be noticed that the packing did not reach the ground, so the bees did not receive any dampness from the earth, as they would if the packing had reached the ground, and there was enough chaff above the hive to retain the heat, and to absorb all the moisture arising from the bees; and as there was no board or cap in the way to retard the dampness, it left the chaff dry at all times. Those bees wintered the best

of any I ever saw. I have purchased some of them, and have already transferred a few of them. There is brood in every frame; hives are full of bees, and plenty of drones, which have been flying for ten days. There is a *difference*, I tell you, having the bees in this shape, and in having a mere handful of sickly bees and a queen left, which is generally the result of cellar wintering.

S. J. YOUNGMAN.

Cato, Montcalm Co., Mich., May 13, 1883.

Friend Y., I am not much surprised at the success of the plan of burying bees. If conditions are all just right, I believe it is a very sure way of wintering. In regard to raising the chaff hive 12 inches from the ground, I can hardly see how this should make any material difference. Our chaff hives are usually set on four half-bricks, and this raises them so that the air can circulate under them, and this preserves the bottom-board from decaying. The idea of having good ventilation above the chaff is also important. The holes in the gable end of the chaff hive ought to be of good size, say not less than  $1\frac{1}{2}$  inches in diameter.

THE CARPET-STRETCHER FOR PRESSING FDN. ON TO THE WIRES.

I see you have got a new plan for putting fdn. into wired frames. I think I sent you my plan of fastening last August. The plan you give is so near like it I will tell it again. I take little pieces of tin, and drive into the end of a half-inch pine board. You can have the board go the width of the frame. I prefer it half way. Place your fdn. on a board that your frame will slip over; put on your wired frame; take your piece of board with the tins in the end, and use it as you would your carpet-stretcher. I can put in fdn. faster and better than I can with any thing else. I drive the tins in half an inch apart. Any boy or girl can make one. E. A. ROBINSON.

Exeter, Maine, May, 1883.

FIRST SWARMS LEAVING WITHOUT CLUSTERING.

In last GLEANINGS you ask bee-keepers who have seen first swarms leave directly for the woods without clustering, to "stand up and testify." Several years ago I was standing within ten feet of a hive when the bees in it commenced to issue. They came out very rapidly; and seemingly, before all had had time to issue, the swarm started directly off. I followed them quite a distance, far enough to be certain they were bound for the woods. They were the first issue of the first swarm from that hive that season. They came out with greater rapidity than usual. They didn't stop to circle around in the air as usual, but remained directly over the hive until nearly all had issued, then started directly for the woods. They took a course that compelled them to go at least a mile before there were either bushes or trees for them to cluster on. I had another swarm go away under circumstances that made it practically certain that they left without clustering, but I didn't actually see them do so.

HONEY VINEGAR.

Mrs. Harrison wishes some of the sisters to tell about honey vinegar. I don't happen to be a "Sister Bee," but presume Mrs. H. will not object to my having a say on that account. I think the trouble with her vinegar is, that it is yet unripe; that is, not fully made. I have used no other kind than honey vinegar in my family for over ten years past and wouldn't think a moment of changing it for ei-

der vinegar. This same thing Mrs. H. complains of bothered me at first, until I learned that it takes lots of time to fully make it; since then I have had no trouble. I usually fill up one or more large barrels every year with honey and rain water, and let them stand until the third season, when I usually find it fully made. I have never succeeded in getting good vinegar in less time than the third season. Honey vinegar not fully made has what my family calls a sickish sweet taste that is very unpleasant, especially if used with hot victuals. O. O. POPPLETON.

Williamstown, Iowa, May 14, 1883.

DOES THE LOSS OF A LEG IMPAIR A QUEEN'S USEFULNESS, ETC.?

The select tested queen we received of you the 31st of August last, we thought a little dark at first; we tried to introduce her into a stock of pure Italians, made queenless for several days previous, but we made an utter failure, after trying smoke, water, and every other device known to us, to subdue their vindictiveness. Finally, on the seventh day, we rescued her again, minus a leg; caged her and put her in a hybrid nucleus, and after 24 hours we released her, and she was received cordially, and was laying in 24 hours. I raised two nice young queens from her last fall, and they are filling up their hives with beautiful three-banded workers, even brighter than those of their mother, with which I am now well pleased, even if she is to be a life-long cripple.

JOHN HARDIN.

Keiths, Noble Co., O., May 15, 1883.

Thanks for your report, friend H. I am glad you did not lose the queen, for you might have decided against her on account of her being so dark. A great portion of the queens we get from Italy are dark; but I believe it is invariably the case that young queens raised from them are much brighter than their mothers, as in your case. I think it is a very good idea to try a queen in another colony, after you have tried so long to introduce her.

SWAPPING A QUEEN FOR GLEANINGS, ETC.

Bro. MacKenzie says, "Why not ship a pretty queen to Novice for GLEANINGS, beginning with May?" so I have just done it. I have always had lots of queens, but never mailed one; never made a cage until this one; never made any candy until this. I feel a little nervous over the result; but as you acknowledge the receipt at once, I shall not have long to wait, so here it goes. When I read so much about the unfavorable possibilities of early bee cultivation in the Northern and Middle States, I just think we have surely a bee paradise in this climate where we can raise queens in February; no wintering, no spring dwindling, no feeding. For several years I took up GLEANINGS, and was the first to write you of Mr. Perrine's floating apiary, which I was then building for him. I was much interested in this, to see how it would turn out. I have often been requested to write, as best I might, a history of it all, as I kept posted in all its doings from first to last.

HOW TO GET PLENTY OF CHOICE QUEEN-CELLS.

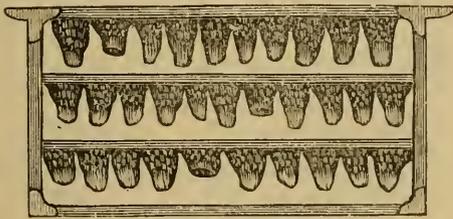

I showed a bee-man the way I raise queen-cells. The idea comes from the 3-bar frame shown in GLEANINGS, page 362, for August, 1880, with a reference to page 322 of July, how to raise the best brood for these cells. Nor is it less valuable, since I see you indorse it. I can easily imagine it would be highly appreciated by a host of interested readers, and

those who at times make a *try* at raising queens. Would it be too much to ask that we might be favored with seeing it appear in an early number of GLEANINGS? I believe Doolittle, to me the highest authority on all bee-doings, writes in favor of this way of raising queen-cells.

ED. NOTLEE.

New Orleans, La., May 2, 1883.

Your queen came to hand in excellent order, friend N. I think you did pretty well for your first attempt.—In regard to again printing the directions for getting good queen-cells, as it appeared as recently as 1880, I hardly think it would be best. Most of our friends can turn to the pages you indicate. However, we give the drawing again, for the benefit of our new readers.

HOW TO RAISE GOOD QUEEN-CELLS.

We would explain to our readers, that queen-cells are obtained as above by putting in two more bottom-bars in your frame, as you see. Strips of comb containing just hatched larvae are then fastened with wax on the under side of these bars. To get the cells regular distances apart, the surplus larvae is removed, and the whole hung in the center of a strong queenless colony. The plan is virtually the one given in Alley's new book; and on turning back to the volume for 1880, and reading the descriptions alluded to by friend Notice, it would seem almost as though Mr. Alley got his plan from this source. Those who have GLEANINGS for 1880 can turn to the pages mentioned above.

#### IS THE EXTRACTOR TO BLAME?

In looking over GLEANINGS I see so many losing bees in wintering, and I wish those brother bee-keepers would tell us whether they used the extractor or not last summer, as those bees here that had the honey taken from them last summer or fall, and had to fill up their hives with fall honey, have died, or at least lots of them; but those that did not take any out of the brood-frames had splendid luck, some of them not losing any, and giving them no protection, or scarcely any. I think the reason is, the fall honey was not good to winter on. I believe the extractor is a good thing; but I think a person needs to have judgment in using it. The prospect for honey here is good. The fruit-blossoms were abundant, and now the white clover is coming in bloom.

JOHN HASKINS.

Empire Prairie, Mo., May 18, 1883.

Friend H., several years ago, when the extractor was used more extensively than now, there were several surmises that it was to blame for much of the wintering troubles. Now, however, many of the bee-keepers produce comb honey so exclusively that they don't use the extractor at all. Yet these losses in wintering and springing bees are just about as before. I think very likely,

however, that many colonies are lost for the reason you mention—that their honey has been taken away, so that they are obliged to fill up with fall stores not as suitable for wintering as the clover and basswood honey.

#### WHEN TO PUT ON THE BOXES, ETC.

Will you please state how I can tell when I should put boxes on upper stories? Would you recommend beginners (and I am one) to place *fdn.* in the brood-frames, and in boxes, or would it be well to wait a while until we get more experience? I have but one hive. They are Italians. I bought them of Alfred McMains, Chariton, Iowa. They were out all winter, unprotected, when the thermometer stood 26° below zero. They came out all right. I have had no experience in bee-keeping. Having but one stand, I am like a hen with one chicken. I want to be careful, or else I'll get "busted." I have your A B C book, and I think it's splendid, because it aims at making every thing so plain.

I am glad that you are concerned in the moral standing of society, and advise men so invitingly to quit the use of tobacco, with all other kindred evils.

EVAN. B. MORGAN.

Cleveland, Iowa, May 7, 1883.

Nobody can tell you just when to put on your surplus boxes, friend M. It can be determined only by watching the work in the hive. When the bees get every thing full in the brood department, and are beginning to build new bits of comb at the end of the frames, in their desire to occupy more room, then is just the time. Or, better still, have the boxes on a day or two before this time. You don't want to get them on until they are just ready to go right into them. I would recommend *beginners* to use *fdn.*, and they can't well do any harm with it, if they don't do any good, especially if they don't have more than one colony to experiment with. The hen that takes good care of one chicken will probably have more in due time, so I think you are all right where you are.

#### DO BEES EVER GO OFF WITHOUT CLUSTERING?

Yes, they do when they come out the second time. And that carries me back to my first experience in bee-keeping. In the summer of 1862 I had a swarm issue, and after flying a short time they returned. The next day they again came out, rose up in the air, and left for the woods. I followed them about a mile, and they clustered on a tree 40 feet from the ground. I cut the tree down, and hived the part that I did not kill. They went to work contentedly, and prospered. I have never lost a swarm of bees by absconding, and that was the nearest that I ever came to it.

C. H. FRANCE.

Erie, Pa., May 20, 1883.

#### SWARMS GOING RIGHT OFF, AND NO "MISTAKE."

I had thought, like "Old Foggy," that bees never went away without clustering; but last summer I had one go right off, and did not stop to say good-by either; but I did not see it go. I will let my wife tell how it went. Here it is: "They were partly out when I saw them—perhaps half out; they did not scatter as much as bees usually do, but remained in a body; they did not wait till they were all out, and a great many returned to the hive." But, hold on! may be this is not enough evidence for Old Foggy.

Here sits Jemie. What say you? "Mother's statement is correct. I saw them go, and they were not long about it either." Now I can give you more testimony that they did go to the woods without clustering, if necessary; but this, I think, is sufficient. I followed the course; they went two miles, and I think I know just where they are, if they did not die last winter. I have two cases of bees getting eggs for queen-cells that were never laid by a queen in their hives. Do you really think they steal them? I have some doubt about it.

Findlay, Ohio, May 15, 1883. D. C. ROUTZON.

We have good evidence, friend R., that bees carry eggs from one comb to another; but the question, whether they ever carry an egg from one hive to another, is not yet established. Many facts seem to indicate that they do; or, at least, eggs are found in hives, and no other explanation can be found as to their presence there. That these eggs are not laid by fertile workers, we know, because they hatch out genuine queens. Who can tell us how they get there?

I have 42 colonies now in good condition; 12 of them have the top stories on, full of nice honey. I lost one during the winter. The imported Italian queen I got of you last fall had 16 dead bees in her cage, and was on the road 5 days. The bees were exceedingly pleased when I turned them loose on the combs, and in 30 minutes were out after water and stores. They are doing well now.

Rape is the only honey-producing plant that will pay to cultivate here, according to my experience. It grows finely and will bring 2 or 3 crops per year when it is seasonable. J. H. RODERICK.

Dodd's City, Texas, Feb. 19, 1883.

#### TEXAS, ETC.

Are you really two months behind in your work? That is really too bad, Bro. Root. If you don't do better, I don't know but we shall have to have you locked up in one of those fire-proof rooms in that new factory, and give the whole business over to the girls. But please send the extractors just as soon as possible, for my upper stories are all sealed, and I am having to divide my bees in order to get empty frames for them to work on. Texas against the world for honey. JAMES L. WALLER.

Benton, Texas, May 11, 1883.

Thank you, friend W., but I hardly think the girls, or boys either, for that matter, would get on any faster by having your humble servant locked up in the vaults. It is very seldom that we can not send extractors as soon as the order is received. In your case, you did not send the order directly to us, which caused some delay, and it had been gone some time when the above letter reached us. We are very glad indeed to hear that Texas is still against the world.

#### DRONE OR WORKER FDN. FOR SECTION BOXES. WHICH SHALL WE USE?

Although we have been selling both kinds of thin fdn. for several years, I don't know that we have had any very positive reports as to which is better. I am pretty well satisfied that drone is worked out faster, but several have complained that the queen is more apt to go up into the boxes and start drone brood. Others declare the coarse drone comb does not make the honey as at-

tractive looking as the smaller worker cells. Still, others claim that worker is worked out just as fast, if not faster. Perhaps only one or two have taken this latter ground, however. Here is a friend who is most emphatically in favor of drone comb for starters. Here is what he says:—

Gloves and foundation received all right; but I can't see why you sent *worker*, when I told you I *must* have drone. Now send me 3 lbs. of drone starter or drone fdn. for 1-lb. sections, thin, and nicely nailed up in wood box. Is this plain enough? If I did not say drone before, all right; but if I did, what shall I do with this? I want drone, and must have drone right off, and that must be thin, and fresh made. I am quite sure that I told you drone before, as I would use no other if it were given me.

I started in last winter with 40 stands of bees on summer stands, or in chaff hives. Of course, I have got 40 yet, and shall use chaff hives, for it is cheaper and better than a cellar for wintering bees.

Jackson, Mich., May 5, 1883. W. D. HIGDON.

Friend H., will you please give us your reasons for being so emphatic in wanting drone? No doubt you are right, and I presume you have tried both kinds; but the rest of us want to know about it, you see.

## Ladies' Department.

IN your April GLEANINGS, p. 166, is a letter from W. S. G. Mason, which tells my case exactly.

All the names are like Latin and Greek when you don't know any thing, and I didn't. I had 3 hives to start with last spring; had 11 swarms and about 200 lbs. of honey; some I doubled up; put ten in the cellar; all came out right but one, which had dysentery, and got so weak the others robbed it while I was from home. All they cost me last summer was \$9.37 for hives and honey-boxes. Your bill of necessities looks very formidable.

#### ARE BEES RESPECTERS OF PERSONS?

I had no smoker, and tried a pan of chips; but I thought the more I smoked them the madder they got. I had a bee-man here last week to look at my hives, and he smoked them very little, and those very bees that would have gone after me like furies seemed just as harmless as house flies. He hunted out the queen and took up the bees in handfuls, and I and the children all around, and every bee seemed to have forgotten that it had a sting.

#### BEE-KEEPING FOR WOMEN.

I feel as if I wanted to shake hands with Mrs. Harrison for what she says about bee-keeping not being too hard work for women. I am trying it; and if I succeed, others may be encouraged to try. I have partially lost the use of one hand through blood-poisoning. It is over three months since it happened, and I can use only my thumb and first finger. I had my other hand hurt by being thrown out of a buggy, so you see I have two *lame* hands; but I can watch the bees, and do the light work; and when it comes to any thing heavy I can call the boys. The difficulty would be with some, they may not have "the boys" to call. I like tending my bees better than any thing else, and I thought perhaps they had not much honey, and needed feeding; so I and "the boys" weighed the hives, and concluded

that those that weighed the heaviest had so much more honey than I fed the lightest.

A week ago I was feeling very much discouraged about my hands, when I saw in the JUVENILE, "Woe unto him that striveth with his Maker." Then I thought, the Lord made my hands; and if he thinks I can work better for him with maimed hands, I am content. "He doeth all things well."

A BEE-WOMAN.

Deanesville, Dine Co., Wis., April 23, 1883.

In regard to bees behaving well when handled by somebody else. I will say, my friend, that I think the difference is in the bees and not in the operator. I remember once when we had such a time with a colony of hybrids that we could hardly go into the garden where their hive stood; and only the next day I went out and opened the hive and took a frame of comb, bees, queen, and all, and carried it into the house and showed it to my wife triumphantly, and told her that they were the same bees that we tried to handle the day before. She exclaimed in astonishment,—

"Do you mean to say that these are the same bees that were so vicious yesterday?"

"I do mean to say that these are the same bees, exactly. Come and see them."

We went and took the frames out of the hive and handled them in every way, and put them back without a sting; whereas, the day before, all the smoking we could give them did not seem to have any effect. I presume the reason was, that honey had begun to come in plentifully, all of a sudden.

I am very glad you liked the little text I quoted. I have sometimes wondered whether these texts that I pick up from month to month every do anybody else as much good as they do myself when I find them. I am rejoiced to see that you get the spirit exactly, of the one I quoted.

I will let you know how Oregon is to-day; but just bear in mind that you were mistaken when you supposed me a juvenile.

WILLOW HONEY.

Father's bees began working on willow bloom the 9th of January, and they are at it yet. For three weeks past we have had very warm weather; the cherries, peaches, and plums are beginning to bloom now, so the little pets have all they can do. Father looked through them this morning, and they have lots of honey already. The honey from the willow has a slightly bitter twang, just enough to give it tone. It is more like horehound candy than any thing else. We have the "evergreen" blackberry, and it is a famous honey-plant; begins to bloom in the latter part of April, and the bees work on it till the last berry is gone, which is late in August.

I suppose you are terribly bothered with such long letters. I am a passionate lover of pets, but I am not a juvenile.

OREGON ON THE TEMPERANCE QUESTION.

I must tell you, the only saloon in our little village is closed. The keeper said he would have to do something else, because he couldn't make a living at that. There is a strong Good Templars' lodge, a Band of Hope, and a Sunday-school here, and we all fight alcohol.

A. M. HALL.

B-averton, Oregon, March 17, 1883.

Well, my good friend "A. M.," if you

aren't a juvenile, I think you must belong in this department; I will try it, any way. May God's blessing rest on the community that obliged the saloon-keeper to try something else for a living.

## Humbugs & Swindles

Pertaining to Bee Culture.

We respectfully solicit the aid of our friends in conducting this department, and would consider it a favor to have them send us all circulars that have a deceptive appearance. The greatest care will be at all times maintained to prevent injustice being done any one.

ENCLOSE you ten cents more, for which please send me that number of GLEANINGS that contains Mitchell's "patent claims." It was published several years ago, if I am not mistaken. Mitchell has an agent here who claims to have a patent on some kind of a division-board.

CHAS. F. UPHAUS.

Batesville, Ripley Co., Ind., April 23, 1883.

Mitchell and his division-board has been for years our old standby in this department. People are getting so generally posted, however, that he of late has found few localities where his patent swindle would work. We published his claim in July number for 1878, which we send you. Tell the agent you mention that he will get himself a very bad reputation by having any thing to do with Mitchell or his division-board. The matter has been fully ventilated at least a dozen times in the past eight or ten years.

## Blasted Hopes.

Or Letters from Those Who have Made Bee Culture a Failure.

MY first year's subscription to GLEANINGS has expired, and now the question is before me:

Must I give up GLEANINGS, with all its friendly associations? Must I no longer read of D. A. Jones, Doolittle, Hutchinson, and many others whose names have become dear to me through the reliable pages of this noble journal, all for the sake of one dollar? And then there is the JUVENILE, so sweet and childlike. Why is it that GLEANINGS has done so much, and JUVENILE promises so fair? Friend Root, your own self has done the work. Go on with your good work; keep up your tobacco department, as it concerns me deeply. I have been smoking for 20 years; have 4 little children who see my example. Well, I must be going; put me down in the Blasted Hopes as a bee-keeper, and I will smoke on "for this time."

A. P. STAIR.

Whitney, Ala., April, 1883.

Well, I declare, friend S., your kind letter wound up a little unexpectedly. In some way it seems to remind me of our recent Sunday-school lesson. Are you sure you are not "kicking against the pricks" just a little? Your conscience is accusing you, I should think, from your own admission. Rise up, old friend, and come along with the juveniles. Surely you don't mean to go on setting a bad example before their little eyes, do you?

## Notes and Queries.

### HOW IS THAT FOR CONNECTICUT?

I HAD a swarm come out the 16th of May. Apple-trees will not bloom for about one week yet. Bees wintered with but little loss, in this part of the State. They are more than two weeks ahead of last year. E. H. COOK.

Andover, Ct., May 18, 1883.

### CELLAR AND SUB-EARTH VENTILATION.

I wintered 115 out of 116 in cellar — sub-earth. See Aug. GLEANINGS, 1882. F. H. CYRENIUS.

Scriba, N. Y., May 14, 1883.

In May GLEANINGS, p. 249, in editorial note on willow, change *kilm* mark to *Kilmarnock*.

New York, May 7, 1883.

JOHN PHIN.

[Thanks, friend P.]

### A GOOD REPORT FOR THE ZINC HONEY-BOARDS.

The zinc honey-boards *will do*. Lots of honey, and no brood in upper stories. F. N. WILDER.

Forsyth, Ga., May 7, 1883.

I increased the one stand I bought of you last spring to six, and got 26 lbs. honey, and sold out at \$40.00 profit. A. I. PARK.

Concordia, Mead Co., Ky., April 23, 1883.

Bees are boiling over, but no honey coming in; feeding 100 colonies is quite a job, but it must be done, to keep the bees out of mischief.

Luling, Texas, Apr. 21, 1883.

J. S. TADLOCK.

I have never known bees to gather so much honey from fruit-bloom. My best colonies are literally full of brood and honey, and have queen-cells containing eggs preparatory to swarming.

Washington, Pa., May 12, 1883. L. W. VANKIRK.

Bees are doing finely now; they have made such a rush for the boxes the past 3 or 4 days, it makes one feel happy who had to feed them three or four weeks to keep them alive. W. S. CAUTHEN.

Pleasant Hill, S. C., Apr. 21, 1883.

In the May No. you ask those who have known bees to leave for the woods without clustering, to *rise up*. We had one last summer that left for the woods as soon as they were out of the hive.

MRS. A. P. STANBRO.

Clyde, Oak Co., Mich., May 12, 1883.

### COMBS FULL OF HONEY.

I am in a quandary. I have a great deal of surplus honey taken from hives last fall in combs, and I do not think they will need much if any of it. I use no extractor with my hive; run for box honey. What do you advise to do with it? WM. M. YOUNG.

Nevada, O., May 12, 1883.

[See page 336, friend Y., for an answer.]

### THE BAD WEATHER, ETC.

Storms all around. A great destruction of life and property. A severe frost last night, badly injuring small fruits. The pastures and roadsides were beginning to whiten with clover. It is all killed. The air is heavy with the smell of frost-bitten vegetation. I shall have to feed my young colonies for some days, as the bloom is all destroyed.

Marissa, Ill., May 22, 1883.

WM. LITTLE.

[I think you are borrowing trouble a little, friend L. Feed liberally, and make up for break in honey yield.]

### GOOD FOR ARKANSAS.

D. A. Sailor, of Clear Lake, Pulaski Co., this State, 20 miles north of here, got 1200 lbs. of comb honey in sections, all filled, and some more unfinished ones, which he used at home from 10 stands in the spring, and increased to 30 stands of bees.

GEO. E. LYTLE.

Flat Bayou, Jeff. Co., Ark., April 19, 1883.

### FROM 4 TO 11, AND 350 LBS. OF HONEY.

I began in spring of 1882 with 4 colonies; increased to 11 by natural swarming, and took 350 lbs. surplus honey in comb, nearly all in sections; wintered on summer stands in single-wall hives. All came through safe, and answer to call to-day.

Minier, Ill., May 19, 1883.

WM. M. BISHOP.

### TWO QUEENS IN A HIVE.

I united two stocks last fall. The two queens were working together in harmony on the 15th of this month. I saw them rub together.

ALEX. MCKECHNIE.

Angus, Ont., Can., April 26, 1883.

[Well, I should think that was close enough for all practical purposes, friend M. We should like a whole hive full of just such. Who can supply them?]

### DEAD BEES UNDER THE WILLOWS.

Bees are working nicely on fruit-bloom and willows; but under the willows large numbers lie dead. Have any other cases been reported, and do you know the cause?

### FROM 2 TO 8, AND ——

I commenced with two swarms in the spring of 1882; increased to eight, which I wintered without loss, in a cellar. JOSEPH S. SECCOMB.

Auburn, N. Y., May 21, 1883.

[Don't know, unless it was the cold rains that killed them. Willows are not poison, are they?]

### SMILERY.

Don't you think I can speak for one little corner of the Smilery? I can say, smilingly, that I believe I have the first natural swarm of hybrids, or any other kind of bees, in Pennsylvania. They issued on the 18th day of May. My wife had them in a new hive five minutes after they had clustered. If any of your readers can boast of an earlier swarm, let them speak out. WM. F. GEIGER.

Beatty, Westm. Co., Pa., May 19, 1883.

[I am glad to see you smile, friend G.; but Pennsylvania is a pretty large State, and it may turn out that somebody else has had a natural swarm before you, especially when this comes in print to call them out.]

### SWARMING WITHOUT CLUSTERING; ANOTHER "CLINCHER."

In May GLEANINGS, page 242, "Old Foggy" has settled it to his own satisfaction, that bees never swarm out without settling or alighting on some tree or place of some kind. Now, I will state, for his and others' information, that on Sunday, June 25, 1882, my wife and I were sitting near our apiary, when all of a sudden the bees commenced to swarm out of a hive, and in less than two minutes they struck a bee line for the nearest woods. I tried to follow them, but could not, as they went too fast. So I took their course and followed them about one mile, and found them going into a large oak-tree. So we can say we saw a swarm go off without clustering. If you think worth while to publish this, you may.

ELIAS HERSHEY,

Leaman Place, Pa., May 21, 1883.

## Our Homes.

DEAR friends, I take pleasure in giving you a sermon preached several weeks ago by my good friend and fellow-worker, Mr. C. J. Ryder, of Medina, Ohio. You will observe how nearly his line of thought runs with the Home Papers I have been giving you for a month or two past.

I pray not that thou shouldst take them out of the world, but that thou shouldst keep them from the evil.—JOHN 17: 15.

"A good sermon, that," said a man to his neighbor when returning from one of our city churches, where they had listened to a sermon on the Christian duty of not being conformed to this world.

"Yes, it was a good sermon enough," replied the one to the other, "but somehow these requirements of the Bible in that matter are impracticable for a man in business or society. It was all right for *him* to speak as he did; he is a minister of religion; but this thing can not be carried out in practical life."

What this man said, many others think. The ideas of the Bible seem beyond the possibilities of everyday life. The rank and file of men may look at these bright spots in the moral sky as they look at the stars at night—admiring them, but never dreaming of possessing them. A poet leaning over a ship's-rail at night sang these words:—

Five thousand stars are in the sky,  
Ten thousand in the sea;  
And every wave with dimpled cheek  
That leaps into the air  
Has caught a star in its embrace,  
And holds it trembling there.

So of these moral stars in the galaxy of the Bible, even if they reflect in the troubled sea of life around men, they are held only by the liquid fingers of the waves. Too far away these high ideals of the Christian life seem. But they ought not to be far away. The Christian is to be found in the world. He is to be a Christian in the world. The gospel is meant for busy men. No new version of the Scripture suited to the possibilities of everyday life in this 19th century is needed. The old version is intended for these very possibilities. This text gives us the *where* and *how* of the Christian life. The first is a guideboard, pointing out the road; the second is the wagon in which to travel. It is not a carriage, with rich upholstered cushions, nor is it an ambulance with a soft couch; it is the plain old wagon of Christian endeavor. Peter and John jolted over the road in it, Paul traveled in it; Luther and Calvin and Knox and Finney—every earnest Christian, in every age, has ridden in this same old wagon of Christian endeavor. No soul was ever "carried to the skies on flowery beds of ease." The sky to which a soul came in that way would be that of æsthetic sentimentalism, not the heaven of the Scripture. The soul that wanted to travel on a bed would better be taken to a spiritual hospital for treatment, than to heaven for lazy enjoyment. It is in the midst of this busy world that the follower of Christ is to be found.

This text locates the Christian. "I pray not that thou shouldst take them out of the world." These words of the Savior put the Christian in the world; that's his place. Christians are to be followers of Christ. What value would there have been in Christ's life if it had been spent in the cell of a monk on Mount Hermon or Tabor? Our Savior found his

work among men. Seclusion is often cowardice, not sanctitude. Ignorance of what we ought to know is not virtue. Paul could reason with the cultured Athenians, reaching them through his familiarity with their "own poets." If we can find a common theme between them and ourselves, the way is open at once for presenting Christ as Paul did. A Christian, after reading the Bible, took up a daily paper, saying, "Now let me see how God is governing this world, and which of his promises he is fulfilling among the nations to-day." We can not neglect the world's work, its thoughts, its sorrows, its hopes, if we are really intent on following Christ. In olden times men were familiar with the affairs of their neighbors in their own school-district, but what an enormous school-district we live in, in these days! There are mother Bull's boys just across the pond in England; beyond them, the jabbering German lads, and the fun-loving French boys. The sons of the old lady that has built a stone wall all around her lot, to keep out the children, are well known to us. There is only one family in this great school-district of the world with whom we are unfamiliar, and that is the black family of Africa. They live in an unhealthy neighborhood. How near we stand to the heart of the world! We touch the throbbing pulse in the telegraph; we listen to its measured breathing in the puffing steam of locomotive or ship; we think with the world; individualism is giving place, perhaps too largely, to socialism. It is in this world, busy, eager, restless, that Christ has put us.

The Christian's place is in the closet of secret prayer; it is at the family altar; it is in the sanctuary of public worship; but it is also in the busy market on the street; in the office or store. "I pray not that thou shouldst take them out of the world," was the best request that Christ could offer for us. He made no mistake. Not only for the sake of the world, but also for the sake of his followers, the world is the best place for them.

It is said, that in Mexico there is a marked difference between those living in the mountains and those living in the lowlands. The mountaineers are strong, vigorous, active. They are intelligent beyond their lowland neighbors. The reason for this is evident. The mountaineers must work for their bread. In the lowlands, food grows around them with scarcely an effort. We need Christian mountaineers—those whose spiritual sinews are made strong by hard toil; those who have climbed the heights of Christian experience in the face of a mountain gale. Spiritual strength comes as physical strength comes—by meeting and overcoming opposition. Lowland Christians who live on the self-produced fruits of tropical growth never do any thing to feed others. They are like a queen bee; you must put them in a colony of workers, or they will starve to death.

Take a map of the world, and put the pointer on the thought-centers; where are they? The United States, with only the thumb of one hand and the tip of one finger reaching below the 30th parallel of north latitude. Look at Europe; where are the centers of thought and of action there? England. But Lizard's Point is only just down to the line that cuts Canada from the United States. Germany, which holds in her hands the destinies of Europe, has every inch of her area north of the 45th parallel.

As I take it, there is a great spiritual lesson in this map of the world. What does it say to us? It says that ice and snow and cold make men rugged; that

a struggle to live makes men worth living. Men who work with brain or hand against odds grow strong, and turn the currents of the world's life and history. Christian life developed in the midst of hardships is rugged.

One danger which seems to threaten religious progress to-day is the absence of real hardship in Christ's service. Christ's side is fast becoming the popular side; men see that it is to be the winning side. Science has advanced with tremendous strides during the last hundred years; but religion has taken two steps to her one. In 1800 there was one Christian in 14; in 1880, one Christian in 5. Statistics which seem to be accurate give the number of Christians in the world at more than 400,000,000, against half that many in 1800, which means that there have been more conversions to Christ in the past 80 years than occurred during the 1800 years previous. There is great encouragement in these figures, written on the dial of God's providence.

But there is danger in them too. Religion is gaining almost entire control of our schools of higher education. Take one fact: During the last fifty years, the Christian colleges in America have increased tenfold; other colleges, three and one-half fold. The students in Christian colleges in 1880 were 70 per cent of the entire number. In other colleges, 30 per cent. To-day the numbers from Christian colleges have increased from 70 to 83 per cent, and those in other colleges have fallen off from 30 to 17 per cent. At this rate Christianity will monopolize all the schools of higher training within a few years. The very air is vocal with the fulfillment of prophecy, "I will overturn, overturn, overturn it, \* \* \* until he come whose right it is, and I will give it him" (Eze. 21:27). He is coming. Men begin to realize it. It will be just as successful to "lift up a puny, human hand against him in the day of judgment," as it is to-day. One might as well attempt to dam Niagara with feathers, as to stop the progress of this on-coming kingdom of righteousness. But the final victory will come through the God-directed efforts of the mountaineers in Christian life — those who live well up to the north. Christ knew the dangers of success as well as of opposition, and yet he offered this prayer for us: "I pray not that thou shouldst take them out of the world." Every legitimate occupation is an open door for Christian usefulness. If you are in a shop or store, you may reach those whom others fail to reach. You meet the same companions daily. Your work unites you. You learn their life's history, bit by bit. You have common temptations. The Lord has placed you in this little world; *there* is your Christian work, as truly as your daily task. Be ambitious to rise; fit yourself for a larger field; but do the best Christian work possible, where you are.

There is a second part to this text. The Savior not only prayed that his followers might be left in the world; but that they might be kept from the evil. The world is evil, as truly as it is busy. It is not the work of Christians to bring the standards of righteousness, which God has given us, down to men, but to lift men up to these standards. The object of revelation is to present motives which shall keep us from sin. This prayer of Christ is not a petition for the impossible. The Savior meant just what he said—"keep them from the evil." This very standard of righteousness is possible, because it is the Lord's standard. His strength is promised his followers. The disciples were not to be kept by

supernatural power, granted in some miraculous way, but through their faith in their Lord's help and promises, and their own plain Christian endeavor. It was only as they put themselves into God's hands, and strove earnestly to keep his commandments, that they fulfilled the conditions of being kept. The life-boat saves a ship's crew from drowning. They would have gone down with the wreck but for the life-boat; they would have gone down notwithstanding the boat, had they refused to get into the boat. "He who does the will of the Father, shall know of the doctrine." If we pray, "Lead us not into temptation," and then run where temptation is, we can not honestly add, "deliver us from evil."

The Lord uses means which are not at variance with our nature. He keeps us by awakening love in our hearts toward him. What does love do? It leads us to imitate those whom we love. The resemblance is often surprising between those who have spent years of happy married life together. They grow even to look alike. Love imitates its object. So those who love Christ unconsciously imitate him. They grow more and more like him. This imitative power of love is one of the means which God uses to keep us from the evil of the world. But love also seeks to please the one upon whom it rests. Sacrifices are readily made, that the person loved may be gratified.

A recent writer has said, "The enthusiasm of love, directed by good sense and sustained by holy principle, has made men victors in the severest trials, as they have grasped the banner and pressed forward in the name of the Lord." There is, then, this unconscious imitation of Christ, and there is also the voluntary effort to please Christ; this twofold power of love which reaches us in the world.

These are by no means the only methods which the heavenly Father uses in answering Christ's prayer; but I desire particularly to emphasize this power of the love for Christ in keeping us from evil. If we can only grasp this thought; if we can only have in our hearts this love, it will hold us amid the temptations of life as a needle is held to the pole.

In conclusion, let me say that this scripture teaches that Christians are not to seek escape from the hardships of life by retirement. Their place is among men. The gospel is for those who are busy. Its very object is to keep busy men from the evil which is in the world. It is powerful, because it presents the powerful love of Christ, and awakens a corresponding love in the soul. Paul stood on a rock in the midst of the tossing sea of uncertainties and temptation when he could honestly say, "Nay, in all these things are we more than conquerors through him that loved us; for I am persuaded, that neither death, nor life, nor angels, nor principalities, nor powers, nor things present, nor things to come, nor height, nor depth, nor any other creature, shall be able to separate us from the love of God which is in Christ Jesus our Lord."

There you have it, friends; God wants you right in this busy world, probably right where you are now. That is, so far as outside things are concerned. Of course, he does not want you among any sin and wickedness that is of your own making, but he wants you to battle manfully with the sin and evil of the world. Are you on that rock on which Paul stood? Do you feel every day that, through God's guidance, you can say you are *more* than conqueror? Do

you ever get discouraged? A Christian ought not to get discouraged, for this is God's part of it. Your part is to do hopefully the best you can with the world as you find it. It is bad to get into a fault-finding way with the world. It is bad to find fault with such friends as God has given you; with your neighbors and surroundings. Do you not know you can cultivate a way of objecting to every thing you meet? And then you can also cultivate a way of receiving, pleasantly and thankfully, every thing you meet. I think I shall have to tell you a little story here. I may have told it before, but it will bear telling again, and perhaps I shall tell it a good many times before I die. It is this: Two men were just about stopping work for the night. One of them said he must hurry home, or his wife would scold him, because he had kept supper waiting. The other remarked, as he passed along, that he never heard his wife scold, and that he would like to hear her, just for the novelty of the thing. Said his neighbor,—

"You would like to hear her scold, would you? Well, I can tell you how. Just get her a load of crooked wood. Nothing in the world will make my wife scold so as crooked wood."

Said the other, "Well, I believe I will try it, just for the fun of it."

Accordingly, when he was sorting his next wood, he took pains to procure a load of crooked sticks. In fact, he picked out the worst-shaped wood he could find, and quietly laid it in the usual place, saying nothing, but awaiting the result. Nothing was said, however, until the wood was nearly used up, when his wife said pleasantly, one evening,—

"Husband, our wood is almost gone; and if you have any more like the last, I should really like it—the crooked sticks fit around the pots and kettles so nicely."

Do you get the idea, friends? God is sending you wood, or material for your work, if you choose. He sends you friends, neighbors, and companions and helpers, and you can look at them as "crooked sticks," if you like. I wonder if any one ever did have the temptation to think God had put him into the world among a lot of crooked people. Do you feel that way, my friends? If you do, I am inclined to think it was Satan who whispered such thoughts into your ear. Don't ever let them come again. Think, rather, that what you see that looks crooked, God sent in his wise providence to be a help to you, if you will only take it so. Take the crooked sticks and use them as best you can, and they will help you on in your work to build a Christian character. You will be better off for having had the crooked and rugged paths to walk in; and possibly God has given you a faculty for making straight much of the crookedness you find, if you set about it with a prayer to him to help you. Think how that good woman took the load of crooked wood. I think she must have been a Christian—don't you think so? I suppose she looked on that load of crooked wood smilingly, at the outset. She knew her husband brought it, and she knew, too, that he loved her as no one else loved her in this world, and therefore it must be right

for her to have it. With the assurance of his love in her heart, she accepted the wood, even though it was different from any she had ever had before, and it proved a blessing. In the same way we are to bear in mind that it is a kind Father who loves us, who gave us these trials. You know how differently we look at things at different times, friends. Different people, also, have different ways of looking at things. Some are always pleased, and others are always displeased. Which class do you belong to? Of course, you know I don't mean that we should let every thing pass just as we find it; for the great battle in life is to make right the things that are wrong. Wrong meets us at every step. Sin and evil meet us everywhere. We hear profanity on the streets.

While it is a grievous sin in the sight of God, yet it is so; and while the sound of it calls on us loudly to wake up and stir ourselves in the cause of Christianity and right, yet we may be the better Christians for having met these trials. The effort it costs us to reprove the one who takes God's name in vain (in a way that will make him a friend of ours, and not an enemy) brings with it a blessing. Did you ever try it, my friends? and have you never learned that even the worst blasphemer may be reached in such a way as to induce him to do better (if not cease entirely) if you go about it in the right way? Many and many a time have I felt that I should like to be spared from such encounters. I have felt that it would be such a privilege, if I could be in a community where there was no swearing or intemperance; yet if there were such communities, would it be best for all the Christian people to move there? What would become of the world? What would become of the boys on the street, were there no one near or on hand to reprove and plead with them? How does it come, think you, that Christian people are scattered so evenly over our land? Take a look abroad at the world. There is not a neighborhood or a community that does not contain some good earnest Christian. Here and there they are sprinkled over, as if God, in his providence, had purposely placed them there, for a kind of light-house, as it were, to give warning, and to encourage and lend a helping hand to others who are striving for right. Is this all accidental, think you? Suppose it were otherwise. What would the world be, if each of these old "wheel-horses" in the cause of Christ should give up in discouragement, and move away? Suppose they should want to get out of the world, instead of living in it. A few months ago I had quite a talk with you about those who wanted to get out of the world, or who slipped off life with its cares and trials and responsibilities. What do you think of such? Is it not a pleasant thought, friends, that Jesus prayed that we should not be taken out of the world? And is it not a wicked thought for us to cherish any lingering desires to leave the world, and leave the place of usefulness where God has placed us, before he is ready?

Of course, we are not to sit still in the world, and let it go. There would be no virtue in that. We are to be as watchmen, as

sentinels. We are to be faithful, also remembering the promise to those who are faithful in a few things. There is a promise, you remember, to those who are faithful in so little a thing as a cup of cold water. God sees and remembers.

A good many times I get letters from beemen, asking me if I would not advise them to move somewhere else. Now, while I think it is right, and perhaps among one of God's plans that people should move about, and fill up vacant places, and go abroad into new countries, still I have a sort of feeling that there is a good deal of moving about that comes from a longing to find some easier place, or to get somewhere where we should be excused from responsibilities that now surround us. Many times it comes from a desire to try something different, or to have a change. Several are now talking of going to Florida. My advice has been asked in the matter many times. As a general thing, I don't believe I would advise it. When young people get married, let them go off and start in some new country, and build up a new home, and make the foundation for new towns and new railroads, if they choose; but I don't believe it is well for elderly people to move about very much. Do you know that such changes are expensive, dear friends? Do you know by experience what it costs to tear up and cut loose in one neighborhood, and commence in another? To those contemplating moving, I would ask, first, why do you move? Is it that you may find some place easier for yourself, or is it that you are seeking God and his righteousness? or, in other words, because you think there is a place where you think you can do more good than where you are?

You know, friends, I am getting to be a little along in life. By one of God's providences it has been my lot almost all through life so far, to see boys and girls start out in life. Those who came to me years ago, saying, "Please, Mr. Root, can't you give me some work?" are now, many of them, heads of families, and their children come asking for work in the same way that they did. Many that I have had in my employ have risen to posts of great usefulness. A few have gone down, as it were. One or two fill drunkards' graves. While I say it, I say it sadly. What makes this difference? I have learned by experience which young man or young woman will rise in the world, and occupy posts of usefulness, or, at least, I think I can tell something about it; and when I tell you a little of my experience here, please bear in mind I do so solely to illustrate one of the truths in our little text of to-day. Those succeed almost invariably, who take hold of the world, and the work and the people they meet, with cheerfulness and courage. One young man wrote to me some little time ago, and asked me if I could give him a place to learn bee-keeping. When I asked him what wages he would expect, he replied that he was willing to let me give him just exactly what I found him worth, but that he would like enough to pay his board. He was educated and intelligent. I presume he had a purpose of making himself so useful that he would get reasonable pay. I paid

him about enough to pay his board, for perhaps two weeks. At the end of that time I told him one day that I felt ashamed to pay a boy so little, who could accomplish so much, and gave him about the wages of a man. In a few weeks, however, his pay was increased again, and so it has been from time to time, until he gets now very nearly as much as any man in my employ. One especially valuable trait with this young man was, that he never found fault with any thing or anybody. He took our work and our people (and your humble servant, perhaps) exactly as the woman took the load of crooked stovewood. In such a factory as ours, with so many people, and all sorts of people, of different ages and habits, of course we have many disagreements. One of our greatest causes of disagreement is the matter of pay. A few days ago one of our town boys met me and asked the oft-repeated question,—

"Mr. Root, haven't you a job for me?"

"But, D., you use tobacco."

"Well, if I give it up, you will give me work, won't you?"

"Yes, so far as the tobacco is concerned, D.; but there is another thing that comes in our way. When you worked for us last, we couldn't agree about the pay. You were dissatisfied with what we thought you fairly earned. Shall we not have the same troubles now with you, or, in other words, will you be willing to go to work for what I think I can afford to pay?"

"Why, Mr. Root, it doesn't seem as if you did do quite as well with me as you did with the others when I was there last. Of course, I want a fair chance with the other boys."

You see, friends, there was a difference of opinion. I arranged it in this way:—

"Look here, D., you know Mr. W., the foreman of the saw-room, and you know, too, that he is a good, fair man, and likes the boys."

"Yes, I know Mr. W., and he is a nice man."

"Well, D., you are to go to work under him. We will have it this way: I will pay you whatever he says you are worth, and your actions and your work shall fix the pay. Won't that be fair?"

"Yes, that will be fair, and all right."

This fixed the matter pleasantly, you see, for the boy was to let his actions speak, and he was to agree to abide by the verdict of these actions. A good many times I tell the friends who work for me, when they are complaining that they have not been used well, to make no reply, only by actions. Let their *lives* do the talking. If they have been wronged, let the lives they lead day by day answer the wrongs, and refute them.

Many of you have, perhaps, read the life of Mueller. You will remember that quite early in his great work he formed a plan of letting the world pay him what it chose; in other words, having no salary, even when he was a minister. He asked God daily for things he wanted, but never asked anything from mankind. In fact, when asked once if he needed money for his work for the orphans, he declined to answer. Mueller was in the world, and through the world he saw

God; and as he trusted God, he also trusted humanity. You know the result. The world has poured millions of dollars into his hands, and yet he never solicited a copper. God has placed us in the world. He wishes us to love the world, and trust the world — recognize the world as a blessing and a great gift. Even though crooked, we are to take it thankfully. Are we doing it, my friends?

I pray not that thou shouldst take them out of the world, but that thou shouldst keep them from the evil.

## Tobacco Column.

A MINISTER TAKES A SMOKER.

**W**HEN I get a smoker I shall lay away my big meerschaum. To-day I was with Mr. H. Waughtel, and he was smoking. He is hale and hearty. I said, "Uncle Henry, it is about time to quit the pipe too."

"Well, Will, I would if it were not for my bees."

So I offered to furnish the smoker if he would quit, and he agreed to do so. You may accordingly mail him one. I would advise you to get him to write for your paper. He is competent, and an E. M. minister.

M. W. MURPHEY.

Cuba, Fulton Co., Ill., May 6, 1883.

Thank you, friend M. May God bless you in your efforts to lead men to give up the bad habit. I am especially glad to hear of a minister dropping it, because I know he will never go back again. It is an encouraging thought, that the ministry as a body have now almost entirely given up the use of tobacco. Some of the old gray-headed ones hold to it, of course; but I believe it is almost an unheard-of thing to find a young minister using it in any shape whatever.

Allow me to say, in all candor and truth, that, after using tobacco (both smoking and chewing) for 35 years, I left it off last August, and am no longer a slave to the vile habit, and have persuaded several persons to do likewise.

F. W. THOMPSON.

Quincy, Ill., April 17, 1883.

I have concluded to quit the use of tobacco. I was 24 years old yesterday, and have been a constant user of the filthy weed for 14 years of time. If I break over, I will send you the money to pay for the smoker.

GES. A. CATER.

Summerfield, Noble Co., Ohio, April 6, 1883.

I see you are giving a smoker to every one who will discard the use of tobacco. If you will send me a smoker I pledge you my word that I will, by the help of God, never use it again. If I do, I will pay you for it. I do this because every time I see the smoker I will think of the pledge. It is my desire to quit it, for I know it is a filthy habit.

Salisbury, N. C., Feb. 18, 1883.

L. R. WEBB.

I noticed in GLEANINGS that you would send to any bee-keeper (who used tobacco habitually) a smoker, if he would agree to abstain from the use of tobacco; and as long as he abstained from its use, the smoker should remain unpaid for; but if he resumed its use again, he should pay you \$1.00 for the smoker. I willingly acknowledge the above, and shall pay you for the same if I resume it again.

J. K. GREGORY.  
Crooked Lake, Pa., Apr. 4, 1883.

I quit the use of tobacco the first of February; and if you have not withdrawn the offer, you will please send me a smoker.

J. H. ALLENDER.

Tunnelton, W. Va., March 13, 1883.

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE OF READING MATER.

MEDINA, JUNE 1, 1883.

But whoso shall offend one of these little ones which believe in me, it were better for him that a millstone were hanged about his neck, and that he were drowned in the depth of the sea.—MATT. 18: 6.

CUSTOMERS wanted for 30 or 40 black queens. Only 31 cts. each. It is not often we have them, so now is your chance, if you want them.

BASSWOOD LUMBER WANTED.

BASSWOOD timber suitable for sections is now getting to be scarce in our locality. Will those who have such lumber for sale please tell us how much they have, and how low they can furnish it by the carload?

THE GOOD CANDY MADE OF POWDERED SUGAR.

The Good candy made of powdered sugar stirred up with honey is working nicely. The bees eat it, sugar and honey both, without rattling it down or wasting it. Two queens went safely to Canada. Every bee was alive, and only about one-fourth of the candy consumed. How long does it take to learn so simple a thing?

PLEASE don't be in a hurry, friends, in deciding that somebody has tried to "beat" you. It is a comparatively rare thing among bee-men to find one who deliberately and willfully decides to wrong another. Please be slow in "thinking evil," and remember how many times you have decided hastily, and afterward you have found out it was only a mistake or a misunderstanding.

SHORT-HAND.

QUITE a number of the friends have written to us lately in short-hand. When the Munson system is used, we have no trouble in reading it; but the other systems are practically illegible. As there are but two here who can read even the Munson system, perhaps it would be better, in view of future contingencies, to write entirely in long-hand, as all business letters are preserved. We have no objections, however, to letters in the principal European languages.

THE clerk who opens the letters is again complaining because the friends will persist in sending dead queens back in letters. What in the world do you suppose we want of dead queens, friends? It is enough to have you write to us that they are dead, without having their miserable bodies pushed under our noses. Now, will you not please remember, don't send back queens, or any thing else, for that matter, until we tell you we want you to do so? Tell us what the trouble is, in plain English, and we will then tell you what to do.

We have 5627 subscribers this 28th day of May, 1883.

WAX is now getting to be so plentiful that we can pay only 34 cts. cash, or 36 in trade.

UNTIL further notice, we shall pay 90 cts. for untested queens, and sell them for \$1.25.

OUR pay-roll Saturday night, for the week ending May 25, was \$761.50. You see, friends, there are a few of us, at least, at work filling your orders.

TRADE is still booming, but not quite as brisk as when the JUVENILE for May was sent out. We shall doubtless be ahead on all orders in a few days more. We can always send fdn. at once when so wanted, and so we can, as a general thing, regular goods of almost any kind; but it is just about all we can do to keep them in stock, without undertaking to make odd-sized sections, frames, etc.

We are sorry to hear that the bee-hive factory of Adam Miller & Son has been recently destroyed by fire. They are, however, about starting up again, or are doubtless started up before this. I have not yet learned whether they were insured or not. Look out for fires, friends, and keep insured. Don't go into any business, or have your work in any sort of a building, that won't admit of insurance. This is a duty you owe your fellow-men who patronize you, as well as yourself.

PLEASE don't make long, expensive trips for your goods, friends, until you have had some intimation that they have been shipped. A friend has just written us that he has been 24 miles after his goods, three times, and yet he ordered them only a week ago. I am very sorry indeed to hear of such disappointments, but it seems to me our friend was a little thoughtless. After you have been informed that the goods have been shipped, it is quite soon enough to go after them.

As many bee-keepers are moving to Florida, and many more contemplate trips there, it may be well to consider the desirableness of such a plan. The most I should fear would be the point in the sermon we have this month in Home Papers — that a climate that would furnish every thing with so little labor would ultimately tend to cripple one's best powers and energies. How is it, friends? Can we afford to dispense with the frosts and snows of the North? I, for one, don't believe I can.

We are very glad indeed to call attention to the low prices at which bees are offered by the pound by some of our advertisers. This would be an especial favor to those who have lost bees heavily, because they can, at a small expense, populate again their deserted hives. I presume they will very soon sell all they have to spare. With the great number of losses that have been reported during the months of April and May, there will probably be a large demand for bees by the pound, and low prices will be a kindness to those wanting.

#### MILDEWED SECTIONS, AND WHAT TO DO WITH THEM.

During the excessive damp weather, there is more than usual tendency for sections to mold or mildew, especially if the lumber is not fully seasoned, and to have the sections fold nicely the lumber should not be too dry. Well, now, friends, do not be in haste to pronounce them worthless, even if they do look

awful. Fold them up and stack them in a heap until thoroughly dry, and you will see them, usually, turn white again; but if they do not, tack a sheet of sandpaper on a table, get some cheap help, and sandpaper them off. It is not a long job, after you get at it; and if the sections are some you got of us, I will pay for fixing them up. There is something queer about the way basswood will "sweat" in damp weather.

CARELESS and heedless people make a world of trouble; but in no place do they make more trouble, perhaps, than in an express or freight office. Imagine one who is needing goods badly, say supplies for his apiary at the time when the honey is coming in, being told that no goods had come for him, and it afterward proves that they were in the office all the while, in some out-of-the-way place, forgotten! Here is a little item that a friend just sent us: —

I have received my goods. The agent here had them in his office. I went and asked him for them, and he said they were not there; but when you hunted them over the line I had him "penned up." Then he looked and found them.  
Covington, O., May 21, 1883. J. N. F. SHELLABARGER.

#### EXTRA COMBS FILLED WITH OLD HONEY.

QUITE a number are asking now what they shall do with such. Put bees on them, by all means. If you can give a new swarm combs filled, or partly filled, with honey, you can get them into the boxes just so much quicker. After they get well to work in the boxes, and find the honey in the way, they will often uncap it, and move it into the sections above. They will be getting your old honey into new sections and into new combs. Of course, I would not want to do this unless the old honey were a good article. I would never think of extracting the honey in old combs, unless I wanted extracted honey. If you don't need them all now, use them later in the season for building up colonies. Where one wants to raise more bees, they are the nicest things in the world to do it with.

#### THE INTERVAL BETWEEN FRUIT-BLOSSOMS AND CLOVER.

THE bees with us are just commencing on the fruit-bloom. This is, perhaps, the case with many of you. Of course, there is no danger of robbing now, nor is there any danger of the bees starving, unless very bad, stormy weather should ensue. But when the fruit-bloom is over, then look out. Colonies heavy with brood will need many pounds of stores to carry them through until clover blooms; and if they have not a bountiful supply of stores, be sure they are fed. Keep egg-laying and brood-rearing going right along at a galloping rate, and don't mind the cost of sugar. Any thing will do to feed now. Cheap maple sugar, brown sugar, wet with water, or even grape sugar; but I would not give them any more than they will need to take them through until clover. Sometimes locust-bloom comes in and fills up this gap. Keep a careful watch of the plants and flowers, and stop just as soon as the bees can get natural stores. But whatever you do, don't let them starve for lack of food during this, perhaps the most critical point, during the whole year.

#### DELAYS IN RECEIVING GOODS.

It may be worth while to tell our bee-friends a little how mercantile men do in lines of goods that are in great demand, to avoid delays. It is simply this: They send an order to the factory six months ahead, or a year, before the goods are wanted, and

tell them to make and ship them at their convenience. By so doing, they have a full stock on hand when none can be obtained elsewhere, and thereby advertise their business in a way that nothing else does, by furnishing goods promptly that can be obtained at no other house. Of course, this requires capital, but much money is lost by the need of a thing at just the proper season, and it should be remembered that with most of you, money can be obtained for about six per cent interest. Now, this small amount of interest is a trifling matter, compared with losing a crop just for lack of proper facilities for caring for and marketing it. Of course, this would apply only to staple goods that are sure to be needed year after year. In our business, we often order supplies of honey-knives and such like goods in the fall, so as to be sure to have them ready for next spring.

#### CORRECTING MISTAKES.

It is an old saying, and one that is generally true, that right harms no man; but it seems to me, my friends, that we sometimes carry the matter of rectifying mistakes to almost too great a length, and often, perhaps, without hardly thinking of it. With the multiplicity of goods we offer for sale during the busy season, like the present time, mistakes will, in spite of us, creep in, and you know I have requested you to inform us of these. But suppose the mistake in question is only on a five-cent or three-cent article. Is it really worth while to have expensive clerks stop their work and hunt over files of old letters, to see whether the error was in your order or in our filling the order? I suppose most of you, in dealing or in making charge, are accustomed to let a matter of three or five cents drop, when the change is not at hand to make it right. A postal card is just at hand to-day, complaining of some mats for hives. After the clerk looked it up, we found it was the second time he had written about it; and on looking up the order, we found that he had only two mats at five cents each, and one of them was too small. The time consumed in hunting it up was far more than the value of the mats. Now, we make it a rule here to hand over five cents to anybody who says we owe him that amount; and when we receive goods with shortage or breakage to an amount not to exceed 25 cents, I have, *as a general thing*, been accustomed to let it drop rather than to make anybody any trouble about it. Would it not be best to consider this point a little?

#### A "BIG TROUBLE."

THERE is one big trouble, friends, that I don't just now see how to get over. It is the old story in regard to carelessness. One friend writes us just this minute, to say that the file he said was not put in with his goods is found, after all. A few days ago he declared we didn't send it, and his order had to be hunted, to see if he ordered one. When found, with *two* checks on it, to show that *two* clerks had seen it put in, I was either obliged to scold them for carelessness, or write back to our friend that he *must* have overlooked it. Neither one is a very pleasant task to do. Should I send him another by mail, without even stopping to look up the order, and thus save time and trouble? There are two objections to so doing: At the low prices we sell these things, I can not afford to; and then, again, we often find that the man who says he ordered a file, didn't order any at all — he only *thought* he did. I must keep a check on the clerks too, and most of them want to

know when complaints are made of their work. There is no way but to go back, hunt up letters, and trace complaints. Yesterday a friend wrote that the rabbits he declared were left out were in the package a'ter all. Somebody had lifted them out with the tin hive-covers, and then he declared there were none sent, and an innocent clerk came very near having to pay heavy express on more rabbits. It often takes more time to hunt up such blunders, and get at the truth, than it does to put up the goods. What shall we do, and who can help us in this matter that is such a very great clog and hindrance in business?

#### COOK'S NEW MANUAL.

We have just received a large invoice of Professor Cook's "Manual of the Apiary." The book has been thoroughly revised, and contains much additional matter, besides a large number of new engravings added. It seems to me that every bee-keeper should have Cook's Manual. The ground occupied is in many respects quite different from that of our A B C book. As I have explained to you before, the A B C book is written mainly to give plain practical directions for the A B C scholar to make a success with his bees, with as little expense as possible, and as little confusion as may be, as would come from knowing all the different hives, etc., now in general use. Now, Cook's Manual, in one sense, occupies a much broader field than the A B C book. He touches on many things that I omitted entirely. He also describes many methods of management that no mention is made of in the A B C book, and gives a bird's-eye view, as it were, of the present state of affairs of the science of bee culture over the whole world. Of course, he does not describe as many things minutely, nor go into details as I do in the A B C. Had he done so, the work would have been too voluminous for most readers. As Prof. Cook is one of our leading entomologists, he has taken up the natural history of the bee, and carried it further, in many respects, than the A B C book has. We have made arrangements with friend Cook, so as to furnish the Manual at the same price as the A B C book, both wholesale and retail. That is, when you are making up a club for the A B C and GLEANINGS, you can count Cook's Manual on the same terms.

#### CIRCULARS RECEIVED.

We have just printed for H. B. Harrington, of this place, a 4-page list of bees, queens, and farm implements.

Our friend Byron Walker, Capac, Mich., sends us a 4-page circular and price list of bee supplies that ought to be read by every bee-man, even if he doesn't buy any goods of him.

E. A. Thomas & Co., Coleraine, Mass., have mailed us a very complete catalogue of their improved strains of bees; 4 pages the size of this.

P. F. Rhodes, New Castle, Ind., has sent us a one-page list of bees and queens.

N. S. Coggeshall, Summit, N. J., has just received from our press a 6-page list of bees and queens. On account of the destruction of their factory by fire, friends N. S. & W. E. Coggeshall furnish no supplies at present.

M. B. Moore, Morgan, Ky., sends out a one-page list of Italian queens. With each order, friend Moore sends a specimen of his penmanship. Hardly in a lifetime do we find so exquisite a penman as he is. Friend Moore has the good will of our types on that score, as have Hasty, Hutchinson, and others.

L. E. Mercer, Lenox, Iowa, sends us a 16-page list of bee supplies. In winding up, friend Mercer writes the following very kind words relative to the A B C book and—friend Novice: The A B C book is certainly the best book ever published on bee-keeping. It is especially adapted to the wants of the beginner. Every person that has a stand of bees should have one of these books; they are well bound and nicely printed, and illustrated with many fine engravings. Friend Root has a peculiar way of writing that makes one feel when reading his book as though he were just talking to him; and I am sure that after you have read his book you will, as I do, think of him as "friend" Root.

**OUR \$175 ENGINE AND BOILER.**

A WORD OF PRAISE, WHERE IT IS WELL DESERVED.

**A** WORD for those engines. The one I ordered of you some time ago, a cut of which is shown in your circular, works like a charm. It is called 2-horse power, but I can do more with it than can be done with two horses. I can saw 20 cords of wood in a day with it; and for grinding feed (for which it is used mostly), I can grind 10 bushels per hour, and it is a clipper to run bee-hive machinery. The engraving is a little wrong; the governor is not as shown.

We are having cold rainy weather. Bees are having a slim chance; when it is warm enough for them to fly, it is too windy. Chaff hives are the only safe thing this spring.

A. OSBUN.

Spring Bluff, Wis., May 21, 1883.

Thank you, friend O. I remarked but a few days ago, that it was a little singular that not one breath of complaint had ever been made of any one we had sold in the years past. They have been improved some, since the cut was made.

**SAVE YOUR FOWLS. SAVE TIME AND MONEY.**

FANCY POULTRY, POULTRY POWDER, ITALIAN BEES, BEE-HIVES, &c.  
For circulars, address  
J. R. LANDES, Abton, Ashland Co., Ohio.

TO increase my business I make the following unparalleled offer, price and quality considered:—Dollar Italian queens, 75c; one queen to new customer, 50c; setting of Brown Leghorn eggs, \$1.00; two settings, or one queen and one setting, \$1.50. Correspondence solicited. Queens shipped in July and August. C. M. GOODSPEED, Thorn Hill, Onca. Co., N. Y.

**CONTRACTS WANTED WITH SUPPLY DEALERS,**

Dealers, and those who contemplate becoming such, are requested to write for estimates on job lots of hives, sections, etc. We make specialties of chaff and Simplicity hives, but will make other styles, if unpatented, and ordered in considerable quantities. Let us know the kind and probable quantity of goods you expect to handle, as well as any other information you may deem necessary, and we will send you prices that we are confident will be satisfactory.

S. C. & J. P. WATTS,

101fd LUMBER CITY, CLEARFIELD CO., PA

**HOLY - LAND AND CYPRIAN QUEENS AND Farm Implements!**

I have a fine lot of pure Holy-Land and Cyprian queens which I will sell for one-fourth more than Root sells his Italians. Also a few pure Albinos; they are light-colored, and very gentle.

I keep on hand, and can ship from the factories where made, a stock of Farm Implements, a two-horse corn-planter, with drill attachment; one-horse corn-drills that will plant in hills; a steel-toothed harrow in three sections, with lever to clear from trash, or pass over obstacles; spring-tooth harrows; common harrows, with 40 or 50 teeth; sulkey hay-rakes; sulkey cultivators, plow-sulkeys, etc. Send for Circular.

H. B. HARRINGTON, Medina, O.

**COOK'S BRUSH**

**FOR GETTING BEES OFF THE COMBS.**

Just what every apiarist needs. Brush is 4 1/2 in. wide, handle 8 inches long. Sample brush, 18c; 7 brushes, \$1.00, 15, \$2.00, by mail, postpaid. Per gross by express, \$15.00. **T. J. COOK,** 6d New Point, Decatur Co., Ind.

**ITALIAN QUEENS.**

Single queen (untested, laying)..... \$1 00  
Six for..... 5 00  
Address **R. A. BAGSHAW,**  
6d Blue River, Wash. Co., Ind.

**COMB FOUNDATION.**

Italian Bees by the pound, nucleus, or colony. Queens furnished when desired. Five per cent discount on A. I. Root's prices. For particulars, address  
4-6 E. Y. PERKINS, Jefferson, Greene Co., Iowa.

**L. E. MERCER, LENOX, IOWA,**

Breeds Pure Italian Bees and Queens for sale; Manufactures the Root Chaff Hive, the Standard Langstroth Hive, and the Mercer Chaff Hive. Sections, dovetailed or all-in-one-piece. I furnish every thing needed to run a first-class apiary. Satisfaction guaranteed, or money refunded. Circular and price list free. 6-7d

FOR FULL COLONIES OF

**ITALIAN BEES AND QUEENS,**

4-6d TWO AND THREE-FRAME NUCLEI,  
Address **P. F. RHODES, NEW CASTLE, HENRY CO., INDIANA.**

ONE-PIECE SECTIONS a specialty. Pound size, \$1.50 per 100; comb fdn. 65c per lb. Circular free.  
2-6d **B. WALKER & Co., Capac, St. Clair Co., Mich.**

**BEE KEEPERS' GUIDE**

28 Pages, 50c per year. SPECIMEN COPY FREE.  
5-7d **A. G. HILL, Kendallville, Ind.**

**PURE ITALIAN QUEENS.**

Carefully bred from imported and selected home-bred mothers of best strains. Safe arrival guaranteed by mail.

1 untested queen, before July 1, \$1.10; after, 90 cts.  
6 " " " " " " 6.00; " " " " " " \$5.00

Tested queens, Nuclei, etc., etc.  
Send for circular. **D. G. EDMISTON,**  
6d Adrian, Lenawee Co., Mich.

**W. Z. HUTCHINSON**

Rogersville, Genesee Co., Mich.,

Is now receiving Italian queens from the South (for particulars see advertisement in April GLEANINGS), and can send them by return mail at the following prices: Before June 1st, untested queens will be \$1.50 each; during June, single queen, \$1.25, or six for \$6.00; after July 1st, single queen, \$1.00; six queens, \$5.50; twelve, \$10.00. Tested queens (reared last season in the home apiary), before June 1st, \$3.00 each; during June, \$2.50 each; after July 1st, \$2.00 each. Safe arrival guaranteed. Make money orders payable at Flint, Mich. 5fd

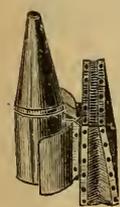

1883 THIRTEENTH YEAR. 1883  
**Italian  Syrian Queens.**

Tested queens, in April and May, - - - \$2 50  
 Tested queens, in June and after, - - - 2 00  
 Untested queens, in April and May, - - - 1 25

He that is faithful in that which is least, is faithful also in much.—LUKE 16: 10.

PUBLISHED BY A. I. ROOT, MEDINA, OHIO.

Vol. II.

JUNE, 1883.

No. 3.

**MYSELF AND MY NEIGHBORS.**

WHO IS MY NEIGHBOR?—LUKE 10: 29.

All things work together for good to them that love God.—ROM. 8: 28.

**H**OW little do we realize how dependent we are on our neighbors, until we are suddenly deprived of one or more of them! I have told you something of the new neighbor who has been of late taking down what I say to you, in the short-hand writing, as you may remember. Well, of late our mails have been very heavy indeed, and almost every clerk in the office was getting gradually a little behind, even though some of them worked pretty well into the night, to keep up. We got more help, until there was hardly sitting room for us; but the new help could take hold of only a limited part of the work, as a matter of course; but as we were getting over into the month of June, I thought we would not get very much behind, for orders usually begin to drop off a little toward the middle of June, as a general thing. It did occur to me at the time, that it would be a rather sad thing if any of the principal clerks should be sick right in such a crisis; but I kept hoping they wouldn't, just yet, any way. Please do not think I am speaking lightly of the bodily welfare of my boys and girls, for I certainly do not mean to, but I only meant to express my anxious solicitude for the rights of those of you who may have to wait for

your goods, as well as for the good reputation of our establishment. Well, just about as soon as the June No. was sent you, our short-hand writer asked for a couple of days' absence, and I thought I could handle the type-writer again for as much as two days, without very much trouble, and so she went away. Thinking she would be back promptly, I piled up some letters that I thought could wait as much as two days, without harm. Instead of the mail's getting lighter, they seemed to grow heavier, until great piles of unread letters began to stare me in the face before I went to bed at night. Toward the close of the first week in June, the neighbor right at my side, who has almost sole charge of the books, and all the money that comes in and goes out, was suddenly summoned to the death-bed of her mother. Of course, it gave us a shock here, to hear of a death in the family of a shop-mate; but to you who know us only as the folks who hold your money, and do not send your goods, it was a different matter. What should we do to save you from loss, who know nothing of our family affairs here? At once I turned my thoughts toward Ida, of whom I have told you; for, in fact, Ida was equal to taking almost any post in our whole establishment; but she, poor tired girl, was already nearly overburdened. All the help possible was given her; but the morning after the book-keeper was called away Ida was taken with nervous fainting

spells, almost the minute she reached the office. It seems her girl left her unexpectedly, and she tried to do her own housework before coming here, and a long walk on a hot morning overtasked her strength, and she was carried home and laid on a bed of sickness that seemed to cut off all hope of even her presence to direct, for at least several days to come.

What was to be done — especially what was to be done for you, my friends? Ernest had been assisting the girls in the office work, and knew how to fill a great many important posts. His health is greatly improved, and he has decided not to take his northern trip until after the swarming season. I asked God what was to be done, and then I got the best help I knew of. As every room in the building was doing its utmost, I was obliged to call in outside help mostly. Ernest, Maud, and even Blue Eyes, were installed, and a little demure black-eyed woman whom the children fondly term "Aunt Mate" was installed in the place Ida had so long held, of opening the letters, counting the money they contained, and distributing them for the dozen or more clerks to whose department they belonged. Do you think it would be a small thing to just open letters and take out the money, my young friends? Well, I tell you that, after years of experience, I have found it one of the most trying and difficult things I ever called upon a hand to do, to do it accurately and rapidly. I have seen a great many who thought they could do it; but before they were through with one large mail, they found out their mistake. For instance, a great many of you say you put so much money in the letter, and then forget to do so, and it therefore devolves on the clerk to count carefully all the money and stamps, and note the same on one corner of the letter, and then see if it agrees exactly with the amount claimed to have been inclosed. A careless person might drop some of the stamps or money, or might leave some of it in the envelope when it is thrown into the waste-basket. Again, many of you omit your name or town or State, and sometimes we find a clew to it on the envelope; no envelopes are to be thrown away until the full address is seen to be all there; and besides these two things there are almost a dozen other equally important ones to be kept constantly in mind. It is true, that every one who sends us a letter ought to be sure himself that the address is complete; and he ought also to be sure the money is right, and that all stamps or loose articles be securely pinned or pasted to the letter, so they can by no accident be dropped. We have learned by sad experience the importance of thus fastening every thing inclosed, securely to the letter, although very few letters come to us that way. Only last week a friend insisted his stamps were all inclosed, even after being told they were not, and he then said our clerk must have left them in the envelope, and that I ought not to employ such careless clerks. No wonder poor Ida looked hurt at such an insinuation. After all the intense zeal and earnestness with which we, day after day, scan carefully, *inside and out*, every envelope

that is put into our hands, to be told we must have left the stamps in the envelope! I tell you, friends, carelessness is reduced to an science here in this busy office of ours; and were it not, our business would never have assumed the position it has now.

Well, Aunt Mate opened the letters—she is Mrs. "Neighbor II," you know, and of course she knew bees, and letters too, pretty well. Another new neighbor must count the money and get it to the bank; and I tell you, that was another pretty big job, for one unused to it. Some of the other clerks might have assisted, it is true; but they were already overburdened, as it was. Willing and able helpers we had, almost as many as could get a sitting-place or standing-place in the office; but without the old "stand-bys," Ida and Miss M., our office looked like a "home without a mother." Folks were complaining because we did not send the goods, and the goods were going by the carload daily; but the stoppage in the office prevented their bills from going, and for a few days it seemed almost impossible to tell any one whether his goods had gone or not. Were the machinery of the ledgers moving along with its accustomed daily routine, it would be easy to tell all about it at a glance; but as it was, I was, almost for the first time in my life, unable to give every letter a prompt answer by return mail. As it was of far more importance that goods be sent, than that questions were all answered, for nearly a week some of you may have written, and written *again*, even without any reply. Of course, we got many lectures on the importance of punctuality, and a good many seemed to take it for granted that *that* was the way we *always* did things when they administered advice; but we were too busy to say a word back, and perhaps it was just as well to let actions speak instead of words.

Miss M. is with us again, and the pile of unanswered matter is diminishing; but Ida is still prostrate on her sick-bed; and although she teases daily for some of the letters to answer to you, my friends, she looks so white and feeble that both the doctor and myself tell her she had better lie still and be quiet. Although it has been a hard matter for me to think of the annoyance it has perhaps given you, my friends, yet there have come some pleasant experiences about it. Many of the boys and girls who are my neighbors have developed business powers and abilities I hardly expected to find; and if you should get a price list or a sample copy addressed to you in a very pretty, childish hand, you may recognize it as the handwriting of Blue Eyes. We have all worked hard to keep up, and many of us have prayed that God would give us strength and wisdom; and if any of you, my friends, have suffered serious loss by this blockade in the office here, if you will tell us what will make the matter satisfactory, I will try to pay it. God has taught me a lesson by it; for I know better now the value of these kind neighbors about me, and I can feel, too, how helpless I should be without them. It has, as it seems to me, drawn closer the ties of friendship that exist between us, and made us feel that

we are working busily here together for something that can not be computed in dollars and cents.

### VIRGIL'S TREATISE ON BEES.

*Continued.*

#### THE ORIGIN OF TIN-PAN MUSIC.

**C**OME, now, of nature's gifts to bees I'll tell,  
How Jupiter did cause them to excel;  
For what reward they sought the tuneful  
sound

And clanging brass of priests on Cretan ground,  
And feared the king of heaven, whose power did rise  
Within the cave beneath the Cretan skies. (1)

#### BEES AS AN ORGANIZED NATION.

Bees, and they only, (2) of all things create,  
Have common offspring, (3) public buildings great,  
As of a city whose undying cause  
'Dures on for ever under mighty laws; (4)  
Alone their hearts with love of country move,  
Alone their settled household gods they love. (5)  
Of coming winter mindful, swift they ply  
Their work in summer, and their stores lay by.

#### DIVISION OF LABOR. (6)

Some watchful seek the food that nature yields,  
And by a fixed agreement scour the fields; (7)  
And part within the inclosure of their homes  
Do lay the first foundation for the combs,  
The soft propolis that on bark appears (8)  
Placing, like sad Narcissus' lasting tears; (9)  
From thence with art the tough wax they suspend,  
While others all their care and labor lend  
To nurture up, their numbers to replace,  
The full-grown youth, the hope of all the race;  
Others, the purest honey crowded stow,  
And cells with liquid nectar cause to grow; (10)  
Others there are to whom by lot there fell  
The keeping of the gates to guard them well.  
These, observations take on clouds of heaven,  
And warnings give ere harmful showers are driv-  
en, (11)

Else from those coming in they take the loads,  
Or, phalanx formed, forth from the inclosed abodes  
The drones, ignoble herd, they sternly drive, (12)  
And strict forbid their access to the hive.  
Thus flows the work with zeal almost sublime,  
And fragrant honey reeks with smell of thyme.

#### COMPARING LITTLE THINGS WITH GREAT.

As when from metal mass in waxen heat  
The Cyclops haste Jove's thunderbolts to beat, (13)  
Some, blast on blast with bull's-hide bellows make,  
The hissing shafts some temper in the lake;  
Meanwhile, with blows laid on, Mount Ætna groans,  
Each following each in rhythmic thunder-tones;  
With mighty force their giant arms they raise,  
And turn the bolt with forceps divers ways.  
Not otherwise, if little things with great (14)  
One may compare, the fervent love innate  
To Attic bees, of holding honeyed store,  
Each in his duty urges evermore.

(1) In this month's section we run upon some of the queer things that little people in Virgil's time had to believe. I'll tell the story over; but as to believing it, you don't "have to." You notice, the poet does not explain much himself; he rather took it for granted that so well known a doctrine did not need much explaining.

The Romans taught that there were many gods,

and that these many gods had a king over them who was the supreme ruler of heaven and earth. A great while ago Saturn was the king of heaven. After a while he had a little baby-son whose name was Jupiter. Somehow or other, Saturn found out that his son would grow up to be greater than himself — would be king of heaven in his place, while he would have to take a back seat. After reflecting upon the matter, he resolved that he would eat little Jupiter up before he got big enough to be king. Some kind friends of the baby desired to save his life by hiding him; but as babies will cry, and Saturn would be certain to hear him, the project was a pretty difficult one. At last it was managed in this wise: There were a lot of priests in Crete who conducted their worship with an unearthly racket, made by pounding on metal instruments. They kindly consented to worship a little more and a little more zealously than usual, so as to keep up a rumpus all the time, night and day. There was a cave there where the baby could be kept out of sight, and the noisy worship prevented Saturn from hearing him. A motherly goat furnished the milk for the baby; and to crown all, the bees interested themselves in the matter, and brought honey to the cave for the baby. And so it came about, that Jupiter grew up on milk and honey until he was strong enough to put down old baby-eating Saturn and take the throne himself. Of course, Jupiter couldn't do less than to reward the bees that had fed him so long; and so he gave them wisdom and honor above all the insect creation. And they, on their part, are very fond of remembering how they won their great honor, inasmuch that, even when they are running away, if you will make a racket for them, like that which the Cretan priests used to make, they are so pleased that they will kindly stop and consent to go where you wish them to go.

(2) I think we may mitigate this statement by supposing that Virgil meant that no other creatures showed *all* these wonderful points, rather than that no other creature could show any of them.

(3) "Common offspring." Here the author is "just a shouting." He gets near a point that has been almost totally neglected by moderns, although it may be of considerable importance. To illustrate the matter, a grafted tree is the common offspring of the tree that furnished the stock and the tree that furnished the cion. It is usual to think only of the latter as the parent tree; but it is well known that the former does exert a certain influence. Take a twig of Early-Harvest apple, and cut it into two cions. Now graft one on a tree that bears small, late, sour, crabbed apples, and the other on a tree that bears large, good, early apples. Both trees will be Early Harvest — "pure" Early Harvest, we may say; but, if I am right, they will differ a good deal from each other in the direction of their original fruit. I have been getting more and more convinced that the same sort of warping takes place in bees. Who has not seen how certain hives, or groups of hives, retain good or ill qualities from year to year, although the queens have been changed meantime? If we can put any faith in the statements of seemingly truthful men, the Cyprians were gentle at first (while the brood reared by gentler bees lasted), and afterward became perfect furies. I pretty strongly believe that, in constitution, energy, healthfulness, wintering qualities, and perhaps some other things, bees inherit not wholly from the queen and drone, but also in a lesser degree from the workers that se-

crete the milky chyme, without which the eggs can not hatch. This chyme is surely more vital to the hitherto dormant egg than the sap of another root is to a grafted cion. If this doctrine is correct, two female eggs from the same queen, one reared a queen in a valuable colony and one in a worthless colony, will each partake a little of the energy or worthlessness in which it was developed. Still further, two combs filled with eggs from the same queen, one given to an energetic colony and one to a worthless one, will hatch out workers varying in the same directions.

(4) The determination to do just so, and no other way, that bees manifest so strongly, is quite suggestive of the idea that they recognize the force of some mighty laws that they would not swerve a hair's breadth from if they could, and could not if they would.

(5) A bee's love is not personal, but seems to be a love of locality, somewhat like that of the cat among animals, only a great deal more so.

(6) This division of labor is among men one of the triumphs of modern civilization; but the wise little bees reaped the advantages of a division of labor ages long ago.

(7) I guess this "fixed agreement" is an error. Their good judgment, and wonderfully keen scent, will account for their movements, I think, without supposing that they agree to harvest a certain white-clover field to-day, and the chestnut pollen to-morrow, and the earliest basswood bloom the next day. They do certainly have some speedy way of finding out just about where their bread is buttered.

(8) "Bark" — who would have thought of that as a source of propolis? And are there indeed two grades of propolis, one to putty up cracks, and one to mix with beeswax in laying the foundation for the comb?

(9) Narcissus was a nice and sensible (?) young fellow who fell in love with himself. He cried so much to think he couldn't marry himself that he all pined away. His tears were considered imperishable, and the tear-shaped drops of propolis, often dotted about the top of the hive, are here compared to them.

(10) How accurate this is! They won't build comb much in advance of the honey-flow; but when the honey comes in, then the cells will be extended right away.

(11) This is a rather doubtful point. It may possibly be that the old sentinel-bees around the entrance do observe the weather for the benefit of the colony; but I rather think it is the field-bees themselves that do that; in fact, they must sometimes, or they could not get home so promptly, just in advance of a sudden shower.

(12) Notice that Virgil does not fall into the prevalent modern error of saying that workers *sting* the drones, but gives us the exact facts. Bees very rarely sting drones, although I have seen one case of it. They simply drive them out of the hive. If they will go elsewhere, well and good; if they insist on returning, they just keep worrying them till they worry them to death. (Human smart housekeepers are oft accused of doing the same with the masculines.) Pin an insect to the wall with a cruel pin, and he will live two or three days; but shut him up in a little box, where he can worry and scabble around, and he will worry himself to death in a few hours, sometimes in one hour.

(13) Here's another thing you don't have to believe. Jove is another name for Jupiter. The Cyclops were enormous one-eyed giants who lived underneath Mount Ætna, and worked at the blacksmith

trade. They made thunderbolts for Jupiter to throw when it thundered. When they got a fresh order for a thousand of them, that must be done in time for the next storm, I suppose they pitched in about as friend Root's boys do in filling the spring orders.

(14) Some of the critics strongly condemn Virgil for bad taste in comparing honey-bees to Cyclops. It is bold; but to my mind it seems admirable; in fact, scarcely any passage in the poem more impresses me, considered as poetry simply.

FRANK BENTON'S NOTE.

Mr. Benton has my thanks for the added note concerning Virgil's bee-eater, as drawn from actual observation. Should this translation ever be republished in permanent form, I shall be glad to avail myself of it.

BAD GRAMMAR.

I didn't see, until it appeared in the JUVENILE, that I had a singular verb agreeing with two nouns, "Rare as the wealth and taste of kings adorns."

The verb can not be changed without spoiling the rhyme; but we can cuff one of the nouns into an adjective, and make it, —

"Rare as the tasteful wealth of kings adorns."

So that's the way we'll play it was.

E. E. HASTY.

Richards, Lucas Co., O., June 8, 1883.

Well, I do declare! And so, friend Hasty, we are to believe this "tin-pan business" all came from that story about the priests raising a din to drown the baby's cries. Our boys in jail once on a time took a sudden fancy to singing hymns with such unusual energy that suspicion was aroused, and investigation showed they sang to drown the noise one of their number made in trying to saw off one of the bars of their grating; so you see those priests were not the only ones who used zeal in their devotions, to drown some other noise and divert suspicion.

I can't quite agree on No. 4, friend Hasty. I will grant that Cypis brought up in a hive with gentle Italians would very likely learn to be gentle too; but I don't believe a queen would raise offspring perceptibly different, no matter what kind of bees nursed her. Still, you may be right, and I wrong.—In regard to No. 7: There is something wonderfully strange in the way bees do scatter over their whole field, giving each basswood-tree about an equal number of bees, even though they be miles apart. Why is it that some trees are not overlooked entirely, and others overcrowded?—Friend H., the little sketches you give us in this paper, of ancient mythology, are especially interesting after having read about Jupiter and Mercury in our recent Sunday-school lesson; and your whole translation seems to be eminently fitting for a juvenile bee journal. We have already discussed, here in the office, having the whole in a neat little book, when it is finished.

#### HOW NETTIE'S PA HUNTS BEES.

ALSO SOME SUGGESTIONS IN REGARD TO CHEAP BEE-HIVES.

WE do not keep many bees, but sometimes pa hunts them. First he puts out some bait, which is some honey-comb, then watches to see which way they fly. When they gather all they

can carry they fly straight to their home. When papa finds a swarm in a hollow tree he saws it off above and below the honey, and nails a board on top, and sets it on a board. It is raised up a little, so the bees can get in. At night, when they are all in, he covers up the holes, and takes it home. Sometimes he chops the tree down, smokes the bees, and gets the honey. One year he got over 400 lbs. of honey in this way.

#### DECOY HIVES, AGAIN.

Sometimes he takes a box or nail-keg, and nails up both ends, and makes two or three holes so the bees can get in; he fastens it up in a tree in the woods, and in a few days or weeks a swarm finds the box and takes possession. One year he got a swarm in an old churn, and once he took a sugar-trough gourd, cut a hole in one end, and got out the seeds, and fastened the end up again, then bored two or three holes for the bees to go in. In a few days there was a swarm in it.

NETTIE FREED, age 13.

Lowell, Ind., May 21, 1883.

Why, Nettie, your letter is just wonderful. Gourds for bee-hives! I thought of that once a great while ago, when friend Waldo advertised his sugar-trough gourds, but I couldn't think how to get movable frames into them. Well, after what you have said, Nettie, it has just popped into my head what we will do. Raise lots of gourds, all sorts and sizes, and then when somebody's apiary gets the swarming mania, as friend Hasty and others have told about, just let them swarm, the more the merrier, and put the large swarms in large gourds, and the small ones in small gourds; and when anybody wants to buy some bees with a queen, just sell them a gourd full. You see, they could just crack open the gourd, and let the bees out on their frames; and if there were brood of any account in the larger sheets of comb, they could be transferred. If we use pretty small gourds, the bees would get them full sooner, and swarm again so much the quicker. We would have to judge of the value of each queen by waiting until her bees had hatched, and looking at them as they came out. For convenience, the gourds might be hung to the branches of trees; and wouldn't they look just funny? If they didn't all sell in the fall, they would be light and easy to carry into the cellar for winter. I suppose we might get our surplus honey by cutting holes in the big gourds, and sticking little gourds into them, by cutting off the handle so as to make a neck about like the mouth of a bottle. Our honey would then be ready to go on the market, not "sugar in a gourd," but *honey* in a gourd, and it would likely be the lightest and strongest and cheapest package ever made. By the way, Nettie, how much of a task is it to get the "insides" out of a gourd?

#### EUGENE'S LETTER ABOUT LOCUST-TREES.

WRITTEN BY HIS SISTER MAY.

**A**S you print a bee paper for boys and girls, I thought I would tell you some things I know about bees and honey, and where they get some of it. I have a swarm of bees that I bought from papa for a dollar. I saved the money that had

been given me, and paid for my bees. Papa has 22 swarms of bees. They are all Holy-Lands and Italians but one swarm, which is a black one. I help papa extract honey. I turn the extractor, and sometimes I hold the smoker and smoke the bees when papa is taking out the frames.

#### HONEY-LOCUST OF TEXAS, ETC.

Bees get honey here from horsemint. It blossoms about the last of this month; they get honey also from elm, persimmon, and black-jack trees. But the best honey-tree here that I know of is the honey-locust. It grows up as high as the oaks and elms; lots and lots of them grow in Trinity River bottoms, and the bees just go down there in great droves when these trees are full of blossoms.

There are two kinds of honey-locusts. Do you know the difference between them? I will tell you after awhile. They have leaves just alike, and slick bark, until they get to be big trees. The leaves grow on a stem about as long as my hand, and from this leaf-stem there put out in pairs from six to eight leaf-stalks, and on each side of these leaf-stalks there are little leaves about as wide as my fingernail, and twice as long. They are green and slick on both sides, but the upper side is the greener and smoother. The young leaves are sometimes red when they are little. The blossoms on the honey-locust are of a yellowish-green color, and grow in spikes, as papa calls them. They are shaped like a bunch of grapes. The bees sit on the edge of these little flowers, and just lick up honey by the mouthfuls. The honey-locust bears a great long pod, or bean, from half a foot to a foot long; some of them are nearly as long as my arm. These pods, when they are little, look nearly like young beans; and when they are ripe, in one side is a lot of seeds that sometimes will rattle against the hull when you shake them, and in the other side is a sweet waxy stuff that I can't eat much of, as it gets strong in my throat in a little while. Well, now, have you found out the difference between these kinds of locusts yet? I will now tell you that one has thorns at nearly every leaf-stem, and lots of them on the body and limbs of the tree, and the other has no thorns on it anywhere. So you see there is quite a difference; but bark, leaves, and blossoms, are just alike, and they both bloom at the same time. They both furnish lots of honey. One of papa's swarms nearly filled the upper story of a chaff hive with honey from these trees in a week; then the blossoms all fell off. We extracted two gallons of locust honey from one swarm, and it is nearly as clear as water, and very good.

I like to look at the pictures in GLEANINGS, and on the covers too. We have young mustang grapes big enough to make pies. Ma makes them just as she used to make gooseberry pies in Indiana. They make good pies, but it takes lots of sugar to sweeten them. I will send you a can full of them; and if you like them I can send you some vines in the fall, and you can raise them; that is, if they don't freeze to death in the cold winter.

If you print this in GLEANINGS I will get another letter written some time. I can't write, so I got sister Mary to write my letter. If this is worth a book, I'd like Pilgrim's Progress. EUGENE D. ARWINE,

Bedford, Tarrant Co., Tex., May 21, 1883.

Many thanks, my little friend, for the grapes, and also for your very good and interesting letter. To be sure, you shall have Pilgrim's Progress, and we credit you with

\$1.00 besides, which you can divide with sister May, if you choose. I should be very glad to hear from you again. We made a very nice pie of the grapes you sent.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Oil, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chiel's amang ye, takin' notes;  
An' faith, he'll pient it."

**A**ND now it is the middle of June, children. Do you love June? Are the bees humming overhead with that peculiar sound that speaks so plainly of clover honey, around your house? Are you having swarms come out almost every day? and are the beautiful snowy-white combs growing every day in the section boxes? Are the green fields so inviting you can hardly stay in school? and is it almost strawberry time where you live? Is it fun to live? and do you thank God every day that he has given you the precious gift of life? I hope life is joyous to you all; for if it isn't, it certainly ought to be. David once said, "Great peace have they which love thy law." Well, now, if you haven't that great peace, I am afraid it is just because you do not love, and love to study, that law.

My pa has 12 stands of bees. He wintered them in the cellar, and they came out in good condition.  
Doylestown, O. DANIEL HOUT, age 8.

We have 25 stands of bees; 7 of them are in Simplicity, and 4 of them are Italianized. Papa sold 14 stands, and he said he was going to send for a honey-extractor.  
S. D. TUTTLE, age 11.  
Mill Springs, Ky., April, 1883.

My pa has 6 stands of bees. They are all in very nice condition. I help my pa work with the bees in the summer.  
MYRTLE A. DAVIS, age 11.  
North Salem, Ind.

#### ELWOOD AND HIS GRANDPA.

My grandpa had 13 swarms of bees, but this winter one of them died. He had one hive in the cellar. He has a mill. I have one mile to go to school, but it is closed. Our nearest Sunday-school is about two miles. I do not go. I can answer your question. "And let us not be weary in well doing; for in due season we shall reap, if we faint not." Gal. 6: 9; also

II. Thes. 3:13. If this is worth a book, please send me Ten Nights in a Bar-Room.

ELWOOD SPRENKLE, age 8.

Wrightsville, Pa., April 18, 1883.

So you found the text in two places, did you, Elwood?

My brother Charley has 2 stands of bees, and he takes GLEANINGS. I like to nail sections together, and work with the bees; and I like to work in the garden.  
EDDIE STEEN, age 9.

Findlay, Ohio, May 27, 1883.

#### CHICKEN CHOLERA.

Tell Fannie M. Faris that we have used poke root for chicken cholera with good results. Pound it fine, and soak in water or milk over night, then mix with corn meal, and feed.

Bremen, Ind. JOHN S. R. KUNTZ, age 8.

Pa has one hive of bees. I like to gather eggs when I can get a lot of them, but I got only 27 tonight. Our dog eats some of them when he can find them.

MATIE D. FERGUSON, age 9.

Clarence, Ia., Apr. 9, 1883.

#### A NEW KIND OF FUEL FOR SMOKERS.

Papa uses buckwheat hulls to burn in his smoker, and thinks it is the best stuff for smoke. He puts a little green grass in the top to keep it from throwing sparks.

Drinker, Pa.

STELLA T. FISHER, age 10.

Answer to Ada Finch's question, Who washed his steps in butter? It was Job. How many persons mentioned in the Bible died twice, and who were they?

KATIE PURDY.

Westover, Ont., Can.

And now, Katie, please tell us what Job meant by washing his steps in butter.

#### THE SWARM IN THE GARRET.

I am a little orphan girl. I live with my uncle and aunt. I help my uncle with his bees. He has a big swarm in the garret of the house. One day they came into the sitting-room through a little hole in the wall. We feed the bees sugar and honey.

Staunton, Ind., April, 1883.

ANNE CASPER.

We have two swarms of bees; one of them is mine and pa's. Pa is a mason, and works in stone. He is afraid of bees, and they sting him. Ma and I have to take care of the bees, and pick berries in the summer. I have a sister in Chicago, and I am going to stay over there two or three weeks this summer.

FRED A. CULVER, age 13.

Benton Harbor, Mich., April, 1883.

I thought of writing sooner, but I had no spare time, as I had to go to school. I like bees very much, and hope to be a bee culturist some day. I am in the fourth reader, and like to go to school, because we have a kind teacher and good schoolmaster. I like to read good books.

W. H. TILL, age 11.

Allegheny, Pa., March 5, 1883.

#### HIVING BEES.

Draw a long woolen stocking on the end of a pole; and when the swarm begins to settle, place the stocking where the bees seem thickest, and hold it there until it is completely covered with the whole swarm. Have a sheet spread, and then lay the pole, or, rather the stocking, on the sheet in front of the hive.

ANNA E. KOSER.

Milford, Ill., May 13, 1883.

## HENRY'S OLD BLACK HAT.

My pa has 7 stands of bees. I help work with them. When the bees swarm I hang my old black hat on the fence. But there is never a bee goes about it. There, now, you may have it at what it's worth. My pa was going to send you a letter, and I thought it best to put mine in with it.

Sands, N. C. HENRY C. HAYES, age 8.

That's right, Henry; I am glad you did. Is it the black hat I may have, or the letter?

## GETTING THE HONEY OUT THE OLD WAY.

My father found a swarm of black bees in an old oak-tree. In the latter part of September he took the honey out. In the evening, after they were all in the tree, he smoked them with flour of sulphur, melted, and fastened to a pole with a cloth on the top of it, and on the cloth he put the sulphur; he then set it ablaze, and put it in the entrance of the tree. That killed them all. The next morning he climbed up the tree and cut a hole into it, and then took out the honey. This is my first letter.

Creston, Ind. JOHN R. RIEBE, age 13.

## JENNIE AND HER MOTHER.

My brother has about 16 hives of bees, and he got a great deal of honey. He got the first premium at the State Fair twice, and at the County Fair once. I have an elder sister, but she is going to school, and there are none but mother and I to do the work. We are cleaning house now. We take all the things out of a room, and clean them and the room, and then put them back again. I feed the chickens, and gather the eggs. We have a fruit-drier. I wonder if it would not do for an incubator.

JENNIE MCBURNEY, age 11.

Primrose, Pa., Apr. 20, 1883.

## HOW DORA'S FATHER MADE AN ARTIFICIAL SWARM.

I like you, for I think you like little children. I have two little sisters; we have 18 colonies of bees; we winter them in a cellar; this is the second winter we have kept bees. Our cellar is quite damp. Last summer we had a colony that swarmed out three times, and went back every time; then papa examined them, and he found that they had four queen-cells just ready to hatch; then he divided them, and took one of the cells and pulled the top off, and let her out, and then put her into the new hive, and they did well.

DORA STOUT, age 9.

## A SWARM COMING OUT IN THE RAIN.

Dora has written such a long letter, I think she needs a red light held up to her. I am going to help papa tend to his bees this summer. One day our bees swarmed when it was raining; and before we could get them in a hive it rained quite hard. I guess my papa will send to you for an extractor.

LEONORA L. STOUT, age 7.

Richland Center, Wis., March 30, 1883.

I am glad you remember the "red lights," Leonora; but I hardly think Dora needs one, for she has given us a good plan to divide a hive; and then you know, too, she is an especial friend of mine, isn't she?

## AN IMPORTANT (?) FACT FOR BEE-KEEPERS.

I read in the JUVENILE that you would give a book for any fact in bee culture not generally known. As my pa did have some bees, I asked him if he knew a fact not generally known, and he said he did, and it was this: "If you do not take good care of them in the cold winter they will all die, just as mine have

this winter, because I did not take care of them and fix them for winter." I am not yet fifteen years old, but shall be soon, so I send you five cents for a book; and if my fact is of any use to bee-keepers, you will please print it and send me two books.

BERTIE TILLINGHAST.

La Plume, Pa., March 11, 1883.

Sure enough, Bertie, the fact you give is an important one; but I am not quite sure it is not generally known. I rather think your father smiled a little when he gave it to you, did he not? Never mind; it is good, any way.

## LETTER FROM A FIVE-YEAR-OLD LITTLE GIRL.

I help papa clean off old section boxes, and pick up the scraps of wax when he is making comb fdn., and put them in the wax-extractor. I help him all I can.

ELLA B. KINCADE, age 5.

## HOW MINNIE HELPS HER PAPA, AWAY DOWN IN ARKANSAS.

I see you are so kind as to give the children a book, and so I thought I would write to you. I like to help papa with his bees. He has about 80 swarms. The bees are working very fast on willow and cottonwood trees and wild flowers. I help papa clean off section boxes, and help put in fdn. guides in section boxes, and also help make fdn. on plaster molds of papa's own construction. The next day after he made his plaster molds he saw some advertised in GLEANINGS, just like them, only yours are made of metal. Papa ordered a \$25.00 fdn. mill of you on the first of March, and waited until the first of April, and it never came, and so he had to make some fdn. on his old molds that he had last year. The bees were so near swarming that he had to have some to put in his new frames for this year's swarms.

MINNIE L. KINCADE, age 8.

Sterling, Ark., April 4, 1883.

## A CAT STORY.

This time I write about a cat belonging to the same neighbor as the dog which I wrote about in my first letter. The cat was watching a rat which was in between the lining and the siding of the barn. The crack through which the cat saw the rat was not big enough for the cat to get even its head through. The man stood and watched it for quite a while. He expected to see the cat bump its nose, but it did not. When it got ready it gave a spring and stuck its paw in and knocked the rat out and then killed him.

IRVIN ADKINS.

## A HORSE STORY.

My uncle, who lives in Omaha, once had a horse which was very knowing. One day the horse went down to the blacksmith's, and held his foot up to be shod, and would not go away until he was shod. So the blacksmith shod him, and then he went home, and his master had the bill to pay.

ALTIE V. ADKINS, age 10.

La Porte, Ind., April 7, 1883.

Well, now, Altie, that is a wonderful case of intelligence in the horse; but if you will excuse me, I am almost inclined to think it sounds a little more like a fish story than a horse story. Did you hear your uncle tell that, and are you sure he did not tell it for fun?

## MINTA'S LETTER.

Well, Uncle Amos, here I am again, trying to write another letter, but am not at all pleased, because

my other letter was not printed, and I guess I shall have to be put in the Growlery. Now, Uncle, I am not at all afraid but that you will print it if it goes until next year, for I suppose you have so many you have to lay some of them by for next time.

Brother Henry's Italian swarm wintered strong and well; the queen has many young bees. Henry says he thinks it will swarm before long. He hardly thinks of any thing but his bees. He had good luck with them through the winter, while the rest of us lost one. I had one, and that died too. I want to know if there can be three or four queens in one hive, as long as there are drones.

I go to school. We have a lady teacher, and she is a teacher, I tell you. When she speaks to the boys, and words won't do, she tries something else. She has one eye on her work and one on the boys, and sometimes she suddenly has one of those boys out on the floor by the collar or ears or something else.

I bought a pet lamb this spring, which feeds from a bottle, and my sister Caddie and I bought one for our sister Nellie.

Please send me a few of those cards, "Jesus, teach me not to swear," etc. I want to give it to some boys who come to our school, who swear; they are a disgrace to the school. MINTA F. MISER, age 10.

Mantua, O., June, 1883.

There are sometimes two queens in a hive, Minta, but very rarely three, unless it is just about swarming-time, when a lot of them happen to hatch out all at once, and go out with a second swarm. As a rule, each hive has one queen, and no more.

#### MAKING HIVES BY HORSE-POWER.

My pa has 70 stands of bees. I like them. My brother takes GLEANINGS, and I like to read it. My pa has a mill for making bee-hives. I like to drive the horse in the mill. MARY L. BEDELL, age 11.

My pa has not unpacked his bees yet. They are packed in chaff. He has a mill for making the slats for boxes. We have a new house, and we are building a barn. We keep about 20 hens. I set two, and so did ma, and we are going to see which has the most. If you think this is worth a book, please send Rescued from Egypt. EDITH BEDELL.

Kawkawlin, Mich., May, 1883.

#### FROM 2 TO 13, AND 200 LBS. HONEY.

Last spring my pa started with two hives, and now has 13 stands out of those; he got a smoker of you. He likes it very much. A bee stung me on the nose, and it hurt. My pa took 200 lbs. honey from his bees last fall, and left their hives full to winter on.

Bloomington, Ill. ROY C. HAYES.

Well, here we are again, just the same as ever. How are the bees? Ours are all right. They are gathering honey from gooseberry and cherry blossoms, etc. We have 4 canaries—2 little ones and 2 big ones. We had six, but one died, and the cat killed one. One of our hives of bees swarmed out the other day, and they tried to go into another hive, and the other bees killed the queen.

Danforth, Ill. LIZZIE JOHNSTON.

My uncle John keeps bees. He had 40 swarms, and three of them died. This is the first letter I ever wrote to you, and I read in the third book. My pa died about six years ago, and I live with my uncle John. He got some Holy-Land bees, and he thinks they are the best. FANNY EDITH LEE, age 9.

Stevensville, Ont., Can.

Pa has 10 stands of bees, and ma has 2 stands. Pa feeds his bees syrup made out of granulated sugar. One warm afternoon they carried in 8 lbs. of sugar made into syrup, in one hour. Pa wintered his bees on their summer stands, and he did not lose a stand. They are all in good condition this spring.

MARY B. COLEMAN, age 12.

Kinderhook, O., March 20, 1883.

#### BEEES AND BEE-TREES.

I do not know much about bees, but pa says they are awful nice to work with, if they would not sting. A neighbor of ours was bragging about a bee-tree on his place, but he did not brag long, for a number of young men, or rascals, went and cut it down. He was awful mad about it, but could not find out who did it.

WILLARD W. LCCIE.

Cousecon, Ont., Can., Mar. 7, 1883.

Papa has 84 swarms of bees in a cave, dug in the ground, and 11 out of doers. He has had them out all winter. They have got big boxes over them. He wants to see which way is the best to winter bees. I have two brothers, Fitz and Fred. Fitz goes to college, and Fred wants to be a bee-man.

EVA FARRINGTON.

Strawberry Point, Ind., March 7, 1883.

Very good, Eva; but won't you tell us now which *did* winter best?

My brother Charles has 16 swarms. He has one Italian swarm, and is very proud of them. They are such industrious and economical fellows. He has one swarm of Holy-Lands, but it was late in the fall when he started with them, and we can not tell much about them yet, except that they do not like their neighbors. If one enters their hive they seize him and escort him out instantly.

WALTER H. LARRABEE, age 10.

Horton, Mich., March 21, 1883.

#### BEEES AND TOBACCO.

When any one who uses tobacco comes here to see the bees, they get cross, and will sting, so mamma says.

CARRIE BELL PROSCHER, age 5.

La Grange, Fla., May 3, 1883.

Well, I declare, Carrie, you have given us a very valuable fact in both medicine and bee culture, haven't you? Now I think I can guess pretty sure that your papa doesn't use tobacco: am I not right? So you see I was all right, wasn't I, when I decided, some years ago, that bee-keepers ought not to use tobacco.

I live with my uncle. He has 16 hives of bees. He had 20 hives, but he lost 4 in wintering. He has the chaff and Simplicity hives. He got about 300 lbs. of honey last summer; he extracted some. My aunt and brother hived a swarm of bees a year ago last summer. They made 3 lbs. of honey in sections, and enough to winter them. I helped my uncle when he extracted honey. We children eat the cappings. I like to help him work with the bees.

EVA JAMES, age 13.

Kellsville, Ind., Apr. 4, 1883.

Now, Eva, I wonder if the secret of your liking to help so well, about extracting-time, has not something to do with those same cappings. I have seen children before who liked cappings; and, come to think of it, I don't know but I have seen some grown-up folks who had a way of getting their fingers in among them.

I like honey, and molasses too. One day I found a screech owl in a hollow tree. My father has no bees, but grandpa has. JOHN E. ALVIS, age 13.  
Montrose, Ia., March 20, 1883.

I have read the letters in the JUVENILE, and like them. My uncle takes GLEANINGS. He keeps bees. He has one colony upstairs. I saw the queen last summer, on the comb. [PEARL LAWSON.  
Staunton, Ind.

#### UPWARD VENTILATION.

Bees have wintered well so far. Father left the top story on one hive, and thinks it is in the best condition of any. He thinks top ventilation is quite important for successful wintering.

MILES G. WYTH.

Townsend, Mass., March 12, 1883.

A SIX-YEAR-OLD FRIEND TELLS US WHAT HAPPENED WHEN HE WAS A "LITTLE BOY."

MY PAPA HAS 15 SWARMS OF BEES. WHEN I WAS A LITTLE BOY I WENT OUT WITH A STICK TO PLAY WITH THE BEES, AND THEY DID PLAY WITH ME UNTIL I MADE A BIG NOISE, WHICH BROUGHT MY PAPA IN A HURRY. THE NEXT DAY I COULD NOT SEE OUT OF ONE EYE, AND THE MINISTER WAS HERE, AND HE LAUGHED. WELL, I SHOULD LIKE JACK THE GIANT-KILLER.

FORREST L. COLBY, AGE 6.

ENFIELD CENTRE, N. H., MARCH 12, 1883.

Well, I don't wonder very much that the minister laughed, Forrest, for I think I should have laughed too, especially if it all happened when you were only a *little boy*.

HOW TO CURE LEFT-HANDEDNESS; BY AN OLD JUVENILE.

I want to tell "Left-handed Laura" and other juveniles how my teacher broke me of writing left-handed. He set me a copy. I went to my desk (just promoted to one), feeling very important. I took my pen in my left hand, of course, as I was left-handed, and I was trying my best to make straight marks, when the teacher's fist came violently in contact with the right side of my head, and I lay sprawling in the aisle. As soon as I could, I got on my feet, when the teacher (?) opened his mouth, and spoke thus: "Young man, never let me see a pen in your left hand again." And I didn't. Children, how do you like that kind of teaching? "I am a little boy of 5, with a 0 at the right-hand side of it. Mr. Root, is there any thing about bees in this? If there is, I want a book. C. E. MCRAY.

Canon City, Colorado.

Friend M., we can all of us thank God that such ways of guiding the infant mind are now happily, at least for the most part, passed away. Reason, kindness, and love, are first tried, and severity, if ever needed at all, only as a last resort. What would be done with a teacher now days, were he to attempt to cure urchins or left-handedness after that fashion?

#### SOME INDIAN STORIES.

I have been very much interested in hearing my parents tell about the Indians that inhabited this St. Croix Valley about 30 years ago, and thought some of the JUVENILE readers also would like to hear something about them. Before the St. Croix Valley became a wheat-growing country, the steamboat used to bring loads of flour from St. Louis. One

time it brought up a load of lime, and a party of Chippewas thought it was flour, took one barrel, and carried it twelve miles into the woods, and when they got to their camp and opened the barrel they were very much disappointed. At another time they stole butter off the steamboat, and ate nothing but butter while it lasted, and it made them all sick, so none of that tribe will eat butter. There is an old squaw living near this village, called Mindy, and she (like all the other squaws) is a very neat sewer. Once a tribe of Sioux came here and got into a fight with the Chippewas, and Mindy got stabbed, and thought she was going to die, and so she sent her boy with a very nice patchwork quilt to my sister. She soon recovered, and sent her boy after it.

St. Croix Falls, Wis., Jan. 8, 1883. EVA AMERY.

#### THE TYRRELL BOYS AND THEIR BEE-KEEPING.

I received your GLEANINGS, of which my grandpa made my brother and I a present. We had 10 colonies of bees last winter, and increased to 21. We lost one. My brother and I kept up with them as far as the marsh. We were barefoot, and could run fast. We saw which way they went into the woods, but we couldn't find them after. We sold one to Mr. Shum, and one was robbed by the bees. I made hives to raise queens this summer.

W. E. TYRRELL, age 11.

#### THE SWARM IN THE HEDGE.

My brother said that we kept bees, so I will tell you about a swarm of bees. A farmer came and told pa that there was a swarm of bees in a hedge fence on his farm, and that if he came out and took them away he could have them; but pa was busy for a week, and could not go and get them. The bees had built combs the size of a half-bushel in among the limbs, and there wasn't a bit of shelter over them. Pa got the bees, but no honey, for some one had been there the night before, and had built a fire of green corn-stalks, and had smoked the bees up on the upper limbs, and then took the honey. They were the gray bees. They are in a hive in our apiary. They have a good supply of honey for winter.

La Porte, Ind.

CHARLES R. TYRRELL.

#### SAMMIE'S QUESTIONS, ETC.

Mother takes your journal, and I have been reading some of the letters from your little friends. I should like to be one of your friends too. My pa had several stands of bees, but the moths killed them. My brother has four bee-trees in the woods, and we should like to know the best way to get them out, and what kind of a hive to put them in. Mr. Root, can you tell me how the bees make their wax? One of my neighbors has a stand with wire cloth over one side, so that you can look at the bees at work. When they come in with honey they back into their cells. What makes them do that way?

Penn, Fla.

SAMMIE R. BOWEN, age 13.

I shall be glad indeed, Sammie, to take you into the circle of little friends, for there never can be too many of us while we are seeking to tread in wisdom's ways. Now I wonder if some of the other little friends could not answer some of the questions you ask. Is it probable that the moths really killed the bees? What shall her brother do with his four bee-trees, and what kind of a hive shall he put the bees into? How do the bees make wax, and what do they back into their cells for? Who can give us some light on all these points?

#### HOW CORA'S FATHER GOT HIS HIVES NAILED UP AND PAINTED.

Father has 21 swarms of Italian bees; he also received the 25 Simplicity hives. We had quite a time getting them set up; but after we got one up we were all right, and now father is transferring them to our new hives. They look very pretty; we painted them white. We are very proud of them, as there are no hives here like them, except those of our neighbor, perhaps.

CORA BEAR.

Beaver Creek, Col., May 15, 1883.

#### A CAUTION TO COMB-FOUNDATION MAKERS.

We have been making comb foundation for three days, on the machine pa got of you last spring. We had quite an accident while we were making it. Last night a pail of wax was sitting on the stove melting. The stove was very hot, and the wax boiled over; it immediately caught fire, and blazed to the ceiling; but we soon got the pail off the stove, and got the fire put out. The bees are hard at work.

MARY WINDSOR, age 12.

Leamington, Ont., Can., May 30, 1883.

#### HOW EDDIE MADE A SWARM CLUSTER.

One day in July, as I was standing in the stable-coor, I heard the bees flying over; so I ran after them, and threw sand and rocks at them till they began to settle on a tree. As soon as they were all settled we cut the bush down and got them hived in a box, and took them home. This was the 29th of July, the first year. That year I took no honey; this year I took about 70 lbs. from the old one, and it swarmed three times; from them I took no honey.

EDDIE H. SHERMAN.

Fillmore, Iowa, Feb. 11, 1883.

I have been wanting to write to you a good while, but I could not write very well, and mamma was sick, and she told me to wait until she got well, and she would show me how; but she never got well. She died a little while ago, and we are left without any ma to take care of us, so I had to write this myself. I did love my dear mamma so much; but I still have a good papa to take care of me. Papa's bees are at work on the clover.

LILLIE MANUEL, age 10.

Alma, Ark., May 10, 1883.

May God bless and comfort you, my little motherless friend Lillie.

#### A SAFE KIND OF PARTNERSHIP.

Pa and I are partners in bee culture. We have got 15 hives—13 in Langstroth, and 2 in old box hives. We are going to transfer the two as soon as we can. The bees are so bad about robbing this spring, that it is almost impossible to handle those that have much honey. Our bees have been doing badly until about a week ago. Our bees did well last year. We got about 800 lbs. from 8 hives, all comb honey. I help pa work with the bees. I am not afraid of them. Ours are all blacks. I will tell you some time how pa and I came to be partners in our bees.

WIBY DELLIS, age 13.

Hubbard City, Texas.

#### LEROY'S OPINION ABOUT THE ITALIANS, ETC.

Pa has six swarms of bees—four black ones, and two Italians. I think the Italian bee is the best when they can steal their food. The black bee works earlier and later in this country. The Italian bee can not stand the cold as well as the black bee. The queen is always guarded by other bees. Pa says I must watch the bees this summer, and he will

give me ten cents for every swarm I see first. I think they are going to swarm in about one week.

LEROY ROBBINS, age 11.

Watsontown, Pa., May 22, 1883.

#### HOWARD'S LETTER.

My pa has 8 stands of bees. I have one black one. I want to raise a yellow queen, and pa's bees are all Italians but 2. We had a swarm; we put it in a Simplicity hive, and it stayed only 4 days, and then came out and went off. I have heard that a bad beginning makes a good ending. I hope that will be the way with us. The bees are real cross; but we have a smoker, and we will tame them.

Answer to Annie Cameron's question, How often is *yes* used in the Testament? I can find it but once. It is in Matthew 17:25. What two chapters in the Bible are alike?

HOWARD FISHER, age 12.

Franklin Mills, Pa., June 4, 1883.

#### HOW TO MAKE THE BEES TAKE HONEY THAT IS CANDIED IN THE COMBS.

My pa keeps bees; he has 27 stands. He winters them in the cellar; 2 died; he made a hand-barrow, and I helped him carry them out. He has them in the Simplicity hive and L. frames. He makes them himself. He has one stand of pure Italians. The rest are blacks; he paid \$3 00 for the queen last fall. He bought her of Mr. Williams, of the Railroad Apiary, Berkshire, N. Y. Pa puts brown paper on top of the frames, instead of cloth. I will tell you how to make the bees work over candied honey; that is, in old combs. Uncap it, and sprinkle water on it, and the bees will take it all out clean.

ALBERT D. SMITH, age 9.

Caroline Depot, N. Y., May 21, 1883.

#### THE ROCKY-MOUNTAIN BEE-PLANT IN ITS NATIVE HOME, ETC.

My father has 18 stands of bees. They are all Italian. He got the hives, and I helped him set up brood and honey frames; I set up 200 sections in 3 hours. I have a brother-in-law who, when he sees a bee, will run, for he is afraid of them. I am not afraid of bees. I can go among them without my bonnet on, and not get stung. My father is transferring his bees into the new hives. One day not long ago he went to go across the river, and found a large swarm of bees in a tree. They had 30 lbs. of honey. I see in your A B C the Rocky-Mountain bee-plant. This same plant grows abundantly here, and in all the valleys of the Rockies. The bees work on it.

JESSIE TOOF.

Beaver Creek, Col., May 14, 1883.

#### SUB-VENTILATION, ETC.

Papa sub-ventilated his bee-cellar this past winter. When the thermometer stood 16° below zero outdoors it was 43° above zero at the mouth of the pipe in the bee-cellar; therefore it gained 59° while passing through the pipes under the ground. Papa put 153 stands of bees in the cellar last fall, and found but one dead when he took them out. Mamma calls our place "Honey Grove," because papa has kept bees here for 22 years. Don't you think that is a nice name? I like to work among the bees with papa and mamma. Last year I assisted in putting fdn. in supers; I also extracted honey, and expect to help this season. When the JUVENILE comes, papa hands it to me and says, "Here, Viola, is some mail for you," and I like to read it.

VIOLA E. OREN.

Mt. Auburn, Benton Co., Iowa, April 2, 1883.

## PEARL'S LETTER, AND ALL ABOUT THE FOLKS AT HOME.

I help my uncle go through the beehives, and I saw two queen-cells in one hive. My aunt is going to get some more bees. We have no bees. My ma has 65 little chickens; my pa is a blacksmith; we have a good cow, and I have all the milk I want to drink. My ma is going to make an incubator out of an old turkey-hen. I have a brother five months old, and I have a sister 7 years old.

PEARL LAWSON, age 9.

Staunton, Ind., May 21, 1883.

## THE WAY THEY PUT IN STARTERS AT "ABBEIE'S HOUSE."

Mamma has 9 swarms of bees, and I have one which she gave me. My papa doesn't like bees very well. He doesn't like honey; because he says it is too sweet. I was out with mamma, helping about the bees, and one stung me, and I said it was a stingless bee now. I have seen the bees come to their hives and would be laden with pollen, and they looked nice. I have seen the bees, and have seen them gather honey. We were getting boxes ready for a swarm, and we put in starters, and I would hold the comb over the stove and let it melt just a little, and then put them into the box, and they stuck, and we had good luck. The bees have gone to work in the boxes. We use pieces of comb for starters.

ABBIE E. FREEMAN, age 14.

Guildhall, Vt., May 25, 1883.

## SUSIE'S LETTER.

Pa keeps bees. I am the only one to help him; the rest are all afraid of them. I have two little sisters younger than myself; one of them is 6, and the other 7. My ma died when I was 7, and then pa got grandma to live with us. Grandma died last fall, and pa broke up housekeeping, and sent me off to school about 20 miles from home, and took my little sisters out to grandma's. Pa is keeping house again, and we were all glad to get back home. We haven't any school this summer, but grandma sends me to Sabbath-school except when it rains, and then my little sisters and I have Sabbath-school at home. We sing a hymn, and then we read our lessons.

SUSIE IMBROSE, age 10.

Asb Ridge, Wis., May 28, 1883.

Susie, I most strongly commend your plan of passing a rainy Sunday; and may God bless all of your little household.

## ORSIE'S TROUBLES AND RESOLUTIONS.

I am 5 years old. I can not write, so I have my sister write for me. I fed the bees rye flour, and I got stung, and I do not think I shall be a bee-man. I think I will be a horse-jockey. I have a colt one year old. I go to school, and get cuffed every day. I wish you would send me one of those books. Please send me Ten Nights in a Bar-Room.

ORSIE P. KINGSLEY.

Comstocks, N. Y., May 24, 1883.

You got stung by the bees, and cuffed every day at school; and then decided you would grow up into a horse-jockey, did you, friend Orsie? Did you ever hear of "jumping out of the frying-pan into the fire," my young friend? Seems to me that is what you propose doing, do you not? I like horses, and I like horses that can go fast; but that word "jockey" I don't quite like to see a boy resolve to take upon himself. Sup-

pose you look in the dictionary, friend Orsie, and see what a jockey is. When you find it, tell us whether that is what you are going to be.

## HOW FRANK HIVED HIS FIRST SWARM.

I just captured my first swarm of bees. They came out and I settled them. And then I took the swarming-box, got them in it, and one stung me in the eye, and on the tip of the nose, and then I dropped the box that they were in, and ran away, and then I went back again, and got 'em and hived them.

## SWARMING-BOXES; FRANK'S SUGGESTIONS.

You must not make your swarming-boxes so heavy for little boys; the box was so heavy that I could hardly carry it, and after I had them in the hive about a half-hour they came out, because they didn't have any honey, and then they alighted in one of our cherry-trees, and then I got them in the swarming-box, and put them in the hive the second time, and gave them some honey, and now they stay. If you think this is good enough, please send me a book, Ten Nights in a Bar-Room.

Eureka, Ill.

FRANK SCHEIDEL, age 11.

It is tiptop, Frank, and I believe you are half right, for I have been thinking of a willow basket made just right, instead of the heavy swarming-box. Who can give us such a basket, by the thousand?

## THE HAASS CHILDREN, AND HOW SYBILLA'S FATHER HIVES BEES.

My father has 42 stands of bees in box hives, and if they swarm we take tin pans and beat on them, so that they can not hear the noise which the queen makes, and then they will settle on the first limb that they can come to. We then sprinkle some water over them, and take the hive, and hold it under them. We take some green bushes, and then we can hive them. My teacher gave me the JUVENILE to read, and I read it with much pleasure. I do not think I deserve a book, but still I should like to have one. I can read and write German, as well as English. I should be glad if you would print my name; I never saw it in print before. I think it would be very nice.

SYBILLA HAASS, age 12.

Well, Sybilla, I think we can afford to print any little girl's name who can read and write both English and German.

My teacher gave me the JUVENILE. The bees begin to work here in Texas in February and March; they get their pollen from the elm-tree blooms; and in May they get it from the wild china and prickly-pear flowers. The name of it is cactus, but we call them prickly-pear. Did you ever see a prickly-pear flower? They look beautiful; they are of two different colors — red and yellow. My teacher has ten Simplicity hives; they are the first I ever saw. His bees are blacks.

ANNA HAASS, age 13.

My teacher told me to read the JUVENILE, and see if I could not write a letter. My papa tried to keep some bees once; he had one swarm. The queen took the lead, and then the rest followed. Papa knows a swarm in the woods. It has no honey yet. I will tell you from what kind of flowers they get it — prickly-pears, and elm, cherries, peaches, and oleanders. They are red flowers. I don't expect a book, because I did not tell you much; but I should like to have one.

LOUISA HAASS, age 11.

Francisco Perez, Medina Co., Tex., May 24, 1883.

THE REASON WHY ALL THE LITTLE LETTERS DIDN'T GET PRINTED, ETC.

You will find the word "butter" in Isaiah 7:15, 22. I wrote you a letter in Dec. last; you never printed it, nor sent me a book. If you do not this time, I will not call you "uncle." Father has 26 stocks of bees—17 in Root chaff hives, the rest in Simplicities, packed in sawdust, on summer stands. They had a fly, March 2, and were all alive then.

WM. J. PURDY, age 7.  
Westover, Ont., Can., Mar. 12, 1883.

I am sorry, William; but we had so many letters then that I couldn't find room for them all. Don't you see we are getting back to them now? Your letter above is away back in March. You see, when it is cold weather, and the children are kept indoors, they write a great many more letters than they do at this time of the year, and so we shall have to go back and take up the old ones. Can't I be "uncle" still? We surely did send you a book, William, and, as you say you didn't get it, we send one again.

CLARA'S DESCRIPTION OF THE WAY HER MOTHER CURES THE HEN CHOLERA.

I read in JUVENILE, of some one inquiring about curing chicken cholera. Boil thick milk, and stir in wheat bran while boiling hot; feed them while warm; feed this every day until well, and then twice a week through the season. Ma has had good luck with this for 8 years. I have 3 brothers and 2 sisters and one little niece. She has blue eyes. Ma and I stop the bees when they start off, by going ahead of them, and throwing water up. Pa has 20 colonies of bees; they are doing well. CLARA PHEISTER.

Etna Green, Ind., April 6, 1883.

Well, Clara, there is one thing about your remedy I like very much, and that is, it is something that wouldn't hurt a hen, if she wasn't sick at all. In fact, I am inclined to think boiled milk and bread would cure a great many diseases of human beings as well as fowls, if they took it in place of doctors' stuff.

LULU'S BEE-STORY, AND SOMETHING ABOUT DUCKS ALSO.

In the spring of 1881 my father found a swarm of bees, and where do you think he found them? About six miles from here, between the siding and plastering, up close to the eaves of a house. He cut a hole in the plaster, took them out, put them in a box, and brought them home; they had only four by sixteen inches, but of course their hive was quite long enough. They had built comb down about two feet. They were very black. We now have three new swarms from them, all nice Italians. The funny part of the story is, they had wintered there when two-thirds of the bees about here died. Pa says there have been bees in the railroad water-tank in Adams, the last three years. He keeps ducks to help the bees kill moths. He thinks most of them, next to the bees, of any thing we have on the farm. They watch as a cat watches for a mouse, around the hive, and catch the millers. The bees never sting them, as they do the chickens and turkeys. We have the prettiest duck. He is as white as snow, and has a big top-knot. We call it his cap. His name is "Ole." LULU A. BISBEE.

Lyle, Minn.

A COLONY OF BEES UNDER THE HIVE.

My grandpa keeps bees, and has for over 40 years, or ever since he lived in Illinois. Last fall he and a friend were out looking at them, and, happening to look under a hive, what do you think they saw? A

swarm of bees had gone underneath the hive (he uses the L. hive) some time during the summer, and had several combs built from the bottom to the ground, containing supplies, ground cleaned off and coated with propolis. It was late in October before they were discovered. My pa went in November, took them out, put them in an L. hive, and brought them home, and they wintered nicely. My pa takes all the bees that folks in our neighborhood are going to kill with brimstone. He says he can't bear the idea of having the poor little fellows killed. He feeds them on frames of honey, and usually winters them as well as any of his bees. He now has 31 colonies; lost 36 in wintering. PEARL GRAVES, age 11.

Duncan, Ill.

So they undertook to coat the ground with propolis, did they, Pearl? I should have thought they would have fared badly when it rained. I commend the spirit of your pa in saving the poor little bees, and I am glad to hear that he usually winters them, as a recompense for his kindness in keeping them from starvation.

BOTTOM VENTILATION, ETC.

In the fall of 1880 pa packed 31 swarms in timothy chaff, with bottom-boards in, and had one swarm alive in the spring. He bought 4 swarms; increased to 16, and took 800 lbs. of extracted honey. In the fall of 1881 he packed in the same box, in oat chaff, with bottom-boards out. All came out strong in the spring. Pa says he thinks putting bees away to winter, with bottom-board in, kills more than any other thing. He put one swarm in the cellar where there was water within a few inches of the hive all winter, bottom-board off, just to try them, and they came out in the spring as bright as a new dollar. Last spring we bought 4 swarms; increased to 53; took 1300 lbs. of extracted honey, and in the fall packed 18 swarms in chaff boxes, and built outdoor cellar for the remainder. They are nearly all buried under the snowdrift. I think I shall be a "bee-woman" when I get big, for I like to work among bees. I often help pa when he is hiving, or extracting honey, and they hardly ever sting me; but if they do, it doesn't hurt more than a second or so.

MARIE L. BISBEE, age 12.

Lyle, Minn., Feb. 24, 1883.

Thanks for your valuable report, Marie. I see your letter came away back in February, and now we should be glad to know if your father found that leaving the bottom-boards off last winter was successful again. There is something a little mysterious about this matter of ventilation. While, a great many times, results seem to show directly that plenty of air saved them, at other times it seems equally plain that so much ventilation killed them.

A MOTHERLESS LITTLE FRIEND.

I go to school. My ma is dead. She died the first of March. My pa has sent for a bee-hive, but has not got it yet. I like honey very well. My aunt has got a postoffice. I live with my grandpa. I go to Sabbath-school when it is not too cold. If my letter is worth a book, I want Ten Nights in a Bar-Room.

Linn, Ia., March 10, 1883.

May God comfort you, my poor little chick. No wonder you forgot to sign your name, and no wonder that so many of these little ones in their loneliness write the sad words,

"My ma is dead." Think of it, ye living mothers. The time may soon come when *your* darling, too, may echo these words. Are you sure that, in such an event, they will turn to Him who has said, "Suffer little children to come unto me"? Are you sure their teaching has been such that they would, in that case, turn to God the Father as the only hope of meeting with you again on that far-off shore? Little one, we did send your book, even if you did skip your name, childlike. "Lu," the mailing clerk, loves little girls, especially those who have lost their mammas, and she caught at what you said about your aunt being postmistress, and sent the book to you, in her care. Did you get it, and will you not tell us next time what your name is?

#### A CELLAR FULL OF BEES, ETC.

My papa has 8 stands of bees; all of them wintered well. He took off about 400 lbs. of honey, and sold and gave away about 200 lbs. Yesterday, when we came home from Sunday-school and church, we found the cellar was just swarming with bees. We could not walk around without stepping on them. One corner of the window-screen was torn off, and they got in there; but none of us got stung. What a time we had getting them out! We darkened up the cellar, and left the door ajar.

#### A HINT IN REGARD TO CHURNING.

May be some little girl has to churn for her mamma as I do. If she will put a half-pound oyster-can over the handle, so it will just cover the hole, it will not spatter at all, hardly.

MYRTLE HARTWELL, age 10.

Very good, Myrtle; but you didn't tell us what made the bees go into the cellar so; but if you didn't, I think I can. I think some of you left some honey, or some other sweet, that some stray bees got a taste of, and then there was fun. When they get into any room in that way, just get the honey away from them, the first thing. Shake it, and get every bee off, and then take it into some close room, or tie it up in a bag; and if you don't want to lose your bees, go and open wide every door and window, and let them examine the premises well, to see that there isn't another drop of honey to be had, and they will then very soon go home satisfied.

#### EVALENA'S QUESTIONS.

My pa keeps bees. He has lost one swarm this winter. His bees swarmed last summer, and went to the woods. Pa followed them to a tree in a neighbor's timber. The man cut the tree and burned the bees, after giving pa consent to cut it and save them. What do you think of a church-elder who would do such a thing as that? Our school was out yesterday. I worked through Ray's Third Part Arithmetic, and reviewed it, in four months. Pa has two more trees with bees in them that have wintered so far. What time would be the best to cut and transfer them to movable-comb hives? Is the Simplicity as good as the chaff hive? Do the frames of one fit in the other? EVALENA CHAPMAN.

Kilbuck, Ohio, March 12, 1883.

Why, Evalena, I should think that a church-elder who would do as you say, had got a little backslidden, or that his religion had grown rather cold. You don't want to

have any man let his religion grow cold, do you, my little friend? It always makes me feel sad when a church-member forgets his religion, or seems to forget it.—I think the best time to cut a bee-tree would be about fruit-blossom time, for then the combs would not be very heavy with honey, nor would other bees be very apt to rob.—The inside, both of the Simplicity and chaff hives, are exactly alike, and so the same frame fits all. The chaff hive is better, because the walls are protected both from the winter frosts and the summer sun.

#### GLATFELTER'S BEE-FEEDER.

I have been reading the JUVENILE and GLEANINGS for some time, to find out something about that bee-feeder I sent you. It finally came, pictured in May GLEANINGS, page 263, called "The Boy's Bee-feeder." I wish you would change the old name, if you please, and call it "Glatfelter's Bee-feeder, of New Philadelphia, Ohio." My papa has been trying all kinds of feeders, and threw them all away, except this one; it's just "boss;" can be used on any hive.

This is a bad spring for bees, it is so wet and cold; but the white clover is coming up finely, and I think we shall have a fine honey season. Papa went into winter quarters with 20 stands, and lost 6 in April. The reason, papa thinks, is that he commenced to feed them too soon. Some of them swarmed out, and some of the queens died. Oh! pa got a pound of bees in a little box, and a queen with them, from Alabama, and he is looking for some every day from Tennessee. Pa tried an experiment with one strong colony last fall. He gave them no upper ventilation, and they died. Pa's hives are all double-walled.

JAMES A. GLATFELTER.

New Philadelphia, O., May 22, 1883.

All right, James. I should have given your name before, but you did not write it on the bee-feeder, so I could tell what it was when I got ready to use it. I will cheerfully change the name. But are you not giving the invention all to your father, when it really was yours? Or are you and your father in company, like Wiby Dellis and his father, on p. 352? Your father's experiment, of wintering bees without ventilation, gave a very decided result; don't you think so, James? Your idea suggested, that feeding bees too early in the spring may sometimes kill them, is no doubt correct, and I am strongly inclined to think that by far the better way is to do the feeding in the fall, and then disturb the bees as little as possible, until they can fly freely.

#### HOW CHARLIE GOT HIS SWARM OF BEES.

Father has 7 colonies of bees. He got 3 just one year ago, and increased them to 6. We have one Italian stand of bers. Last fall pa found one hybrid swarm on a bush, and we had only one extra hive. Don't you think the bees knew we had that one hive? Pa has got his bees in the Langstroth hives, except one colony. One time when pa went away he told me every swarm that came off and I put into a hive I could have; so one swarm came off and settled on the cellar-door, and I put them into a hive. I have hived two or three since then. We have a feed-mill, and when we are grinding the feed the bees swarm all around and gather lots of pollen from the meal, to feed the young bees. We got lots

of honey from our bees last year. Will you please tell me about that 75-cent telephone, and how far it will articulate?  
 CHARLES TURNER, age 13.  
 Hopkins, Mo.

"FUN" IN TRANSFERRING, ETC.

I have received your smoker on tobacco pledge. I think it is beautiful. I am very much obliged to you. You know I told you I have one hive of bees; they are in an American hive. I do not like that hive, so I thought I would transfer them into a Langstroth. My father is afraid of a bee. If one bumps against him he thinks he is stung. I got out the first frame, and shook the bees into the old hive. My father grabbed the frame and "lit" for the house. When he got half way out of range of the bees he said, "Fred, you'd better shut up the hive, or you will get stung to death." I didn't have any veil on. I got out three more, and shook them into the old hive; but about that time one "lit" on my eye, and stung me so that it shut up. It was swollen up so badly I didn't stop to pull the sting out. I didn't have any time for any thing. I got them all in the frames (the combs, I mean), and did the job all up, then went into the house, took the sting out of my eye; but the poison was all in my eye. I was about half an hour transferring, so you see I got all the poison in my eye. But you must remember that this is the first time I ever tried transferring. I am not afraid to try it again.

Some of the bees got up my pants leg, and then I had fun. Didn't I jump? well, I should "smile."

FRED R. THOMPSON.

Quincy, Illinois, May 4, 1883.

VICTORIA FIELDS AND HER BEES.

I was out early this morning among the bees. However, I must tell you that I was going to request a place in "Blasted Hopes;" but since the weather has got warm, my hopes are getting better. You recollect in my last letter I said the bees of one hive spotted the snow on a warm day. Well, I commenced to feed them sugar syrup, but die they would, and die they did. They had about 20 lbs. of sealed honey when they died. I had thought of getting a pound of bees and queen this spring; but papa not being able to work, I shall have to wait until some other time. Myrtle, my little sister, over 3 years old, will walk right up to the bees, and play among them, and I have never known her to get stung yet. I always work among the bees with bare hands and bare head; and in my two or three years' experience I do not think I have got stung half a dozen times. Did you ever know a colony of bees to die with dysentery, and have young brood at the time? Ours had. I noticed on one piece of comb several cells with brood.

I like to read "Myself and My Neighbors" in the JUVENILE. According to Mr. Hasty, Virgil, a great many years ago, understood practical bee-keeping pretty well, or the theory, at least. We have had no swarms yet this season; but the bees are building up strong, considering the weather, which has been cold and wet, cloudy and gloomy, all spring.

VICTORIA J. FIELDS.

Valley Point, Pa., May 31, 1883.

Yes, Victoria, I have known a great many bees to die of spring dwindling, with brood in the hives. In fact, I believe that is the way they almost always do. I am glad you are not discouraged at your bad success in wintering.

KIND WORDS FROM OUR CUSTOMERS.

The A B C book has been received. The "get-up" of the book is very neat.  
 J. H. M. BARRITT.  
 Criswell, Ga., March 31, 1883.

The Waterbury watch I got with GLEANINGS is a little wonder, sure. Keeps good time.  
 Tiffin, O., Apr. 9, 1883. MARCUS HOLTZ.

I was going to grumble about the delay; but the stuff is so nice that I am more than satisfied.  
 Holmesville, O. W. P. COLEMAN.

Send me one cake of that maple sugar for a sample; also one of the nicest cakes you can pick out, for somebody I know of.  
 D. E. L'HOMMEDIU.  
 Colo., Iowa.

OUR 25-CENT SILVER THIMBLES.

I have ordered three silver thimbles of you before, and am very much pleased with them.  
 Yankton, Dak. ELLEN G. FITCH.

I received my hives last Saturday. I found every thing all right, and the lumber was much better than I expected.  
 Ira D. KRASS.  
 Jackson, Mich., May 24, 1883.

GLEANINGS AS AN ADVERTISING MEDIUM.

I have sold all the bees I had for sale. The last lot I sold to Mr. Oatman, Dundee, Ill., 101 colonies.  
 Jefferson, Wis., May 12, 1883. C. GRIMM.

I received the goods a few days ago. They are all that could be expected for the money sent. All of the household articles are excellent.

S. C. FREDERICK.

Coal Vale, Kan., March 25, 1883.

That fdn. mill is just splendid; all O. K., and the goods gave much pleasure and joy, as they were so neat, nice, and cheap. Hives, frames, etc., are perfection. The ground is one sheet of white clover, and honey and swarms are pouring in. Please accept thanks.  
 F. O. SHEPARD.

Arrow Rock, Mo., June 2, 1883.

I am very much pleased with the sun-glass. When the sun shines I do not need a match to light my old pipe.  
 JOHN W. CORBETT.  
 Bennettsville, S. C., March 23, 1883.

[Well, now, friend C., it seems to me that is rather "cool." Do you suppose I am building up a trade on sun-glasses, just to help tobacco-users light their pipes a little handier?]

QUEER "FIGGERS."

What kind of arithmetic do you use down there? I sent 13 cts. for 1 oz. of Russian-sunflower seed, and one pair of five-cent scissors, leaving 3 cts. for postage. I received the scissors and two ounces of seed, requiring 4 cts. postage—19 cents for 13. If you keep on dealing that way, somebody will get rich. It is worth more than 5 cts. to see our two-year-old Blue Eyes with her scissors.

Howard Center, Ia.

BURDETTE HASSET.

Please mail to my address as below, a copy of your A B C of Bee Culture, cloth. I bought a copy two years ago, paper back, and loaned it so much that it is now well worn, so I want a copy for myself, and the one I now have for those unable to buy one. The bee-keepers of this section are waking up, and are adopting the Simpliety. I have made and sold, since last spring, about 150 to 200 Simpliety hives; orders still coming in. I am the only one in this country who has genuine Italian queens.

Pocahontas City, Md.

R. M. STEVENSON.

A PLEASED A B C SCHOLAR.

I received the smoker and fdn. to-day in good condition. I am greatly pleased with them. There were 25 persons at the postoffice when they arrived, mostly old men; some of them had never seen nor heard tell of such things. Most of them knew I had the "bee-fever," as they call it; but just imagine how the old gray-headed fellows were amazed when I undid the goods, and explained to them what they were for, and what I could do with them. I am starting up a good deal of excitement on the bee business in this backwoods part of Kentucky, as

they know that it is only 12 months since I bought and commenced handling my first colony of bees, and now I have 3 good hives, and looking every day for more to issue from them.

HENRY W. CARMAN.

Custer, Breck. Co., Ky., May 25, 1883.

The ten-inch \$25.00 fdn. mill and other goods shipped to me April 13 came to hand on the 23th. The freight was one dollar and one cent — much less than I had expected. We were soon making full sheets of fdn., but began on narrow strips. The wax would stick some at first in the mill, but that was owing to cool weather, as some sheets broke like glass. It was the first roll mill I ever saw; and considering our inexperience, we think we did well. Every thing gave satisfaction, from the Novice honey-knife to the Clark smoker. We have had people guess the price of the 35-cent clothes-line. Some have guessed as high as one dollar.

Fayette, Ia., May 8, 1883. FRED TIMMERMAN.

Please accept thanks for your Home talk in the March No. It has done me good, and helped me to preach for the Master, and I feel that it was a voice from him, to encourage me in the hour of trial and temptation. It has done me good when my brethren have told me that my talks have done them good; so please accept this brief note, hoping it may do you good also. We are having a very gracious work, and one of the most honored instruments in the hands of God is a saloon-keeper, who has been the means of turning many from the power of Satan to God. Bro. Root, pardon me, a stranger to you; yet I seem to know you well through GLEANINGS. Bees are in good shape; loss less than 2 per cent.

E. T. FOGLE.

Hartsville, Barthol. Co., Ind., Apr. 7, 1883.

[May God bless you for your kind words, my dear friend, and for the cheering news you give us of the work in your vicinity.]

Inclosed find 28 cts., for which please send me the Christian's Secret of a Happy Life. I thought perhaps I might find something in it that I ought to know or do. I am not a Christian, Mr. Root, but I wish I were. I am one of those awkward, bashful men, who say just what they ought not to. I have often felt that I ought to get up in meeting and ask the prayers of Christian people, but it would come in my mind that I would make a fool of myself; better sit still; so that is the way it went. I am now 35 years old; have three very nice little children — two little girls; one two, the other four, and a baby boy. I want them to grow up to be Christians. Will you pray for me, Mr. Root? The Bible says the prayers of the righteous avail much, and I have often thought if I could have a good talk with you, and tell you how I felt, it would do me good. I used to be a reader of GLEANINGS, and enjoyed it much; but since I came to Missouri I have been too poor. I hope to be able to spare a dollar next year. I came from Illinois two years ago for the health of our little girl, five years old then. She had consumption; and one morning, shortly after we got here, she began bleeding at the lungs, and the blood gushed from her nose and mouth; she could not catch her breath, and she died in my arms. It was such a trial to give her up! She was my pet, and thought much of me; and my good dear mother has been laid in her grave since I left home. Oh, Mr. Root! pray for me, that I may meet them in heaven.

J. T. SHUMARD.

Panacea, Mo., May 8, 1883.

[May God bless you, and help you to be a brave soldier of the cross, my good friend. To be sure, I will pray for you; and you, on your part, must not be afraid. Push boldly forward, and never fear. If it is his will that you should make a fool of yourself, be one for his sake. Try to let the memory of those loved ones only draw you nearer toward God who has taken them.]

#### A "GREAT BIG" "KIND WORDS."

The first copy of GLEANINGS came to hand in due time. I am very much pleased indeed with it. Your instructions on "How to make a cut-off saw-table" were just what I stood in need of, and I consider that article alone worth the price of your yearly subscription, besides the other interesting and instructive matter contained therein. In fact, I can hardly see how I or any one else could have got along a year without it. I could not have done so, I am sure, had it not been for the A. B. C. With it I came through my first-year's work in good shape. I

will tell you how I managed, and what the results were. I purchased 54 colonies from Mr. Christie last May. They had been in other hands, and were consequently in a very weak and destitute condition — ten or twelve entirely queenless. The forest and fruit bloom was gone, and a cold wet June followed. Many of my friends and neighbors offered sympathy for my bad prospects, and, indeed, it did look repulsive for a greeney; but I continued to work; and with the aid of your A. B. C. and a good barrel of sorghum sugar, of my own manufacture, I carried them through until the basswood bloom came on; and after that I had easy sailing, and came out in November a good way "ahead of the hounds;" viz., 88 colonies, and close on to eight thousand pounds of honey, and plenty of stores to winter on. I put them in a well-ventilated cellar for winter quarters in November; in March I took them out, minus two; one had smothered. For some cause the entrance had become choked; the other swarm was queenless, and of course I could not expect them to come through.

I am now feeding and building up 100 colonies for basswood bloom; and although some think it extravagant, and money lost, to feed bees in June, yet I expect to get it all back, with a good honey per cent; for I marketed last year's crop at 14 cts. net, and have a great many good customers, some already waiting for honey.

#### SORGHUM FOR SPRING FEEDING, AND HOW TO USE IT.

Perhaps some one may desire to know how I feed the sorghum. I dissolve it in warm water to a thin liquid, so it will run out easily through a tin teapot; fill combs, and insert one right in the center of the brood-nest. Almost invariably I would find on the third day the syrup all removed, and the comb filled with eggs, when I would again repeat the operation, just shoving the others one side, remove an empty comb, and insert another filled with syrup, and so on; thus in a few weeks they were strong, and in good shape for work.

S. W. BIRD.

Maple Landing, Ia., June 2, 1883.

I have been profited and helped more than I can express by the practical talks of the "Home" department. I have made them do more work than in my own home. I have sent them to those whom I specially thought might be helped; sometimes to the prison, sometimes to our county jail, or to some home where such a practical talk might do good. I believe God has blessed them, and is blessing you in giving you the means to reach so many. I do not know much about bees. I am like your juvenile correspondents who "like honey but are afraid of bees."

#### A NEW FACT (?) ABOUT BEES.

I have two neighbors; one old gentleman and the other an old lady. The old lady made complaint to the old gentleman that his bees injured her grapes. "Oh, no!" he said. "It is not my bees; for my bees always fly west." As the old lady lived to the east of him, his apology for his bees was conclusive. This is a point I have never seen argued, that one's bees always follow a certain direction, and yet may be it is so. You who know every thing about bees will certainly know. If I were younger, I think I should catch the enthusiasm from reading the journal; but I thank you for your kindness in giving me the pleasure of knowing of the success and enthusiasm of so many.

#### SOMETHING ABOUT THE INMATES OF OUR PRISONS.

I am still interested as much, and more than ever, in the prisons. I visited the Ohio Penitentiary this winter, and had the privilege of speaking to the men in their Sunday-morning prayer-meeting, and in their regular morning service. It was a wonderful sight to stand and look into the eyes of such an audience, nearly 1300 men, all in prison garb. I have been glad to see that the member from your County, Hon. A. D. Lacey, has the cause of the prisoners at heart. I took great interest in the bill for abolishing contract labor, and was so sorry that it failed. I believe that the contract-labor system has much to do with the insubordination of the prisons, of which we have heard so much the past year. The most humane manner of managing prisoners ought to be studied. And I know that there are those who will not let the matter rest until such abuses as grow out of contract labor are abolished. With many wishes for your success in benefitting so large a number, spiritually as well as in every other way, and in earnest purpose to follow the great Leader, I am yours in Christian fellowship, MRS. E. H. FARR.

Norwalk, O., May 22, 1883.

WAX has dropped, and we have such a stock on hand that we can pay only 30c cash, or 32c trade, for all shipped us after this date.

W. A. SANDERS, Oak Bower, Hart Co., Ga., has 15 black queens, that he will send to anybody who wants them, for 31 cents each.

Our friend George, the label and job printer, wishes me to say that a nice little book of samples of labels, with prices of all kinds of job printing, is now ready to mail. Mailed free to anybody who wants it.

TO-DAY is the 14th, and as the fearful blockade we have had in the office is hardly yet straightened out, the book-keeper suggests that, if you give the number of your ledger page when writing, it will often enable us to answer you one mail sooner.

ORDERS for fdn. mills are all filled; and by the time this reaches you, we shall be prepared to ship 10-inch mills by next train. In fact, we have quite a number almost done, and we shall now keep them boxed up ahead, ready to ship. Other sizes can be put up on very short notice.

As it is much more important to get goods off for waiting customers than to look up complaints and misunderstandings, I hope those who don't hear from us in regard to the latter will bear our silence patiently. Come right to the point, and say what it is you want, and we will send it, and accounts can be straightened up after the rush. If you get your goods twice, dispose of for us what you don't need, if you can; and if not, we will direct in regard to their return or disposal.

Do not, I pray you, friends, be in haste to write back that some of your goods have been omitted. Open every package, no matter if you do think it can't be there. Over and over again, some one of you says a part of your goods was left out, and our overworked, tired, worn-out clerks take a laborious hunt over books and letters, and then go home with sad hearts and weary bodies, and the next day comes a postal card, very quietly saying it was a mistake; he "hadn't opened all the boxes," or "didn't think of their being in the center of a crate of hives," etc.

### EMPTY COMBS.

A GREAT many are still asking what to do with the empty combs from hives where the bees have died. Put more bees on them, friends. If you are going to work for extracted honey, give each colony 30 or 40 of them, and they will store an immense crop of honey in a hive four stories high. If you want to divide them at any time, take off one, two, or three of these upper stories, and give a queen to each, and they are a nice swarm almost at once. Don't let the worms get at them, even if you have to brimstone them, according to directions in the A B C.

We have now all kinds of queens on hand, ready to ship by return mail, except blacks and hybrids. When ordering either of these, be sure to tell us what to do, in case we have none on hand. I was somewhat surprised, after our last journal went out, to receive so many orders just as soon as we made it known we had 30 or 40 black queens on hand. Two or three telegrams came for them the minute the journal was received, and orders have been coming daily almost ever since. Would it not be well for those having blacks and hybrids for sale to let it be known?

ONE of the juveniles (page 356) inquires about the distance our 75-cent telephones will work. He will see by our price list that we furnish with them 200 feet of wire, and one-eighth of a mile is about as far as they work real satisfactorily; still, with all the conditions just right, they answer very well for a quarter of a mile, and even perhaps half a mile. When the distance is so long, the rooms where they are located must be perfectly still and quiet, and the wire must be drawn very tight.

### FILLING ORDERS.

WE are still considerably behind on orders by freight; and a few days back, on some of the orders by express; and the mailing clerks have a rather larger heap of letters before them than is usually the case. But as orders are slackening quite perceptibly, we shall not be obliged to delay anybody much longer. I know quite a number of the friends have felt hard about the delays on freight shipments, and that many think we have no business having more "business" than we can attend to in a *business-like* way; but I think that, if you inquire, you will find such a state of affairs is not very unusual in the growth of any business. More help we have had as fast as it could be used, and more machinery has been purchased, until there is really not standing-room for it; and to remedy this last trouble we started the new factory, even when it seemed almost unwise to do so. This new factory is now up to the first floor, and the expense of sleepers that the floor is soon to be laid on looks almost as if it were more fitting for a pasture lot than for a building; yet I dare say we shall fill it completely, almost as soon as it is ready. I know my reputation has suffered, and I am sorry for it; for I know very well the best advertisement in the world is *good goods* by the very first train after the order is received. I enjoy "hugely," sending folks goods before they expect them, and I feel dismal when I have to make anybody wait. We are planning hard on facilities for giving you almost any thing in our price list the minute your order is handed us from the postoffice, and I have little fear but that we shall find enough to do, when we truly deserve it. The girls are already feeling happy at the prospect of an office carpeted, with hard-wood finish, inside blinds, and a little outside of the roar of the machinery that is now right under us. You will come and see us then, will you not?

### WHAT TO DO WHEN GOODS ARE NOT AS YOU ORDERED OR EXPECTED.

AS most of my life has been spent in buying as well as selling goods, and as I believe I am generally considered a desirable customer, I think perhaps a few words from me here may be helpful. When you order, make your order plain; and when you order from a catalogue, copy the name of the article from the catalogue, in the *very words* used by the catalogue, and give price. Be especially careful to give the price, as the price often gives the clew to what is wanted, when the writing is so bad or so brief that it could not be guessed at otherwise. If you use the same terms the maker of the goods uses, any mistake made must surely be his fault. Well, after you get your goods, if they are not satisfactory, write at once to the shipper, and tell plainly what the trouble is, also stating just how much rebate you think you ought to have, to make it all fair. If he is a fair man, and you yourself are a fair man, the matter can usually be closed up at once; whereas, if you make a long story of it, without stating definitely what is wanted, he may conclude your custom is more bother than profit, and pay no attention to it. Large business houses, as a rule, do not often write long letters. Many times, when time is valuable, it is cheaper to hand over 25 or 50 cents, or even a dollar, than to go through with a long list of particulars. May I say, in closing, that it always pays best in the end to help the man you buy of, out of any mistake or misfortune, the best you can? I have a great many times kept goods sent me by mistake, rather than put to trouble and expense the one who sent them, and I have never found a case where a man forgot such a kindness. Sooner or later I had my reward. The man you trade with is your neighbor, and you are ever bound to love him, and to look out for his interests, as well as your own. It may gratify your feelings a little to talk back harshly to him, when he has made a blunder, and to put him to needless expense, when you are provoked; but it never brings lasting happiness, nor puts money in your pocket.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

## \$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \* use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

# WE ARE AFTER YOU!

Hybrid queen, and all the bees in a colony, not less than three pounds, for \$3.00, after the 10th of July.

**M. L. WILLIAMS,**  
VANCEBURG, - - LEWIS CO., KY.

# FIELD PEAS THAT BEAR HONEY!

Our readers have doubtless noticed the many reports we have had of honey from peas during the past year or two. We have just received a large lot of them for seed, from friend Burrows, of Lynnville, Tenn., who writes in regard to them as follows: "These stock peas, so celebrated for honey, should be planted in June, and will make a continuous flow of honey from August to frost, and a heavy crop of peas." Price \$1.75 per bushel; \$1.00 for half a bushel; 60 cts. per peck, packages included. By mail, post-paid, 20 cts. per pint. If sown in July, they will give a crop of honey, but may not mature the peas.

**A. I. ROOT, Medina, O.**

## FULL COLONIES Italian Bees with Queen In Root's Simplicity Hive, \$7.00.

F. D. GILLET, BRIGHTON, LORAIN CO., OHIO,

SEND postal for my 20-page price list of Italian, Cyprian, and Holy-Land Bees, Nuclei, Queens, and Apiarian Supplies. 4fd H. H. BROWN, Light Street, Col. Co., Pa.

# Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

## CITY MARKETS.

**CHICAGO.**—There is not any demand to speak of for comb honey, hence the prices vary. There is a good demand for extracted, and at the present writing there is not a package of white honey in the market. It would bring 10 cts.; dark, 8 c. *Beeswax*, 30 @ 35.  
I. A. BURNETT.

Chicago, June 23, 1883.  
[There, friends, there is a chance for you, if you have got any nice honey that you want to sell at 10 cents. Is it not a little singular that comb honey should be uncalled for, while extracted is in good demand? I can not help saying I think the idea a sensible one, any way. Real nice extracted honey is, to my mind, preferable to comb honey for actual use, every time.]

**MILWAUKEE.**—The honey market here is very quiet now indeed, and but light demand. What sales occur are in a small way. Choice 1-lb. sections, 17 to 18 cts.; fair 2-lb. do., 16 cts.; common and dark do., 14 to 15 cts.; extracted, in tin cans, 11 to 12 cts. The supply is small, and the season will be later than usual for getting new crop. A. V. BISHOP.  
Milwaukee, June 22, 1883.

**NEW YORK.**—We take pleasure in sending you our present quotations on honey and wax, as follows:  
Choice white-clover, in 1-lb. secs. (no glass) per lb. 20@21  
" " " " (glassed) " " 18@20  
Fair grades " " 1 and 2 lb. secs. " " 16@17  
Choice buckwheat, " 1-lb. secs. (no glass) " " 15@16  
" " " " (glassed) " " 14  
Extracted clover, in kegs and small bbls. " " 10@11  
" buckwheat, " " " " 8@8½  
Prime yellow beeswax, " " " " 36½  
H. K. & F. B. THURBER & Co.  
New York, June 22, 1883.

**CLEVELAND.**—Honey in 1-lb. sections is in moderate request at 18 to 19 cts. for best white; 2-lbs. continue very dull. Extracted, no sale at all in our market. *Beeswax*, there is none offering, consequently no price. A. C. KENDEL.  
Cleveland, June 21, 1883.

**CINCINNATI.**—Extracted honey has commenced to come in freely, and a large crop is reported from all quarters. The demand is very good, and keeps pace with the arrivals. No change in prices. I have received several nice lots of comb honey, for which we paid 15 @ 16 cents on arrival. Arrivals of *beeswax* were good of late; 32 c. is our price on arrival. C. F. MUTH.  
Cincinnati, June 22, 1883.

**DETROIT.**—Honey.—The honey market is almost lifeless; it is quoted at 15@18 cents, but there is scarcely any demand. *Beeswax* is worth 30@35 cents. Detroit, June 25, 1883. A. B. WEED.

**BOSTON.**—Comb honey, 20 cts; extracted, 10 cents. Trade is quiet. CROCKER & BLAKE.  
Boston, June 22, 1883.

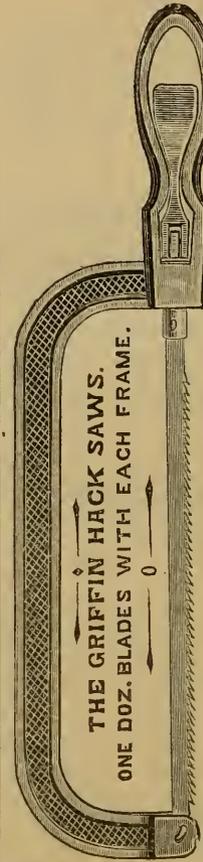

# ITALIAN BEES,

\$7.00; by pound, \$1.00. Queens, \$1.00. Also about 200 broad frames with tin separators for sale cheap.  
E. A. GASTMAN, Decatur, Macon Co., Ill.

# NOTICE!

No more full colonies or nuclei, or bees by the pound for sale. I have sold all I can spare.  
T. S. HALL, Kirby's Creek, Jackson Co., Ala.

# AN IMPROVEMENT IN SAWS FOR SAWING METALS, ETC.

Who has not felt the want of something to cut metals rapidly? An ordinary hack-saw will do very well when it has a good sharp whole blade; but when the blade gets broken and dull, how vexatious it is! In the one shown below, which can be used for sawing wood, horn, bone, ivory, or almost any thing as well as its legitimate use of sawing metals, the blade is made so that it can be put in, in a twinkling. The blades are easily detached, being fastened in place by two simple pins; and are strained up for use by means of the lever, and the tension is thus easily maintained. The blades are tempered so hard that they can not be filed, and when dull are to be thrown away and a new one inserted, which is cheaper than a hard saw can be filed. And furthermore, nice new sharp blades cost less than 5 cts. when bought by the quantity. The plan of fastening the blade is very ingenious indeed, and it is all done by simply moving a lever inside the handle. We can furnish these saws, with one dozen blades, for \$1.00, all packed in a neat little box. If wanted by mail, add 20 cts. postage. Extra blades are 5 cts. each; 45 cts. for 10, or \$1.00 a hundred.

ADDRESS  
ALL ORDERS TO  
**A. I. ROOT,**  
MEDINA, - OHIO.

# BEES by the POUND.

I have no more bees for sale at last month's prices. Prices for July as follows:

Pound of bees, - - - - -	\$1 25
Untested queen, - - - - -	1 00
Hybrid queen, - - - - -	50

Ten per cent off in lots of ten or more.

**NOTES FROM THE BANNER APIARY.**

No. 44.

A VISIT TO "OUR CLEARING," THE HOME OF "CYULA LINSWIK."

IT will be remembered that, in the Feb. GLEANINGS, Cyula Linswik stated their determination to sell, or give away, every one of their 75 colonies; well, it might not have been the reading of my last article, "From 60 to 16," that led Cyula and her sister to think that I would be glad to buy their bees, but, be that as it may, soon after its appearance I received a letter offering me 30 of the colonies upon very liberal terms; and Monday morning, June 11, found me *en route* for the bees. The four hours that I had to wait in East Saginaw for a train, were very pleasantly and profitably spent in visiting Dr. L. C. Whiting and J. H. Wellington and O. J. Hetherington. Dr. Whiting has about 30 colonies in the little yard back of his house.

IMPORTANCE OF SPRING PACKING.

Dr. W. showed me one colony, the frames of which had been covered two weeks with wire cloth, the purchaser not having come for the bees when expected, and there was a loss of at least two combs of brood. Although it is getting a little ahead of my story, I think I will say right here that the bees at "Our Clearing" were snugly packed all the spring with quilts and cushions, many of which had not been removed when I was there, and the hives were overflowing with bees. Taken upon an average, the colonies were stronger than those bought of friend Robertson, and that is saying considerable.

At Messrs. Wellington and Hetherington's, I saw

several labor-saving machines and contrivances for nailing frames, putting together sections, putting in fdn., and so on. These gentlemen are the ones who use the frames that can be turned upside down. If I remember rightly, they have about 175 colonies, all of which, except two, are located about 4 miles out in the country.

After several hours of "railroading," unbroken by any incident except that the engine once brought the train suddenly to a standstill just as the engine was running upon a heavy logging chain that somebody had carelessly left lying across the track, and less than an hour of buggy-riding,

OUR CLEARING

was reached, just as the shades of night were falling. An inviting supper was soon ready. This dispatched, we adjourned to the sitting-room, and talked bees. Miss Cyula cornered me down pretty closely on my sugar-feeding hobby; she wanted to know if this feeding had not induced breeding, and that *that might* have had its influence. As the feeding was all done in 3 days, it was my *opinion* that such was not the case, but I could not "get out of it" until I promised to feed extracted honey to some of my colonies another fall.

Early the next morning the work of selecting the colonies, and preparing them for shipment, was begun. We had not much more than commenced before it began to rain, and we were obliged to carry the colonies into the old house to pack them. Yes, since the new house on the hill nearer the road was finished, that old, romantic, vine-covered log-house has been used for a shop and store room; its pantry, bedrooms, and cubby-holes reminding me very much

of my own shop. Nearly all of the bees were pure Italian; and gentler, better-behaved bees it has seldom been my lot to handle. But then, I don't wonder they are amiable, as they are handled more gently than many women handle their babies.

#### NAMING QUEENS.

When these ladies bought their first colony they very appropriately and romantically named the queen Eve, and they have continued this pretty habit ever since. Of course, I *smiled* when they first told me this; and when I saw that the smiles did not offend them, I laughed; and as name after name was given, the cuteness of some of them was such that I had to sit down and laugh out loud. When I tell you that a peep into their bookcase showed rows of bound volumes of the *Atlantic Monthly*, a copy of Shakespeare, standard volumes of poetry, etc., and that upon their table were copies of the *Century*, Harper's, *American Agriculturist*, *N. Y. Tribune*, GLEANINGS, and *A. B. J.*, you can easily imagine that the queens were well named. To myself was accorded the honor of naming a young laying queen; and, as they already had a "Nora" and a "Cora," I named her "Ivy," after our baby. Had I not been so hurried to get the bees ready, and get them to the train, I should have taken pains to mark the name of each queen upon her hive, given the list of names here, and then customers could have ordered queens by name. Well, joking aside, there are some advantages in naming queens; as, if a queen is named, she possesses more of an individuality; and, if she or her bees show any peculiarities, they are more easily remembered, and reference is very easily made to any particular swarm, by simply naming the queen.

When I gazed at the magnificent sugar-maples that skirted "Our Clearing" just back of the apiary, I did not wonder that there was some disappointment because they did not blossom this year. I also understood why it was so difficult to stay at home and prepare the bees for winter when these same maples sent out their thousands of gaily colored cards of invitation in the autumn.

Please let me say to Mrs. Harrison, that Cyula and her sister were liberal with their help; as Cyula said: "If five dollars a week isn't liberal, what is?" Neither was it lack of kindness that deprived them of their help; but circumstances entirely beyond their control. From reading the last JUVENILE, I should judge that you, friend Root, have had a little experience in the same line, and it was not from "using too much economy" either.

Reader, did you ever prepare any bees for shipment? If you haven't, perhaps you have but little idea what a task it is, especially when some of the frames have metal corners, and the hives metal rabbits, and the frames have all to be nailed fast, wire cloth tacked over the hive, then the hive turned upside down, and the bottom-board fastened on with screws. Well, we worked faithfully all day until 9 P. M., and were up at it again the next morning at four o'clock. Eight o'clock A. M. found us saying good-by and 9 o'clock found us and the bees all aboard an express train bound for home.

Whatever may be said for or against bee-keeping for women, one thing is certain: Cyula Linswik and her sister have made a financial success of bee-keeping, and I presume the readers of GLEANINGS will be glad to know that this success is to be continued, as there are between 30 and 40 colonies yet left at "Our Clearing."

By pathetic appeals to express agents, I so man-

aged that the bees were not delayed at transfer points, and had the bees safely deposited in my own apiary by 9 o'clock P. M., the same day that I started with them. Thursday, Friday, and Saturday, were spent in transferring them, and Sunday three of them swarmed, and Monday morning, while I was going to the P. O., one of the newly hived swarms came out and cut sticks for the woods. My brother "went for them" with the fountain pump, and succeeded in driving them back into the yard; then his pail of water gave out; and while he was after another pailful they said "good-by." Had I been on hand to have kept him supplied with water, we probably should have saved them. This is my first loss from absconding.

W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich., June 22, 1883.

And you did another good thing, friend H., in making that visit to "Our Clearing," even if it was more a business visit than otherwise. Well do I remember the old log-house you describe so vividly, and a very pleasant visit I had, not only in the old log-house, but out among the bees as well. Like yourself, I, too, got well enough acquainted so that we had some very hearty laughs. The different queens had different names then as now, and one was called "Medina," if I am correct. The sisters told me of the new home that was in prospect, and where it was to be built. But I laughingly told them that perhaps they would never see as much real enjoyment in the new as in the old.—Now, friend H., you have let the little folks know the name of that new baby. And that reminds me that I have not said a word as yet about a new baby at our house. He is blue-eyed, of course; and although nearly six weeks old, is as yet without a name.—You talk about the trouble of fixing frames with the metal corners for transportation. Had you provided yours with some of the spacing-boards we describe and illustrate in our price list, you would have found it a very simple matter indeed.—I am very glad to know that the sisters have made the bees a success. And I feel like protesting once more against their giving up the business.—In regard to help: If I am not mistaken, in a little time good help in the shape of boys and girls will be coming and asking for some work to do. We have here now over 140, and new juveniles are coming daily with the old question, "Mr. Root, haven't you something for me to do?" May God's blessing rest over "Our Clearing."

#### GOOD NEWS FOR BEE-KEEPERS.

A LETTER FROM OUR OLD FRIEND, L. L. LANGSTROTH.

DEAR FRIEND:—After almost two years of suffering from my old head trouble, I am once more so much improved in health that I can take some interest in bee matters. Let me first thank you for the volumes of GLEANINGS which you sent me last winter. I can assure you that I have read them with very much interest.

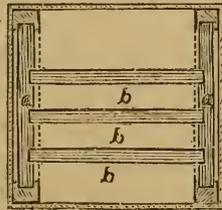

DRONES FROM WORKER EGGS—NOT A NEW IDEA AFTER ALL.

On page 55 of my work you will see that I noticed in 1852 (as I see from my journal, and not 1854), drones reared under the same circumstances, so fre-

quently referred to by some of your contributors. If the spermatc filaments of the drone remain some time upon the surface of the egg, it is easy to conceive that the bees can remove them before they get into the micropyle of the egg, and hence drones instead of workers.

#### THE CHAFF - HIVE PROBLEM BROUGHT UP AGAIN.

I wish to make some suggestions for the improvement of your standard chaff hive. You will remember, that years ago you asked for some practical way by which the frames could be inserted in the top story so that it would not be necessary to remove them all in order to get access to those below. I think that this can be done, not only without injury to the main features of your hive, but with an increase of storage room above for frames or sections, besides other advantages. Let me begin by saying that the doubling the case of the upper story is not only unnecessary for the protection of the bees below, but a positive injury to them, in the winter at least, by making that upper story like a damp cellar, and preventing it from drying out as it always does when made of a single thickness. This is one reason why the chaff cushions in your hive are so often damp, when in those I have made they are comparatively dry. Let your top story be made of single thickness, and you not only get rid of this evil, but have much more storage-room, either for frames or sections. Not only so, but you gain just the room which you need for easy instead of cramped access to the lower story. There is good room for your arms, for want of which, even when there are no frames to remove from the upper story, I always dislike to manipulate with your hives, especially if there is much work to be done. Suppose, now, that you have all the room which would be gained by a single thickness of the walls of that story. I will show you how to arrange that space for frames, by a simple plan which I used very successfully more than 15 years ago. My upper stories were made of only  $\frac{1}{2}$ -inch stuff, and were strengthened by four posts, serewed one into each corner. These posts did not come up level with the sides of the cover, but were kept just enough below to allow frames to rest upon them (*a, a*), a little below the frames which sit from front to rear in the upper story (*b, b, b*). To sustain these frames, thin rails of hard wood, about three inches wide, with upper edges beveled to a sharp edge, were fastened up against the corner posts. The dotted lines represent these rails. You will see that the space in front and rear of the upper frames was utilized for holding storing-frames, which also prevented the bees from building combs between the upper set of frames and the front and rear walls of the upper case of the top story. In the hives I used, in order not to use frames resting on the corners, of a different size from the standard L. frame, the lower story was made to hold 13 frames, in a brood-chamber  $18\frac{1}{2} \times 18\frac{1}{2}$ , instead of  $18\frac{1}{2} \times 14\frac{1}{2}$ ; but there will be no need of your chaff hives holding more than ten below.\* If you wish to get access to any frame below you need only remove one or two above, moving some of

the others nearer together, and there is nothing to prevent you from lifting out the lower frame, the rails on which the upper ones rest being no hindrance at all.

In this way you avoid all the heavy lifting, and other trouble incidental to the plan of the old two-storied hive, when you desire to get access to the lower story. If you still, for any reason, desire to have the upper walls of your chaff hive double, you can avail yourself of this plan, by making the air space very narrow; but in my opinion the hive is much better if single thickness above. There was a time when I would have tried to patent this plan; but while I neither question the absolute right of any inventor to patent any original patentable device, nor the absolute wrong of parties who knowingly infringe upon valid patents, as a matter of plain business common sense I would advise against patenting devices which can so easily be appropriated by others, as almost every thing connected with bee culture must necessarily be.

#### SOMETHING IN REGARD TO PATENTS.

Where the manufacturing of any patented article requires costly buildings and machinery, and heavy capital, men will think long and often before they attempt to infringe upon it; for in their costly plant they give ample guarantees to those who will defend their rights. On the contrary, if a man could invent the most useful article that human brains ever devised, but which could be easily and cheaply made by almost any one, in order to reap any substantial benefit from his patent he must expect, as the rule, to engage in almost endless litigation, and to spend one fortune in trying to make another. I hope, my dear friend, that you will make at least one chaff hive on the plan I have suggested, and put it to the test of actual use in your apiary.

Last year, in this place, at this time, the weather was most propitious, and the fields and roadsides white with clover; but it had no perceptible fragrance, and the bees in my neighbors' apiaries had to be fed to be kept from starvation! This year, notwithstanding the frequent and drenching rains, our houses are sweet with the smell of clover; and in the intervals when they can work, the bees are accumulating stores at a great rate.

With kind regards to Mrs. Root and family, and to each laborer in your industrious hive, I remain as ever,

Yours respectfully,

L. L. LANGSTROTH.

Oxford, Butler Co., O., June, 1883.

Sure enough, friend L., on page 55 of your book we find this very matter recorded, even away back as long ago as 1852, as you say. It seems to me strange that during all the discussion we had in the matter, no one even suggested that you noticed the same thing. Since you speak of it, it seems to me that I must have seen it and afterward forgot it so far that it only seemed to me that some writer had suggested the possibility of drones removing the spermatc filament before it had made its way into the egg.

In regard to your improvement on the chaff hive, after my experiments with the hoop hive, which you may remember, I felt somewhat doubtful in regard to the bees storing honey as well in an upper story made of a single thickness of thin boards. For a powerful colony, your arrangement would give an immense crop of honey. But after

\* By using smaller frames than the standard L., or dummies instead of frames, any standard L. hive might be made on this plan.

trying the end frames (*a, a*) with an arrangement quite similar to the one you suggest, I feel sure I would not like it. The bees trouble by building little bits of comb, uniting the ends of the frames of the main hives to these single crosswise combs. By using a wide frame with tin separators, and having the separators turned next to the ends of the brood-frames, possibly it might work very well. Yet I do not see how we could very well avoid being obliged to make these extra frames a little shallower than the one occupying the main part of the hive. Dummies have often been suggested, but I have always found them decidedly objectionable. They occupy room where the bees might be storing honey. Then they are always getting stuck fast unless they are arranged exactly like a brood-comb. If so, I should very much prefer having a brood-comb to a useless board.

I believe we pretty nearly agree in regard to patents; for all that, I would suggest that the improvements in bee culture are almost invariably found to be the work of many people; or, if you please, the result of little suggestions thrown out by a great many bee-keepers. In view of this, can one man very consistently attempt to monopolize the whole of any invention?

We all of us return kind regards to you, and rejoice that you are once more able to give us the benefit of your great knowledge and experience in every thing pertaining to the hive and honey-bees.

#### THE COMBINED CRATE AND SHIPPING-CASE.

ALSO SOMETHING ABOUT ONE-PIECE AND DOVE-TAILED SECTIONS.

**I**N April number of GLEANINGS, page 176, friend Heddon gives notice that in your next issue he will give what he regards as clear objections to my section and system of surplusage, and at the same time professes his readiness to be converted if he is mistaken in his conclusions. Considering that friend Heddon is getting to be quite a magnate in our profession, this month's notice of his intention to demolish our system of surplusage was, indeed, a great kindness; but after waiting two whole months for his attack, I am somewhat astonished to learn that friend H. has never used a combined crate and case (see page 315, June number of GLEANINGS), and I confess that, until he consents to do so, I fear my chances of converting him are very slim, in view of what has already been said by those who have made this system a practical success. His arguments are too much like those of the man who, after doing a vast deal of thinking, tried to prove to another that it was impossible for a certain tree to bear fruit, when that other had for years past been enjoying the products of that very tree. Fancy some one trying to convince friend H. that the Given press or wired comb *fdn.* is a failure. But, friend H. says that he has one of my sections, and that he "can not accept it as a good one; that it has not the strength of good all-dovetailed work." As the section referred to is one that I sent him, and had to take its chances in the mail-bags, very likely it had some weak joints when he received it. I presume all understand what friend Heddon means by using the language just quoted, since he advertises his estab-

lishment as "Headquarters for the Nicest of All-Dovetailed Sections." Well, I have one of friend H.'s sections that he sent me as a sample several months ago, and it is really a nicely finished section. When first received I compared it with one of my nailed one-piece sections; and as far as strength is concerned, there was but little choice between them. I told our "new partner" that we would lay them together on the shelf for a time, until they became thoroughly dry, and compare them again.

Now, when friend Heddon's article appeared, and I read the passage quoted above, I was reminded of the two sections, and had them compared once more. My "new partner's" comment was, "If Mr. Heddon could handle them now, he would take back what he said about your section not being as strong, etc.;" and mine was, and is yet, and if his section was made a little heavier, and nailed or glued at all four corners, it would be a good one. As it is possible you have not seen one of friend H.'s sections, I will mail you the one referred to; and as you already have some of mine, in view of friend H.'s criticism, I want you to tell the readers of GLEANINGS which you regard as the better section.

Perhaps friend H. is correct about his section being handsomer appearing than the one engraved in GLEANINGS; but this is not our regular style of section, which, you will remark, has closed *ends*, except a bee-space at both top and bottom, a style which in appearance and handling, we think, compares favorably with any other. As we use both side and end wedges with the crate, it is an easy matter to get either style in or out of the same.

If friend Heddon will consent to try some of my packages, I will furnish them free of charge, and I am confident he will be pleased with them.

Capac, Mich., June 21, 1883. BYRON WALKER.

I am afraid, friends, we are getting into a little controversial mood. Let us all try to excel in our different ways. But at the same time can we not be very careful about any reflections by any one on each other's ways of doing things that have even a shadow of unkindness about them? The combined-crate system of work is obtaining very great favor this season. As you and friend Heddon both agree on the importance of narrow sections and no separators, perhaps you will eventually agree pretty nearly in regard to a case for holding them. In regard to the comparative strength of one-piece sections and those dovetailed all around, I might say that only yesterday I accidentally knocked friend Heddon's sample section off the window-sill, and with it one of the one-piece sections. While the one-piece was not even knocked out of shape, the other tumbled into four pieces at once. Very likely this is not a fair test, because a dovetailed section when in the hive would be pretty well gined at the corners by the bees, and very likely the other would also, but perhaps to a less degree. Friend Heddon's sections are very handsome, and, in fact, they are made of that beautiful white poplar that friend Manum always furnishes. In appearance, I should judge they were some that friend H. purchased from friend Manum. Will it not be well for supply dealers to keep on hand both kinds? If friend Manum keeps up the standard of his work as he has done, his sections are bound to take the foremost rank in the market. Could he not make us an extra nice one-piece section of the same material?

## MRS. HARRISON'S REPORT ON WINTERING.

ALSO A FEW WORDS ABOUT OVERSTOCKING.

**O**UR bees are in fine condition to-day, June 11th, and there is a magnificent bloom of white clover; but there have been as yet only two or three days when bees could gather honey. It was astonishing, how much was gathered on those two warm, sunshiny days. Cool wet weather is the rule, since the advent of clover bloom, and will insure good fall bee pasture, if it spoils the honey harvest of the present.

Our bees wintered well, with the exception of some colonies that I experimented upon. I thought that I would try a tall hive, and so made one by putting one-half of the frames of the lower hive in the upper story of the L. hives, and division-boards each side, filling the intervening spaces with dry cherry leaves. I congratulated myself that, if the shallow frames failed, these surely would come through all right, as the upper frames were solid with well-ripened honey, and the bees could crawl up as they needed it. During the severe cold weather I took a great deal of comfort thinking of these fourteen colonies, all packed so nicely, and it is well I did; for it was all the pay I ever received. Only two survived the winter, and these were very strong in early spring. They carried all the honey into the upper story, and built out their combs all white, as they do when honey is plentiful; but this early breeding was no benefit, as they were smaller than some others later in the season.

The loss was very slight, where Hill's device and chaff cushions were used. Four out of 70 colonies came through, though some "petered out" during spring. We noticed particularly, the past winter, that protection from winds is a great advantage, and facing the south a desideratum. Two hives that stood in the shade, and had no protection from winds, died during winter. Out of 22, standing on the east side of the house, only two failed at roll-call. The house was a good protection against west winds. These faced east.

I've been very much interested in reading what friend Pond has to say on "overstocking." The head of our firm has always contended in the affirmative of this question, while I have been upon the negative. There is a town in this county which the resident bee-keepers claim to be overstocked. I went on an excursion to a town forty miles distant, and, after leaving the vicinity of the Illinois River, I looked out of either side of the car on to a sea of waving corn — corn joining sky. I saw no waste land; it was all subdued by the plow, with the exception of now and then a wet piece, which was drained, and yearly mowed for hay. When fields are yearly cultivated, what chance have perennial flowers? Goldenrod, horsemint, figwort, etc., can find an abiding-place only in the hedges, and along railroads. Where we live, in the valley of the Illinois River, there is very rich land that has formerly produced immense crops of corn; but of late years, probably owing to tile drainage, it has been subject to overflow; and their owners getting discouraged, let it lie idle, and Spanish needles and blackheart (*polygnum*) grow there in great luxuriance.

Friend Pond, the rocks of New England are the bees' best friend, for they protect the flowers from plows, cultivators, harrows, reapers, etc. When I journeyed through your country I observed much

land undisturbed by the plow, which is in such striking contrast to our own. Here the goldenrod was blooming in the greatest profusion; but as soon as arable land was reached, not a blossom was to be seen. Along the rivers and streams of the West, where there is woody, unbroken land, the bees fare better than on our fertile prairies, where king Corn rules.

Peoria, Ill., June 11, 1883.

MRS. L. HARRISON.

## HOW FAR AND HOW FAST MAY A SWARM OF BEES GO?

SOME VALUABLE FACTS IN THE MATTER.

**O**VER thirty years ago, when this country was new and but thinly settled, my father kept bees; and quite frequently we lost swarms by their leaving for parts unknown. One day, while following an absconding swarm, I was crossing a cornfield where a young man was plowing corn, near the opposite side of the field from where I entered it; and seeing me coming on the run, and ringing an old cow-bell, he took in the situation at a glance, and hastily unhitched his horse from the plow, and threw down the fence, led it out on to the prairie, and mounted ready for a chase; and as the bees passed over him he gave pursuit, having to keep his horse on the gallop to keep up with them. He followed those bees seven miles, and they then crossed the Cedar River at the same rate of speed as when he first started in pursuit; and the water being too deep to ford, he had to return without the bees. Fully half the distance followed was through open timber, yet the bees kept right on without making an effort to stop and cluster.

DO BEES EVER GO OFF WITHOUT CLUSTERING?

I know that they do. I have watched them coming out of the hive, and leave without clustering.

DO BEES REMEMBER THEIR OLD LOCATION OVER WINTER?

Last fall I put 25 hives of bees in my cellar; and wishing to change the location of my apiary about 100 feet to the south of the old location, I put out all of my bees on the new stands, and, thinks I, now I will see how many bees will find their old places. A few bees flew around the old stands; but on looking I found as many bees to the east, west, and south of the new location as were to the north at the old stands. Near sundown I went to the old stands to look for bees; but not a bee was there; although 8 empty hives stood promiscuously around, not a solitary bee took up its residence therein. I lost no bees from spring dwindling. My cellar is damp, and requires to be drained; and at one time the drain clogged up so that water covered the floor of the cellar to the depth of 2 inches, with no bad results to the bees. I keep every thing needed in the family in the cellar, such as potatoes, cabbage, turnips, etc. I have wintered successfully in the same cellar for several years. We are, this 9th of June, feeding our bees, although the ground is covered with white-clover bloom. The continual rains wash all the nectar away, and our bees would starve did we not feed them. Last year we fed until June 20, for the same cause, and it looks as if we must feed as long this season.

W. S. FULTZ.

Muscataine, Iowa, June 9, 1883.

There, friend F., you have furnished us a case that comes pretty near covering the very ground we wanted. I have often

thought of following swarms on horseback; but around here the fences would be an obstacle. You were near the open prairie, and that boy plowing, alarmed in time by your cow-bell (who says cow-bells don't do good?) was just in trim to give us the desired information we now want. Doubtless, he thought he had made a failure of it; but if you know where he is now, just tell him we have placed a dollar to his credit, for that seven-mile ride. Let us sum up. We now know that a swarm of bees sometimes goes as far as seven miles, and that they travel, when on the "war-path," sometimes, at least, as fast as a horse gallops, and now we want to know how fast that horse went. Probably 10 miles an hour, friend F.—I think some bees, or bees sometimes, perhaps, remember their location the fall before; and other times, or other bees, do not.

#### A NEW BEE JOURNAL.

OF late, the advent of a new bee journal has become quite a novelty; more so, in fact, than their departure. But here lies before us a genuine sample of "Vol. I, No. 1," of the *American Apiculturist*, S. M. Locke, Editor and Proprietor, Salem, Mass. It contains 24 pages of reading-matter, 5½ x 9½, besides 8 pages of advertisements. It is set in "long-primer" type, which is two sizes larger than this, leaded, making a very readable page. The press-work is very good, and great care seems to be taken by the proof-reader. The high quality of the advertisements is especially commendable. In short, Bro. Locke has left little if any room for complaint from any who want a good bee journal. Monthly; \$1.00 a year.

The irrepressible and inimitable Hasty furnishes the following article, which we copy for its intrinsic merit, and as a fair sample of the journal:—

#### POPULAR MISAPPREHENSIONS IN REGARD TO BEE CULTURE.

"Fussing with bees," is what they call it, because, you see, they do not think it laborious enough to be called work—a very suitable occupation for confirmed invalids, and constitutionally tired and re-tired clergymen, and for ladies in search of a sphere. These ideas can not be squelched at once, but we can put in our protest, and some day or other the truth will prevail.

Some women can keep bees. And just so some women can raise forty acres of corn. Success in either path must be won by downright hard work. As a vocation for women, bee-keeping does have this much in its favor: that great tyrant, "Society," gives permission to keep bees; while if a woman essay the forty acres of corn, society would frown her down as an amazon. The woman who goes at bee-keeping as the half of female domesticity goes at housework, or as one-half of well-born daughters go at their various ways of disguising idleness, can do nothing else than fail.

Some invalids can get a few bees, and, by healthful work in the open air, build up their health while they are building up their apiary; but nothing but a ruinous failure could come of the attempt to run a large apiary at once—unless the alleged invalid had somewhere, either active or latent, a large capacity for work. Invalids that suffer seriously when exposed to hot sun, or in any way subject to overheating of the blood, had better let bee-keeping alone. A man who is going to run a hundred colonies of bees through the swarming season needs to be a regular salamander, almost as much so as if he were a puddler of iron, or a steamboat fireman. A little

rebate may be granted here. Nothing herein contained is intended to forbid a confirmed invalid, or any other man or woman, from keeping a few bees, and supplying her own table with honey.

Clergymen are subject to the same restraint as to a vocation that women are. Parishioners would kick up such a row about the matter that walking-papers would have to be made out, if the pastor should mend boats, or keep a grocery. Excepting work with the pen, scarce any thing could be named that would provoke so little opposition as bee-keeping—but no lazy folks need apply. At any rate, unless the support be very inadequate, and the need of more income quite urgent, a pastor should usually be content with a small apiary. A little change of thought, and its accompanying exercise in the open air, will not injure the quality of the Sunday's sermon, but improve it. Really, fellow-mortals, let us pity the sorrows of the poor clergymen—required to dress and live like \$50.00 a year, while receiving \$300 and a donation of the civil-vital sort.

In thus affirming that bee-keeping is hard work, I do not assert that great strength is absolutely required. People who can lift but a small number of pounds may succeed, if that is all the disability. Strength often comes very handy, however; and considerable expenditure of muscle must be put forth for many hours of the day. I have been a farmer-boy under a good old farmer who was a foe to both leisure and play; but I think I never in my life wrought so many hours as last summer with my bees. Apiary work has much of it to be done in a half-bent posture, and is the harder on that account.

To go for another misapprehension, bee-keeping is very dirty work. Outsiders think it is nice—mild, probably, by the dainty purity of a section of clover honey. Alas! there is a difference between the product and the work, as much as there is between a nice sheet of white paper and the work of gathering and sorting the rags. If one contemplated becoming a sailor, he would regret the hard necessity of getting used to having his hands continually covered with pitch and tar. Between tar and propolis, there is scarce a penny to choose. There are agents that will remove propolis from the hands, but practically one has to get used to having his hands stuck up with it most of the time. If something that it will not do to dottle must be touched, just rub the hands with soil or sawdust, or clench the smooth branch of a tree, and wrench the closed fingers around it until the propolis, partly rubbed off and partly glazed over, ceases for the moment to stick.

A brand-new misapprehension that has got afloat of late is that bee culture is enormously profitable, a regular bonanza, in fact, say 100 colonies yielding \$50 each, equal to \$5000 per year. I fear that the sulphurous and nigritudinous lies some brethren and sisters have been telling are responsible for much of this. When you find a bee-man who makes \$5000 per year on his bees, just cast a net over him until the rest of us can come and take a good look. The net will last many years before it is worn out.

Another misapprehension that I fear has gained some currency is that apiculture is a matter of such simple routine that any person, even though not naturally ingenious or thoughtful, can easily master it. This looks to me as the most rank error of all. A bungler can not keep bees with success. In scarcely any other avocation is a living won by so large an expenditure of brain.

To all these disadvantages another must be added. The business has a spice of lottery about it. Frightful losses are liable to come in February, March, and April, sweeping away perhaps five hundred dollars' worth of bees as with the "bees-em" of destruction. Moreover, once in a while will come a summer in which scarcely a pound of surplus honey can be obtained. The downcast bee-man, with no income at all to draw on, must either buy barrels of sugar to feed the bees for their winter food, or sacrifice a part of them. That is to say, part must be sold for the trifle they will bring, and the money spent in sugar to winter the rest; or else colonies must be united with each other, possibly some destroyed altogether, and what honey there is concentrated in a few hives, to keep a fraction of the apiary alive till spring.

There, now! I've pretty much said it. And there are lots of things on the other side of the shield that I have not tried to say. With all the drawbacks, bee-keeping is an intensely fascinating pursuit. Many fail. Some succeed. A very few employ men

and run many apiaries and succeed; bringing up the theoretical possibilities of income pretty high. The conclusion of the whole matter is, that if you have the bee fever, and have it bad, past all cure, don't stand groaning, but plunge in—and the editor and his correspondents, they'll hold your bonnet.

### INEFFICIENT EXPRESS AND RAILROAD OFFICIALS.

WHAT SHALL WE DO WITH THEM?

**A** FRIEND wrote us that his missing goods were found at a station beyond his own, and I asked if it was through any fault in the address, or in shipping. He replies:

Dear Sir: No fault of yours. I think your injunction to push through without delay was fulfilled to the letter, but carried *past* the station to one 10 miles below, and used, no doubt, as a foot-stool by office loafers for a month. When we commenced to complain, then "Benton" was notified and I got my goods in good order. Perhaps a whipping-post along this express line would be of use.

June 12, 1883.

W. B. B.

Gently, friend B. I know how annoying such things are, and I know it does seem sometimes as if it would be no more than simple justice, that a whip should be taken to one so fearfully dead to the interests of his fellow-men, as to let valuable property lie, day after day, without taking a thought or care as to what ought to be done about it. Just last summer, a barrel of valuable oil lay by our station in the hot sun, month after month, until the oil ran out and made a greasy mud-hole, and yet no one took the pains to notify the shipper where it was, or what the trouble was. Could I have found a mark on the goods, I would have sent a notice myself. Cases of this kind are not uncommon, either; and meanwhile somebody is probably sending tracers, and having lots of trouble, waiting and waiting for the goods that never come; and the railroad company, after another long delay, pays for them, because they can not be found. Oh how this world needs faithful men, who will look after the property of others as they would look after their *own* property! or, in other words, who have it in their hearts to "love thy neighbor as thyself." It isn't whipping they want, friends; it is patient and kind teaching, and the spirit of Him who wept over the sins of poor, sluggish, indolent humanity.

### DO SWARMS GO OFF WITHOUT CLUSTERING?

ADDITIONAL EVIDENCE.

**I** WILL count one of a score who have seen the first swarm come out and go off without alighting. And in order to be short, I will just say that, in the year 1839, I commenced keeping house with a number of bees in what we called "gum" hives. I had been taught, that in order to have good luck with bees we would have to brimstone one-half the increase, and that bees never go to the woods without first alighting. Now I'll testify.

In the spring of 1840 I was called from home in swarming-time; left the bees in care of my wife.

I came home at noon and found her gone; in a few minutes my wife came in, pretty well warmed up. She said the bees swarmed, and did not alight, but that she followed them to a tree about half a mile from the house. I chopped the tree down in the evening, sawed it off, drew it home and saved the bees. So you see I was half ready to believe that my bees *would* swarm and go to the woods without alighting.

About ten years passed away, and during that time the number increased to about 50 hives. I made it a point to watch them closely, in order to avoid doubling up. One day while sitting under a shade-tree in the bee-yard I saw a swarm come out, and just as soon as all were out they took a bee-line for some timber about a mile from home. I followed them to their home in a tree.

These two cases satisfy me that bees will swarm and go off without alighting. And still further: I have had a swarm leave me since I have lived in Wisconsin. And for other proof, see T. B. Miner's American Bee-keeper's *Manual*, page 285.

From my own experience I am led to believe that, when bees have selected a home, they go to it without clustering; and that, when they swarm out and alight, they send out scouts to hunt up a home. For this reason, I believe that it is well to hive as soon as they have clustered, and move them to their stand before the scouts get back.

Bees have dwindled very badly this spring. Some of my friends are ready to give up keeping bees. Some lost one-half; others lost all. As for myself, I put 30 hives in the cellar last fall, and still have that number in good condition. I have no swarms at this date. Some queen-cells are started.

JOHN CLINE.

Fayette, Wis., June 12, 1883.

### PATENT DIVISION-BOARDS.

ALSO SOMETHING ABOUT BEE-HIVE PATENTS IN GENERAL.

**O**N page 329 of GLEANINGS I see that Mitchell's patent division-board is once more referred to. That Mitchell has a patent on a division-board, may be true; but that his patent covers the division-board, is not true. So has Fornerook a patent on a one-piece section; but his patent does not by any means cover the one-piece section. It will be observed that the words *a* and *the* have sometimes quite a different meaning. When a patent simply covers a thing, and not *the* thing itself, it is generally of very little value, except for black-mailing purposes; timid people being very easily frightened.

I wish now to call special attention to a fact that seems to have been overlooked by some, to-wit: A division-board patented to Rev. L. L. Langstroth, Oct. 5, 1852, No. 9300—over 30 years ago!—said device being almost the only divider now in use. Please turn to page 407, 3d revised edition of Mr. Langstroth's work on "The Hive and Honey-Bee," and read carefully the 3d claim in the L. patent, as follows:

"A divider, substantially as described, in combination with a movable cover, allowing the divider to be inserted from above, between the ranges of comb."

Directions for making this division-board may be found on page 376, same book, as follows:

"One piece, 18 $\frac{1}{2}$ " x 9 $\frac{1}{2}$ " x  $\frac{3}{4}$ ", each side of each end made  $\frac{1}{4}$ " beveling, for easy adjustment. One piece,  $\frac{3}{4}$ " x  $\frac{3}{4}$ " x 19 $\frac{1}{2}$ ", nailed on the first piece, like the top-piece of the movable-comb frames. By this divider, the size of any hive may be diminished at will."

Now turn to page 96, of the same book, and read the following:

"By means of a movable partition, my hive can be adjusted, in a few moments, to the wants of any colony, however small; and with equal facility be enlarged, from time to time, or at once restored to its full dimensions."

As the Langstroth patent had a long life of 21 years, and then died, *root and branch*, Oct. 5, 1873, nearly ten years ago, it seems to me that any one ought to enjoy, without molestation, the legal right to make, use, or sell a division-board made and used "substantially as described" by Mr. Langstroth. But they who think otherwise will probably pay a royalty of some kind to Mitchell or his representatives, and perhaps it would not be best to deny such the privilege!

M. M. BALDRIDGE.

St. Charles, Ill., June, 1883.

Thank you, friend B., for calling attention to something I knew quite well, but have strangely overlooked, in the many times I have exposed the Mitchell fraud. Those who have defended Mitchell (there are a few who have attempted a sort of defense of his course) would do well to consider the above.

LETTER FROM DR. BLANTON,

THE MOST EMINENT APIARIST IN THE MISSISSIPPI VALLEY.

WE copy the following from the *Planters' Journal*, published in Vicksburg, Miss.:

I herein send you a tabulated statement of the apiaries of Judge Harriman and Messrs. Adams and McLendon, of Chicot County, Arkansas, and Mr. Vaught and myself, of Washington County, Miss. The labor and shipping-cases are not deducted from the proceeds.

We consider the season of 1882 as more than an average one, but by no means extraordinary.

Judge Harriman's report is excellent, when you consider the great loss of swarms; his apiary is in a grove of forest-trees, and he failed to clip his queens' wings; and besides, he neglected his bees, owing to his judicial and plantation duties.

Bee-keeping is a science, and requires a great deal of study with a reasonable amount of enthusiasm, hard work, and strict attention.

One man can attend to one hundred colonies. With comb foundation as a guide, that the bees may build their combs straight; with the movable frame, to manipulate your combs and bees with ease; the uncapping-knife and extractor, to remove the honey by centrifugal force; the smoker to quiet the little workers, and the queen-cage to control and introduce your queen—with this furniture, so to speak, you are prepared for work; and without any one of these, you will certainly fail.

Honey should be taken from the hives almost as rapidly as the bees gather it, at least every ten days; and when they are bringing in the nectar rapidly, I extract from every comb that has any honey, even in the brood-chamber, and when not capped over; running the extractor slowly enough to discharge the honey without throwing out the eggs and larvae. In a few hours there is enough honey stored for feeding the young bees. When the honey-flow slackens, go slow with your extractor, and never extract when the flow ceases. I ripen the honey by evaporation in large tanks covered with cheese-cloth.

I ship in new cypress barrels of 52 $\frac{1}{2}$  pounds net, and comb honey in 28-pound cases.

We never plant any thing for bees in this rich alluvial country. Every tree, shrub, and plant yields more or less honey. I have never known bees to be afflicted with any disease.

To make a specialty of bee-keeping on a large scale, there is nothing that pays more for the capital invested; but do not suppose there is no hard work in it. The bee-keeper goes to church in swarming season only when the sun goes down.

TABULATED REPORT.

Total Proceeds per Colony.	\$49.84	\$19.53	\$24.56	\$31.00
Total Proceeds of Apiary.	149.53	938.75	705.40	13.53

FOR THE YEAR 1882.

NAME.

- Robert J. Adams.....
- G. C. Vaught.....
- Judge H. A. Harriman.....
- William McLendon.....
- Dr. O. M. Blanton.....

These figures seem extraordinary; yet they can be exceeded by the gentlemen, with their present experience and a good season.

O. M. BLANTON.

Greenville, Miss., Feb. 8, 1883.

"LUNATIC" BEES, ETC.

ALSO SOME ITEMS FROM GEORGIA.

I AM somewhat inclined to write a letter about bees, as I hope to gain a little information by asking a few questions. I will begin by saying that some of my bees seem to be fit subjects for the lunatic asylum. At any rate, if I were to see people act as foolish as these bees do, I would decide that the asylum would be the proper place for them. I will try to tell how they do. I have only two hives at present, which seem demented. They spread themselves over the front of the hive above the entrance, nearly as thick as they can stand, and move back and forth as if they were raking hay. This movement they keep up incessantly through the day, and, for aught I know, through the night too. If they were as industrious at gathering honey, as they are at this raking business, I should be better pleased with them. What does it mean? Somebody please explain. I have seen such actions among my bees before this year, but I have never seen any description of it in any bee book or paper.

Do young queens destroy remaining cells? This may be so where there are no workers, as in the lamp nursery; but in a full colony, I am inclined to think the workers attend to that business. At least, this has been my experience. I have seen the workers at it while the young queen was leisurely surveying the combs in a different part of the hive.

I have often wondered how it is that, in the Northern States and Canada, the bee industry is so much more successful than in the South. Here, all we need for wintering is plenty of bees and honey; while in your section you must have houses and cellars and chaff and leaves and straw and cushions, and many other *devices*, too tedious to mention, and yet you say you get 100, 200, or 300 lbs. of honey from one colony in a season. Why, sir, if we could get 100 lbs. average from each colony, we would not ask for a better fortune than 100 colonies of bees to start with. Perhaps there is more in the *man* than in the *locality*. If that is so, please send some "sure-enough" bee-man here to teach us how to do it.

Our bees have stored but little honey up to this time. We have had no "swarming extraordinary" this year, as we have had only 11 natural swarms up to this time.

J. M. HARRIS.

Cedartown, Polk Co., Ga., June 16, 1883.

Another friend tells us of tramp bees, and now we have lunatic bees. Yes, I have witnessed the same phenomenon, and I can not tell what they are doing, unless it is scraping off the boards around their doorway, much in the same way the good housewife sweeps and scours the floor and doorsteps. With us they usually take up this employment when there is but little to be found in the fields—after basswood has failed, for instance. I believe the newly hatched queen usually lites open the cell, and the bees then take it in hand, and tear the cell down and carry off the embryo queen piecemeal.—I suspect we get more honey in the North, because of the men, the locality, and the influences of the climate on the men.

## DANGER OF OVERSTOCKING.

WHAT HEDDON SAYS.

I HAVE read Bro. Pond's criticism on my views regarding the above subject, as penned by him on page 315, present volume. I thank him very much for his eulogy of my ability as a bee-keeper, and I am sorry he can not give me more credit as an honest and unselfish man. However, the same way that I have gained his good opinion in the one respect, I will try to gain it in the other. I have a little different philosophy from Bro. Pond. When I find a man possessing the amount of knowledge and analytical power that he gives me credit for, I always find him either too wise to allow himself to be immoral; or, if he is, too keen to write his immorality or selfishness to the public. Regarding the "sugar-coated pill," and the "suspicion that troubles" me, allow me to say to Bro. Pond, that my pill was not created as an antidote for any internal trouble, but for an *external* one. Does not friend Pond well know that, years ago, when I was alone in showing up facts upon this subject, reprimanding the vile practice of some supply dealers in trying to get all classes into our pursuit, defaming the skill of the few who were succeeding, by heralding the

"glad tidings of great joy," that honey-producing was all gold, just the thing for sick men and weary women—in fact, all persons out of a job, who had failed at all else; when no Dr. Miller, Hutchinson, House, Hasty, and a host of others were there to help me; when the few who did see the point had not the bravery to stem the current of the calumnies of the majority, that then I was called "selfish," "mercenary," "scares," etc.?

Suppose you and I and a few others had a "corner" on honey-producing. Is it undue selfishness to try to keep that corner exclusive? Our editor has over 5000 names of bee-keepers. I wish I had them. I want to place my circular in fair competition with his. Is that list open to me? I will allow any one to copy my list who wants to, who will do so, making me but little trouble. I will hire it done for them. But I will not put aloft false reports, because I deal in supplies. When George Grimm tells me his and his father's long experience with many hundred colonies, was that when over 40 colonies were kept in one bee range? The pro-rata yield was very perceptibly lessened. When Hetherington, Harbison, and Oatman tell us by their *acts*, that, after about so many colonies, we had better sell, or move on and increase, I am forced to value *every* inch of the field I occupy. I would not have another put a single colony in my field—mine by right of priority; and, in the language of the great Confucius, I will "not do to others that which I would not have them do to me."

Friend Pond, if I know your experience as a honey-producer correctly, I am not willing to admit you as good authority on the subject under discussion. Of sizes of frames, safe methods of wintering, the case is different; but, close that law office; commence poor, feed and clothe the ones you love, and who love you, with the products of the bees, or go hungry to bed, and I will admit you, and I will have you as earnest on our side of this question as I am.

I have sold, during the past spring, 84 colonies of bees. I have 150 left in my apiary. I sold 2 yesterday for \$20.00. Well, my field, if exhaustless as it is supposed to be by the doctrines taught in friend Pond's article, \$49.00 would not have purchased those two colonies. I have fixtures and knowledge to make them worth more than that to me, while they may prove a poor investment, at half the price, to the purchaser. My field is my capital, to a great degree. I am the friend of every bee-keeper that is, now and at all times. I can do him no greater service than do all in my power to controvert the action of many to plant in this path opposition, both in the field and the market. The great law of supply and demand, and influencing prices, has not yet deserted the realm of honey-production.

Dowagiac, Mich.

JAMES HEDDON.

Friend H., there is just one little sentence in the above which I feel like protesting against. You have used a quotation from the Bible in a sort of irreverent way that I can not think wise or well, even though your views of such things should differ from those held by some of the rest of us. We are a mixed company, remember; and to shock people, where no good can come from so doing, I can hardly think either courteous or kind.—In regard to our list of bee-keepers, it is now something like 150,000, and represents the labor of several clerks for several years past. As the names are printed

in alphabetical order, and no name appears twice, the task and cost of getting it up is enormous. I have sold some of the sheets for 50 cents per 1000 names; but unless I was satisfied they were wanted for advertising good and honest goods, or for sending out circulars that were fit to be put into the hands of the children of our land, they could not be had at any price. The list has cost me, in cash paid out for advertising, and for the labor of clerks, perhaps over \$2000. Do you think I ought to give them away? Do you think anybody could go to your office and copy off the names for much less than 50 cents per 1000, friend H.?

I should not have brought this matter in here as I have, did it not seem as if some explanation was demanded; and, come to think of it, I wonder if we are not all a little out of order. I think we will lay most of the blame on friend Pond, for writing in regard to the matter of overstocking in a way that I can not but feel was hardly the thing toward friend Heddon, even if he did try to put it kindly. Shall we not now drop the matter right where it is?

#### D. A. JONES IN REGARD TO THE PURITY OF ITALIAN BEES.

ARE THEY A HYBRID RACE?

**I**NCLOSE an item, clipped from the *Montreal Weekly Witness*, written by our esteemed friend, D. A. Jones, of Beeton. It so entirely agrees with the notions that I have had, that I would like you to publish it. ILA MICHENER.

Low Banks, Ont., Canada, June 15, 1883.

#### ITALIAN BEES.

SIR— I write you concerning the work of Italian bees, a subject which apparently admits of a variety of opinions. Last summer I bought a dollar Italian queen from a reliable breeder, which I safely introduced, and which in due time populated the colony with bees. Not being at all acquainted with this variety of our "little pets," and not being certain of their purity, I am at a loss as to what to designate them. I remember reading an article in a bee paper, to the effect that Italians as a rule show the three bands only when expanded with honey; and again in Prof. Cook's new Manual I read they are always visible. The progeny of my queen show but two bands, when in a normal condition, although the third is present, but only showing itself when the abdomen is elongated. They also appear to be more vindictive than their black neighbors, which would strengthen the opinion that they are hybrids. Of course, I will be able to discern as soon as drones show themselves, as from such queens, I believe, they are always pure. Thinking, however, a full explanation of the matter from one of your experience could not fail to be instructive to some among the many readers of the *Witness*, I take the liberty of thus addressing you. J. BORLASE WARREN, Gambridge, Ont.

You will not be able to judge of their purity by the drones, as queens bred from pure mothers, and mated with drones of another race, show *pure drones while the workers are hybrids*. Italians have usually been considered a pure race by many, but latterly there appears to be little ground for any other belief than that they are all hybrids; that they are only a cross of the Holy-Lands and blacks in Italy, and their breedings. Most of the black blood has been bred out by the constant breeding of hundreds of years; and the changes in food, climate, and surroundings, for this long period, has tended somewhat to change, and to a certain extent form a distinct race of bees called Italians. I, previous to my travels in Europe, Asia, and Africa, when searching for new and choice races of bees, found that what were called "pure" Italians varied very much; that they were not inclined to duplicate themselves; that by selecting the dark strain, and following that course of breeding, I could produce black bees; or by selecting the lighter, I could breed lighter and brighter, until they were just as handsome as Holy-Lands. It was always a mystery to me how a pure Italian, imported from Italy, could breed such a variety of bees; but after having traveled, and investigated the matter, I had no difficulty in arriving at a conclusion. I found blacks and hybrids in

France, Germany, Austria, Switzerland, and also in parts of Italy. I also found in the Sicilian Islands black bees, and some slightly crossed with Italians, but not as black as the German or French, as the Sicilian seemed to have more and longer gray hairs on the abdomen. Now, from Mount Etna all the way around the Eastern coast to Catania, the northeast point next to Italy, for many miles the channel is so narrow that bees in swarming can and do cross from Italy to Sicily, and *vice versa*. Just across the Adriatic Sea, along the Dalmatian coast, and on both sides of the Dalmatian coast, and on both sides of the Dalmatian range of mountains, there are the finest, and, I believe, the best blacks in the world. All these facts go to show that they (the so-called Italians) have been imported from Asia long ago, and the evidence is made still stronger when it is remembered that the trade from Palestine and Cyprus passed up through the Grecian archipelago, crossing the Adriatic Sea to Italy, and that honey and wax were two of the principal articles of commerce. No doubt, the finer and better bees from Palestine and Syria found their way into Italy in large numbers. It would seem hard to state just what we should consider pure; perhaps the three gold bands will be found the best test in the matter.

I am aware that friend Jones does not agree with several of the friends who have visited Italy, in regard to finding black bees there; but as his investigations were much more extensive than any other, very likely he is right. I confess I can not quite see, though, why the same does not apply to the Cyprians and Holy-Lands as well. In regard to color, this can be changed either one way or the other, with almost all of the animal kingdom, by careful selection in breeding. Providing we get the honey, what does it matter what we call them? In connection with this subject, I believe that all agree that crossing the Holy-Lands with the Italians always produces gentler bees, while crossing blacks with Italians has exactly the reverse effect.

In speaking of bees crossing the channel, friend Jones strikes on the question before us now, in regard to how far a swarm of bees may fly; and as we found that bees fly much further over a sheet of water than over land, doubtless swarms would do the same. If they "lit out" to go across, they would have to cross or die, and so they might fly across, where the channel was as much as ten miles; and we would naturally suppose that after-swarms, led by giddy young queens, would be the ones to make the "long stretches."

#### SEASONABLE HINTS, ETC.

DRONE OR WORKER COMB FOR SECTIONS.

**I**HAVE used drone and worker fdn. for sections; think I shall use only worker hereafter; drone will do when honey is coming in plentifully; but in a poor season, when but little honey is stored in the sections, the queen is almost sure to lay in those drone combs, even if you use a separator; especially is this the case when there is no drone comb in the brood-chamber. I always like to have at least some drone comb in the brood-chamber, as they are better satisfied than if there is none.

SWARMING WITH CLIPPED QUEEN.

Will swarms return when three or four unite and have no queen among them? Yesterday four swarms came out about the same time, uniting and clustering on a peach-tree, which I had to prop up to keep it from breaking. Well, now, what was to be done? I removed the parent hives, setting others in their

place, thinking each swarm would return. They had scarcely settled when they began to fly in the air, circling around for some time; some entering other hives, and in a short time clustered on the same peach-tree. I then got the fountain pump and gave them a good shower, and put them in four hives, giving each one a queen. Well, now, what would have happened had the queen's wings not been clipped? Will those who are averse to clipping queens' wings please explain how to manage such affairs? Friend Doolittle, you advise clipping the queen's wings, and so do I; but you don't explain how to manage swarms when they cluster together. Won't you explain?

#### QUEENS NOT FOLLOWING THE SWARM.

If you can not find the queen when they swarm, and she has her wing clipped, just open the hive and see if she is not yet in there. She will sometimes not come out with the bees.

#### CHAFF HIVES FOR A COLD SPRING.

I prepared 33 colonies for winter—19 in Simplicity, and 14 in chaff hives. Those in the Simplicity hives were packed with chaff, and division-boards used. I also use division-boards in my chaff hives. They seemed to winter about alike, and were fully as strong in bees when they were unpacked, as those in the chaff hives; but after they were unpacked, they seemed to dwindle some, and increased very slowly, while those in the chaff hives increased right along, and were not much affected by the cold, unfavorable spring.

H. J. SCHROCK.

Goshen, Ind., June 17, 1888.

## "Remindery,"

Or Department for duties to be attended to this month.

**A** GREAT flood of honey is upon us. Reports of the wonderful crop of white clover come from all sides; and the best part of it is, that there is honey in the blossoms, and has been from the first. Usually we have a period of from two to three weeks between fruit-bloom and clover; but this year clover came right on the heels of fruit-bloom, and, in some localities, even before locust-bloom. Now, the thing to be done is to save the honey. Don't sit down helpless, and say you can't, but just take care of it, and save every particle, in spite of circumstances. Ever so many are just now writing for more hives, frames, and boxes, saying they had no idea of such a flood of honey, and were unprepared for it; and that if they can't have their things at once, the honey will be lost. Of course, we will do all we can for you; but I tell you, the honey must not be lost, and need not be lost. It does a bee-keeper good to be pushed once in a while, and to be thrown on his own resources. It develops his inventive genius. Let us see what can be done while you are waiting for your things, or at a time when honey and swarms are coming, and you have no accommodations for either.

Before I would hive swarms in kegs and boxes, as is often done, I would drive stakes in the ground, and tack a strip across, to hang the frames on. If you can't get the

strips and stakes otherwise, buy common plasterer's lath, and I think you can all get these, without much trouble. Put the lath up edgewise, for the frames to hang on, and have them come just the right distance apart. Now hang in one frame of unsealed brood, to hold your swarm, and to start the bees right; then lay strips of lath along on top, in place of frames. Watch them every day, to make the bees build the combs straight and true. I think it is the nicest fun in the world to guide them in the structure of these new, nice combs. Of course, you will let this work go on only until your frames and hives come. When they do, break out the new combs and fasten them in the frames with melted wax. I would take all white combs without brood, for fastening into section boxes. I almost forgot to say, our impromptu hive is to be covered with a cloth, held down at the edges with bricks and stones, to give the bees protection enough, so they won't swarm out. To keep off the rain, lay a board on top, held in place by a stone. If you run out of section boxes, split common lath, plane the inside and edges, and cut them up in a miter-box, and nail with wire nails or brads. This is slow and expensive work; but it is better than losing the honey. Find somebody in your neighborhood who wants a job, and make him happy by setting him to work. School children, with some older person to look after them, will take to this kind of employment like ducks to water; and if you are the man you ought to be, or woman either, you can teach them to do nice work.

If your hives want extracting, and no extractor is to be had, make some kind of a home-made extractor. Any barrel or can will do that will hold the honey, and allow the frames to revolve. A wooden frame, covered with wire cloth, can be made in a little while, and a crank, directly on the top of the shaft, will extract very well, only it takes a little more time. *Don't let a drop of honey be lost.* You can stand it to work until 10 o'clock at night, and be up by four in the morning, for a little while, until you get ahead of the bees a little. If you get very sleepy, you can go to bed a little earlier; but don't cut off the morning hours. I rather like being crowded that way for a while. It is fun to go to bed and drop asleep almost as soon as your head touches the pillow, and it is fun, too, after you are up, to see the sun roll up and herald in the new day, while the bees rub their noses and "light out" to their work. Mind you, there is to be no gossiping and loafing these days; no picnicking or excursions for a bee-keeper in the month of June, unless he is a smarter man than the most of us.

Look out, too, about queenless colonies. If you are raising queens, never let a great big strong swarm be idling away its time, waiting for a queen-cell to hatch, or for a young queen to get to laying. A bee-keeper can always find something profitable to do in June, if he has as many as 40 or 50 colonies, and I never saw the apiary yet of that number, where I could not point out something that needed immediate attention. "Do ye mind?"

## FROM DOOLITTLE.

BEES FLYING 90 MILES AN HOUR.

**I** SEE by the last two numbers of GLEANINGS, that what I said of the experiment, regarding bees being let to fly from a train of cars going 30 miles an hour, as given by P. H. Elwood, has created quite a stir, and the whole talk seems directed toward Doolittle, while as yet I have not said a word regarding what I thought in the matter. Several years ago, when there was quite an excitement about overstocking a locality with bees, I said that bees flew from 4 to 7 miles from their hives for stores; and in trying to prove the fact, I mentioned the "90 miles an hour" experiment, as above. But for all my reasoning, giving facts, etc., friend Root was an unbeliever till friend March came forward and converted him. At that time I made some experiments to see how fast bees fly; and as a result I came to the conclusion that a bee could fly 75 miles an hour in a still day, with a clear atmosphere, while in a damp, muggy, or windy time, they do not fly more than from one-third to one-half as fast. Also, the bee does not get at full speed till half a mile or more from home, while, when returning with a load, the last half-mile is gone over very slowly, more especially as the hive appears in sight. That a bee can not breast a heavy gale, I am well aware, as their wings are not made for that purpose, as are those of a duck, and some other strong-flying birds; but of one thing Mr. Shuck is mistaken; which is, that a wind blowing 90 miles an hour would take the hives out of my yard; for we had a wind blowing 82 miles an hour, three years ago, and not a hive was stirred, although several houses and barns had their roofs damaged to some extent. But, to the experiments I tried:

The special New York express train running on the N. Y. C. & H. R. R. R. runs 60 miles an hour at certain places between Rochester and Syracuse; and by standing a rod or so from it as it passed I was enabled to get the rate of speed which was required to make that time fixed in my mind so that I could guess pretty closely as to the relative flight of any object. About a mile from my apiary is a rise of ground over which the bees must pass in going for basswood toward the close of the harvest. Here I could hear the sound of the bees as they passed over; but I had, up to this time, seldom seen any, except in a strong wind, when the bees always fly nearer the ground. I lay down flat on my back, and placed my hands each side of my eyes, and looked steadily up to the sky. After a little I could see the bees pass; and to say that I was surprised at the rate of speed they possessed, in a still, clear day, is placing it mildly. After a careful comparison with the train going 60 miles an hour, I decided that 75 miles an hour was about the rate of speed the bee attained when going 4 to 6 miles from home for stores.

Again: A good horse will trot a mile in 3 minutes, and a man can run nearly as fast as a horse will trot, for a little way, say 15 or 20 rods. Thus a man can run at the rate of 20 miles an hour. Now, a swarm of bees does not fly in a straight line; that is, each bee does not fly in the direction the swarm is moving, for all observers are aware that each bee describes a circle, so that it looks as if the bees were going through the air in every direction. This will be observed at whatever rate of speed the swarm is going. Thus it will be seen that the bees travel

about three times as fast as the distance made by the whole swarm. As there are swarms, when, under full headway, that no man can run fast enough to keep up with, even for a little way, this gives nearly the same result (75 miles an hour) as before.

Once more: The church which I attend is situated  $2\frac{1}{2}$  miles from my apiary, in the direction of the teasel fields; and in coming from church I often notice the bees going home with their loads of teasel honey, whenever they have a strong wind to face. At two miles from home they pass by me, facing quite a strong wind, at the rate of 25 or more miles an hour, while, when I get within one-fourth of a mile of home, I can easily drive my horse so as to keep up with them. As they come nearer, they fly still slower, so the horse need not go off a walk to keep up with them, at from 5 to 10 rods from the apiary. In a still, clear day I do not see any bees till I get near the apiary; but by stopping my horse I can hear them flying over at any place on the road.

Friend Root says, on page 314, that he has "often kept up with bees without driving fast, when they were going to and from a buckwheat field," but he does not say how near he was to his apiary, nor whether the day was clear and still. Friend Root, did you not "hazard that opinion" of bees flying from 10 to 15 miles an hour from what you had seen while within one-half mile of your apiary, on a windy or muggy day? If you have seen bees flying to and from a field, at a distance of one mile from their home, and one-half mile from the field of flowers, on a still, clear day, you have seen something I never have, except as I have given, where they flew over the rise of ground.

Borodino, N. Y.

G. M. DOOLITTLE.

Thank you, friend D. Since you mention these things, and explain them, many facts come to mind to convince me you are at least not far from right. For instance, I do now remember that the bees were not far from their hives, when they flew alongside of our buggy. I have, too, noticed bees flying over a hill, when they seemed to go like a flash of light; and, by the way, I wonder how many of the friends have learned to see a bee on the wing. When you can hear them roaring overhead, look up, and you will see nothing; but after a great deal of trying you may get your eye on a single bee; and if you can turn your head fast enough to keep your eye on him, you will, of a sudden, discover not only this single bee, but a multitude, right alongside of him, moving with almost incredible speed. I once heard a roaring noise overhead, and looked up just in time to see a large swarm high up in the air, going at a speed so great that it seemed to me no horse in the world could keep up with them. They were out of sight in an instant. Now, we all know that swarms often go so slow that one can almost keep up with them on a walk. Who can say how fast they may go, when really in an emigrating mood? Now a word in regard to railway trains running 60 miles an hour. I have been told by good authority, or at least what I consider such, that trains do not get up to that speed, not even for a single mile. Have we an experienced railroad friend among our number who has seen this thing tested by actual, careful test?

## A NEW HOME IN FLORIDA.

BY OUR OLD FRIEND DAMKÖHLER.

**M**Y present place is on Estero Creek, about 18 miles south of Fort Myers, and the same distance by water from Punta Rassa. I am situated on a beautiful navigable creek about from 20 to 100 feet wide, 12 feet deep when tidewater is in. The tide rises here only two feet. This is a healthier location, and not subject to overflow; free from malaria (the only sickness in this land), and very good land for oranges and fruit-trees. The land is mostly covered by the cabbage and saw palmetto; and on river or creek, by mangrove, cottonwood, and a dense shrub alongside the creek, shows the richest land. Live-oak, willow, persimmon, muscatine grape; in fact, every bush and shrub produces here, honey and flowers. Further back we have pine woods, mostly pitch pine, and cypress swamps. But don't think by the name of swamp we mean a nasty, unhealthful place full of miasma or malaria. I tell you, there is in the open streets of Medina at least ten times more malaria and sickness, and impurities in the atmosphere, than in the everglades or swamps of South Florida. Send your consumptives to these swamps, and in the course of two years they are young men again, full of new energy, and new blood and power. My selection was quick, and I think a good one too. I named my apiary the "Garden of Eden Apiary," on account of the many cabbage-palmetto trees which stand on the same, and as soon as I have more time I shall go down the coast and fetch and plant the royal palm on my land. I took from my old place 100 basswood, catalpa, tulip, and sourwood trees, and the fine pussy willows, and all thrive now well in the Florida sand, bringing forth buds and nice foliage. I believe in planting bee pasturage, even in Florida, too. The ground here is covered, besides the shrubs, with saw-palmetto, pennyroyal, buckberry, and flowers, which I do not know, of all descriptions, and at all seasons; 100 of the very choicest mulberries, for silk-producing, which I brought along, stand now in the beauty of their new dress.

### VANILLA AS A HONEY-PLANT.

A Dr. Hansen, whom I had the honor to become acquainted with, and who took your address in order to become a subscriber to GLEANINGS, disclosed to me his secret in studying the propagation of the vanilla plant, and how to make it bearing fruit. This encouraged me to raise this plant, as it will grow here well, and is a fine honey-plant.

My 27 stands of bees which I brought here, some in weak condition, are doing well now, and breeding up well. They bring in honey of a very superior flavor and smell; but I did not know from what plant this delicious nectar came. But the bees started down river toward Estero Bay, which by beeline may be  $2\frac{1}{2}$  miles distant. I never yet saw a bee on a flower or shrub around here, except for water, and when I gave them spoiled comb with honey, far away from the apiary, to lick up. Last Tuesday I concluded to go by boat to Punta Rassa, 16 miles distant; but tide, wind, and waves often compel us to be 3 or 4 days on this trip before we come home. As my enterprise here is hailed by all the few citizens, and they have a desire to help me on to success, they show a great sympathy for every thing. I told them of the beautiful honey which came in slowly; I asked about the different sorts of mangrove, of which there are more than 10,000 acres

about blooming, and there are many different varieties. One gentleman took me by the hand, a little way from the house, to a great shrub. As we neared the shrub, a beautiful aroma filled the surrounding air, just as my honey smelled and tasted. Oh what a wonderful shrub! for its great round leaves, I did not perceive its flower, but a stem about 6 inches long, covered thick with white flowers, etc. I was delighted in the highest degree over such perfume, so powerful, so very delightful. There must my honey come from, and no other plant. I was sure of it, and know it is so. This shrub is called here the sea-grape, and acres of the same stand on the sea-shore, near salt water. It is very easy to transplant, and spreads itself rapidly and very wide, but doesn't reach up the creek to my place; but by next year I hope I shall have planted both shores of my creek with it, as the tide water reaches up here. And so I plant cocoanut-trees, and have 250 nuts ordered from Panama. The bloom of these beautiful shrubs is in May here; and so is the saw-palmetto. What a beautiful perfume even this great blossom had, so powerful!

No Northern man has any idea of the expression, "garden of Eden," and not without a reason; but the garden must be cultivated. It is in a wild grandeur, beautiful through and through. I broke a few blossoms of the sea-grape and took to the hotel, and told them my story, and all exclaimed, "Oh! that smells already like sweet honey."

But now comes a big drawback; and this is, that the "cow-boys" burn up the whole woods and country, to keep vegetation down, to kill snakes, insects, etc., and to start the grass. This destroys the fountains of the precious honey. But now, my dear sir, you must not think hard or low of these men by the name of *cow-boys*; for they are gentlemen of clear water, some worth from one-fourth to one-half a million of dollars; but they are men used to exposure; men of learning, who found, by camping in the swamps, their health, and cure for broken-down constitutions. They are merchants of New York, and officers of the U. S. army, who, after the Florida War, chose South Florida for their home; and now these gentlemen, and others of influence, promise me not to burn any more for some miles in my neighborhood, and their word is as good as gold. We have no court, no lawyer, no thief, no bad man in this county. If the North had many thousand of these men it would be better for them! I am the only settler in this district. My neighbors are alligators, snakes, mosquitos, and sand-flies. The alligators pay me every day a visit when I go to the creek, but keep at a respectful distance. The snakes are quite plentiful, but not hurtful, and keep out of my way. The rattlesnake and moccasin I have not seen yet, and the other snakes are innocent and useful, because they exterminate the poisonous snakes. I killed to-day a yellow snake, and was afterward sorry I had done so. When I examined her mouth she had no fangs nor poison. Three to four big blacksnakes play among my planted trees before the bee-hives, and my children go barefooted, and water the trees. I do not intend to kill them; they are of great benefit to us. They are 5 to 6 ft. long.

Now, in short, the whole vegetation seems to me to breathe and produce peace, sweetness, and honey, except the pitch pine and cypress, and may be both of them are useful for the bees. When I drove nails into a pitch pine, before my tent, a thick sap sprang out and ran down the tree. "Oh! honey! honey!"

cried my children, who came with their fingers, and licking it up. Both found, to their astonishment, the supposed honey to be of a bitter taste, like turpentine, and I had to use strong measures to keep my little 3-year-old girl away from licking it, for I feared she might be sick, as I myself had tasted the sap, and felt pangs of colic after it.

The whole region, from Clearwater down Manatee River, Peace Creek, Charlotte Harbor, Caloosahatchee River, in the Hamock and swamp lands near the coast, are the best fields for the bee-keeper; besides, I do not hear or know any who bother the bees.

Two nests of two bald-eagles are near me on my way to Punta Rassa, and the sand-crane, crows, and the different sorts of water-fowls and sea-birds, with the gaudiest plumage, and no bee-eaters. The mosquito-hawks are not bad near the apiary, but are bad near the sea-shore and great water-courses, and may take many of my pets away when in search of nectar. The ants trouble a little when the bees are not placed on a platform  $1\frac{1}{2}$  or 2 feet high, which I did. Besides, when so located, no toad can reach them. This precaution, Mr. Hendrick, of Cedar Key, gave me, and I acted accordingly, and brought 700 feet of lumber over from Fort Myers for the purpose. The transport of this lumber cost me over \$20.00.

On Estero Bay, River, and Creek, are thousands of acres of mangrove, mixed with cottonwood, sea-grape, cabbage and saw palmetto, mastics, many kinds of cactus, live-oak, etc. But the disadvantages of great wide water-courses is the mosquitos, sand-flies, and mosquito-hawks; and if the apiary is not watched, the bear will soon find them out and partake of their honey.

The moving of my goods and bees from Punta Rassa to this place took two weeks, and cost me over \$60.00, 16 miles distance; besides I was over 8 hours naked in water, amid the alligators and saw-fishes, to shove the boat with my feet over sand and oyster banks, over tree-trunks and stems, in which the boat was caught, and I entered my possession alone, with my bees in the dress of Adam, after 8 hours of hard labor, my whole back side from head to heel burned and blistered from the rays of the sun. Next day I had a heavy attack of chill from the exposure.

We are all hearty and healthy now, and thank the Lord for it! The thermometer raised to 90 and 95°, and the cooling sea-breeze enables me to do hard work without inconvenience, except on very calm days we feel a little exhausted, but not much. The nights are all cool; and after midnight you draw the cover closer. Mosquitos and sand-flies are troublesome on calm days and early mornings, and late evenings in the night. We have no trouble to sleep well, as my good tent shuts them out.

#### FLORIDA HONEY.

I hear that a New York man, Mr. Thurber, and a Cincinnati man, visited Florida to look after the resources of honey here, and they said the Florida honey is the best in the world, and I believe it!

#### AN INSANE BEE-MAN.

A brother bee-keeper was here (I do not know his name) with Langstroth hives, extractor, etc., who failed. Mosquito-hawks destroyed his bees, and he became insane. Others say he was crazy before he went further South on the sea-shore. They car-

ried him to Key West, and brought him to an asylum, where he will now be kept. His few things, the bears afterward destroyed in the apiary. I shall try to find out his name. G. DAMKOHLER.

Punta Rassa, Monroe Co., Fla.

Friend D., I am afraid you are a little hasty in deciding so soon to call your place the "Garden of Eden Apiary." If I am not mistaken, yours is one of the enthusiastic temperaments that are often cast down, discouraged, and disappointed. I confess that I like the prospect you have pictured before you in your wild home; but do you fully realize how much you have to do to make this wilderness a home fit for your wife and children? A great many have written with much enthusiasm of Florida, but very few have ever yet reported a realization of these bright anticipations. Are you sure you and your children won't get lazy, without any frost and snow? and will they get an education, with the zeal and enthusiasm they might have were they battling with our Northern winters?

### MRS. AXTELL TELLS US MORE ABOUT BEES IN THE HONEY-HOUSE.

ALSO SOME OTHER MATTERS.

AS you asked me to come again, I will do so, and reply to questions in regard to bees in my honey-house. The two honey-houses at home, bees could not get out of and in to, unless carried in or brushed out; and the one at our Timber Apiary bothered us some when honey harvest closed, as a few bees did get in and out, which would cause bees to hang around the house. It seemed impossible to fasten them all out, as it was not a plastered house; the other two were plastered. There was no pollen in any of the houses, to my knowledge; no brood-combs; probably a few cells in the surplus frames of honey, but I doubt if there was as much as a whole section full in all three houses. There might have been more, as the two houses at home were both nearly solid with comb honey, and the one at the other apiary held only the honey for a few days at a time, until removed home.

In two of the houses there were large sheets of brood in all stages, and considerable capped brood, some nearly ready to hatch; but I don't remember whether any hatched out, but think there was, as the comb looked dark in the center, as it does after brood has hatched. We would leave the wooden doors open as long as we could without attracting robbers from the outside, in hopes that they would come to the screen doors. A few would come, but we could not get them all out, as more would slip in each time we went in, if we had been carrying in honey; but at night they would all leave and go home to their hives. At the close of the harvest, perhaps a teacupful hung around the door a few evenings, and I gave them to a queenless colony that I had set near one door.

#### STRAINING EXTRACTED HONEY.

I see you and others seem to think extracted honey needs to be run through a strainer. I can't see any use of the strainer at all. Impurities immediately rise to the top, and can be skimmed off. The barrel should be skimmed once or twice a day. Our honey is perfectly clear — every speck rises, and it

seems to me to be a great deal less work than to bother with a strainer.

Our hive is large, and I don't see how bees could suffer for want of upward ventilation, as we take out the surplus and set the bees in center of hive, and covered with 2 thicknesses of coarse cotton cloth and thin boards on sides of brood-frames, then filled all up with dry chaff, oats, or buckwheat. The capacity of hive is 65 to 70 lbs. of honey, besides the brood-nest. There is opportunity to put a hole through the end of roof (which is slanting), and cover with wire cloth; but we thought they wintered better without.

#### ANOTHER FOUNDATION PRESS.

The plates for pressing foundation were made by a man living in Des Moines, Iowa, but I can't recall his name. They are about 11x12 inches. They were made to lay the upper one down on each sheet that was pressed, and to be used in a cider-mill press, or something similar; but we soon cracked little pieces off the ends, so Mr. Axtell fitted them solid in thick boards, and hinged them together, and they now do fine work, though I suppose it is slower than with the presses. He spent some time at first, trying to make it work well, by cutting the cells in the plates deeper, etc., so he determined, after putting so much work on it, to make it work well. We sheet the wax first. My sheeters are of wood, size of pressing-plates, which I like to have soaked in water a week before using, as they are then so full of water that the wax does not stick. We put on our wash-boiler, and pour in two pails of water, then about 10 or 15 lbs. of wax, and let it melt slowly. We put more wax in a kettle, with a pint or more of water, and melt. Then we lay two sticks of wood down by my lounge, and the girls set the boiler on them. Further to my right hand I have the dish-pan full of warm water (rather warmer than milk), in which my wood sheets are soaking, the face of which is smooth, with a handle attached to it like a mason's hawk, or the tool he holds his mortar on. When all is ready I dip one sheet in the wax, one side of face first, then the middle, then the other side; if I dip it in flat down, there would be air bubbles all over the sheet. When the face is all covered with wax, I hold it up till done dripping, always taking care to let the wax run off the side that was in last; then change it to left hand, and with right lift out the other sheet from the pan of water. While the water is dripping I drop the sheet with wax on in the water, then dip the sheet just taken out, and change to left hand, to hold while the right picks up the empty sheet in the water, and so on. Rattie presses the sheet down in the water, and the wax lets loose of sheet — when she lifts it up; then she picks out the sheet, and pulls off the little edges around the sides, and lays the sheets in piles. When the wax gets cold we pour in two qts. of water, and more wax as needed, until we get the large boiler full of water and wax all sheeted off. I could not handle the panes of glass for sheeters; and then when they were put in wax endwise the dregs in the bottom would sometimes adhere; whereby, if only laid flat on top, all the wax was used up, and that boiler of water exchanged for clean. I think the water makes the wax whiter, as dark wax will be light by that process. I have no dark foundation. As it is rather hard on me to do, I sheet only the one boiler full of water in a day, of 2 or 3 hours. The water, when poured out, looks quite yellow.

#### HOW SOON ARE THE BEES CLEAR OVER THE SPRING TROUBLES?

*May 7.*—Bees are doing their best, as the fruit-trees are in bloom now. It has taken very careful nursing this spring, to bring them through. I think I have seen it in print, that bees recover from the dysentery when they get natural pollen; but ours did not entirely. It was only day before yesterday I noticed a fresh spot on the hive, and the sidewalks were spotted not many days ago, two weeks or more after getting pollen. Those wintered in cellar were the worst in this respect; but we lost more of those wintered out of doors. This was why they clogged the entrances to hives so badly — not the ice and snow, as we first supposed. Often we found a patent pall full of dead bees in the hives, or nearly so; of those wintered out of doors, sometimes just a few alive, and perhaps going out and in from top of hive, if there was any possible way to get out.

We had hired a young man to keep the snow from entrances, so we did not go over to care for them so soon as we would have done otherwise; but when we did go over, there were about 35 or 40 clogged up thus. We think it was the honey, though it was sealed up as well as usual last fall. The hives, many of them, seemed to have large circles of brood before they died. As it had not all hatched out, many that were short of honey seemed to have eaten more than the live bees, as all had plenty of honey last fall.

I don't think we ever had so much brood in the hives for the amount of bees, and we have fed no flour either. We now prefer to keep the bees as quiet as they can be kept early in the spring, and we half believe flour feeding an injury, instead of a benefit. But give them plenty of honey in combs from this on, until white clover, by setting the frames outside of division-board, and letting them carry the honey in, and giving the bees only so many combs as they can cover, and fill with brood.

#### PREVENTION OF SWARMING BY ABUNDANT ROOM AND VENTILATION.

Last summer, when the bees began to be strong, and commence filling up with honey, I thought I would give plenty of ventilation, and see if I could not in that way prevent swarming; so I took off one side of the hive, and just leaned it up against the hive, to shed the water when it rained. Sometimes it would be the back or front; they would go though a heavy rain, and I could see no difference; but when they got ready to swarm, they swarmed all the same, only made it harder to find the queen, as they could get out so fast. I noticed they would store most of their honey on the opposite side of the open end of the hive. In one or more hives the brood was left exposed on the open side, which they generally kept covered two or three bees deep.

SARAH J. W. AXTELL.

Roseville, Ill., April 26, 1883.

Thanks again, Mrs. A., for the important points you bring out. Your plan of making wax sheets will no doubt make nice ones; but it would be much slower than the way we do—four large sheets at one dipping, while you make only one.—In regard to spring troubles: I believe they have lasted this year much longer in almost all localities. We have had several reports of bees dying, or swarming out, clear up to the first of June.—I am much interested in your experiment on ventilation. You know it has been

recently suggested, that swarms that go off without clustering are from hives with large entrances. Did you have any such experience with these hives with such abundant openings? I, too, have noticed that where no division-boards were used, the bees would cover the exposed comb, especially when it came to be used for brood with a dense covering of bees, and that they stored the honey more over against the protected side. Our experiments in the house apiary brought this out clearly. For comb honey, we want rather close hives, and not too much ventilation; and I feel pretty sure they should be well protected from the great heat of the sun in the hot summer months.

#### WHY NEW SWARMS GO OFF.

SOME GOOD THOUGHTS FROM FRIEND TRAIN.

**Y**ES, swarms do sometimes come out and go off without clustering. My answer to the question asked by "Old Foggy," p. 242, May GLEANINGS, is as above. I have several times had the bees get the emigrating fever so badly that they would often do so. This has always happened when honey was scarce in my immediate vicinity, and a good flow at some distance. I am situated 5 or 6 miles from heavy basswood timber; and when basswood blooms freely, and there is a dearth of other bloom, we always have a regular fight to keep any bees at home; and during such times they quite frequently come out and leave without clustering. And with this state of things they do it so often that I dare not, as usual, leave them to cluster under the eye of a small boy or woman, but am on hand with my big looking-glass and my double-barreled shotgun, well loaded, shot and all; for when they make up their minds to go, they lose no time "fooling around," but rise right up over the top of the maple grove in which they sit, out of reach of blank cartridges, and away they go. So let Old Foggy take notice, that at least one man "has seen bees come right of the parent hive, and go off without clustering."

#### CHICKENS IN THE BEE-YARD.

F. D. Clarke asks about keeping chickens in a beeyard. I can only say I have kept chickens in my beeyard every year for over 15 years, and have never had them eat any bees, and the bees seldom disturb them; and the chickens are, we think, a great help in subduing the moth. They are very busy, early and late, eating not only the worms but the moth also. But we coop the mother-hen, and remove the chicks as soon as they will do to wean, and plan to have a young brood to take their place. We now have a brood of 22 chicks just installed.

#### BEE-CELLARS, AND SUB-EARTH VENTILATION.

Since I am writing, allow a few words about beecellars, etc. I note your remarks, page 244, May No., relative to sub-earth ventilation. That is all right, if you do not have too many bees for the size of the cellar; but if you have more than one swarm to every 20 feet of cellar space, you must let in air colder than the earth. What we really want is a sub-earth pipe, and a pipe without the "sub," so that we can let in cold or modified air at pleasure. I have my cellar so arranged that I can bring all the air that enters, through 16 feet of narrow air-chamber filled full of ice; so when the temperature outside gets above 40° we resort to the ice-air chamber. In a

few instances this last winter, the thermometer in the cellar went down to 40°, the first time in many years; and at those times we used a kettle of coals from the stove, which we use to create a draft out of the cellar. Said stove always has a good supply of live coals whenever the bees are in cellar, day or night. We have no trouble in keeping the cellar warm enough; and with proper care we can keep the temperature nearly steady at about 45°. It should never be lower, for the best results. I have become so confident in my cellar, and ability to regulate it, that I would not give one per cent to have my wintering insured, if the bees are in a normal condition in the fall; and I do not care how much pollen they have either. I do not mean to boast; be it far from me; but I have wintered bees in cellar 15 successive winters, and have not lost 5 per cent in any winter of the 15, and for the last 5 winters I have not lost one per cent; and all the losses I have had have resulted from some abnormal state of the bees, or from carelessness on my part. And then it makes me feel so bad to read of heavy losses, that I feel like talking strongly. And I am not satisfied with having them come out merely alive, but I want them perfect. All of my 131 colonies came out perfect this spring, save 2, and they only soiled the front of their hives a little near the entrance; their combs were clean. All the rest scarcely fouled a thing, even in their first flight. The two exceptions referred to were caused by my own carelessness, and that is usually the trouble, if we have any losses; for a *nuclei* or *queenless* colony will winter, if the temperature is kept right all the time. Keep the conditions all right in cellar wintering, and I think a good healthy swarm of bees are as sure to winter as a well-fed healthy steer.

#### HYBRIDS FROM BLACK QUEENS AND ITALIAN DRONES.

I just happened to think that the strain of bees may have had some influence in my case; but I guess not (my bees, it is true, breed late and early, and are well acclimated), unless it be the small admixture of Italian blood. And, by the way, I am so well pleased with this cross (Italian drones and brown queens), that I have sent for a dozen Italian queens to raise drones from, and I mean to decapitate all other drones for one year, and watch the result. My present hybrids certainly differ materially from the hybrids that others write about, and that I see at other apiaries.

H. V. TRAIN.

Mauston, Wis., May 17, 1883.

Thank you, friend Train, for the suggestion that the cause of bees decamping without clustering might be due to the fact that they had discovered a better hunting-ground, and one that would save many long, laborious flights. If bees do really sometimes fly six or eight miles, I can hardly think they really like the fun of carrying a heavy load that far. Well, it would hardly be beyond their instinct to figure out, as it were, the advantage to be gained by starting a new "ranch," right in the midst or on the border of these more desirable locations. And here opens a new field for us to investigate. Where wild swarms do most congregate in the woods, there is where the bee-keeper should aim to locate. The swarm I alluded to, which the women-folks saw go off, went right over to a tract where both clover and basswood abounded in great profusion.— Small chickens would doubtless do very well; but the reports found elsewhere of grown

fowls learning to eat bees, ought to induce us to look carefully into the matter of confining them near the hives. Our poultry have so large a range that they seldom go near the bee-hives.—In regard to sub-earth, friend T., I believe it is generally held that air, brought from a sufficient distance below the surface of the earth, will always be of the right temperature, neither too hot nor too cold. If the bees in the cellar got too warm where there was a sub-earth pipe, I presume the deduction would be that the pipe was not large enough, or that the air was not made to pass through it with sufficient rapidity. I should very much like to try my hand at making a sub-earth bee-cellar to my liking.—We find very nice hybrid bees, with black queen-mothers, in the swarms that our farmers bring in to us; and since you mention it, it occurs to me now that the bees are often quite gentle, as well as good workers.

### MARKETING EXTRACTED HONEY.

FRIEND D. A. JONES TALKS TO US ABOUT IT.

**F**RIEND JONES mails us the following, clipped from some paper, he doesn't say what, and with the remark: "You can publish this, if you wish." To be sure, we "wish," old friend, so here goes:—

This is a subject in which considerable more interest should be taken, as it has much to do with success or failure in apiculture. If, after the apiarist has struggled hard throughout the summer to secure a large crop of honey, he attempts to place it on the market, and finds the price so low and sales so slow, that no profits are to be realized, and very poor remuneration is received for his labor, he loses interest in the business, and looks around for some more profitable occupation — perhaps leaving the pursuit in disgust. If, on the other hand, he sells his crop rapidly, and at good figures, realizing handsome profits, he becomes exceedingly enthusiastic, and not only extends *his own* business, but others seeing his success, also embark in the fascinating pursuit, and thus our numbers are increased.

The great evil in connection with the marketing of honey is the manner in which the small, uneducated bee-keeper places his crop before the public. Not knowing its value, he places it on the market in such unsalable shape, and in the hands of dealers whose knowledge of the trade and its requirements are as limited as their own, and who will not pay more than two-thirds value for it, besides thinking it a hardship to have to buy it at any price.

A change is, however, coming over matters, and instead of our having to seek a market, we are sought after, and are offered far more at wholesale than we formerly received at retail. Why this great change?

It is being brought about by the plan of exhibiting at fairs and exhibitions, hundreds, thousands, and tens of thousands of pounds of honey, in such attractive shapes that visitors are amazed at the mountains of honey; this department becomes one of the leading attractions of the exhibition, and the honey is largely purchased by the visitors, and taken home as one of the "big" features.

No one would think of taking honey to an exhibition to compete for prizes, in milk-pans, buckets, etc.; then why take it to market in any other than the best shape? There the competition is even greater; for besides having to compete against other honey, it has to compete against every other imaginable mixture that man can devise, many of them unhealthful, poisonous mixtures, composed largely of glucose, and better adapted to sap vigor and life from the human frame, and fill our cemeteries with premature graves, rather than be a luxury on our tables. Now, if this vile stuff were not placed on the market in a more attractive form, would it take the place of honey? Are our bee-keepers going to slum-

ber? Are they less intelligent? Can they not devise as attractive packages? Can they not devise as attractive labels? Can they not devise packages as suitable in size, and as well adapted to the requirements of the trade? Can they not devise a plan of placing it on the shelves of the retailer, and on their counters, so that it will appear to better advantage than any other goods in the store? The goods that present the finest appearance on the shelves, and are the most pleasing to the eye, are the ones which will sell the most rapidly. Every merchant wants his place of business to outshine that of his neighbor, and the brighter and more attractive his display, the better he will be able to obtain his end.

By our putting up honey in packages, ranging as follows: 2 oz., 4 oz., 8 oz., 1 pound, 2½ pounds, and 5 pounds, they come within the reach of all; the smaller sizes are purchased by children, instead of confectionery, and these advertise the larger, increasing their sale tenfold.

A uniform size of package is also very desirable; after placing the honey in tins, label them, inclose each in a wrapper to prevent the labels from chafing or being injured in appearance, and then place them in neat cases ready for shipment in the following sizes:—

12 tins 5 pounds	makes a case of 60 lbs.	1 dozen.
24 " 2½ "	" " " "	60 lbs. 2 dozen.
60 " 1 "	" " " "	60 lbs. 5 dozen.
120 " ½ "	" " " "	60 lbs. 10 dozen.
240 " ¼ "	" " " "	60 lbs. 20 dozen.
480 " ⅛ "	" " " "	60 lbs. 40 dozen.

Packages of half the above quantities could be handled advantageously.

The wholesale merchant may then purchase as many cases and half-cases as he may require, and his travelers will carry samples, and dispose of it in the same manner they do all other canned goods, to the retailer. In this way tons of honey are disposed of to merchants in out-of-the-way places, which we would not otherwise reach. Why is honey not found as are all other canned goods, in our mining districts, in the camps of our soldiers, in the new States and Territories, in the new towns along our newly constructed railroads, and in thousands of other places in America, where it could be sold with profit to both producer and consumer? When will we learn to supply our own market with our own products, instead of allowing foreign goods to take their place, and forcing us to seek a foreign market with smaller profits?

If this system be properly carried out, honey enough can not be raised in America to supply the demand.

### NEW HAMPSHIRE AND FLORIDA CON-TRACTED.

BY OUR OLD FRIEND HENRY DANIELS.

**I** MOVED from New Hampshire to Amelia Island, Fla., last November, bringing with me a small swarm of bees — a swarm that could not possibly winter north. The express charges were 40 cts. to Boston; came as baggage the rest of the way. It was a small light hive, only three combs, a pint of bees, and a *very* few pounds of honey. From Boston it came by ocean steamer. It was all together ten days on the road. In Fernandina, by shaking the box, I could hear a feeble hum from a seemingly solitary bee. I concluded it must be the queen alive, and had the curiosity to look; surprising! there was not a dozen dead bees in the lot, but some very tired ones. The hive was placed Nov. 16th in the shade of an orange-tree; and after developments were watched with interest.

The next day they took up with scouting over the island; found the weather all right, but not much honey until January, when the peaches, plums, oranges, etc., began blossoming, when the honey commenced to flow, and so has continued to the present. Well, what of the bees? Finding nature so free, so bountiful, so continual a succession of the nectar of life, are they following in the footsteps, so to speak, of the native humanity — becoming lazy, slothful,

dirty, don't care what, "enough is as good as a feast," kind of a style? Not at all. It has been good weather, and a hum, hum, hum, work, work, work, right along. On the 10th of January there was more sealed brood in the hive than live bees in the swarm. To-day, the 10th of May, the produce of that swarm fill four ten-frame hives — improve each shining hour, not gathering honey all the day to eat it up at night, but storing in big 8 x 16 handsome white slabs on comb fdn. The comb is white, the honey between golden and silver; a peculiar, but very nice flavor and taste. If they continue to improve in geometrical ratio, I shall have 64 fine swarms by November to feel big about — some contrast to my disheartening time with bees in New Hampshire last year. The 1st of May, 1882, I had 51 live fair swarms of bees. I took the best care of them, made preparations early, buying quantities of fdn., sections, hive material, etc.; and for result, the 1st of Oct. not one new swarm; no honey, and dwindled to 30 odd swarms of bees. Misery loves company, doesn't it? Every dog has his day, doesn't he? When you come to Florida, come and see me.

HENRY DANIELS.

Fernandina, Fla., May 8, 1883.

### ITEMS OF EXPERIENCE FROM FRIEND J. A. GREEN.

INCLUDING SEVERAL ITEMS OF IMPORTANCE.

**I**N making my spring report, as I promised in my wintering report, given in May GLEANINGS, I have little change to make in the results given then. I have had some slight losses since then. Several of the swarms used in queen-rearing last fall have dwindled somewhat, and others have become queenless, so that I have united down to 140 to begin the season with.

#### A DRAFT THROUGH THE HIVE NOT DESIRABLE.

The swarms that had large entrances at each end of the hive have dwindled enough to convince me that a strong draft through the hive is not desirable. On the other hand, one of the very strongest swarms I have was wintered in a large chaff hive, with 12 frames below and 5 above, only partially covered with a piece of duck.

#### TENEMENT HIVES.

I am compelled to admit, that the swarms in tenement hives used considerably less honey than those in either chaff or single-walled hives. I did not weigh the stores allowed them in the fall, so I can not tell exactly how much less they used than the others, but should estimate it at 5 lbs. less than those in single-walled hives. There was not so much difference between them and the chaff hives, but still a very noticeable one. The tenement hive, though, is so inconvenient to handle, that, unless they prove superior for honey production (which I have not had opportunity to test fairly), I will not make any more of them.

#### POROUS COVERING A DETRIMENT DURING THE SPRING MONTHS.

While I do not think it makes much difference whether enameled cloth or a porous covering is used during the winter, I believe very strongly that no porous covering should be used over bees during the spring months. In the spring, bees need all the moisture generated in the hive for the raising of brood, and any current of air, no matter how gentle, which carries off this moisture, and, of course, with it a large amount of heat, is injurious.

#### ENAMELED SHEETS; GOOD POINTS OF.

If moisture condenses on the under surface of the enameled cloth during rainy weather, all the better. I should be glad if such were always the case. Bees need large quantities of water when rearing brood; and if the weather is such that they can not fly out without it, they should be supplied inside the hive, or they will suffer.

#### WATER FOR BEES.

Last week, on a warm sunny day, when the bees flew freely and gathered honey, with also, doubtless, a full supply of water, was followed by a rainy day, the rain falling steadily nearly all day. During the afternoon I observed that the bees were getting restless; and about 4 o'clock many swarms had a row of bees along the entrance, sucking up the moisture from the soaked earth, while some swarms, less wise, flew out into the rain in search of water. A saturated sponge, or a little water poured into the hive, soon quieted them, showing that all they wished was to renew their supply of water, which had become exhausted in 18 hours or less. I removed the last of your wooden mats yesterday, and I don't think I shall use them any more, unless for experiments in wintering.

#### SWARMS IN THE HONEY HOUSE.

I was much interested in Mrs. Axtell's account of the swarms of bees that formed in the honey-houses, and I have had some experience in that line myself. Two years ago I stored my comb honey in a small house-apery in which were two swarms of bees. I allowed these bees free access to the interior, where about 600 lbs. of honey in sections was stored upon shelves, in order that they might empty all unsealed and broken cells. By the way, this is a plan of which I have never seen any mention, though it may not be new to some. In this case it worked excellently, all unsealed honey being taken out by the bees, thus preventing all drip when the honey was carried to market. There was no trouble about the bees uncapping the honey, although there might have been if their hives had not been full of honey. About the last of July I noticed a small cluster of bees in the upper part of the room. Whether these bees came from the swarms already there, or were brought in with honey, I can not state. On examining them I found that they had removed the honey from two or three sections, and filled them with brood. The honey removed had been stored in several small combs which they had built overhead, and this honey was, as Mrs. Axtell has remarked, exceedingly thick and nice — much better than that in the sections. Now, the interesting point is, as you have said, Did these bees fly out of doors while they raised their brood, or did they rear the brood without pollen? I am certain that there was no way for them to get in and out except by going through the two large colonies, which is improbable, unless they watched their chance and dodged in and out of the door as it was opened and shut, which is still more improbable. I am positive, though, that they raised brood with little or no pollen, as I particularly remarked that the larvæ seemed more delicate than usual; in fact, almost transparent; and when they were capped over, which I think, though I am not certain, was after a longer period than usual, the caps, instead of being of the usual yellowish color, observable even on new combs, were as white as those on the finest comb honey. It would have been interesting to make careful experiments on them,

but I had not time then, and the swarm dwindled away and soon disappeared.

#### WHAT A POUND OF BEES MAY DO IN A YOUNG LADY'S HANDS.

Mr. House's advice to friend Rice, in *Blasted Hopes*, induces me to "have my say" in regard to what a pound of bees may do. July 8, 1882, I sold a pound of bees and queen to a young lady beekeeper of Ottawa. They were supplied with two frames of brood, but received no other help. Before winter they had built up into a good swarm, and produced 17 lbs. of honey in sections; and now, to crown all, have wintered safely.

#### PUTTING LABELS ON TIN.

I suppose many honey-producers have felt the need of a reliable method of making small labels stick to a smooth tin surface. The label sticks all right as long as it is moist; but as soon as it becomes perfectly dry, the adhesion vanishes. After some futile attempts to roughen the surface of the tin with chemicals, I decided that what was needed was something that would prevent the adhesive substance from becoming perfectly dry. I first used glycerine for this purpose, and found it an improvement; but soon discarded it for honey. Honey will never dry up enough to peel off from tin; and as it is sticky in itself, it does not injure the adhesiveness of any substance with which it is mixed. For putting on labels, I use and prefer a solution of dextrine to which is added about  $\frac{1}{4}$  its volume of honey. For gummed labels, use a mixture of honey and water. Probably cheap molasses would be better than honey; but I have used honey, because I preferred to "encourage home industry;" and besides, I did not have the molasses. J. A. GREEN.

Dayton, LaSalle Co., Ill., May 15, 1883.

#### CLIPPING QUEENS' WINGS, ETC.

##### DO WE REALLY WANT THEM CLIPPED?

**L**AST Sunday one of my finest colonies being crowded, I examined to see if I might go to church. The first comb taken out disclosed a capped queen-cell. A dozen more were found, and all taken out with four solid sheets of brood and adhering bees. The swarm issued while I was at work. I took out every queen-cell and put in new combs, intending to bring the swarm back. But they came back; and many being on the ground, I looked for, and found the queen—a fine Italian. I let her run into the hive, and found it was one of the few I clipped. She appeared to be all right. To-day, looking into the hive, five days later, I find a full set of cells, some of them capped, and some only half built out. I counted 14. As the hive was full of bees, and ten frames at that, no swarm could have issued. She was not displaced for inefficiency, for she was one of the best. It was evident that she laid no eggs since Sunday, for there is no young brood.

This is the second queen I have lost this spring from clipping. I clip no more. In the other case a monstrous swarm issued and alighted, and in twenty minutes returned to the parent hive. All cells had been taken out. Five days later, new cells were found in abundance, and no queen. The colony was depleted, as before.

Locust bloom is more abundant than I ever knew before, and a larger amount of nectar is secreted. The trees are masses of white flowers now. This is

regarded here as a harbinger of a fruitful year, and surely there never was such promise of fruit of all kinds.

#### MAKING NEW SWARMS STRONG, SO AS TO GET BOX HONEY.

I have practiced very successfully the plan mentioned by Mr. W. Z. Hutchinson, of at once strengthening new swarms, and making them *boom right off*, by adding brood largely. My aim is not to increase, because of my large fruit business and farming operations. J. W. PORTER.

Charlottesville, Va., May, 1883.

I agree with you in regard to clipping queens' wings, friend P.; or, rather, *not* clipping them, when we have control of the apiary so as to prevent swarming, as we have here. When you are working for box honey, however, and no increase, it is a little different. Suppose your swarm had gone out when you were at church, for instance. I know there are difficulties both ways, and I presume that, while some will settle down that they want every laying queen clipped, others will be equally sure they don't want any clipped queens in their apiaries.—Giving frames of brood to new colonies, so as to get large crops of box honey, will work tiptop if you can keep them from getting the swarming mania. But when they get this mania, giving brood will simply foster the swarming impulse.

#### SWARMING WITHOUT CLUSTERING.

##### FRIEND PETERS GIVES US A LITTLE TALK ABOUT IT.

**I**N reply to the position assumed by "Old Foggy," in your May issue, page 242, I have to say that he is not more positive in his belief about bees *always* clustering when they swarm, than I was up to 1860. I had then kept bees 35 years, and often asserted the fact that no noise of bells or drums ever arrested a swarm in its flight, or induced bees to cluster, under any circumstances, and ridiculed the idea of bees absconding without taking time to cluster, to find a future home.

With this conviction riveted in my mind, I one day saw the very same thing which had often been told me, but never, until then, proven. It happened thus: I had a colony, which had clustered some days preparatory to swarming. One day it swarmed; but the swarm returned without clustering. That night we had a heavy rainfall succeeded by cold weather, which lasted five or six days. On the first warm day, said colony swarmed. I was on hand, and followed the swarm through the orchard, expecting it to cluster. The bees continued their course beyond the orchard; and instead of mounting high in the air, and flying rapidly, they came low down, just above my head, and crossed the field slowly until they came to a dead ash within the plantation, half a mile from the house, and went into a hole in the tree. The next day we cut the tree down, hived the bees, and they did well. Three years after that date I had a swarm come out, rise high, and go off rapidly. I followed them on horseback to the woods, where they entered an old deadening; and when I was about to abandon the chase, I noticed they circled about a sassafras, and I waited and saw they housed themselves in it. I gave the tree away.

On a third occasion I followed a small swarm just

out of the hive to the woods, three-fourths of a mile, when they clustered about five minutes, from having dirt thrown among them, I suppose; but before I could have a hive brought from the house they were off again, and went about a quarter of a mile to a tree.

Now, Mr. Editor, I have been looked on as a bee-man for 50 years, and these three instances are all that I ever know during that period. In fact, so very rare is the occurrence of bees absconding without clustering, that I censure no man for disbelieving it entirely. Without ocular demonstration, I never should have believed it myself. A thousand negatives will not disprove one positive.

#### HONEY VINEGAR.

One question I wish to put is for your correspondent A. L. Davidson to answer. He says in May No., page 243, "In making honey vinegar, never allow what is called mother to accumulate." That is the very point. How does he prevent the mother accumulating? I made 40 gallons of most excellent vinegar last year, but I doubt whether we ever got the benefit of more than two gallons. It all went to mother. While I think honey vinegar a most excellent and healthful article, I do agree with Mrs. Harrison, that there is a taste, or, as some would put it, a *twang* about it, that can not be disguised by any amount of mine.

GEO. B. PETERS.

Council Bend, Ark., May 24, 1883.

### FRIEND GOOD, AND HIS NEW HOME IN TENNESSEE.

ALSO A FEW WORDS ABOUT THE SOUTH IN GENERAL.

I HAVE just returned from my second trip to Tennessee. I purchased a small piece of land, 58 acres, near Tullahoma, where I expect to move next fall. I also purchased a lot of bees there. My brother, who has had considerable experience with bees, is going to move there at once to take charge of the bees. We are thinking of starting two apiaries there — one Italian and one Holy-Land. I will send the queens from here, and have the bees all Holy-Lands this summer.

I have had a great many letters and cards, asking about the South, and nearly every one asks the question, "Do you think a Northern man will be safe in the South?" To which I answer, yes, just as safe as he is in the North. I never met with as kind and generous people as I did in the South. Let me relate one instance.

While in Alabama I stayed three nights and two days with a man who was an officer in the Confederate army, and was taken prisoner and kept two years at Indianapolis. While with him, he went with me through the neighborhood, and showed me the country, and treated me as if I were a brother of his. When I wanted to pay him for his kindness, he says, "Do you think we are mean enough to charge you for two days' board, while you had me in your State, several years ago, and kept me two years, and did not charge me a cent?" The people in the South are anxious to have the Northern men come and help build up the country. Good farming land can be bought for from \$6.00 to \$30.00 per acre; and for farming and stock-raising, I think it would be preferable to the North.

I. R. GOOD.

Nappanee, Ind., May 5, 1883.

### ARKANSAS NOTES.

A HOME-MADE BEE-KEEPER, AND HOW HE MANAGES.

I HAVE been instructed as well as amused by the reports from the brethren. But I have not seen a single word from our State, and this makes me feel like saying something on the subject of our honey resources.

I used to keep bees in Ohio (your adjoining county, Wayne), but the cold winter of 1880-81 killed them and induced me to do as friend Good has done — take up my abode in the sunny South. I was unable to find any bees for sale until this spring, as the business is very much neglected here. I bought 11 swarms of black bees about the first of March, for \$2.50 per swarm. They have increased to 23 swarms. The first swarm came out April 17th. I put them in a hive long enough to hold 18 frames, 10x12½ inside measure. I confined them to 9 frames at first, with a division-board; and when they got them pretty well filled I took out the division-board and filled the hive with empty frames, alternating them with the full ones. On the 19th of May I extracted 24 lbs. of beautiful white honey from 9 of the combs, the rest of them being nearly full of brood. The bees are all doing very well. I have them all transferred into frame hives. I have taken over 200 lbs. of honey, and sold a half-interest in the bees for \$50.00, so you see I am doing well enough. The swarms were all considerate enough to cluster on a small tree in the yard, and stay there till I came home to hive them (I work 10 hours a day at the stove factory, and tend the bees between times). I expect to devote my entire time to bees next year. I believe this is an excellent place for them. There are plenty of wild bees in the woods, and it is no trouble to winter them here.

#### SUB-EARTH (?) VENTILATION.

Two of the swarms I bought were wintered sitting on the ground, the lower ends of the combs being in actual contact with the earth. The pigs got into the inclosure where they were kept, and rooted the earth up around the hives, so that the bees had to tunnel to get out. One of these two was the first to swarm. Some of the others were in very poor hives; the bees could get out at the top as well as at the bottom. The people here keep bees only in box hives, and rob them in May by taking off the top of the hive, and digging out what they can. My hives and extractor and smoker and foundation are great curiosities here. My extractor I made myself in half a day, at an expense of 25 cts. for wire, and 50 cts. for honey-gate, and an empty barrel. If you think it will benefit your readers, and not seriously interfere with your sale of extractors, I will send you a description of it. It works first rate. I took 116 lbs. of honey with it in 4 hours, taking out the frames and replacing them in the hives without any help whatever. I am retailing extracted and some dark broken comb honey at 15 cts., and am getting a pretty good trade. I believe in developing a home market. Wishing you and bee-keepers generally (and the ladies in *particular*) the best of success,

I am yours, — B. F. SOLLIDAY.

Newport, Ark., June 3, 1883.

Friend S., you have almost started a new plan for wintering bees, by setting them in the dirt. Years ago this idea was advanced as a means of affording sure protection against the moth. — Give us the particulars of your home-made extractor, by all means,

I am always glad to have my sales decreased when it results in a public good. Wooden utensils for honey have, I believe, been mostly laid aside, however; and although a barrel, or a half-barrel, will do very well for holding the machinery for an extractor, of late years they have rather gone out of use. Very likely, a temporary extractor might be rigged up in a few hours, on a plan such as yours, so as to save a crop of honey that would be lost while waiting to have an extractor sent from a distance. By all means, tell us about it.

### HAND-POWER BUZZ-SAWS, ETC.

#### BELTS OR COG-WHEELS; WHICH IS BETTER?

**O**N page 242 you ask the question, "Do you want a belt on a hand-power buzz-saw?" Friend Bradley also says, "Tell friend Kingsley to throw his belt away, and fasten the saw to the shaft that the fly-wheel is on." Well, it does seem that theory would teach us that this would be best; but I should like to affirm, that in this case there is a great difference between theory and practice. I have tried his way exactly, but must say that it does not do as well as the way I have it. Why? Well, the faster your saw turns, the faster it will cut, and the better the work it will do; and again, with the belt pulling one way on the fly-wheel, and the cog-wheel the other, there is almost no friction on the shaft-bearings, the cog-wheels being near the fly-wheel.

I think friend B.'s 12-inch saw a little improperly arranged, to not cut over  $3\frac{1}{4}$  inches. I have made some of mine to cut 3 in. with a 7-in. saw. There is much to be gained in getting as great a depth as possible, especially for a ripper. The job is very incomplete when we simply turn the nuts true, and place the saw between them. For example, I use  $\frac{3}{4}$ -inch mandrels, but use saws with 1-inch hole, and on the first nut (octagon), I turn a place that will just fit the saw.

#### BLACK LOCUST.

I see in friend Wiltse's talk about honey-plants, May number, he reports black locust as producing no honey. I must confess that I was a little surprised at that; and if you, Mr. Root, or anybody else, could sit in this upstairs room with a large locust-top just out the window, and see the golden-banded fellows alight upon a blossom, and begin to swell, and keep swelling until one drops off and stumbles away to his hive, I say you'd be surprised too. I think it safe to say, that each strong colony is to-day carrying in locust honey at a rate of from 5 to 8 lbs. per day. You may judge how full the trees are of bloom, by the bunch I send you.

Greenville, Tenn.

CHAS. KINGSLEY.

### "J. R.," AND THE WAY HE TRANSFERS BEES.

AS NARRATED BY HIS BROTHER.

**T**HE other evening my brother, "J. R.," gathered up his "tricketts" and said he was going out to the railroad to transfer a hive of bees for the section boss. I had never seen any transferring done, so I thought I must go along; and I thought since reading the A B C, on stings, I could stand a few at any rate. We reached the place, and the first thing the women said was, they were "very

bad to sting," and did sting every time they went about them. "J. R." did not pay any attention to that. While the rest of us stepped back he got every thing ready. The women wanted him to be *sure* to have every thing that he would need before he began, for they were going to get far away. "I am too!" echoed around from some half a dozen who had gathered there; but "J. R." picked up his smoker (or what is left of one), and walked up to the old box hive that the *bad* bees were in, blew a little smoke in at the entrance, and thumped the hive and picked it up, and laid it down on the ground, and in a few minutes had it all to pieces, and the comb cut out, and put into a nice hive and frames, and without their stinging either. I asked him why he did not get a new smoker. He said he did not have the money. I told him I believed that Bro. Root would send him one, for he has quit chewing tobacco for one year. Now will you not send him a good smoker? and if you want pay for it, or you do not feel like sending him one for doing good to himself in quitting the use of the filthy tobacco, he will send it soon. He also is talking of sending for GLEANINGS, though he has sent off his money for hives, and has not got them yet, and no word why they are not sent, so he has much on his mind, and is wearied sometimes about not getting his hives. He says Root does business more to suit him.

Georgetown, Ill., May 21, 1888. C. V. LINDLEY.

I am really afraid, friend L., that he gives "Root" more credit than he deserves *just now*. We have sent him the smoker.

### AN A B C SCHOLAR'S FIRST YEAR'S EXPERIENCE.

TRIALS, TRIBULATIONS, AND SUCCESS.

**O**NE year ago last May I took a strange notion to try bee-keeping. I had a brother who had tried it enough to be an enthusiast on the subject. But he found better employment—he went to preaching; and the fall before, he had left quite a stock of hive material, section boxes, etc., with us. We had ten colonies of black bees, and, having all this stock on hand, through his earnest persuasion I decided to make the attempt. It was only a trial, for I had no faith in the business as a matter of profit. It was also a very trying ordeal; for, though we had kept bees on the place for a number of years, I had scarcely attempted hiving a swarm; had never taken off a box of honey, much less doing any thing else with them, and I dreaded to "tackle" them as I would a herd of wild cats. But other reasons, added to my brother's entreaties, goaded me on to make the attempt.

Of our ten colonies, five were in the eight-frame Langstroth hives; two were in box hives; one in what was intended for a movable-frame hive, but had by mismanagement been made the most immovable and unprofitable of all, and two were in small cracker-boxes. I made no effort to transfer; but one of the last two named absconded. The other one did the same about a week later. I decided to have that one, so I put it into an empty L. hive. But mere hiving was of little avail. They would come out for one to put them back, as often as four times per day. I then tried feeding a little liquid honey wo happened to have, and afterward some sugar syrup; but as soon as I ceased feeding, they absconded from the hive to that same old peach-

tree. At this juncture the smoker I had ordered arrived; and after a mental effort I resolved to give them a frame of brood from another hive. No soldier, it seemed to me, had ever undertaken a more daring enterprise than that appeared to me. Not one of our hives had ever been opened after they were set upon their stand. After a big dinner to make me stolid, good-natured, and brave, with smoker, hatchet, butcher-knife, a kettle of fire and smoking-wood, and my woman, I, in my shirt-sleeves, made the charge. We had always put our honey-board next to the frames, and of course they were sealed down tight. I had a tussle to get the board loose, killing a number of bees in the operation. An old apiarist would have enjoyed the scene, if I did not. There was I on my knees, blundering away, my partner standing with the smoker pointed like a cannon upon the devoted stockade; and every time a bee would show its head, discharging the entire volume of that battery upon it. We pretty much smoked them out, and I worried a frame out of the center. I put it and the bees, which were then hanging to their favorite limb, into the hive. You may well believe that I was discouraged when those contrary little bugs swarmed out that afternoon, after all I had done. After I had about concluded to let them have their own way, however, they felt satisfied, and quietly returned of their own accord. I had no more trouble with them on that score.

I quickly learned to do many little jobs with the frightful little insects, that I would once have thought impossible. But my tribulations were not over. When white clover bloomed, and the bees began to cluster heavily in front of the hives, I was in a great hurry to get section boxes on. I had to teach myself every thing; or, rather, I and "my woman" had to teach me, and the headwork of the latter was no small item; but I got them on—and then?—and then for eight long weeks I watched and waited for some favorable sign. Those "onery bees" would "lie out;" and when I would smoke them in they would lie up. They would settle themselves complacently in the section boxes, and fairly laugh at me as I looked anxiously for some fruit of labor on the part of the world-famed busy bee. Occasionally a colony would swarm, often having two trials of it. This failure to do any thing during what is usually the best season, the secret of which was the extremely wet weather, was very discouraging. I began to think that I could not make expenses, light as those expenses were.

About the last of July, one old colony began to work on some of the starters next to the glass. It made me smile. In two days they quit it. That made me droop. In a few days a swarm came off. I then took another look, when, oh joy! two boxes of the next row showed comb nearly to the bottom of the box. That marked a new era in that summer's history of my apiary. Soon another and then another commenced work, until 14 colonies were busy in their upper stories. The honey season had begun at a time when, as I understood, it usually begins to fail. For two months the bees labored, and achieved as I believe blacks seldom do. I realized about 600 lbs. of comb honey, almost all in section boxes, and I would no doubt have obtained more if I had not hampered them all with separators. How I did watch thier progress! From two to five times per day I would raise the caps, peep in, and calculate. How supremely pretty those boxes

of white comb, when sealed, looked! and how I did smile! Thus far I have sold about 450 lbs. at an average of about 20 cents. I extracted about 90 lbs. from surplus combs, selling the most of it in lots at 12½ cents.

#### BEEES WILL STING.

At least, mine will sting me. It is true, that in the early part of the season I seemed to learn that there was scarcely any of the difficulty and danger I had so dreaded. I got along swimmingly. I would open hives, and take out and look over frames without veil, smoke, or stings. I felt proud of my success, but feared at the same time that a good beginning would make a bad ending, and so it proved. Later in the summer, although in the busiest of the season, they got to stinging me most viciously when walking quietly through the apiary. They gradually drove me to the use of the veil when removing and putting on section boxes, although I learned to be easier and gentler with them all the time. Of course, their rabidness reached its climax upon the sudden failure of the honey-crop. As they could not get at my face, they would plant their firebrands in my wrists as thick as grass, and once they sent me in to my partner, whimpering, "Mother! won't you help me pull these stings out?" Already this season I have had my face and eyes bunged up twice, as if somebody had been fighting me.

#### NEW SWARMS; THEIR EXTRA ENERGY AND INDUSTRY.

New colonies store a great deal more honey than those that stay at home. New swarms were at work in the section boxes after filling the brood-chamber, when old stocks that had not yet swarmed were idling in the boxes and outside the hive. This year's colonies produced twice as much section honey as those in the old hives, with their brood-chamber full. An after-swarm brought me as much as some old colonies; and when fixing them up for winter I found a great deal more in the brood-frames of the new stocks than in those of the old. Can this be because it is the young bees are left at home at swarming? I think it is because the swarm sent off just learns through necessity to be industrious.

#### HEART'S-EASE, OR SMARTWEED.

A variety of smartweed, I suppose it is the English variety, if the indications of the last year hold good, must be a first-class honey-plant. The wet season kept some fields from being cultivated at all, and in them and fields of corn, where the farmers could not keep the weeds down, there was a remarkable growth of this plant. I think that my bees gathered as much as, or more, from it than any other flower, and furnished honey for six or eight weeks. The quality of the honey is excellent. I never saw comb or sealed honey of a purer white, and I am not at all sure that I can tell it from white clover by the taste. I am wicked enough to hope that the immense crop of last year has so thoroughly seeded the earth, that the farmers can not get rid of the weed this year. In connection with this I would say, that when a frost, about the 20th of September, suddenly terminated the honey-season, considerable white clover was yet in bloom. smartweed blossoms were falling, and Spanish-needle honey was about gone. The yield of the latter lasted only about two weeks. Honey gathered from plants earlier than white clover, in this locality, is not good. I can eat that from Spanish needle and goldenrod, but spring honey I can not "go."

#### QUESTIONS.

How high above the ground should hives be set?

Do you set your hives right down upon the pile of sawdust? Can comb honey be ripened out of the hive, as well as that which is extracted? An old apiarist tells me that he would render into wax all combs that had reached the age of four years, and make the bees build anew. Would that be advisable? Do those old thick-walled cells diminish the size of the bees? I am inclined to think they do. I examined some old combs.

GEO. F. ROBBINS.

Mechanicsburg, Ill., June, 1883.

Thank you, friend R., for your vivid account of your first year's experience. One interesting thing in letters from beginners like you is to note the rapidity with which one can learn, under the influence of real, genuine zeal and enthusiasm. By another year you will be almost ready to give us one of the stunning reports that we are getting so frequently of late. You will see by A B C and price list that we support our hives on four half-bricks. If you object to this height because the bottom-boards rot, turn your bricks up edgewise—Comb honey can be ripened out of the hive so as to be so thick it will scarcely run, on the plan friend Doolittle has several times given.—It would be rather sad, I imagine, if our friends who buy so much fdn. were obliged to melt it up and buy more once in every four years. I should use comb ten years at least, and I don't know but that I would twice that length of time. The idea that old combs make the bees smaller, is, I believe, an old exploded humbug.

## Bee Botany,

### OR HONEY-PLANTS TO BE NAMED.

#### WILD LUPINE.

**I** SEND you a specimen of a honey-plant that is new to me. Please write me what you know about it; and if you wish them, I can supply you with seed, either for your own use or to sell.

J. MCL. BROWN.

Sowers, Dallas Co., Texas, May 17, 1883.

Answer, by Prof. Lazenby:—

This is a very pubescent specimen of *Lupinus perennis*, L.; calyx deeply bilabiate, 5-toothed. Wings of corolla slightly united at the summit. Stamens monadelphous, anthers alternately oblong and globose; legume 3 to 5 seeded, in this specimen quite pubescent. This herb is found principally in sandy soil, growing about one foot high, and is often cultivated for ornament. Several species of the genus are quite showy. The flowers of this species are blue, varying to nearly white, borne in a terminal raceme. Leaves palmately composed, 5 to 9 foliate; leaflets oblanceolate, mucronate, 1 to 2 inches long,  $\frac{1}{4}$  as wide; leaves alternate on the stem, pubescent beneath; generally called "Wild Lupine," but often called "Sun-dial," because its leaves are said to turn with the sun, facing it all day.

W. R. LAZENBY.

O. S. U., Columbus, May 23, 1883.

When I first saw the plant mentioned above, it seemed familiar, in some way; but not until Prof. Lazenby mentioned "sun-dial" did I recognize it as a flower in our garden, away back in my boyhood. It was its peculiar habit of moving its leaves toward the sun, that used to attract my atten-

tion. As I look at it now, after having studied the great family of peas and clovers, it somehow seems to be a connecting link in the wonderful series, and an old friend besides.

#### A HONEY-PLANT THAT BEARS SOUR BERRIES.

By this mail I send you a few seeds of a shrub which is one of our best bee-plants. It blooms very early in spring. If you should want more seeds of this shrub I will gather some for you; but you must let me know soon, as the sheep, goats, birds, and cattle, will soon eat them all up. The bushes grow only about from 2 to 5 feet high. Please state what the botanical name is. As these berries are very sour, they are used for making vinegar. Hogs get fat on them.

HERMAN FUCHS.

Tiger Mills, Texas, May 5, 1883.

Prof. Lazenby replies:—

The branch with berries, we are are not able to determine from so little material. If the gentleman will send some flowers, if he can procure them with more leaves, we will try to determine what it is.

Columbus, May 23, 1883.

W. R. LAZENBY.

Now, Prof. L., I, in my innocence, should have told our friend that it was some sort of a sumac, on account of its sour berries, even if the leaves are quite different from any sumac I ever saw. Perhaps I should say berries with some sour substance on the outside, for that is really the only thing sour about them.

#### ONE OF THE MILKWEEDS.

Plants from Herman Fuchs, Tiger Mills, Burnett Co., Texas: No. 1 is a "milkweed" (*Asclepias*), probably *A. Michauxii*, Decaisne. It is a somewhat weedy plant, with a milky juice, and flowers in umbels, regular, 5-parted, sepals and petals united at base; stigmas 2, united and covered by the united stamens. The flowers are given a peculiar appearance by the corona, or crown of hoods covering the stamens, and often inclosing a horn-like process. The pollen is collected into two masses in each anther, and united by slender stems. In this species the leaves are long-acuminate, 2-4 inches, green on both sides; umbels, 20 to 30 flowered. Pedicels about 1 inch long, slightly pubescent. The calyx is green, sepals lanceolate, corolla greenish white, petals spreading; hoods yellowish green, closely folded inward. It is a plant often very troublesome to bees, the pollen-masses adhering to their feet, and clogging them when they visit the flowers. Fruit, follicles, in pairs.

#### PRIMROSES AS HONEY-PLANTS.

No. 2 belongs to the "Evening-Primrose" family (*Onagraceae*), and to the genus *Enothera*; but the species is not given in any botanics at my command. It is an herb with alternate leaves, 4-parted flowers, the calyx-tube united with and prolonged beyond the slender ovary. Petals 4, obovate, bright yellow, stamens 8, with long anthers; pistil compound, with a four-lobed stigma; ovary long (1 in.), and slender, 4-celled, many-seeded. The flowers are about 1 inch broad, and very showy. Several species in this family are quite pretty ornamental plants, and a number are very pernicious weeds. Found chiefly in pastures, and on the borders of cultivated fields.

WILLIAM R. LAZENBY.

Columbus, O., May 16, 1883.

Our friends will recognize the former as the milkweed figured in our books, and that has so often been complained of as an enemy to the bees.

## Heads of Grain, From Different Fields.

THE MAN WHO DIDN'T WANT ANY MORE BEES.

**I** WISH to tell you something about the colony of black bees, which is new to me, and probably may be of some interest to you. It swarmed on the 25th of April, a large swarm; but I did not want them, and they remained on the tree over three days and nights before they left. B. B. TEMPLE.

Danville, Va., May 24, 1883.

Why, my friend, I don't see any thing half so funny about the bees as I do about you. I wonder what our A B C friends will think, to hear of a man who would let a rousing good swarm hang three days on a tree, and in the month of April too! Why, if we had them here we should expect to build up a whole apiary with them in one season; or if we sold bees and queens by the pound, we should make them do enough to pretty nearly, if not quite, buy a cow before snow comes again. Are bees so plentiful in your parts that a body could get fine large swarms in the fore part of the season, just for the asking? Well, well! I suppose they are gone; but I should really like to know which way they went, and if they left any comb inside the cluster, after their three days' sojourn, wondering all the time, probably, why you didn't "get up and dust," and put them into a hive.

SOUTH-WESTERN MISSOURI, ETC.

I settled here in 1870, and have traveled over most of this part of the State. From what the old settlers say, it must have been a perfect paradise for bees before the country was settled up. The settlers have told me they had found as many as forty beehives in a season, and that prairie chickens got so much honey-dew on their wings they could not fly. I have seen it very abundant, but the honey is poor and dark, and I would rather the bees would eat it than I. But we have some splendid honey-plants that are natives of this country. I guess I had better say something about honey-plants, for that is where bees get the honey.

BUCKBUSH, AGAIN.

The best native is what is called buckbush. It is a shrub about two feet high; commences to bloom about the first of July, and from that to August; and in the fall and winter it is covered with small red berries. The buckbush yields a honey that I think has no superior, and bees will fill their hives before you are thinking about it, when it is in bloom. Simpson grows everywhere. We have three or four varieties of sumac. Red-bud grows along the streams; also willow and maple on the prairie. We have a great many plants that the bees work on. There is a variety of clover that the bees are very fond of. There is a plant, the leaves of which resemble spearmint, and the flower grows on a spike like gladiolus, that continues in bloom from June till September, and which I think is equal to the Simpson. Then we have goldenrod and wild dahlias, and sunflower in great profusion. Of the cultivated honey-plants, we have the different varieties of clover, all of which do well, but are not very plentiful, owing to the newness of the country; but popular caps the climax of them all, except the willow

jessamine, of which I wrote you. In conclusion, I will say, from what I can learn from reports from other sections, and my own experience, that we have a good bee country. We are highly favored in respect to climate, there being little or no trouble in wintering. I have never lost a hive by cold. Bees fly more here in the winter than I want them to.

Hudson, Mo., May 21, 1883.

S. S. JOHNSON.

Our friends will recognize the buckbush as the *Symphoricarpos*, already described and illustrated in our back numbers.

SWEET CLOVER, ETC.; AND SOME OF FRIEND MCGEE'S PLEASANTRY.

I thought I had enough hives, sections, and other fixings; but when I see how strong the colonies are, with a prospect of a heavy fruit-bloom, especially peaches, and the immense quantity of sweet clover that is almost knee-high everywhere, it scares me to think of it. I expect a big surplus from sweet clover this season. You know the 369 lbs taken two years ago was from sweet clover in August, when every thing else was dried up. Apricots opened last Saturday; peaches will be out to-morrow. Sweet cherries blossomed this morning. Well, how is Uncle Amos and Ernest, and all the rest of the girls and boys? and how is the carpet-stretcher? Tell Miss—"Uno" that the softer the wax, the easier the carpet-stretcher will work. I have got the telephone up. It works well. You ought to have heard the bees rattle it yesterday. I don't know what kind of a racket they will make on it when they swarm. Tell Mr.—(with the white hat in the saw-room)—to keep his eyes on the boy when he saws out the hives. I guess this is all you will have time to read to-day. Remember me kindly to Ernest and all the rest, especially old Mr.—what's his name that packs the hives? Uno. GEORGE H. MCGEE.

Point Marblehead, O., May 8, 1883.

SCRAPS FROM AN A B C; WINTERING.

Winter is gone, and I am through without the loss of a single colony. Chaff packing did it. I am sorry that I have not watched the temperature at which a bee becomes stiff through cold. When we on the coldest days of winter can keep the inside of the hives above that, the great problem of wintering is solved; at least, I know one who thinks so. Some of my colonies last fall would not more than cover 6 L. frames. I left in the full number, 10, and it appears to me that the cluster moved *en masse* across the hive, following up the honey.

DYSENTERY.

Neighbor W.,  $\frac{1}{2}$  mile from me, last fall had 7 colonies; 5 were in frame hives, 2 in box hives, all unprotected, except honey-board and cottage-roof cover. I examined them last fall, and found them in as good condition as were mine, except one, for which I gave him directions how and what to feed, but they died early from starvation; 3 others died of dysentery, caused by nothing but cold. The hives were in a bad mess; the sides were literally covered with dirt. The combs contained at least 8 lbs. of honey to the hive. There was not a bee left in one to-day, having left honey and brood in all stages. Cold was the sole cause of dysentery in this case.

TREE-PLANTING.

I have planted this spring 10 maple and 100 basswood trees, from 6 to 12 ft. high, on the sides of the public road. I trimmed some to a straight pole, and on a few I left only a few branches, and a couple I did not cut at all. I was laughed at by a few, who

said I was foolish to plant trees for the benefit of others; but laughing does not hurt me any. If we sit down and wait for things to turn up, they will never turn up; the world is too full of sitters and laughers now. As friend Doolittle says, sitting around saloons never accomplishes any thing. I am on friend D.'s side there every time.

#### STATISTICS.

I wish to make a suggestion, which I think would be of benefit to bee-keepers in making out statistics, were they to give the coldest weather registered at their respective places, as it then would be known what they had to contend with in wintering. January 21st and 22d was our coldest — 6° below zero.

#### BUZZ-SAWS.

About Christmas, after studying the engraving in GLEANINGS, I concluded to build a power saw. I ran it from a shaft running 35 revolutions per minute, with pulleys to give 800 revolutions. It is not very stylish, but it is lightning "on the cut." I use 12-inch saws. I bought a second-hand mandrel, connected boxes, at a bargain, and an old 16-inch saw on it at the time. I put it on the grindstone, cleaned it up, took it to the saw-works, and had it cut down to 12 inches, and purchased a Simonds cut-off saw. No foot-power saws for me. I have made all my hives, frames, separators, and racks, and find it nice work — that is, to get every thing as it ought to be.

WILL ELLIS.

St. David's, Ont., Can., May 14, 1883.

#### SOFTENING THICK, OR CANDIED HONEY, BY STEAM, ETC.

You say, on page 252, "Your plan for softening honey by steam is hardly new." Well, is this your conclusion, or can you give some one's experience? Now, own up, as you did about the bees going right off without clustering, or tell us all about it; and if you know, why did you not tell us about it before? Further: if you knew about it, why did you ask the question. Does not the water from the condensation of the steam dilute the honey so much as to make it unsalable? We extracted only about 600 lbs. last spring in the way mentioned, and that was rather thicker than it should be for market. When fairly cool, nearly one-fourth was candied in the bottom. Most certainly, if we had wished to feed the honey, we never should have extracted it; neither would we recommend others to extract.

W. H. BALCH.

Oran, N. Y., May, 1883.

But it so happens now, friend B., that I was not mistaken about the bees going off without clustering, does it not? In the back volumes of our journals, many plans have been given for softening old thick honey, that it might be extracted; and I had an impression that steam had been tried, but I may be mistaken. It seems to me that water added to honey, in any shape, would injure the color and flavor, and it was my impression that this was the objection urged when the idea was suggested some time ago. I can not now turn to the place where it was discussed, but perhaps some of our older readers can.

#### SMOKE FOR GETTING SWARMS OUT OF INCONVENIENT PLACES.

Mr. Benedict said: A good plan is to have a long pole of pine or basswood, made so it can be spliced, if not long enough, or with a groove to slide one in the other, to lengthen it; have a strap of iron on one

end to fasten rags or other material to make a heavy smoke; if the bees alight in a high place, smoke them until they are dislodged. They will almost invariably alight nearer the ground than their first place of lodgement. It is best to apply the smoke as soon as they begin to settle. Sometimes they alight in the forks of a tree, and then it is necessary to use a good deal of smoke. Have another pole with a swarming-box attached, made with the sides bored full of  $\frac{1}{2}$  or  $\frac{3}{4}$  inch holes; put this box above the bees, and if they do not run into it, smoke them in. Mr. McCreary uses the pole and swarming-box. He fastens two large pieces of comb on the pole, pouring melted wax between them to fasten them together; he seldom uses smoke. He has tried Benedict's plan, but likes the pole with comb attached best; he did not cut a limb to get a swarm last year at swarming time. The pole he uses is made in sections, to slide up to lengthen the pole.

MORROW CO. BEE-KEEPERS' ASSO'N.

Cardington, O., May 11, 1883.

#### APPLE-BLOSSOM HONEY.

Pardon me for trespassing on your valuable time; but are you not mistaken in regard to the honey from apple-blossoms? On page 94 of A B C, you say, "They are neither equal in quantity nor quality to clover, basswood, and some others." Now, in this locality they are better in quantity, and, it seems to me, equal in quality. My best hive gave me 36 lbs. in ten days; 4 or 5 of them very bad weather. A friend of mine who has had a large experience says he has known them to gather 10 to 15 lbs. per day, which, considering the quantity of bees in a hive at this season of the year, seems to me an immense yield. The sample I send you was about one-fourth sealed, and has been extracted 36 hours.

Unionville, Conn., May 30, 1883. C. J. SANFORD.

I really beg your pardon, friend S., and gladly change the statement made in the A B C book. Your sample of honey is beautifully clear, and has an unmistakable flavor of apple-blossoms. If I were to decide, I think I would give fully as much for it as for clover or basswood. Since tasting of your sample, I am reminded that I have often cut out luscious mouthfuls of apple-blossom honey, when the combs just began to show it, and then it always seemed beautiful; but when we got out the extractor, and took out a pallful or more, it seemed to be dark and rank. It now looks as if other honey, possibly from dandelions or hickory, might have been mixed with it. I now feel enthusiastic over apple-blossom honey again, and I should really like some of it bottled and labeled, so we might let the great sweet-loving public pass their judgment on it.

#### MAKING THIN FOUNDATION.

Just tell the "brothers," as you call them, when making thin fdn. into strips, just as the last end of the strip is going through, to start another, so as to let them lap a little, and there is no trouble to take up the end as it comes through. You can make the strips several yards in length this way, and cut in two as you please. You will say, perhaps, the idea is not new, and that some one has written about it before, no doubt. At any rate, I am glad to have all the little hints and helps suggested by others, whether I can suggest any thing new or not; and I

think the pre-eminence of your journal lies in these small things, so fully explained that all can understand them.

J. G. FITZGERALD.

Brookston, Tex., May 18, 1883.

#### CLUSTERING BEFORE GOING OFF, AGAIN.

I generally calculate they will cluster; but last season I had one swarm come out one day and cluster, and I put them back and gave them combs that were empty, and made more room for them. The next day or two they came out again and worked off to the south over the cornfield, nearly out of sight, before I concluded I'd better walk after them, and I had to walk pretty fast for a while to get even; then I thought I would scatter some dirt among them, as I was on soft plowed ground, which I kept up for some little way; but they still persisted in trying to make off. They went some 60 rods, when, coming to the end of the field and some bushes, they had got pretty well confused, and alighted in three or more places. At first I shook and jarred the smaller clusters, and finally got the most of them together in one place; then I found the queen, took her back in my hand, and left them to come when it should be their good pleasure. This may not hit the case; but the next day or two a first swarm came out, made off against the wind, and I let them get quite a start across the cornfield, about as far as the others, and I just did my best to stop them for quite a way, when they turned off to the west and alighted on a burr-oak bush, and I caught that queen and brought her back in my hand, the same as the other. This swarm had not been out, to my knowledge; but that they came out of hives at this time, I know, and they acted as though they were going a long way to cluster, any way. I was working in the yard, and saw them myself.

V. W. KEENEY.

Shirland, Ill., May 10, 1883.

#### QUAKING-ASPEN FOR SECTIONS.

Have you ever tried aspen, or what we call quaking-aspen wood, for sections? It is the whitest wood I know of; is of very fine grain, and soft. I believe G. M. Doolittle calls it "popple;" others call it poplar; but it is not liriiodendron.

I went into winter with 22 colonies in good fix; came through with 22, but one was queenless, and one a drone-layer. The rest are in splendid condition; plenty of brood in all stages, and lots of drones with some flying.

I sold all my honey last year at 20 cts. per lb.; some in sections, 1½ lbs., and some in large boxes holding from 20 to 28 lbs.; no difference on that account. I will try extracted honey this year.

GREEN R. SHIRER.

Adamsville, Ohio, May 10, 1883.

I have never tried the aspen, for there is not enough of it near us to make it any object. I have seen some blocks split out for stovewood that were wonderfully white. In localities where it can be found in abundance, it might be an object to collect for choice sections.

#### GIVING BEES A FLY IN WINTER.

Your contributors often speak of giving their bees a "nice fly." It seems to be done by placing the hives in the sun, and creating a summer temperature for the time, during which the bees come out, this is questionable. Some of these bees, probably a large per cent of them, are chilled by the cold atmosphere without, and never get back. The loss

may be serious. Is it necessary that bees have a fly? It is said the queen never flies but once. Do the workers in the hive ever fly? I have some hives so located that, when their occupants are made lively by natural heat, and come out, they find it warm and pleasant everywhere. I like this plan better than locating in the sun, in the early spring. The substance with which the twigs are coated, and birds "stuck" by the feet, is called "birdlime," and is described in the cyclopedias. I mention this, as you seem incredulous.

DR. J. W. THOMAS.

Abbeville, S. C., May 20, 1883.

It is questionable, friend T., when the bees fly out, and don't get back; but if I am correct, a good healthy colony of bees will be pretty sure to get back whenever they can be induced to fly out. Where bees are badly demoralized with the dysentery they will often fly out in great numbers, and not come back at all, and I do not know but that they would die just about the same, if they were not allowed to fly at all. We have good reason to think, many times, that a fly saves the life of a colony; and a recent report seems to furnish very conclusive evidence that this is so.—Thanks for your suggestion in regard to birdlime.

#### WATERING AND SALTING BEES; ANOTHER DEVICE.

If you want to keep nurse, or feeder bees, from bothering your neighbors' pumps and old soggy well-buckets, just place in some convenient spot a trough made out of some old soggy wood, but clean. Fill it partly full of water; dissolve a table-spoon heaping full of salt to three gallons of water; it may have to be stronger than this to draw their attention to the trough; but when once they have found it, a spoonful to three gallons of water is enough. The bees greatly prefer this to common water, and I believe that the brood that is reared is superior in strength to that where this is not done. Yet the best part of this economy is to save the loss of your nurse bees that have to go to pumps and wells for their water; and, in lieu of salt, must suck from manure-heaps in the barnyard.

J. B. HARTENSTINE.

Mattoon, Coles Co., Ill., May 6, 1883.

Thank you, friend H. We have many times tried to get our bees to using salt water, but without success. Perhaps it was because it was used too strong. I would by all means keep up such a device, if the bees would use it, and your idea seems to take into account the fondness bees often seem to show for wet sawdust or wet sand.

#### BROOD-REARING LATE IN THE FALL; ARE WE SURE IT IS TO BE DESIRED?

I lost 15 colonies out of 18, from dysentery. Chaff packing and Hill's device would not save them. If winter had held on one or two weeks longer, I should have saved but one, and that one had an Italian queen that could hardly be stimulated to laying sufficiently to keep up an ordinary supply of bees. All the rest had more or less brood in all stages the last of Nov., when the thermometer ran down to zero, and very soon afterward they began to die. Has it occurred to any of our old "veterans," that so much brood in the hive at the beginning of winter might produce it?

I. D. PEARCE.

Kirksville, Mo., May, 1883.

While you speak of it, friend P., it occurs to me that I once had a queen that would

not lay at all in the fall, even though I fed the stock, and tried every way to get her to, because her cluster of bees was so small. When it came time, I put her with her little ball of bees into the wintering-house, with hardly an idea that she could come through; but to my surprise there was just about the same little ball of bees there in the spring; and when it got real warm she commenced to lay, and her colony did about as well as any of them.

#### BEEES FLYING NINETY MILES PER HOUR, ETC.

*Editor Gleanings:*—The June No. is just received, and I am sorry to see that you have misunderstood me. I never said that it is "very dangerous for those to write on a subject whose knowledge is incomplete." What I said was, that "arguing in regard to matters concerning which our knowledge is incomplete" is very apt to lead us into error. The word *arguing* here means *drawing conclusions, proving or showing*, as when Milton says, "So many laws argue so many sins"—a common enough meaning for the word. If you will allow me, however, I will put the proposition in another shape: "One of the most dangerous sources of fallacy is the drawing of conclusions from incomplete data." If you can find a man who does not agree with that, send him along, and Barnum will no doubt give him a good salary as a natural curiosity. That we may ultimately arrive at a correct conclusion in this matter, it is necessary that the question be kept free from mere deductions drawn from imaginary facts; that is, alleged facts which have no existence. A very good example of such vicious methods of reasoning is found in the argument of E. E. Ewing on page 314, June GLEANINGS. His imaginary "vacuum," in which the bees are held and "kept above the cars with scarcely an effort," must be very amusing to any one who has the most elementary knowledge of the laws which govern the motions of aerial fluids. You imply in your note, that Doolittle and myself believe that the usual speed of bees is 90 miles per hour. I expressly disclaimed this. Some horses have attained a speed of a mile in 2 m. 30 s.; is it fair to say that horses travel at the rate of a mile in 2 m. 30 sec.? In regard to the distance to which bees will fly: A friend who has just left me says that he feels certain that they will travel fifteen miles, as he has seen them in large numbers on the prairies in the old times, at a distance of fully 15 miles from either timber or houses. JOHN PHIN.

Cedar Brae, N. J., June 5, 1883.

Thank you, friend P., for pointing out to me my error. I certainly did overlook the fact that your caution was really about drawing conclusions; but even if it was, I thought you were a little rough on the brethren, and, begging your pardon, I think so yet. You are a scientific man, and accustomed to "drawing conclusions" in a scientific manner, while we, many of us, are hard-working men, without much college training; but for all that, we are sound and practical; and if the present advanced state of scientific bee-keeping is not largely the result of our work and research, I don't know whose work it is. You are, perhaps, aware of what wretched work Agassiz and Tyndall made of it, when they thought they might be able to help us. Friend Ewing, whom you cite, has perhaps not worded his

remarks just as he might have done; but for all that, I think we all understood clearly the important fact he gave us. After he mentioned it, it occurred to me that I had seen leaves carried along by a train, in exactly the way he describes. We want you to help us, friend P.; but please bear in mind, we bee-folks are all brothers and sisters; and if one makes a mistake, he expects to have it pointed out to him with brotherly kindness. You have called brother Ewing's philosophy "amusing;" but I am sure if he thinks best to reply at all, it will be in a Christian spirit of gentlemanly courtesy.

#### FLORIDA; FRIEND WOLFENDEN'S IDEA OF IT.

So you think we need the cold weather to sort o' brace us up and make us tly around lively, do you? To speak plainly, you think if we go to Florida we shall get lazy. Well, you are about right. The natives all say they would rather sit in the shade and see the negroes work than to do it themselves. They also say I will soon be of the same mind. Well, so be it. I am going to try it. I have bought a small orange-grove, and am going down in the fall. Part of it is in bearing too. Don't you want a box next fall?

#### ORANGE-GROVES.

Shall I tell you of the orange-tree? They are raised from the seed, and, unlike the apple, the young tree will produce fruit like the parent stock, and bear in from seven to ten years. Young trees are also taken from the woods, but these have to be budded, as the fruit is sour and bitter. These will bear in from 5 to 7 years from the bud. The orange trees blossom in Feb., and the fruit is picked in Dec., and you do not find blossoms and fruit in all stages of development, as I had been told. The fruit will remain on the tree for months after it is ripe; but it does not, for it is picked and sold.

June 3, 1883.

J. L. WOLFENDEN.

#### WINTERING IN SIMPLICITY HIVES.

I have 12 colonies of bees. They wintered nicely on summer stands, four or five in double-walled hives; the rest, no protection except boxes over the hives to keep off cold winds—all in your Simplicity hives. The food for all was granulated sugar syrup, which I think is the feed for winter, every time. No dysentery, no spotting the hives. Hives were pushed forward so there was at least one-half inch open space the whole width of hive. The second hive was set on top with chaff cushion, and holes bored in ends of cover to let off the moisture, and every thing was dry and nice. Hill's device was over the frames, which I think is far preferable to punching holes in the combs. All are breeding nicely now. R. J. FOX.

Natick, Mass., May 18, 1883.

#### EARLY SWARMING IN MAY.

Tell your friend who crows over his early swarm of the 18th of May, that he will have to do earlier business than that, for he is badly left. My friend John Colvin, of Schellsburg, writes me on the 28th of April,—at least, the last week in that month,—“I have just bived a very large natural swarm of bees, and have been stung like the dickens,” if you know how that is. He has also had some five or six since. A Mr. Shondenour had two first swarms the first week in May. We have a late season, and locust and white clover are here together.

ED. D. HECKEMAN.

Pittsburgh, Pa., June 5, 1883.

PURE HONEY, AND FRIEND MUTH'S "PLATFORM."

The following letters explain themselves without comment:—

*Mr. Chas. F. Muth:*—We have an inquiry from Milan, Italy, asking us to name the most important manufacturers of glucose in this country. We presume that you are the best posted gentleman in the United States on the glucose question, and write to ask if you can give us the names of a few to transmit to our Italian friend. D. LANDRETH & SONS.

Philadelphia, Pa., May 9, 1883.

Reply, by friend Muth:—

*Genls:*—Your favor is at hand, asking me for the names of the most prominent manufacturers of glucose. I am a dealer in pure honey, and never purchased a pound of glucose; consequence is, I have sold more than 300,000 lbs. of honey since last October, without the aid of a drummer. New York and Chicago honey-dealers are better posted in regard to glucose manufacturers. It appears that our European cousins are acquiring the same tendency to corruption that we possess. I am sorry that we can not accommodate you, and remain yours truly, Cincinnati, O. CHAS. F. MUTH.

#### CHICKENS IN THE BEE-YARD.

The question is asked, if any of the fraternity have ever tried keeping chickens in the same yard. The question is answered, but not positively, by yourself. I have let my chickens run at will amongst my bees. One evening last summer my wife called my attention to the act of an old biddy gobbling the bees going out and coming in at the entrance of one of my best hives. I looked too and saw her take and eat them as fast as she would have eaten corn. I called "Fancy," our little terrier, and it was but a short time till that hen was caught and killed, and we found plenty of bees in her crop.

#### GOING OFF WITHOUT CLUSTERING, AGAIN.

I can stand up, and hold both hands up for the truth of it—two cases of it before I took GLEANINGS. I have had several go off without clustering, and one I very well remember I watched for some time, knowing before it came it would be a large swarm; and being anxious to save it, I watched diligently. Well, it commenced to come; and as fast as it came it also went, in spite of all the rattle of tin pans and cow-bell. Off she went with the whole family with her, and I after her; but they flew faster than I could run, and "you bet" I was considerably out of fix about losing it, after such a hard run. Since I have taken to clipping queens' wings, I never lose a swarm. W. H. FERGUSON.

Bloomdale, Wood Co., Ohio.

#### A GOOD WORD FOR HYBRIDS.

If I could get any and all bees as good as one swarm of hybrids I have, I should be fully satisfied. They stick to the combs nicely, and are gentle to handle, and such workers I never saw. They just pass in and out, and never stop to tell stories, but work and talk at the same time, and you know that with us, where there is so much to do at all times, if we stop about the door to talk, we shall be just so backward with the thousand and one jobs that must be done to make a success. I think it's something so with the bees. I am going to breed one batch of queens from this swarm for my own use, and see what they will be. Of course, they and their progeny will be dark, but I shall look for light honey from them. I should like to have you see that swarm.

You could look them over without smoke or gloves either. The queen is 3 years old, but does her own housework the same as ever, having 7 Langstroth frames nearly full of brood May 24, and also about ready to take boxes. Don't you think I have one stock to feel pleased with? E. P. CHURCHILL.

North Auburn, Me., May 24, 1883.

#### HIVING-BASKETS, ETC.

Seeing quite a little said about hiving-baskets, etc., let me give you the kind I have used for the last five years. It is a common market-basket, one that is made out of round willow, such as almost any grocery store keeps. They hold about three pecks, and are made oblong, with flaring sides. To prepare them for bee use, I line them with cheap cotton cloth. After cutting off the handle (they usually have a handle on them) on one side, attach a piece of this factory cloth, large enough to cover over the top. The one Mr. Heddon describes as using is too large; it lets the bees spread out too much. Little things go to make up larger ones in a season's work, and those who haven't any thing better may, if they choose, try my kind of a hiving-basket.

Glenwood, Mich., May 24, 1883. W. H. SHIRLEY.

#### THE SYRIAN BEES; SOME QUESTIONS ABOUT THEM.

Some time ago I wrote to D. A. Jones for particulars about the Syrian bees, but have not heard from him. In what estimation are they held to-day by disinterested parties? Are they better than any other imported bees, and in what respect? Are they better workers than the Italians? Are they hardier or larger? Are they docile?

Piqua, O., May 26, 1883.

J. D. KRUSCHK.

Friend K., if you will read over the reports in our back numbers for the past two or three years, you will see that very diverse and conflicting views are held. While some have decided them to be in many respects better, others have decided right the other way. I believe all are pretty well agreed on at least two points, however. These two points are, prolificness and temper. They will rear brood faster than Italians, without question, and, as a rule, they sting worse, especially where one does not know just how to take them. They are little if any larger, and, as a rule, I do not believe they are hardier.

#### PRESSING THE WIRES INTO THE FOUNDATION.

I press wire into fdu. with an instrument like a tracing-wheel. I took a spur-rowel for the wheel. The points should be about  $\frac{1}{2}$  inch apart, and at least  $\frac{1}{8}$  inch wide across the wires, and just wide enough the other way not to cut the wires; have the points creased a little, so they will not slip off. I think this an improvement on the carpet-stretcher. My sheets are drawn out over the wires so nicely, with not a cell changed, that if you could not see the wires you would not know where they are. Try it.

H. A. HARRIMAN.

Grand Lake, Ark., May 21, 1883.

Friend H., the wheel is an old device, and was described in our back volumes some time ago. We have used one, but it bothered some by not going up close to the frame, and we think it does not work as well, nor as rapidly, as the carpet-stretcher. Since adopting the latter, we have had little if any complaint about frames shipped by freight or express, filled with foundation.

## HOW DID THEY GET THEIR QUEEN?

The following rather curious case came under my notice recently. A neighbor who keeps a good many bees noticed that a weak colony had a great many drones. He opened the hive, and found drone brood in worker-cells. He also found a fertile queen, evidently a young one, and a cell, half destroyed, from which she had been, apparently, hatched. The eggs from this queen all produce workers, and the drone brood has now disappeared from the hive. The bees in the colony are all black, but the bees from this queen are hybrid. The presence of the drone brood would seem to indicate the presence of a fertile worker. I can see no solution to the problem, unless it is that the fertile worker died, and the queen-cell started from her brood failed to come to maturity. This queen might have got into the hive from some colony that had swarmed out. What do you think of it? Do bees ever *steal brood* from which to raise a queen?

CHAS. BOWLES.

Hillsboro, Ohio, June 5, 1883.

This looks something like a case of stealing an egg or larva, friend B., but yet I think there is another and easier solution. The old queen, before she failed entirely, laid drone eggs in worker-cells, and the bees, from instinct, started queen-cells from some of the last worker eggs she had laid. The drones in worker cells were not all hatched when the young queen commenced to lay, and this was the state of affairs when the hive was opened. The young bees were hybrids, because she met an Italian drone from some Italian stock in the neighborhood.

## MOVING TO FLORIDA.

If any persons intend to come to Florida under the impression that there is such a great difference between making a living at the North and here, I think they had better change their ideas quickly, and stay at home. If a man is willing to work, let him come; but if he is not already comfortably fixed where he now is, he will find that, if he has to live by labor of any kind, he will have just as much work here to do as elsewhere, to make the *same* living; and, in a great many cases, more inconveniences than in a more thickly settled place. I believe the future here is brighter for a *young* man than almost anywhere else in the United States; but the first four or five years will require hard and steady work. So far as bee-keeping here is concerned, I can not speak, as I have had no experience in that line. As regards any one coming here for health, he must judge for himself, for a man will do many things for health that he would do for no other cause. As a State, I think Florida will rank among the first, if not the first. I should like very much to see our State settled by people from all sections, provided they do not come with the idea that they can live without working *themselves*, or paying for the work.

D. L. ALEXANDER.

Altma, Orange Co., Fla., June 8, 1883.

## FROM A "FRIEND" INDEED.

Although I am a stranger to thee, and but a new subscriber to thy valuable journal, this being my first year, I want to thank thee at this time for the many kind words and good counsel which I have read in the four numbers of this volume. I am very much interested in reading the various departments, but more especially that coming under the head of Our Homes. I think that part alone is worth

more than two or three prices of the paper. I bought two stands of bees last fall; and in order to get posted on the subject I subscribed for GLEANINGS and the *Kansas Bee-Keeper*, and bought a copy of A B C. Bees have come through the winter all right. If I live I will report at some future time what my success at the business may be. I hope to make it a success, but if I do not, and the bees all die, don't put me down in the "Growler's Column," for I do not propose to grumble and complain, but expect to try to live so that I can praise the Lord and be happy.

JARED P. ATKINSON.

Tehama, Cherokee Co., Kan., April 7, 1883.

## WAX AND ROSIN FOR FASTENING STARTERS IN SECTIONS.

What per cent of wax and rosin did friend House use for fastening fdn. in section boxes, as mentioned on page 247, May GLEANINGS? Our bees, 14 stands, are doing finely.

C. P. HOCKETT.

Jonesboro, Ind., May 21, 1883.

Mr. House replies as follows:—

I used 50 per cent or more of rosin. This makes a very firm cement. Rosin alone would be too hard and brittle. Keep the mixture just hot enough over a lamp so it will not harden on top.

How are you all? and how do the boys get on with those estimates? They have my sympathy. I have been through my 40 swarms of bees, and find them in most *excellent* condition; a number have 10 full frames of brood. Apple bloom has just begun. I declare, it seems as though I'd gained 15 or 20 pounds since I got out of doors, and had a chance to kick. I closed out 325 lbs. of honey I had left, in Chicago, at 9 cts., and think I did well. There is a large stock on the market yet.

WALTER B. HOUSE.

Saugatuck, Mich., May 30, 1883.

May I suggest, friends, that rosin has been objected to, on the ground that it is liable to give the comb honey a resinous flavor? Perhaps this might not happen, unless some careful consumer should scrape the section to get his full money's worth, and may be it will never happen at all; but I thought best to mention it.—I thought, friend H., we gave you room enough to "kick," when you were with us here in the office; but it occurs to me now, that college boys often require a whole ten-acre lot, with the bars down besides; and I have heard that they sometimes feel cramped for room even then. I am very glad to know you are enjoying your vacation so hugely. Can you not take time to give us some more notes occasionally?

## QUEENS THAT WON'T LAY WHEN NOT ALLOWED TO SWARM.

My queens all have their wings clipped, and some of them, after several attempts to swarm, stop laying. They did the same way last season, and in each instance I replaced the old queen with a young one, and all was well. Now, can you tell me what will be the result if I let the old queen remain? Will she begin to lay again? All the queens that act in this way are two years old, and in very strong colonies.

SILAS H. HICKOK.

Bethel, Conn., May 26, 1883.

Queens do often refuse to lay, after a swarm has come out and they are put back again. In fact, it is so difficult a matter to make a swarm stay and work, when they do not want to, that I have advised in the A B

C not to undertake it, as a general rule. It is not only the queen, but the bees too, that, when "convinced against their will, are of the same opinion still." Put them in a new hive; and when they get well at work, giving them their old combs of brood, and unfinished sections, will often do; or sometimes they will go ahead, if their old hive is simply carried to a new location. But trying to make a new colony go back into a hive out of which they have just come, either by queen-guards or clipping the queen, is usually a rather unprofitable undertaking all round. Put the young folks into some kind of a new hive, and let them enjoy the fun of commencing housekeeping after their own fashion, and they will pay all expenses, nine times out of ten.

#### FROM 29 TO 60, AND 1600 LBS. HONEY.

Well, here is my report: 1600 lbs. of honey, half comb and half extracted, and increased from 29 to 60; sold to 49, and came out with 49, all in fair and strong condition—that is, in bees; but I lost 4 queens of old age. One drone-layer died; that saved me from hunting her up myself, and I lost 2 young queens from one cause or other, so I doubled queenless swarms with weaker ones, and sold this spring, and doubled, from 49 to 86, and to-day at 10 o'clock I got my first natural swarm. Cherry-trees are just fairly in bloom.

#### WATERING BEES IN WINTER.

I will tell you how I watered my bees this last winter. I have a rubber syringe, and every time the bees got restless I would get a dish of milk and warm water, and squirt in at the entrance about a cupful of water, and it would settle them every time. Those I watered came out strongest. I think it is foul breath that makes the bees die, instead of dampness, just as poorly ventilated schoolhouses affect the scholars.

H. L. WARSTLER.

St. Johns, Mich., May 29, 1883.

#### HOW FAR HAVE SWARMS BEEN KNOWN TO FLY?

A gentleman of undoubted veracity told me of a swarm that came out of a hive which belonged to his father, that went  $4\frac{1}{2}$  miles. They saw them as they went off, and they were seen twice in the air, and when they entered a hollow tree. As they were going in the same direction, the same day, and not a great while between, there can be but little doubt that it was the same swarm. I had a swarm that came out last year, that went nearly a mile.

#### UNSEALED BROOD NOT A PREVENTIVE.

This same swarm had unsealed brood given them, and was placed in the shade, but "away they went."

#### COFFEE SUGAR FOR WINTER STORES.

I should like to add my "little mite" in favor of sugar for winter. My bees were fed with syrup made of coffee "A," as per A B C, for the winters of 1880 and 1881. They came through in good condition. I use the  $1\frac{1}{2}$ -story hive, with chaff division-boards, and cushion top of frames. The hives I place in a shed (for winter), open to the south-east.

#### "THAT CHEIROGRAPH!"

I could not get more than 25 to 35 good impressions from the one I made. I wrote to friend H., and he advised me to buy one, as it was quite a job to make a good pad. For the benefit of those who wish to make their own, I give the following: Take 18 (fluid) ounces glycerine; 2 ozs. gelatine;  $\frac{1}{2}$  oz.

white glue, and 2 drops carbolic acid. Heat them separately, then stir all together. Do not heat the acid. Make the aniline ink strong enough to look bronze on the paper when dry; 155 copies have been taken from a pad made from above recipe.

#### DO BEES EVER COME OUT WITHOUT THEIR QUEEN?

A swarm came out to-day, and flew around in the air 15 or 20 minutes, then went back again. I looked for the queen, and found her walking around on a comb; found three or four queen-cells with eggs in them.

E. H. COOK.

Andover, Conn., June 7, 1883.

#### KENTUCKY, AND THE WAY THEY DO THERE.

Bees are doing well, making honey fast from the white clover, poplar, persimmon, etc. The white clover is better now than it has been for several years. I see, or hear, of a swarm every day. A swarm passed over my shop this morning. I am making hives as fast as I can, for my life, but the old "fogies" won't buy a hive until the bees swarm, and while they are settling, Old Foggy sends "John" down to "Mayes'" shop after a hive, and then, perhaps, when he gets to the shop he finds all the hives that are nailed up are engaged. John then returns without a hive (plenty in the flat, but too late to nail one now), and Old Foggy says, "Well, John, we can put them in this," and backs out of the smoke-house with an old nail-keg, or something similar, and the old man puts the little architects in the old musty thing while John stands covered up under some bushes that may be close by. I am trying to get the people to take an interest in bee-keeping, and have made very good headway. I am making a hive like your Langstroth hive, to take a Simplicity upper-story or cover as you have in the cut on page 19 in catalogue.

W. M. MAYES.

Gordonsville, Logan Co., Ky., June 5, 1883.

#### A QUEEN-CELL NINE DAYS IN HATCHING.

I write to tell you about a queen bee, and how she acted. On June 2d I took a queen-cell from a colony, and gave it to another, which had been without a queen for two months. I had given them eggs several times, and they would not try to raise a queen. How long do you think it took her to hatch? By the record I kept, it was nine days. Then I opened the cell to see whether she was dead. But she was alive, and ready to come out. I took her in my hands, held her a few moments, then let her loose on a comb where were two sealed queen-cells. She began to tear one down. Do you think she will be as good as one which hatches on regular time?

Edna, Kan., June 11, 1883.

W. E. POTTS.

If the cell had just been sealed over, friend P., it would make a difference; but nine days is a pretty long time. I think cutting her out will make no difference. Please report in regard to her.

#### ALLEY'S PLAN OF REARING QUEENS.

In GLEANINGS for June you give a description of a plan for having queen-cells made somewhat after the manner given in the Handy Book, and desire to know if Mr. Alley didn't get the "idea" from the same, as given in GLEANINGS some time in 1880. No, friend Root, I did not get the "idea," or any part of my method of queen-rearing, from any book or bee journal. Twenty-two years ago, Mr. E. A. Brackett, of Winchester, Mass., then agent for Mr. Parsons, of Flushing, N. Y., for the sale of Ital-

ian queens, tested the same plan for cell-building, as given in the last No. of GLEANINGS. Mr. B., as well as myself, found that way of cell-building impracticable (for reasons that all will who test it thoroughly), and abandoned it, and I am quite sure every one who tests that way will soon give it up. Then again, friend R., there is another reason why I did not get the idea from any thing that ever appeared in GLEANINGS or any other journal. I never saw the number of the journal you alluded to (1880); and if I did, I did not read the item you speak of. I seldom ever read much in any journal, unless some friend calls my attention to some particular article. And again, friend R., I have been rearing queens by the present method since 1878, a part of which I can prove to you, if you so desire, and have been experimenting on this thing for 22 years to perfect it. I think there is a good deal about my method of queen-rearing to make it a success, besides merely having cells made in rows. My system is the most perfect and systematic of any in use. If you can find any thing new in regard to queen-rearing that has not been tested here, I should be pleased to see it in print. We have tried and tested every namable experiment ever thought of.

Wenham, Mass., June 14, 1883. HENRY ALLEY.

#### NEW HONEY, AND SNOWSTORMS.

From the 16th of April to the 25th we had fine weather, and the bees gathered plenty of new honey. I extracted 12 lbs. of new honey on the 20th of April, from one colony, and left 5 or 6 lbs. of new honey in the hive, with plenty of old capped honey, and this was a half-blood Holy-Land. But since May 1st they haven't done much, on account of rain and cold weather. They had only two or three hours in mid-day that they could work nicely; and on the 21st and 22d it snowed pretty fast for a few hours, with the apple-orchard in full bloom, and the thermometer 4° above freezing. J. C. MISLER.

Ligonier, Noble Co., Ind., May 23, 1883.

#### A CLEANSING FLIGHT; IS IT ALWAYS AN ADVANTAGE?

On page 324, you thank Jas. Beaton for facts given regarding one swarm purchased, which had a cleansing flight in March, that lived, while the 29 not purchased all died, not having a cleansing flight at that time. Well, here is another fact to put beside it: In the fore part of February, 1870, I purchased one swarm of a party (having 40 colonies all in box hives), and moved it 2 miles over a rough road. Upon reaching home I placed them in a cellar, thinking to set them out for a fly the first good day. This came the last of February; but as the colony purchased was quiet, I let them be where they were till the middle of April, when they were set from the cellar in splendid condition, and turned me \$45 that season. The 39 left had a good flight in Feb. and March; but on May 1st, all were dead.

Borodino, N. Y., June 11, 1883. G. M. DOOLITTLE.

I confess the above is a little stumbling. If it points out a truth, the truth would be something like this, it seems to me: Conditions that would save a colony at one time, might prove the ruin of them at another. In the above case, I think I should prefer to take the chances of having the bees so located that they could take a fly of their own accord when the weather was suitable; but I would by all means have them protected from the prevailing winds.

## Ladies' Department.

#### HOW TO MOVE BEES, ETC.

I WENT into winter quarters with 27, and one died. All the rest came through in splendid condition. We sold our farm, and had to move 9 miles, and every one was wanting to know what I was going to do with the bees. I told them I would take them with me. So we set the day to move; and the day before, I went and packed them all snug in the lower part of the hive, and then late in the afternoon I tacked wire screen over the front to keep them in, and then they were ready to move. My husband put his rack on his wagon that night, so as to have no delay, and then next morning we loaded the bees into the wagon. We set the hives in two rows, side by side, until it was full, and then we set on top of them another row of hives, and we got all of the 26 into the wagon. I tell you, it was full. We then put two straw beds on top, and tied them down tight, until they were solid, and then we started and went slowly, so as not to jar them until we arrived at our new home, and then we set them out. I tell you, the little fellows were pretty cross, being in prison. I did not have one comb broken down.

The bees have done well since we moved. I sold 3 swarms for \$10.00 apiece, and that left me 23, and I have 7 new swarms. I like to work with the bees; but I have to put on the armor, to keep them from stinging. They sting me terribly when they can. Part of them are very cross to handle, and part are very quiet.

MALINDA A. WILKINS.

Seneca, Kan., May 27, 1883.

#### TWO OLD QUEENS IN A HIVE, ETC.

We have 19 colonies of bees all in good condition. All wintered in cellar with thick cushions on and covers off. I found two old queens in one hive, laying side by side. One had both wings off. My husband fed oil cake to the stock early this spring, and the bees would gather thick on it wherever they could find it.

MRS. B. L. SCARLETT.

Anita, Iowa, May 17, 1883.

#### "TRAMP" BEES.

Now don't put me in Blasted Hopes, for I am not a bit discouraged; for a bad beginning makes a good ending. But I do think the spirit of emigration has taken possession of my bees. They will swarm, and settle all right; are easy to hive, but they will not work. They are genuine tramps. They stay in the hive from three to seven days, then take a stampede, then I herd them like sheep. I sit down and let them fly until they settle; then I hive them and bring them back. Sometimes they will stop two or three days; sometimes only a few minutes, and away they go; and this has been the experience of nearly every bee-keeper here. Now I shall put two swarms together, when they will not work alone. I put four swarms into two hives yesterday, and one of them is at work finely, and I think the other will go to work now.

#### QUEENS THAT ARE NOT QUEENS.

I don't think they have any queen when they act like that; do you? There is some kind of a bee in all the hives that act so, that some call queens. I will send you three. Tell us what they are. Some of the hives have eight or ten; but the bees kill every one they can get. I think they are too small for queens. I sent to H. A. March for queens, but

he said he could not send out any until the middle of June; that will be too late; my bees will be done swarming before that time.

MRS. NELSON KELLEY.

Ferndale, Whatcom Co., Wash. Ter., May 30, 1883.

I confess, my friend, your name is quite an apt one for bees when they get the swarming mania, and won't stay at home at all, but let the whole honey season pass by, while they cut up in the way you have described. I have once or twice seen small swarms go out with nothing but one of these small shiny-looking bees, which they seemed to behave toward as if it were a queen; and the way I did was to pinch off their heads as soon as I could single them out. Some of them had a sort of resemblance to a queen, but they were no larger than worker bees. It might be well to inquire how it is that a colony comes to have such queen-workers, but I am inclined to think it is rather a demoralized state of the workers, and that they select some bees and hang around them until they get the shiny, sneaking look they usually bear. I have wondered if these bees were not mostly made up of those that spend their time buzzing about hives, and trying to rob?

Since the above was written, the three queens have come to hand, for queens they are, I should say, even though they have a queer look. The shape is rather short and thick, something like a drone, and they are shiny black. I have mailed them to Prof. Cook, to see if their anatomy differed in any way from ordinary virgin queens.

#### TRIBULATIONS OF AN A B C SCHOLAR.

I feel assured you will not be annoyed with me, coming to you in my trouble; for I am about in the condition of mind as the one represented in your A B C book, on page 284. Two years ago my mother, hearing the noise of bees in the air, ran out and saw them coming toward the house; and laying hold of the bell-wire she succeeded, by vigorous jerking, in making so loud a noise that the bees were confused, and thought it best to wait until they could hear their own voices before going further, and so they settled near the house, on a low tree; and with the assistance of the hired hand, she succeeded in getting them into an old box hive about 12 x 12 x 2½ ft., and in the evening father carried them and put them by the yard fence on a board, and you will wonder if I tell you that we were all very proud of our newly acquired treasure. By watching them day by day we found them working nicely, apparently contented and happy, and succeeded in laying up sufficient store to take them through the winter; and as we knew nothing of the wonders of modern apiarists in handling the little busy-bodies, we were content to let them stand in the box, without being able to even see what they were doing, until an uncle came to see us, who had been working with bees for several years, and reading your books. He persuaded father to make two of your Simplicity hives, and he tore the old box up and put the bees in two new ones, dividing the colony, and making two out of it. They worked nicely, and laid up considerable honey. During the honey season we took about 100 lbs. of honey from them, and left them enough to winter on. We put them in chaff hives last winter; and although the winter was so bitter,

they lived through nicely. We had some little trouble with them this spring, and during the cold weather we had to feed them a few days.

Then came swarming season, the saddest of all seasons to me. My first swarm came out on Sunday, as we were just starting for Sabbath-school. It was 2 o'clock P. M. We managed to get them settled on a tree inside the yard. Mother and myself got them started into the hive (father being absent), and again started for Sabbath-school. We got back home about 5 o'clock. The bees were mostly in the hive, a dozen or two flying around the hive, seeming to like the outside better than the inside. We then carried the hive about 12 or 15 ft. from where they settled. I looked at them the next morning; they had built 3 or 4 inches of comb on 4 of the frames. They did not seem to be satisfied, however, and father suggested that we give them a frame of brood from the old hive. We did so; but about 1 o'clock they swarmed out. We got them settled, and in the hive again, but we had just got into the house when we heard the buzz of bees swarming. On going to the door and looking out, we found the other colony swarming. They settled on a tree close to the house. Father sawed off the limb they were on, and carried them to where we wanted them to stand. They went to work building comb, and seemed as if they meant business. We gave them a frame of brood from the hive they came out of. Both swarms seemed to be getting along nicely; but the next day, about dinner-time, the first swarm went out again. They had about all got out of the hive when the second swarm commenced coming out again. We got both swarms settled, by main strength and awkwardness, you might say, for we all threw dirt and water, and pounded tinware like good fellows.

We got them hived, but they seemed terribly confused. We examined them, and found that both swarms had a queen apiece. About 4 o'clock both swarms came out again. We threw dirt and water, and rattled pans as before, but with no good results with the second swarm. They went off in spite of us. We succeeded in getting the first swarm settled, and in the hive again. We all chased the swarm that went off, but lost sight of them in a little while.

The first swarm stayed with us till next day about 11 o'clock; they then came out and took their flight in the same direction that the others went. Now, if you have the patience to read my story through, you will not wonder at my being down in the mouth. As the bees were given me to handle, you can readily see that reputation is at stake. If you have the time (and I shall wonder if you do) to read this, and answer this one question, I shall be greatly obliged: What made the bees go off?

MAGGIE A. BYRNS.

Mt. Sterling, Brown Co., Ill., June 11, 1883.

Well, friend Maggie, you have had trouble, sure enough. No wonder you call the swarming season the saddest of the year, even if bee-men in general, and bee-women too, if I am not mistaken, do unite in thinking it the happiest of the whole year. As you state it, I can hardly see where you were at fault, and I can't give any other reason for the bees behaving as they did, more than that they had got the swarming mania, and had their trees picked out, and were bound to go. I have had some such

troubles myself, and I once declared I wouldn't have a queen in my yard whose wings were not clipped. Afterward I took to artificial swarming, and kept the bees so well divided they have never since got much of a chance to swarm. I tell you, it just makes me wild to see large early swarms going off, and leaving nothing but a queenless hive with a few bees in it. Who can comfort Maggie in her distress at the loss of her bees? Perhaps friend Doolittle can tell her where she erred in her management; or does he have large early swarms go off in the same way occasionally? I confess that losing two in just that way does seem wonderfully provoking.

## Reports Encouraging.

FROM 11 TO 31, AND 1480 LBS. OF HONEY.

**T**HINKING you would like to hear of a novice's experience in bee-keeping, I send you this. I commenced in Feb., 1882, with 11 colonies, blacks and Italians mixed; in the fall I had 34 colonies, from which I got a yield of 1480 lbs. of honey. I put them in the cellar the last of Nov.; took them out the 4th of April, 1883. They were in good condition. We had our first swarm May 29th; have had 7 since, one colony swarming three times.

Belle Plain, Ill., June 11, 1883. M. K. OUALLE.

SAW-PALMETTO.

We have extracted 61 gallons of saw-palmetto honey in the past few days. I wish I could hand you over a sample of it.

La Grange, Fla., May 16, 1883. ANDREW FROSCHE.

I expected to be placed in Blasted Hopes, but every thing is away up at present — bees swarming, and for the last five days the hives I have on scales have put in 10 lbs. per day. "How is that for high?"

G. W. LECHLER.

Newhall, Los Angeles Co., Cal., May 27, 1883.

FROM 5 TO 32, AND 500 LBS. OF HONEY.

I began in the spring of 1882 with 5 stands of bees, and increased, by artificial swarming, to 32, and found and transferred from trees, 10, which gives me this spring 42 stands. As for the honey of last season, I did not keep a correct account; I think about 500 lbs., only 100 extracted.

Handly, Tex., March 7, 1883. L. R. GIVENS.

NEW HONEY.

The prospects for honey have not been better for years. I have already very nice sections of fruit-blossom honey. I have not seen the locust so full of buds in my life, and hundreds of large trees in reach of my bees. The fields and roadsides are covered with clover.

ALBERT HAKE.

Manchester, Pa., May 22, 1883.

CALIFORNIA; A GOOD REPORT FROM.

After several poor years for bees and honey, we are now having a good season thus far. My bees have increased from 28 to 65 hives this spring, and still they come, and honey comes in fast. We labor under many disadvantages with box hives, 150 miles out and back for lumber, and 3000 miles from your factory. I have never yet seen any foundation.

Imusdale, Cal., May 22, 1883. N. W. FALES.

I started this spring with 14 stocks; have had 6 swarms. I never saw better prospects for a big honey crop. White clover is in bloom, and is everywhere, nearly. I have 9 stocks in surplus boxes, just a "going it." You had better think, with my farm work and the bees, I am kept on the go. But, let them "whoop'er up."

C. H. McFADDEN.

Moniteau, Mo., June 11, 1883.

I have been in the bee business 17 years, but I still must have GLEANINGS. I can not well get along without it. I have wintered 72 stands; lost 2 out of that number. I have sold nearly 3 tons of extracted and comb honey around home, and I did not haul it around either. They came to the house, and took it away.

H. F. CARPENTER.

Polo, Ogle Co., Ill., May 28, 1883.

TEXAS; A GOOD REPORT FROM.

I commenced this spring with 4 hives, and have increased to 10. The four old hives are full of honey. My bees don't notice the horsemint this year. I guess they will work on it after awhile. They went for the horsehound, but it is about over now. Linn will soon be in bloom. I expect to get lots of honey from it.

J. D. WERNER.

River Side, Walker Co., Tex., May 18, 1883.

REPORT FROM OUR FRIEND O. M. BLANTON.

The cold and rainy spring has caused bee-keepers to be quite backward in securing honey. On the 21st of this month the thermometer descended to 53°, and for 3 days we felt quite blue; but now the temperature is up in the nineties, with gentle showers, and the bees are working with redoubled energy on the white clover, which is more luxuriant and abundant than ever known. I started this season with 201 queens with strong colonies, having sold 122 colonies; and after uniting the queenless ones, left me the above number to gather in the nectar of our rich alluvial country. I have extracted to date 5800 lbs.

Greenville, Miss., May 30, 1883. O. M. BLANTON.

## Blasted Hopes.

Or Letters from Those Who Have Made Bee Culture a Failure.

**A**FTER seeing many glowing accounts about profitable bee-raising in GLEANINGS, I feel it my duty to make a report of my brother-in-law, and my own blasted hopes of the present year. Ten years ago, when a youth of 18, I commenced bee-raising with 2 hives, with all the enthusiasm of a beginner. I made an extractor, which, though rough, did good service; I also wrote two articles on bee-raising for the *Southern Cultivator*. Eight years passed, every one of which I had plenty of honey in the month of May, to pay me well for my trouble and expense; but I had in all that time hardly any swarms, and my enthusiasm had settled down to the freezing-point, when I reached the spring of 1882 with 3 hives; after a short absence from home I found they had unexpectedly increased to 8; and with the splendid flow of honey that the month of May brought, my enthusiasm again reached its highest point. At the same time my brother-in-law was caught by the same enthusiasm. He bought 25 hives in Langstroth frames, and procured all the machinery necessary for a modern apiary, and the present spring found us as determined as

two men full of energy can be, to force the increase of our bees, which they had generally failed to do, by natural swarming. The never-failing honey-moath of May came, and failed, on account of dry weather and high wind; and to-day my brother-in-law, with 40, myself with 12 hives, have to resort to feeding. Of 4 queens I raised, I lost 3 in the high wind of the spring.

H. FRANKE.

Blackjack Spring, Fayette Co., Texas, May 20.

Why, friend F., I can not quite see where blasted hopes come in, after all. It is true, you were annoyed by dry weather in May, when you would rather have had some rain; but dry weather hurts other folks as well as bee-keepers, does it not? So far as I can gather from your story, it is not the bees you are complaining of, but the weather, or circumstances, if you choose; and if you will excuse the liberty I take, I would suggest that perhaps a little fault may lie right at your own door. Suppose the wind did destroy three queens out of four; keep on trying. You can have another crop of queens in ten days, and where is there a farmer that can get his crop in that time? Try another ten days, and very likely the wind won't blow then. Have you not made the business pay expenses, in all these ten years? Surely you do not lose your bees in wintering away down where you are, as we do? Again, the season is not over yet. Suppose you did feed in June; have not hundreds of us done the same, and haven't we had our reward, too, as a general thing? Look up, friend F., and help your brother-in-law to look up too. High winds and droughts don't hurt any one, if his hopes are anchored where they should be. He whom the winds and waves obeyed is looking on, and knows it all; and he has said, even the very hairs of your head are all numbered.

## Notes and Queries.

### BEES WORKING ON LILAC.

**D**ID you ever hear of bees working on lilac? Our Syrians have done so quite largely this spring.

A. J. COOK.

Lansing, Mich., June 7, 1883.

[Honey from lilac! Who ever heard of the like before? Wouldn't honey be fine, and wouldn't it be fine to have a lilac orchard? Thank you, friend Cook. Has any one else noticed this? and is it a peculiarity of the Syrians only?]

What is paraffine?

C. P. HOCKETT.

Jonesboro, Ind., May 24, 1883.

[A residue from petroleum.]

My bees are nearly all hybrids, and worse than the desperadoes and prize-fighters that our State is generally noted for.

JOHN UMHOLS.

Nashville, Mo., May, 1883.

My wintering report in brief is as follows: Put in winter quarters, 135, and 21 "on shares." All came through, mostly in good condition; 3 or 4 queens were missing, or had run out of fertility. The bees were united, or made to rear cells. Sold, up to Mar. 1, 12. On hand May 1, 123, and 21 "on shares."

OLIVER FOSTER, 123.

Mt. Vernon, Ia., May 23, 1883.

### A CAUTION TO NEW HANDS.

Charley Hunt's bees came all right, but he lost them in transferring them. The queen came out of the hive, and in looking for her she got stepped on, so he has had bad luck too.

S. K. WILCOX.

Port Chester, N. Y., May 16, 1883.

### THE FIFE PATENT HIVE; A CAUTION.

Friend Root, I think it would be best to warn people against being induced to give Mr. Fife any money. I do not believe that his hive is patented; and if it is, the hive is a worthless concern.

Nappance, Ind., May 5, 1883.

I. R. GOOD.

### CUTTING A BEE-TREE.

I cut a bee-tree yesterday, and transferred them. In so doing, the queen got some bruised, but is still living. They are the pure Italians. They were in a tree nearly four feet through, about 45 feet high in the body. They had 20 lbs. of good honey.

A. L. MARTIN.

Leonardsburg, Del. Co., O., May 4, 1883.

### HOW TO RAISE BASSWOODS FROM THE SEEDS.

I would say, plant seeds as soon as gathered, in late summer or fall. They lie over one year, and comes up the next spring, taking two years for seeds to sprout. An expert can make a success starting them from cuttings; but one must know how to make them root so as to pay.

Rantoul, Ill., Mar. 24, 1883.

H. M. MORRIS.

### A DISEASE OF THE BROOD THAT IS NOT FOUL BROOD.

I think my bees are affected with the same disease as Mr. Hewitts' (p. 256, May No.). They had it all last summer. I thought it might be foul brood; but they could raise queens *sometimes*, and did pretty well making honey; but they came through winter badly. I think I saw bees on exhibition at Michigan State Fair affected the same.

L. C. LINCOLN.

Greenville, Mich., May 23, 1883.

### "OLD FOGY" — HE VENTURES TO "PEEP" A LITTLE YET.

Bees are booming, but no swarms yet. I packed 27 colonies in chaff on their summer stands last fall, and all have come through the winter bright and lively. Does a swarm ever issue and go off without clustering? That is right, friend Root; bring on your score of witnesses, and let us have the matter settled. Yes, I read friend Cyula's letter, and from it I inferred that woods is not a good place to keep bees.

OLD FOGY.

Allendale, Ill., May 7, 1883.

### A QUEEN THAT DIDN'T LAY FOR 8 MONTHS AND 26 DAYS.

I want to know the reason of a queen not laying in 8 months and 26 days. Was it old age, or was she a Democratic queen that she would not lay with black Republicans? I want a Republican queen this time.

Mankata, Kan., May 14, 1883.

DAVID ROSS.

[I am not versed in politics, friend R., and can't answer that part of it; but if I had a queen that didn't lay in one month, I think I should hustle her out of the hive, bag and baggage, and install a new housekeeper. I don't think I could give any reason; but I do know that we have queens once in a while that stop laying, and that can't be started by fresh brood and liberal feeding. I would not be in a hurry to discard queens in the fall of the year, however, for they often stop then, but commence all right in the spring. Of course, you gave the colony brood to keep up its strength all this time, and I think we can commend you as a patient man, to say the least.]

## Our Homes.

Then Moses stood in the gate of the camp, and said, Who is on the Lord's side? let him come unto me. And all the sons of Levi gathered themselves together unto him.—EXODUS 32:26.

I HAVE talked to you so many times on the subject of temperance, friends, I presume I shall need to make no apology for taking up the subject once more to-day. The foe is a common one, I think, for I am pretty sure that in your native town as well as mine there are men who are braving an intelligent public opinion by keeping open dram-shops at this very minute while I write. They are doing this, too, when perhaps a great majority of the people all around them are strongly opposed to the business. In our town we have to-day a strong element in favor of education, intelligence, and Christianity; and numbers of good strong Christian men and women are laboring hard to bring up our youth in wisdom's ways; but although we have wealth and influence on our side, and almost all that one could desire, it would seem that, in spite of us, we have two saloons with open doors, doing a thriving business day and night. Drunken men and boys reel along the streets, and more men and boys come in streams from the country, as well as our town, and turn right directly into these saloons, to come out of them an hour or two afterward with black and bloated faces and leering eyes, to insult the intelligence of a civilized community. Who are the men who keep these saloons, and who continue on in this work? They are just about like those who keep the saloons in your town. They are uneducated, as well as unprincipled, and they ply their vocation day by day, of tearing down and sending to drunkards' graves the youth of our country, while the superintendent of our schools, with the best help our county affords, labors against the dangers of intemperance, and pleads with our boys to choose the straight and narrow path. The superintendent of our schools is a man of whom our county and State might well be proud. I very much dislike to speak ill of any of my neighbors, so I think I won't say any thing of the fellow who stands behind the bar. You can imagine the kind of a man he probably would be, to be engaged in that kind of work. And yet he is working against our free school institutions, and stands, day after day, blocking the way, and dealing out ruin, as if he had as good a right to do it as the schools and churches and Sabbath-schools have to lift humanity up to God. The saloon-keeper has no money, no influence, and no standing. I don't believe he is even making money. His predecessors have failed and become bankrupts. The work is no comfort to him, and no profit. Why does he persist in it? I really do not know, unless it is because the master whom he is serving is really in him.

About a year ago I asked the question at our teachers' meeting, whether we could not rid ourselves of this curse by getting together in a band of 500 strong, and marching

down upon the fellow, telling him that we, as citizens of Medina County, in the name of God, and for the salvation of the youth of our county, demanded him to stop. Would it cause him to stop? To be sure, it would, said several. Some one suggested that fifty good solid citizens would close him up in a minute, if they should go to him that way, telling him they meant business. I know him well, and I am inclined to think he would be scared out, if only ten good men whom I can name would go to him in that way. The only trouble is, then, in getting the ten men to come up boldly, and declare themselves on the Lord's side, in the language of our opening text. I was strongly in favor of trying it in that way; but now God opens a better way for you and me and all to act. Bear in mind, while you consider it, that the penitentiary of the State of Ohio is overcrowded, and mostly with young men at that, and it is also admitted on all sides now, that whisky and saloons are the cause of by far the greater part of it. Now I will let friend Hasty tell where it is God calls, and how he has opened up the way.

### FOR "OUR HOMES" DEPARTMENT.

Now that different bodies of ministers of different denominations have spoken out unanimously in favor of the prohibition amendment to the Ohio constitution, I venture to ask Our Homes to insert something on the subject. I want to set the subscribers who live in Ohio to doing something in the matter; and I think the subject will not be uninteresting to subscribers in other States. There need scarcely be a doubt that Ohio will prohibit the manufacture and sale of liquor this fall by at least 50,000 majority, if a wise and earnest canvass is made; and only think how many thousands of women and children, worse than widows and orphans, will shed tears of joy, and say, "I never hoped to see this day." Besides the direct good in the way of stopping drunkenness in our State, the moral effect of such a mighty breach in the center of the enemy's walls will be even more valuable. Ohio is the most influential State in the Union; let us put her in the van of a good cause.

This is nice and rose-colored, but there is an *if* in the way. *If* we can surmount the two great obstacles in the way, we shall see the rose-colored picture become a reality. The obstacles are, first, and worst, the jealousy between different bands of temperance folks; and second, the faint-heartedness caused by seeing so little good come from such numerous and long-continued efforts in the past.

Let us now look the worst difficulty in the face. It isn't wise to hide our heads under a leaf, like quails, and think the danger is obviated in that way. The great mass of the temperance folks in Ohio are members of the Republican and Democratic parties; but a band, perhaps a majority of the very active workers, have long maintained a party of their own, under the name of the Prohibition party. Unfortunately there is bitterness between these two bands. In the eyes of the latter, the former are mean hypocrites, who pray one way and always vote the contrary. In the eyes of the former, the Prohibition party has wantonly run itself as a political nuisance for the last ten years and more; is destitute of political common sense, and dead as Pharaoh's grandmother. As for them, they will have none of it. "And if this amendment is only the outcome of an

other plot to break up our party, we'll vote against it, notwithstanding we wish the making and sale of liquor to cease." Absurd as this last position is, thousands are thinking that way, and some speak their thoughts right out. Let there be a truce between us, brethren, until the amendment is adopted, seeing we all want that. We know that the man who wants a new party will continue to want it, and the man who detests third parties will continue to detest them; but let these feelings just rest in their little beds for a few months, until we give the common enemy such a drubbing as he never had before in his life. Don't throw away the only fighting chance we have had for a quarter of a century, in mere pettishness. Let every one who goes forth to labor for this amendment, first be sure he is sound on the catchism.

#### THE CATECHISM.

Is this a crusade against the Democratic party? No.

Is this a crusade against the Republican party? No.

Is this a scheme to build a third party, and cunningly use my vote to help on the project? No.

Is this a plan to squeeze the Prohibition party out of existence? No. The truth is, this is simply a battle to stop the sale of liquor. Other matters we will dispose of when we get to them.

After all, perhaps the best way to conquer jealousy is to get warm in the contest, and get rid of the faint-heartedness, which is the second obstacle. Friends, if you will do as we have been doing, I think you will cease to feel despondent. Immediately upon the submission of the amendment, I assigned six school-districts lying adjacent to our new church to different persons, to be canvassed, that we might find out what was the present opinion of each voter about the amendment. The first district to report panned out as follows: Total number of votes, 32; prohibition, 26; wouldn't say, 4; not seen, 2. I need hardly tell you, friends, that my faith in the people went up several hundred per cent about that time. Most of these men are not Christians, and many of them rarely come to our meetings. Two of the 26 are Germans, the only ones in the district. We are far too ready to set down all the German vote as sure for free liquor. Several of the 26 are men who drink too much themselves. We must by no means forget this section of our forces — the men who feel a personal need of prohibition, that they may be free from temptation which they fail to resist when presented to them.

Three other districts have reported since. One, which lies adjacent to the city of Toledo, and feels strongly the influence of city sentiment for high license, reported, prohibition, 6; license amendment, 17; all others, 6. This district was canvassed by a lady. Another lady brought this report of her district: Prohibition, 14; license amendment, 2; would not say, 2; not seen, 4. Another lady, not a *mother* in Israel, but a young lady, reported that she had seen personally every voter in her district. This is not so easy a matter to accomplish as one would think before trying it. The result was, prohibition, 11; license amendment, 11; free whisky, 2. I should delight to get at specimen districts in various sections of the State, and see more definitely how they stand; but I pretty strongly believe that those reported are no better than a fair average of the country districts of the State. If you will collate these figures you will see that, putting all other shades of sentiment together, and throwing in those who will not tell their intentions, and quite a number not

seen at all, prohibition has a clear majority of seven over all — and this at the outset, before the campaign is fairly opened. Notice further, that of the mixed minority, three-fifths certainly, and probably more than two-thirds, are intending to do something for temperance by voting for the first amendment. We hope to make a great many converts from this class between now and fall. When they realize how little their plan will amount to, they will consent to go further and do more.

Now, can we not have the whole State canvassed in this thorough bit-by-bit sort of way? Will not the one who reads this go now and canvass his own (or her own) school-district, and see if the faint-heartedness does not get shaken out of himself in the process? Go in warm earnest; convince people that you have no sinister point to gain, but simply long to see the curse of whisky stayed; and then ask how many will help, to the extent of putting the word "Yes" on their ballots. Will not you, friend Root, let them send in the figures for publication in *Our Homes*? Political State committees have in this manner been able to tell very nearly what the vote of a State would be in important campaigns, before the votes were cast. It will be a burning shame, if the friends of temperance in Ohio are too indolent to do as much. In doing this work, a list of names and postoffice addresses should be made out, and those to whom campaign documents ought to be sent should be marked. This is one of the principal objects of the canvass, to find which voters are hopeful timber to make converts of. The list of addresses should be handed over to some working committee that will send the proper temperance documents.

Ohio's temperance fruit has been a long time on the tree; but it is the nature of fruit to mature slowly, and then drop suddenly. So mote it be. The struggles and prayers and arguments of many years have not been lost, although at times it seemed so; they have been ripening the popular sentiment, and it does seem as if the fruit were ready to drop now.

One frequent and terrible objection thrown up to us is, "Prohibition can not be enforced." It can be enforced. In pretty good measure it has been enforced. There is no room to dilate upon the matter this time; but the mightiest arrow of prohibition has not been shot yet; it is still in the quiver; and when the people get sufficiently aroused to shoot it, it will certainly bring down the enemy. E. E. HASTY.

Richards, O., June 13, 1883.

You will notice that friend Hasty says there are two great obstacles in the way. The worse of the two great obstacles is jealousy between the different bands of temperance folks. Is it really possible, that this thing has stood thus long, because Christian people could not agree? We are opposed to intemperance, and unite in one great body on this; but Satan, knowing we will quarrel before we get to work, stands grinning at us, and laughing to scorn our attempts to stop his work of ruin. Why do Christian people disagree and waste precious time, while precious souls are being lost, about trifling and unimportant matters? Two of the best men I know of in the world, regular old wheel-horses in all kinds of Christian work, once in talking in meeting about a fine new church that had just been built, almost got into a dispute, right before the congregation. What do you suppose was

the point of disagreement? One said the church was all finished and paid for, and the other said it was *not* all finished and paid for. Any schoolboy might have readily gathered, from the statements made, that both were probably right, from their respective standpoints of view; but when we come down to the real point at issue, did any thing hinge on the fact as to whether one or the other was right? I can not see that any thing did. I never knew them to speak in that way before; and although they stopped very quickly of their own accord, it was a lesson to me, that the best of us are constantly in danger of being led by the wrong spirit, and that we can not pray too often for the influences of the Holy Spirit, which God has promised us as a free gift, if we ask for it aright.

What is it we need, then, to help us win the victory in this coming contest? Is it not the grace of God? Even in the Women's Christian Temperance Union I have intimations that there are sometimes faint symptoms of jarring and discord. Is it so, sisters? If it is, there needs to be more praying, and very likely the prayers should be mental ones to God for help, in the very hour and moment when you are tempted. Some of the richest blessings I have ever received were in answer to prayers that were sent up when my face was hot with suppressed irritation. I need hardly tell you, the irritation went down, and the spirit of the Savior rose up, and I came off victor over Satan. One who can do this, and always will do it, always comes off victorious. Show me the individual who prays honestly, earnestly, and hard, when temptation comes upon him, and I will show you an individual whom God will very soon use for his honor and his glory. Brothers and sisters, let us all pray for this Holy Spirit during this battle for temperance. I do not believe that "righteous indignation," as Christians are sometimes wont to term it, is very often wanted. I feel sure that God does not often want me to exhibit it. I know he does want me to show courage, and this is the second great thing we need, as friend Hasty has it.

To come right down close at home, in a few days we are to celebrate the Fourth of July, and I presume many of you who read these pages will take some part in this yearly anniversary of our nation's independence. In our town we have decided to have a celebration. A paper has been passed around to solicit funds for the purpose of defraying the expense of speakers, fireworks, public dinner, etc. One of our saloons subscribes \$25, the other one \$15. Of course, the saloons must be kept open on the Fourth of July. How could young America celebrate the Fourth of July without saloons? I by no means mean to intimate that we could not have a good, great, and glorious celebration without any thing to drink at all that did not intoxicate or exhilarate; but I was only thinking of past Fourth's of July. In connection with the fact of our saloon-keepers subscribing so liberally, I may remark that one of them received three barrels of intoxicants (liquors, not beer, mind you). These three barrels were probably to

be sold on the Fourth of July, even if they comply with the law so far as to permit no whisky to be drank on the premises. The three barrels will, probably, all of it be retailed out in little bottles. Boys who get patriotic (?) and reckless will get these little bottles full, go off in the woods or some out-building, and probably take their first drink on the Fourth of July. I feel terribly about this kind of work, because of the experience I have had with my boys. You remember my boy Albert whom I have told you about in times past. Well, he could get along very well until the Fourth of July or New Year's. Then he was sure to be treated and intoxicated. What a sad act is this on the day when our nation celebrates the anniversary of our independence!

Not very long ago, one of our citizens in passing home in the evening stumbled over some object on the sidewalk. He stooped down in order to see what it was, and received a volley of oaths and curses from the prostrate body. It was our old friend Albert! When the man found himself unable to get him up that he might take him home, he went back a little way, opened the door of one of our saloons, and said, "Here! some of your work lies out here in the street. Get him up and take him home, or he will be a dead body before morning." If I am correct, the saloon-keeper went and took care of him without a word.

You remember, too, of my telling you about one of our young men whom I found with his body across the railroad track, not far from our factory. This boy had one of these same little pint flasks of whisky in his pocket that he had bought at one of the saloons. They meet us at every turn. We find them along the sidewalks, thrown into hedges, out in the fields, in the woods, scattered about broadcast; and I presume they are scattered about just as thickly adjoining all the towns of this our United States of America — little flat glass bottles, something that can conveniently be put in the pocket. When I was in Cincinnati last fall at our convention, in a lunch-room at one of our large depots these little bottles of whisky were tastefully labeled, "Old Rye Whisky. Price 20 cts." I presume the usual price had been about an even quarter; but owing to the lively competition, and their anxiety to win favor with the boys, this enterprising lunch-room keeper had got the price down five cents. After I took my seat in the cars I found that the bottles did not all of them remain standing on the shelf, by any means. Boys in their teens took out their bottles, discussed the different brands, passed the bottles back and forth, as you might expect boys would.

My friends, do you wonder that our penitentiary is too small, and that it must be enlarged still more to accommodate the boys of our land? Do you ever have a Fourth-of-July celebration in your town? Do the saloon-keepers subscribe liberally? Will your boys probably be out late at night? Do they ever get on a strain of carrying on until they fail to consider the consequences of their boyish recklessness? Do we really want open saloons with little bottles of whisky

temptingly displayed, throughout this fair land of ours? Is it not time, think you, to be up and to be doing? Suppose you read again friend Hasty's words.

Now read what my sister, Mrs. E. J. Gray, has to say in regard to the work of the Women's Christian Temperance Union:

It seems a little remarkable that friend Hasty struck upon a plan which has just been systematized, and earnestly recommended to the three hundred delegates assembled from all parts of our State in their annual convention held at Bellefontaine, June 20, 21, and 22. Blank books are already prepared, and can be procured, two for 5 cts., at the headquarters, Cleveland. Any one interested is requested to procure these books, which explain the method of work. We hope all readers of this article will feel that a responsibility rests upon them to do what they can in their own locality. Do not say it ought to be done and wait for some one else to do it. Yes, it is a great work that is before us, and but few, comparatively, are awake to the danger before us as a State. The peculiar manner in which the amendments are submitted seems to us to threaten a long step backward, should the first proposition carry and not the second. Do the people of Ohio want taxation and license of this horrible traffic? When their eyes are fully opened to the fallacy of this doctrine, they will say emphatically, *no!* It is for us who do see, to put forth every effort to influence voters to vote for the second proposition, and not for the first.

The Ohio W. C. T. U. will publish a weekly campaign paper called *The Prohibitory-Amendment Herald*. This paper will be sent to 40,000 voters free. Any person may send a list of names to headquarters of W. C. T. U., Y. M. C. A. Building, Cleveland, Ohio. It is specially requested that persons canvassing for names pledged to vote for prohibition should send the names of all doubtful voters, and this paper will be sent to them free. The first issue appears June 30.

If undaunted courage and persevering effort on the part of the Christian women of Ohio will, with God's help, carry this State for prohibition, it will be done. "Fear thou not, for I am with thee; be not dismayed, for I am thy God. I will strengthen thee. I will help thee. I will uphold thee with the right hand of my righteousness." God bless brother Hasty!

Medina, June 26, 1883.

E. J. GRAY.

Then Moses stood in the gate of the camp, and said, Who is on the Lord's side? let him come unto me. And all the sons of Levi gathered themselves together unto him.

## Tobacco Column.

I HAVE made up my mind to try to see if I can't give up tobacco. Understand that I will pay you for the smoker ten times double, if I ever use tobacco again, unless the doctor says so, if it should occur through sickness, and then I will pay the full price. Keep this letter till I die, so that you can show it any time. Send the smoker as soon as convenient, for I need it as soon as possible.

J. H. BAUERNFEIND.

Nerstrand, Rice Co., Minn., May 19, 1883.

I am compelled to have a smoker; a pipe makes me sick. Send by return mail.

THOS. C. DWYER.

Ronaldsburg, Mecklenburg Co., N. C., May 10, 1883.

I have quit smoking and chewing tobacco. Please send me the smoker you say you will give for a present.

L. P. SMITH.

Bartlett, Shelby Co., Tenn., May 22, 1883.

I have sent to our friend Muth several orders for your smokers. I use them every day, and when the smoke curls up I think what a delightful thing it is to have no "smell of tobacco" about it. You can count on me, beyond doubt. I never will use the weed.

O. M. BLANTON.

Greenville, Miss., May 30, 1883.

MORE FROM FRIEND ROSS — SEE P. 201.

The smoker you sent to me I shall pay you for, as I feel the same about it as if I had stolen it. By the help of God, tobacco I never will use more.

Ibaton, Kan., Apr. 23, '83.

DAVID ROSS.

Thank you; and may God bless you, my good friend, in following the promptings of his Spirit.

I have used my influence to introduce you and your goods, and to tell what you'll do for persons who quit tobacco. The following persons have quit: T. A. Gibson, Dr. M. W. Gibson, and Julius Rogers, all of Davidson College, Mecklenburg Co., N. C. The latter one says if you will send him a smoker, he'll quit for good; the two former say if they get smokers, and backslide, they will pay for them.

Triangle, N. C., May 14, 1883.

C. S. LUCKEY.

Thank you, friend L. We send smokers to all, and put their names in print, as you see, so they won't forget their promises.

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE  
OF READING MATTER.

MEDINA, JULY 1, 1883.

There shall not any man be able to stand before thee all the days of thy life: as I was with Moses, so I will be with thee: I will not fail thee, nor forsake thee.—JOSHUA 1: 5.

TO-DAY, June 25, honey-extractors are being sent off at the rate of about 25 a day, and smokers at the rate of about 100 a day.

We learn from friend D. A. Jones, that the time for the meeting of the N. A. B.-K. Convention has been fixed on the 18th, 19th, and 20th of Sept., 1883. Toronto, Canada, is the place.

MANY of the friends are wanting gloves larger than the limit of our regular goods, which run up to only No. 12. For these extra-large sizes, Nos. 13 and 14, we are obliged to use "driving gloves," as they are termed, and the price is \$2.25, instead of \$1.75, the price of the usual sizes.

We are led to pause a minute, during the busy roar and whirl of business, by the sudden intelligence of the death of friend Houck, who has, for a short time past, had charge of the *Bee-Keepers' Exchange*. The paper is now in charge of Colgrove & Ullery, but we have not yet learned who has charge of the supply business.

ONCE more, friends, the season has come around when dollar queens are one dollar apiece; funny, isn't it? but when we buy them we pay only 75 cents. For the last month we have been so fortunate as to be able to fill orders almost as soon as received; that is, the supply has been just equal to the demand.

WE now have the American Express Co. at our station, instead of the old Union Express Co. which we have had here for so many years. This is good news for our patrons, as it does away with having express matter pass over more than one company, when you are located on the line of the American.

BIG troubles are coming again, because the friends will not remember to put on the county, as well as the town they live in. I do not know but that we shall have to keep saying every month, "Put on your county," or we can not be responsible for the mistakes that may occur in directing. If it is too much trouble to do this, have your full address printed on all your stationery.

#### HONEY PEAS.

WE have quite a trade in the honey peas, and have considerable many left yet. If sown in July they will produce honey just as well as if sown in June; but the peas may not be fully ripened for seed another year. However, since the honey will come in a time when most needed, perhaps it will be well to sow enough during this month to give them a good test at least. For prices, see page 361.

ON another page we speak of apple-tree honey. The tumbler of it that our friend sent us was taken over to the house with a lot of other samples, and submitted to the family. All united in declaring it the finest honey they ever tasted, and far ahead of the other samples. Not only was the flavor beautifully suggestive of apple-tree blossoms, but it was so clear and limpid that one could read print through the tumbler, and yet it was so thick it would hardly run in hot weather. Will those who have any apple-tree honey to sell, send me sample with price they will take for it?

If you are too busy to keep a copy of the order you send us, please do be a little careful about censuring us for what you meant to order, but did not. A few days ago I thought I would send at once, without looking the matter up, every thing that people said was left out of their orders, and then look the matter up, after we got over the rush. Well, the first three or four complaints we got, it happened the clerks were in no way at fault, for the missing articles were never ordered at all! In some cases, the writers insisted on having the order back before they could believe they were so careless. Shall we not try again to be "slow to anger," and cultivate a little more the spirit that "thinketh no evil"?

#### BEES AND HUMANITY.

If you look through the glass of a densely populated observatory-hive during the height of the clover season, you will see so many bees hurrying to and fro, passing and repassing, crooking here and crooking there, with such eager zeal that you fall to wondering whether it be really possible that each individual bee knows what he wants, or what he is after. Well, that is just about the way our office looks now, say toward ten o'clock in the morning. Sometimes three or four will be apparently chasing one after the other; then they turn, one this way, an-

other the other; then others come along, and they dodge, twist, turn, and crook; one grabs one thing, the other another. Some have both hands full of goods; others have an armful, and still another has letters and goods in his hands, and something in his mouth, so he won't forget or lose it. Girls come along with postal cards and letters pinned on their dresses; books are grabbed and pulled open, figures taken down, and books put back, and thus it goes until night begins to thin them off again. The saw-room below is almost a repetition of the scene above, only it is all sticks and lumber. The rooms below the saw-room, where wax, tin, and iron are handled, show the same activity again, and an outsider might think for the moment the whole building was a Babel of sprites and elves (there are 140 of us now) bubbling up antics just for the fun of the thing. Does each one know what he is doing? Indeed he does, and I begin to think perhaps the bees are following a regular business, each one doing his own appointed work, knowing what he wants, and what he is after, just as we do. I look on and wonder, and the feeling is much the same in either case. As I continue to gaze, I seem to see God in his greatness and majesty through this, the work of his hands.

#### SAWS.

WE have just received from the Industrial Publication Company, of New York, a very pretty little book, entitled "Saws," cloth bound, with 75 illustrations and 95 pages. The matter contained in it is, very much of it, quite valuable, especially to bee-keepers; for where is the bee-keeper who has not more or less to do with saws? I suppose, friends, you are well aware that a good man with a good saw will do more work in an hour than a good man with a bad saw will do in a half or even a whole day. It just occurs to me, however, that a good man would never have a bad saw; at least, a good man never ought to have a bad one. The price of this little book is \$1.00, which, if I may be excused for the liberty I take, seems to me to be just about 50 cents too much. Perhaps I may be able to make some arrangement with the publishers whereby I can furnish them at a less price, if I take a large number. The closing paragraph of the book is as follows:

There can be no doubt about there being too many teeth in the modern saw, as generally used, for ripping purposes; and I am satisfied, that if two-thirds of the teeth now employed were dispensed with, the same amount of work would be turned out with them as now, but with less labor, and the saws would be kept in better order at half the expense.

Now while we are on this subject, I want to remark that we have wasted perhaps many hundred dollars in labor by having our grooving saws for sections made with too many teeth. A few weeks ago Mr. Gray thought he would experiment a little in the matter, and the result is that one man now does our grooving easier than two men have done it formerly. All he did was to take out every other tooth in the saws, and make the under side of the tooth a little sharper pitch. While I think of it, I believe I will give you a little woodcut to show the shape and distance apart the teeth ought to be for gang-saws for dovetailing the end of basswood planks.

PROPER SHAPE OF SAW-TEETH FOR CUTTING IN THE END OF PLANK.

Now, not only will the sawyer do more work, but

the man who files the saws says that, with teeth like the above, one filing will answer for all day, while with the old style of teeth the saws had to be filed about four times a day. Just think of it, friends, all this difference by just having a saw with the right kind of teeth! The ones we used before had about three teeth where you see one in the cut.

We will pay 10 cents each for Feb. Nos. of GLEANINGS, 1883. Put your name on the wrapper when you send it."

The clerk who hunts up complaints says, "When inquiring about goods, please state whether you ordered them by mail, freight, or express.

We have to-day, June 28, 5595 subscribers, which is 32 less than we had a month ago, as you will recollect, about 450 having expired, who have failed to renew. Never mind; we shall have the 6000 yet before the year is out, if we have good luck and do not get discouraged.

PRACTICAL CARPENTRY is another work sent us by the Industrial Publication Co. Although the book is more intended for the building of houses than beehives, still it will be quite a valuable work for beekeepers. Fully illustrated with nearly 300 engravings, with a beautiful set of plates in the back, illustrating the different methods of "jointing." Although the book is considerably larger than the one on saws, the price is still \$1.00. We take pleasure in adding it to our book-list. Mailed on receipt of price as above.

#### THE FURTHER-ORDER BOX.

In our office we have what is called the "Further-Order Box." All letters that must await further orders from the writers must be deposited here. Well, a few moments ago I was remonstrating at the number of letters that have accumulated there, and I singled out one large bundle, asking what it was. "Why, Mr. Root, we *could not* do any thing with these, for they are all letters with no names or addresses." There these have to lie, friends, until some one gets mad and gives us a regular blowing-up, and then he usually signs his name. But, only last week we got a big blowing-up from a man, and he did not sign his name then. So we had two letters from him that are still obliged to wait. Don't you begin to think that it would pay you to have your name and address printed on your stationery?

WHEN a man is striving earnestly to do right, he generally looks happy; when he deliberately does wrong, he almost invariably looks unhappy. If he does not look so, at least he feels so. Now, it would hardly do, I presume, to say that every man who looks cross and unhappy has a guilty conscience. But I think it would be true in a great many cases. A few times in my life I have had to do with men and women who had committed deliberate crimes. On looking back and thinking the matter over, it seems to me that these people, almost without exception, showed it in their faces and in their actions. Several times I was led to suspect the guilt, more from their looks and deportment than from any real knowledge in the case; and afterward, when the matter came out (for, you know, "murder *will* out"), I then remembered my impressions and my convictions. Now, friends, is it not so, that, among all the troubles one meets in this world, a guilty conscience is the worst trouble by far?

## ENCOURAGING WORDS FROM "OUR CLEARING."

FEEDING, SWARMING, NEW HONEY, ETC.

**W**E begin the season with 35 colonies. We lost two in wintering — wintered on summer stands in chaff packing — and have sold 38. But you thought we intended to reduce our number to 10? Yes; but to change her mind is one of the inalienable rights of woman. Please do not ask which has contributed most to this result — the difficulty of finding purchasers without advertising, or the suggestions and expostulations of some of our bee-keeping friends. Perhaps it is due to these latter that we (even Nellie) accept the present situation quite cheerfully. It has, assuredly, given us much of grateful pleasure to know that, had we fallen out of the ranks, some of our comrades — and those not the least esteemed — would have missed us.

#### FEEDING THROUGH BAD WEATHER.

Two weeks ago we were feeding sugar syrup to 66 colonies, giving some only a taste — just enough to prevent destruction of brood — while others, entirely destitute, received full rations. Since our first summer in bee-keeping, 1872, when we found our one beloved colony starving in the middle of June, we had had no occasion to feed sugar syrup. Not that there have not been seasons of scarcity, but surplus combs of honey have always taken us safely and easily through. Bee-keepers to whom feeding is no novelty would have been amused at our consternation, as we faced the prospect of being obliged to maintain, on sugar syrup, 66 colonies, most of them strong in bees and brood, and tried to compute the expense per week, should the rain continue, or the raspberry-buds be blighted by frost.

Happily, our fears were not realized. The last feeding was on Sunday, June 10th. I dared not wait till Monday. It rained continuously; but I visited each colony, and made sure that no bee went supperless. On the afternoon of the next day, the first tiny pellets of raspberry pollen were brought in, and we banished all further anxiety. One week from the rainy Sabbath on which I last fed them, six swarms came out before church time.

#### A FORCE-PUMP FOR ARRESTING SWARMS.

A lady friend writes me this, apropos of her management of swarms. "I have a force-pump, and it seems as if I can drive them anywhere, and make them cluster just where I want them to, with it. I doubt my handling a swarm-catcher, alone, as easily as I can my little pump." This indorsement of the force-pump as a swarm-catcher may be to some of our sisters, as to myself, of special value, because made by a woman. She is one of the most intelligent, enthusiastic, and capable lady bee-keepers of whom I have knowledge; and that she finds the force-pump serviceable, and adapted to a woman's use, has weight sufficient to induce me to try it myself the present season. I have never seen one in use, but had fancied that it must be too awkward and cumbersome for a woman to manage — that it belonged rather to our brothers.

#### SWARMING-BASKETS, ETC., IN THE BACKGROUND.

Allow me to quote from the same friend's letter another paragraph which amused as much as it interested me, and which may seem a little startling to some of our sisters — those who are taking their first steps in bee culture, and still handle their pets rather timorously, and always at arms' length. "Mrs.

H.'s 'dish-pan' for carrying swarms isn't half as convenient as 'my big work-apron.' I always have it on in the bee-yard; it will hold half a bushel of bees, and has the advantage of being fast to me. I can let down one end of it, roll my bees in front of entrance, and by unpinning it and holding the binding over top of hive, have my pets all cooped up as nice as you please, with liberty to enter the hive at leisure, and shaded at that. Give me the apron every time for gathering a swarm from a currant or berry-bush!" Is not that an original and truly womanly method, brother bee-keepers?

For the past three days, honey has come in faster than at any time last season. Notwithstanding the cold backward spring, the dearth of honey two weeks since, and the continuance of quite too frequent showers, work in sections is considerably in advance of this date last year. And it has all been done within a week.

CYULA LINSWIK.

June 23, 1883.

Thank you, friend Cyula. I know exactly how you and your sister felt when buying sugar to feed right in June. I well remember the time when it was almost with a guilty conscience that I went to the grocer's and bought sugar to feed my bees, barrel after barrel, and hearing my friends and neighbors say, "Why, that fellow Root has gone crazy. He has gone and bought a whole barrel of sugar, just to feed 'them bees,' and he will never get half of it back in the world." To tell the truth, I was almost afraid I wouldn't either. But I wintered the bees, almost to a colony, and the next season the neighbors were in a greater consternation than when I had to feed the sugar. But it was for another reason. "Who ever heard of such tons of honey?" said they. "And will he ever be able to sell it all?"—I am greatly interested about that force-pump. Are we to understand that it is something different from our fountain pump that we are selling so largely? or is it something that the friend you mention improvised herself?—Your idea of a big apron for a swarming-basket is wonderful; and when reading it I felt to wondering whether any of the bee-keepers of our sex would have the courage to use it, even were a big apron furnished them. After the bees began to climb toward his face, it seems to me he would be in considerable of a hurry to get those strings undone. Your friend must be a genius truly. Can we not have some more hints from her?

#### DOES ONE'S TREATMENT BY BEES DEPEND ON HIS BEHAVIOR?

BEES THAT WOULD FIGHT A STOVE-PIPE.

I AM glad to see by June GLEANINGS that W. A. Pryal has supplemented my correction of the naming of our white sage with an engraving that is readily recognized, the only trouble being that the inflorescence is not clearly represented. I have wondered many times where Prof. Cook got the sample which furnished the engraving in his book and in yours. The flower so carefully pictured there on a larger scale is as far removed from all relationship with the sage family as is the flax or the rose.

But, I write this to ask you if you are sure about your position that a person's manner among bees is

the sole governing power in their conduct toward him. To prove that it is not, let me recite a case in point.

An inoffensive stove-pipe presumed to lift its somber head above the cabin near the city of beehives belonging to one of the apiaries of R. Wilkin, San Buenaventura, Cal. It was on its own soil. It never tried to rob. It had never harbored evil thoughts toward any creature. Whenever a man opened a hive of hybrid bees near by, did it act nervous and fidgetty? No, verily. It bore itself sedately and decorously as any elderly stove-pipe should. But, when the hive was opened, the bees danced the scalp-dance, sounded the war-whoop, etc. (see Virgil), and rushed headlong at the stove-pipe.

How did it behave itself then? I never saw it dodge its head. It did not beat the air. It did not prance nor swear (unlike a man), nor run away. It remained as rigidly motionless as a stoic. In fact, it was and is one. But still came the bees; and they battered and rattled against the stove-pipe's sinless head till it sounded like window-panes in a first-class hail-storm. They even crawled down its whole length into the stove. It was liable to be attacked at any hour of the day, whether fire was in the stove or not. If the former were the case, hosts of bees were killed inside the pipe. At such times the bees would likewise vent their rage on any person who came in sight. As a last resort, we made it a bee-veil of wire gauze; but I fear this was more for the sake of the bees than for the stove-pipe.

*Moral.*—If bees will try to sting a motionless stove-pipe, how can a person bear himself so quietly as to be safe from their attentions?

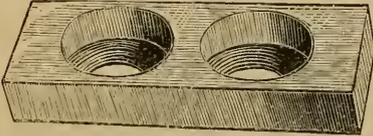

ANDREA NORTON.

Gonzales, Cal., June 13, 1883.

Friend N., "Aunt Mate," who is still opening the letters, has neatly penciled, at the close of your article, "pretty good," and I think I shall have to say the same. In fact, you have got me into a pretty tight place, and I don't know but that I ought to give up; but on the whole, I think I will try to hold my point a while, after all. I believe I shall take the ground now, that human intelligence has a power over the brute creation that a simple, inoffensive stove-pipe has not, and that there is often something in the bearing of an individual that makes a bee, a dog, or a horse, respect and fear him; or, in other words, his presence and manner impress them in a way that a stove-pipe does not, begging the pipe's pardon. Yesterday, while passing through the apiary, I saw a new hand opening a hive, and I felt sure she would get stung, just because she removed the enameled sheet from the frames with too little respect to the feelings, or, rather, *rights*, of the little people underneath. I don't get stung when opening hives, because I know better the habits and dispositions of the bees, and what they will bear with impunity, and what they will not. And further, give me a pupil who is docile, bright, and anxious to learn, and I will teach him to do it just as well as I do. Perhaps I might add, that I do not find one bee-keeper in a hundred who handles his bees as it seems to me they should be handled, and I think both time and money would be saved by humane management.

### CANDY BLOCK FOR BEE-CAGES.

**A**FTER several experiments we have decided in favor of the little block shown below. It is just 4 inches long, and made to crowd in close in a Simplicity section. The block is  $1\frac{1}{2}$  inches wide by  $\frac{3}{4}$  deep. Two holes are bored in it,  $1\frac{1}{2}$  inches or a little larger. The small holes are  $\frac{1}{8}$ . After the block is filled with the Good candy, it is fastened with wire nails in the section box — a block of candy on each side. Bees then have access to it through the small holes.

CANDY BLOCK FOR BEE-CAGES.

You will observe the block is made of such dimensions that the wire caps when squeezed down will not injure a bee. As there are two blocks in a section, the quantity of food is proportioned to the size of the cage. The cage for two sections will hold enough for  $\frac{1}{2}$  lb. of bees, while the cage for three sections will hold enough for a whole pound. When the candy is made of the powdered sugar, such as we have lately advised, there will be no trouble from the grains rattling out. In fact, it stays in the box in a pasty mass until the whole is consumed. We have had no loss this year so far, even when no water-bottles were used, with the exception of one lot that was carried past their destination. The bees then starved because they were over a week on the way. For trips longer than a week, perhaps it would be well to use water-bottles; or the block could be made to hold more candy by putting the two holes a little further apart, and making a third hole between these two. Two openings for bees will probably be sufficient. It may be that during a severe drought this Good candy without water might not answer the purpose so well. The season thus far has been unusually wet. In fact, there has been more or less rain on almost every day. We can furnish these blocks for 2 cts. each; 18 cents for 10, or \$1.50 per 100. One cent each, additional, if wanted by mail.

### A WHEELBARROW FOR BEE-KEEPERS.

**A**LMOST every bee-keeper needs a wheelbarrow of some kind. Even though a wagon-road be so arranged as to come close up to the hives, still there will be more or less work to be done by laborious carrying back and forth, unless it be moved with a wheelbarrow. As the "Bee-keeper's wheelbarrow" is liable to be left out in the weather, it is quite desirable that it should be made so as to stand both the sun and the rain. The one we illustrate below is well calculated for this purpose. The bottom-board is flat, so as to hold a hive or hives safely and securely. It is rather broad; and with the back and front boards, quite a load may be carried, even of bulky articles. It

facilitates the moving of long stuff as well as lumber or scantling. These side-boards can be quickly removed. Furthermore, if the woodwork gets broken, or spoiled by use, any one who can handle a saw and plane can make new ones. Below is the manufacturers' description of them:

The body being a combination of the railroad and garden barrow, is adapted to a larger variety of uses than any other make. Used with side-boards it has a large capacity for holding dirt, rubbish, manure, apples, potatoes, coal, garden truck, etc. With side-boards out, the bottom of the body being flat, makes it handy for hauling boards, posts, tool chests, boxes, cord wood, and a variety of things not requiring side-boards. The bodies are made of straight — not "bent lumber;" can be easily repaired by any one in case of breakage, and are very strong, being made of 1-inch lumber, dressed, and having four strips across the bottom to increase strength, and is very roomy.

The handles, legs, and part the wheel is attached to, are made of extra heavy gas-pipe, 1 1/8 in. outside, all in one continuous piece, making it strong.

No joints for rain and sun to rack and rot. Is practically indestructible; no wear out, as is the case with the wood handles and legs, which soon rot and go to wreck.

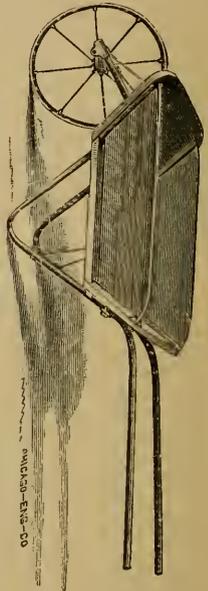

The legs being curved where they strike the ground, will slide along if dropped while in motion, instead of catching in the ground and breaking or straining the barrow, as is the case with other makes.

The wheel is iron, 17 in. high, and has a broad tread,  $3\frac{1}{2}$  inch, making it desirable on soft ground, as it will not sink in.

The entire barrow is well painted, and altogether makes the Leader the best wheelbarrow for general use. Will outwear a dozen cheap ones.

Is light to handle, weighing only 50 pounds. In shipping, they are sent "knocked down;" the bodies nest, and the legs and braces tied together.

The regular retail price of these wheelbarrows is \$5.00 each. We have made arrangements for buying them in quantities, whereby we shall be able to ship to our bee-friends for \$4.00 each. They can be sent by express or freight. Printed directions accompany for putting them up. If sent with hives or other goods, the freight will be only a small item. We have one in constant use, and are much pleased with it.

THE BEE-KEEPER'S WHEELBARROW WITH SIDEBOARDS IN PLACE.

## ON HAND,

A limited number of CHOICE TESTED QUEENS. Price \$1.50.  
L. W. VANKIRK.  
74fd WASHINGTON, Wash. Co., Penn.

## BEE-HIVES FOR SALE!

I manufacture every thing needed by bee-keepers, made of wood, not patented. I make Simplicity and Langstroth hives a specialty. My work is as good as the best, and my prices always please my customers. Send postal card for my illustrated catalogue. 4fd  
H. F. SHADBLT,  
WINOOSKI, - - SHEBOYGAN CO., - - WISCONSIN.

# SHIPPING-CANS For HONEY.

"Iron-Jacket" Honey-Cans.

I presume the friends are aware that ordinary tin cans are not very safe for shipping full of honey, unless boxed or crated. The cans above are ready to be shipped anywhere.

	PRICES.	
1 Gallon,	- - - - -	\$0.25 each.
2 "	- - - - -	.38 "
3 "	- - - - -	.47 "
5 "	- - - - -	.68 "
10 "	- - - - -	1.10 "

By figuring 11 lbs. of honey to the gallon, you can easily see how many pounds each can holds. They are made from tin plates. A sheet-iron casing, with wood bottom, protects them from bruising. The iron jacket is stronger than wood, and far more serviceable. They neither shrink nor swell, and do not split nor fall apart. Every can is tested by steam and guaranteed to be tight.

A. I. ROOT, Medina, O.

## ITALIAN & HOLY-LAND QUEENS.

The handsomest queens for business the world produces.  
**BUSINESS, BEAUTY, AND WINTERING QUALITIES COMBINED.**

We challenge the world to equal them!

Every queen warranted perfect. Tested queens, \$2.00 each. Handy Book and queen, \$2.50; queens warranted as good as tested, and Handy Book, \$2.25. Special rates by the dozen. Send for 32-page circular.

HENRY ALLEY,  
Wenham, Mass.

## WHY NOT BUY YOUR QUEENS

DIRECT FROM THE BREEDER?

TWENTY-FIVE CENTS SAVED IS TWENTY-FIVE CENTS MADE. After the first day of July I shall be prepared to send out from 10 to 15 dozen untested Italian queens (reared from imported mothers) per week, for the small sum of \$1.50 per half-dozen, or \$3.00 per dozen.

Address W. S. CAUTHEN,  
Pleasant Hill, Lancaster Co., S. C.

E. T. LEWIS & CO., TOLEDO, OHIO,  
Manufacturers of the U. S. Standard Honey-Extractor (new improvements), and all other Apianian supplies. Send for circular. 1tfd

GEORGIA AHEAD. Stocks for Apiaries, Silk Farms, etc., cheap as any reliable parties.  
CHAS. R. MITCHELL, Hawkinsville, Ga.

## ITALIAN BEES BRED FOR BUSINESS.

PRICES:

Warranted queens, each, \$1.00; per half doz. \$5.50; per doz. \$10.00. Tested queens, each, \$2.00. Three-frame nucleus and warranted queen, \$3.00.

Full colonies for sale at a bargain. The combs are all in the Langstroth frame, wire-strengthened. Safe arrival and perfect satisfaction guaranteed. See advertisement in May GLEANINGS. Circulars free. Address

J. P. MOORE, Morgan, Pendleton Co., Ky.

He that is faithful in that which is least, is faithful also in much.—LUKE 16. 10.

PUBLISHED BY A. I. ROOT, MEDINA, OHIO.

Vo. II.

JULY, 1883.

No. 4.

**MYSELF AND MY NEIGHBORS.**

WHO IS MY NEIGHBOR?—LUKE 10: 29.

And the Lord God formed man of the dust of the ground, and breathed into his nostrils the breath of life; and man became a living soul.—GEN. 2: 7.

**D**EAR CHILDREN, I have a new topic to talk to you about to-day. I have no idea that this topic will be as interesting to you as to me; and I am not quite certain, either, whether it properly belongs under the department of "My Neighbors," although it surely comes very near indeed to that part of it included in the term "Myself." What do you suppose it is I am going to talk about? Well, it is the new baby over at our house. He is now just about six weeks old; and if I were sure it would be as interesting to you as to me, I might fill this whole JUVENILE in telling you about his funny ways and habits, although he is only six weeks old, or a little more. Have any of you got a six-weeks-old baby at your house? I will try to tell you one reason why my thoughts center so much on him. I used to teach school once; and when I got through teaching that school, some way I took to teaching boys and girls in general, and have been doing it almost ever since. One of the most interesting things to me in this world of ours is the problem of human life, and especially human intelligence. Every day of my life I am teaching somebody something,

and every day of my life I am watching anxiously, and I hope prayerfully, the unfolding of intelligence and ability and skill in those about me. I am obliged to study the money value of these friends whom I meet, because I pay them wages, and the amount of wages they receive is in proportion to the amount of intelligence and ability that they manifest to make themselves helpful to other people. One of the great wants in this world is the ability to make our wants known to others, and also to minister to the wants of others. For instance, a hundred or so of people are coming to us every day, telling what they want; and their letters expressing these wants are turned over, directly or indirectly, to a hundred or more boys and girls, to wait on these people who come to us. Now, the great thing needful is, that we may understand each other—that we may convey the thoughts of our hearts to the thoughts in their hearts. To do this we have a language, and talk. Is it not funny that we can talk to each other? Well, friends that are a great way off can not talk so far; it would make them hoarse, you see, to shout to us away across the Rocky Mountains or across the vast oceans; therefore they write letters. Now, while some of them write real nice plain letters, and tell what they want plainly and clearly, others make horrid work of it. Yes, they make even worse work of it than you children do, for I can read the worst letters from children that have ever been

sent us, a great deal easier than I can some of the letters of grown-up people. Not only that, the grown-up people often tell half that they want, or even less, while most of the children tell it out plain, sometimes two or three times over. Is it not queer that we now talk to each other all over the world, and understand each other, too, pretty well at least?

I have told you before that when a great deal has to be written, we have methods of writing that are shorter and quicker than the way you write. What I am saying to you now is taken down in this same shorthand we have been talking about; and, by the way, I might tell you that we now have in our factory here two shorthand writers and two type-writers — all these as a means of communicating intelligence rapidly and surely from one to the other.

Well, now, we have had all this talk, and not a word about the baby. What do you think it has got to do with the baby? Well, just this: I have been talking about the growth of human intelligence; and it has been a wonderful study to me to study the growth and unfolding and development, as it were, of intelligence in this boy-baby of ours. I was wonderfully curious when he first began to manifest the intelligence that stamps humanity so far above any of the animal kingdom. When he was a week old, or about that, I was sure that he showed intelligence enough to give us one of those wonderful baby-smiles. He did not laugh out loud, of course, and I do not suppose you could call it a laugh at all. But there was a queer turn to the corners of his little mouth, and a sparkle in those soft blue eyes that told to me unmistakably that he recognized his friends, and that he began to realize how much he was loved and thought of in that home of ours. It seemed to me as if it were almost a bright revelation from God's own mind, sent to us to tell us again of his wondrous love for his children. In a week more, the baby began to show funny little ways, and soon he became capable of being taught little tricks, as it were. Perhaps if I should tell you about them, many of you would laugh, and say it was only my imagination, or that all babies do so; and perhaps some of the matrons that read JUVENILE GLEANINGS may say knowingly that it was only the effect of wind on his little stomach, and that a baby three or four weeks old has not a "speck" of sense. We know better, don't we, little friends? Babies do know, and babies do think, and babies do learn, even if they are not a month old yet. Have you any idea how much of a comfort that baby is to me? I tell you, my little friends, I get very tired some of these days, and when I go home and get his precious soft little self in my arms, and just put my face right down under his dimpled little chin, and talk to him, and make him smile, why! it rests me more than any thing else in this world. Even when he is sound asleep I could sit and look at him by the hour. And I would think, too, by myself, that the world might go here and there after pleasures and beauty; but as for me, there is nothing in this whole wide world so handsome and so beautiful

and so pleasing to the eye as "our baby." Perhaps some of you have read "The Christian's Secret of a Happy Life." Well, our good friend who writes this book says in one place, in speaking of the baby of the household, "He toils not, neither does he spin; yet who in all that household is loved and fondled and caressed like that baby?" You see, he has no merit of his own; he is no help about the work of the household; and, by the way, my wife says that, even if he does not toil nor spin, the one who takes care of him does both toil and spin at times in very good earnest. Why do we love him? Is it not because God sent him?

May I tell you just one little trick of his which he has learned within a few days? I might add, he is not by any means one of the *best* babies in the world. He can cry right lustily, I tell you; and sometimes when they want to put him in the crib, and he does not want to go there, he will curl himself backward, standing on his head and heels, and manifesting his protest at being put to bed, in a way that might almost raise the roof of the house if it were not a heavy roof of slate, and securely fastened down. Now, children, I am afraid that is a pretty big story for your Uncle Amos to tell; but I could not think of any other way of expressing the power of baby's lungs, and his vehemence, when he wants to do something you do not want to have him do. Well, now, when I come home, thinking what fun it will be to just get hold of his precious little self (even though his rosy little lips do drool on my coat-sleeves now and then), no matter how hard he may be crying when I get him, he is pretty sure to be good; and after I have talked to him and told him stories, you know, and pinched his fat, chubby legs, and given him four or five big kisses, he will get so good-natured that, with a little provocation, I can make him laugh right out loud — at least, I call it laughing out loud. You see, I just give him a touch on his dimpled chin, and then on his rosy lips, and then on his little pug nose, and he begins to smile with so big a smile that his little mouth is stretched almost to its widest capacity. Then when he can't smile any "wider," he will usually throw himself back, and give a sort of "coo," expressing his relish for the fun.

About this time his mother begins to scold to see how he carries on before I come, and then turn around, all smiles and good nature when I get home! Now, when friends come in to see him, and smile at the idea of a six-weeks-old baby laughing out loud, I just take him and go through with the whole performance, and then you see they have to give up.

Do you want to know what his name is? Well, my name for him is "Peter." When they ask me why I call him Peter, the only reply I can give is, that he looks just as if his name ought to be Peter; and although all the rest of the household scold about it, and declare it shall not be Peter, Peter it is, and has been so far.

Now, little friends, you know all about Peter. And this is not a made-up story either. Don't you kind o' like real, true stories?

## VIRGIL'S TREATISE ON BEES.

*Concluded.*

### THE PROPER WORK FOR BEES OF DIFFERENT AGES.

**T**HEIR city's walls to elders are the care,  
To cap the combs, and cunning work prepare; (1)  
The younger wearied come at evening time  
With legs full packed with pollen from the thyme:  
They pasture the arbutus by the way,  
The smiling crocus, and the willows gray;  
The rich, fat linden, and the cassia too,  
And hyacinths with red and rusty hue.

### HABITS OF LABOR.

To all one rest from toil, one work to all,  
Forth from the gates they rush at morning's call. (2)  
Delay is nowhere; but when vesper tells  
To cease from pasture o'er the plains and dells,  
Then seek they to the sheltering roofs of home,  
Their bodies then refresh beneath its dome;  
A sound is heard, they fan with murmuring roar  
On lighting-board and threshold of the door. (3)  
When now to seek their chambers it is best,  
In later night the sounds are stilled to rest; (4)  
Their members, wearied while in fields they strolled,  
Their own sweet rest doth for a season hold. (5)

### BEES BEFORE AND DURING STORMS.

Not far, indeed, they venture o'er the plain  
To leave their homes when waits impending rain,  
Nor with implicit faith believe the sky  
When fierce east winds in stealth are drawing nigh;  
But, safe from storms, beneath their city's walls,  
Bring water simply when occasion calls. (6)  
Some little flights round home anon they try,  
And pebbles oft they carry when they fly; (7)  
As little boats their needful ballast crave,  
Unstable else before the tossing wave,  
But, with their pebbles, steady as a scale  
They bear themselves straight through the harmless gale.

(1) If this is not the way it is, we will play it is the way it ought to be. Let the old folks tinker up things and "potter around" at home, finding time to tell a story once in a while about times when they were young; and let the brawny young chaps "skirmish" for honey and pollen. But if the exact facts are sought for, why, then, I suppose the aged bees are a good deal like the old man of Clificia, braver and more industrious to the last. I believe authorities now hold that the oldest bees work almost wholly in the fields, and keep at it till they fall and perish, the wearing-out of the wings being often the cause of the final disaster. But I for one would not be surprised to hear it proved, some time or other, that the sentinels, and those that do the more difficult work with propolis, are really aged bees.

(2) I'm thinking of that hive of black bees friend Root had a few years ago. They found out he had a patch of spider plant (which secretes honey only in the night), and that by getting out before it was fairly light they could get a lion's share of it. If they waited a little they would have to divide with a hundred or more colonies, and so they slept with one little deaf ear open, and heard "morning's call" a little beforehand, and "rushed forth from the gates" when it was so dark that friend R. had to get down on his knees to be sure they were actually coming out to work.

(3) The usual minute accuracy of Virgil comes to the front again here. It is not the common buzzing about the doorway that is meant in this place, but

the curious, steady, muffled roar which commences at nightfall of each day when a fine lot of nectar has been gathered in. The roar continues until enough water is evaporated from the new honey, or enough so they decide it will do for the present. Honey just as it comes from the flower would very quickly spoil if they did not "cook it down." They don't put the thin honey in the cells and then blow on it like little boys blowing a plate of hot soup, as some folks seem to get the idea. They know a trick worth two of that. Their own bodies are full of air-tubes, and they evaporate the water out of themselves, and, holding the thin honey in their honey-sacs, the surplus water filters through the walls of the sac and takes the place of that which was evaporated out of their blood by the fanning. They also keep the tube of their ligula, or trunk, full of thin honey during the process, and press it out till a tiny drop hangs on the end. They are careful not to let it fall off. They keep pressing it out and drawing it in again as they keep up the fanning. In fanning they all stand with their heads one way, and move their wings gently. A rapid current of air is thus produced that takes away moisture very rapidly.

(4) In our country I believe the bees sometimes have to fan all night to finish up their job; but probably this scarcely ever happens in Italy, where Virgil lived. The daily runs of honey are small in Italy, and as a natural result the bees would get the honey "done" long before morning.

(5) This is not far from the exact truth. Ancient investigators seemed inclined to go too far in speaking of bees resting, and moderns are inclined to go too far the other way in denying that bees ever rest at all. Truth lies somewhere between the two. Bees have absolute need of but very little rest—much less than animals.

(6) The need of water seems to be one of the most imperative of all their needs. Without water, their babies would suffer greatly, if not die outright; consequently they go for that in very bad or threatening weather, when nothing else is carried.

(7) It seems too bad to explode this pretty tale of sagacity; but I'm "afeced" it will not stand the test of modern research. The facts out of which the mistake seems to have arisen are interesting, and not at all discreditable to Virgil and other ancient observers. In cold windy weather in the spring of the year, some hardy old bees will not keep quiet, but insist on searching the country to see what they can find. And what can be found at such times? Almost absolutely nothing, except old propolis sticking to empty hives and disused fixtures. Various substances are made to do duty as propolis at times, and the stuff may be almost any shade of red or brown, or even black. Nipping and prying away at this stuff, the resolute old chaps break off large irregular chunks of it. It is so hard with cold that they can not make it into rounded pellets as usual; but they manage somehow to fasten it on in the usual place of carrying pollen-balls, and home they go with it. Ancient scientists seem to have jumped at the conclusion that these black-looking, angular fragments were pebbles, carried for ballast.

Very many thanks for the kind and complimentary way this translation and commentary is received. And as for having it in book form some day, we'll see what we shall see. E. E. HASTY.

Richards, O., July 9, 1883.

Friend Hasty, I came pretty near jumping

up and swinging my hat when I read your No. 3; but after a little while I was glad I didn't. May be you are right, though, after all. I am sure you are partially right about bees "cooking down" the raw honey. You know we have had a good deal of speculation about this subject. If I recollect correctly, friend Doolittle, or some one else, suggested that the bees "sort of" "churned" the water out of the honey in homeward flights from the flowers. Now, this idea, which I believe is mostly yours, that bees use their breathing-tubes for evaporating the honey as well as getting the breath of life, I do not know that I have ever heard of before, or ever thought of it; but since you suggest it, I believe you are right. I am sure they hold the honey out on their tongue, and blow it, for I had decided on this long ago; and now I should accept your explanation, every bit of it. Were it not for the fact I mention in the A C, under the head of "Water for Bees," page 260, where I speak of the bees gathering thin watery honey from the figwort, and expelling the watery portion as they start to fly home. Last fall, when they were at work heavily on the gray buckwheat, by stationing myself on one side of the field, the clear water which they threw off as they started for home, heavily laden, was so great that it almost made a small shower. I have collected this watery matter in clean plates, and fasted it, and it is pure water, and nothing else. They throw it off while on the wing; and I presume careful observation will show that it is thrown off in this way when they start for home, no matter what kind of blossoms they are working on.—Once more I congratulate you on the skill with which you have unfolded and explained VIRGIL.

### OUR JUVENILES AWAY OFF IN AUSTRALIA.

A LETTER FROM ONE OF THE JUVENILES.

**A**S papa is writing to thank you for GLEANINGS and catalogue, I desire to thank you for JUVENILE GLEANINGS, which very much interested us. My brother Ernest and I wish we were able to get it every month. We have been keeping bees these last two years. Ernest and I have had a good deal to do with them in the way of hiving and driving them from one box to another, in order to get the honey. We feel very anxious to know more about the modern system of managing bees. We hope, after receiving your A B C, we shall be able to manage bees much better than we can now. Last year papa made 5 frame hives, which are a great improvement on the boxes; but not knowing how to make them properly, the bees build their comb too thick, and also fasten the frame fast to the box, and we have much difficulty in getting the first frame out, and often make a muss in so doing. Last year was a very bad year for bees, and we lost half of them. This is a very much better one so far. This fall crop bids fair to be a good one, on account of gum-trees (*Eucalyptus globulus*) flowering this year.

TREES 300 FEET HIGH.

The gum-tree is one of our most useful and largest trees for all kinds of sawed and split timber. Many

of them grow to the great height of 250 to 300 ft., many of them measuring 30 ft. in circumference at the butt. We have many flowering trees which afford forage for the bees. The wattle-tree flowers in spring (September), about as soon as the willow and peach trees. Many other trees continue to flower up to our first fall month (March), then our noble gum-tree comes into flower. In some of the warmer parts of our colony, bees can get a little pollen and honey nearly all winter, and need little or no attention. They are left standing out anywhere in old boxes, without any cover, or any thing but water. Right in some parts of the woods there are great numbers of bees in hollow trees; and when cut down, people get a great many pails full of honey.

#### KANGAROOS.

We who live on the opposite side of the world from you have a great many things that would be curious and interesting to you; viz., the kangaroo, which carries its young in a bag, or pouch; a great many thousands of them are in many parts of our colonies, and when closely pursued by man and dogs they will often throw out their young ones, that they may escape. The "old man" kangaroo often stands about 5 or 6 ft. high, and are very dangerous to man and dogs, seizing them with their little fore-feet. They will rip them to pieces with their hind great toe, and if there be water near by they will carry them to it and hold them under until they are drowned. If any one can manage to cut their big tail off they will tumble over and lie perfectly helpless, it being their balancing-pole, which is 5 or 6 inches through, and makes capital soup.

#### WILD-CHERRY TREE.

I think it is about time to cut my narrative short, or you will think I am very voluble. So I will only mention one thing more — our wild-cherry trees. It has a beautiful shape; its foliage is like that of the pine, and seldom attains the height of 15 feet. Its fruit is about the size of currants, more the shape of grain, or wheat; instead of the stone being on the inside, it is on the outside, the opposite end from the stem.

Ernest and I wish we lived near you, that we might see you and your factory, where you make all the implements for the apiary, which would delight us very much. How big is that wheelbarrow of yours that is always full of books, and running over? If there were any thing about bee culture in it, and were passing our place, we would be sure to pick up all those that tumbled off. We can get all kinds of books here, and we have many good ones too, but nothing treating on modern bee culture. The JUVENILE we soon devoured, and wish we could get it every month. We can not learn from it what the price would be for 12 months. Please let us know how much it would be, and the best way to send the money to you. NORMAN T. LOUKES, age 14.

Daylesford, Victoria, Australia, March 11, 1883.

May God bless you for your little letter, and the sample bee you sent, my young friend. We send a book from the wheelbarrow full, and GLEANINGS a year for your letter. The JUVENILE is a part of the other, and is never sent separate. The price, \$1.00, covers both. We are all very much interested in your account of those great gum-trees, as well as your interesting account of the kangaroo. It sounds different from reading accounts of these things in books, because we have a real live letter

right straight from you in your far-off home. I am sure we shall all be very glad to hear from you again. I wonder if your people have developed your honey resources as well as we have here. Do you have bees enough to gather the honey from those great gum-trees? and do you understand giving them room in their hives as fast as they can use it?

### IDA'S LETTER AFTER SHE FELL DOWN STAIRS.

A NOVEL WAY OF KEEPING A SWARM OF BEES FROM GOING OFF.

**I**T is much harder for me to write this time, because a week ago I fell down cellar and sprained my arm very badly. I suppose you wonder that I am writing, as it is my right hand that is sprained; but I wanted to tell you that I hived two swarms about four days before my accident. I had a very hard time hiving them, for they were near the top of a high tree, which I had to climb. I think it was just two days after I was hurt that the bees swarmed again. We were in quite a fix, as you may suppose, for there is not one in the family who will try to hive them but my brother Bertie, papa, and I. Bertie and papa were away, and my arm was hurt so that I could not use it; so, what do you think Wilfred did? He poured a painful of water on them, so they could not fly away. They stayed there until pa came home in the evening. Pa took the net that the girls use to catch insects in, and held it under the branch where the bees were, and shook the branch, and the bees fell into it; but pa could not get the queen, so the bees clustered on the branch again. Pa tried several times, but to no effect. He had to cut the limb off, which he was trying to avoid. Pa got them at last. I hope the bees will wait until my arm gets well before they swarm again. I must stop writing, for my hand begins to ache.

IDA SINGLETON, age 13.

Brooklyn Village, Ohio, July, 1883.

I think you have written a very good letter, Ida, and I admire the energy with which you saved the swarm of bees, although I am not sure I would advise pouring a whole painful of water on the little chaps. Did they get dried off, so it did not hurt them any?

### OUR GOOD FRIEND MRS. HARRISON.

ALSO SOME FUNNY STORIES ABOUT HER PETS.

**W**HILE I was at work in the apiary this morning, I was thinking, and kept thinking, of the bee-children. I'm only a grown-up child, and I like Sunday-school and playthings, just as well as you do. You think grown-up people can do just as they want to do. Now, this is a mistaken idea; we can't do any such a thing. The Sunday-school superintendent says, "Sister Harrison, you've got to teach that class," and I do it, when I would so much rather be in a class, and have a teacher take me over the same ground with Paul and Barnabas in that first missionary journey. Did you ever think of it, that people and children all over the world are studying the same lesson, on the same Sunday, since we have the "International Lessons"? Isn't this grand? And if we all "apply our hearts unto

wisdom," the world must become better for this Bible-study. We must abhor the "accursed thing," such as lying, stealing, and being cruel to animals, and to one another. I've read somewhere, that when the apostle John was an old man he used to keep repeating, "Little children, love one another."

When I was at Lexington, at the convention, a bee-keeper looked out of the window and said that he "saw two things that he never saw before — an old woman in a swing, and a calf eating a newspaper." If my mother were living (but she isn't; poor soul, she has been dead a long time) she would have said, "Lucinda, you are so childish." And so I am; but I must tell you about my pets and playthings. The grandest pet of all is a dear little girl. Oh! I've told you about her before; but I mean to get a little boy somewhere, and then I'll have a span. We have a little white bantam hen. Dove is her name; she is eleven years old, and, oh my! the way she lays, cackles, and fights cats, when she has chickens, and gets up on the hives and erows! Crows? yes, just like a rooster.

A maltese cat came to see us this spring, and seemed to like us, and stayed. We call him Thomas, and a "mighty fine cat is he." But, Thomas is cast far in the shade by Fannie Sprague, who is a baby-horse, and rears up before, and antics up behind.

These are all a "happy family;" but there is "enmity" between them and my special pets, the bees. I don't believe that even Barnum could teach them to live together in peace. He hasn't them in his "happy family." If the bees get after Thomas, he scampers off, with his tail looking like a rolling-pin; and the antics that Dove cuts up, trying to scratch off the bees from her comb, is laughable to see. But if they should sting the velvety nose of the colt, I'm afraid that I should have to call upon the rocks and mountains to cover me from impending wrath.

A TOY BEE-HIVE FOR THE LITTLE FOLKS.

I've one of Mr. Jones's little hives that he imports bees in. It has two little frames, about three inches square. Cute, isn't it? I put a young queen in it, and set it where the young bees could crawl off from the sections into it. It is full of bees, and the queen will be laying in a day or two. I want to be playing with it all the time. Who among you will make a little hive, just large enough to hang two sections in, and raise queens in it, and tell us all about it in the JUVENILE?

MRS. L. HARRISON.

Peoria, Ill., July, 1883.

Mrs. H., that is what I call a good juvenile letter. You just tell your friends that I hope you will be childish enough to interest children as long as you live. I am real glad to hear that you are in the Sunday-school work; and I wish you would tell that superintendent that he did the best thing that could be done, when he told you that you had got to teach that Sunday-school class. I would have given almost any thing to have been right behind you, so I could listen, while you knew nothing about it.—Now in regard to a hive for children to play with: A good many years ago neighbor Blakeslee raised queens in nucleus hives, made by setting two sections of honey in a little box. As the sections have no top-bars, so they can be hung in the hive, I would suggest having some little strips in the bottom of the hive, just far enough apart to hold the sections up from the bottom-board; for you know we

do not want to mash the bees when we put the sections back in the hive. The nicest way would be to have some folded tins tacked to the bottom, just the right distance apart. These would act like the metal rabbits themselves. The bees could not well gum them together. The hive to hold these two sections (or perhaps three would be better) is simply a little box with an entrance in one side, and a loose cover. If the sections are those with closed tops, no cloth or enamel sheet would be needed over them; for the hive could be made to fit so closely to the sections that no bees could get up to glue the cover down. If a little brood were in one of the sections, it would hold the bees from going away, very much better; but oftentimes they will cluster about a queen-cell, if one is given them. Plenty of bees to stock these little hives can be had by brushing them off from the sections, or getting young bees from a comb of brood. If there is not more than about a teacupful, they will not be very apt to sting. The principal objection to this little hive, or, in fact, to all little hives, is, that if not closely watched, the queen will fill all her combs with eggs, and then they will all swarm out. You see, she would lay all her combs full of eggs about the first day she commenced laying; and then if she were not sold, or used immediately, there would be swarming out. But notwithstanding all of these objections, I believe such little hives would be splendid playthings for the children; and the expense is so little, even if neglected or lost, it would be only a small item.

#### A "CONVENTION" REPORT.

NOT A BEE CONVENTION, BUT A "COW" CONVENTION.

IT may not be uninteresting to tell the little folks how our people celebrated one of their monthly horticultural meetings. They met at the home of a wealthy farmer who owns quite a lot of Jersey cattle, which proved one of the principal attractions — especially so after partaking of the ice-cream, of which there was thirty gallons, and some of it made from pure Jersey cream. There were about two hundred and fifty present, and five large tables were loaded with every thing good to eat, in their large clean barn.

After the eating, came the seeing of fruits, vegetables, etc., on the exhibition table. Among other things was a basket ornamented with flowers, which, on being opened, was found to contain a four-legged chicken. Children who like chicken-legs would no doubt be pleased with such a pet.

In the afternoon the meeting was called to order by the president; and after the preliminary exercises, the host, a most genial gentleman, read an essay on the cow, and he spoke from practical experience, being rich in Jersey cattle. After this followed a lengthy discussion on cows in general, ladies as well as gentlemen taking part.

Strawberry culture was next introduced, after which the meeting adjourned to meet in four weeks.

There seemed to be but one thing lacking, and that was honey; but I promise myself there will be at least one pound of white-clover honey next time. Honey is quite plentiful now; and for once, persons

can take their choice or chance of more bees or more honey. We like the one-pound sections here, and find the ones that fold, very easy to make, but not so generally inclined to stand square as the ones made of four pieces. E. M.

Anderson, Ind., July 7, 1883.

I am sure I can not say, my good friend, how much the little folks are interested in such conventions; but I am inclined to think you must have had plenty of them on hand. I guess, too, they went home rejoicing. The ice-cream part, I am sure, they were interested in; and I think it quite likely that many of the children, as well as the women, were interested in the Jersey cattle. By the way, did I ever tell you that we have a little Jersey heifer? Her name is Lena.

#### IS THE FIRST-GATHERED LINDEN HONEY SUPERIOR?

AN IDEA SUGGESTED BY A LITTLE GIRL.

IN regard to linden honey, we think the honey gathered in the latter part of the season, when the flowers begin to fade, is not nearly so good as that which is gathered first; and if it is all mixed together, it will spoil the flavor. We keep ours separate, and sell that which was gathered last, at a much reduced rate. We have a pond, 114 by 75 ft., and about 5 ft. deep. There are two pipes leading from it; the one goes through the dam into the side of a trough, so that the water in the trough is level with that in the pond, and the other is so we can let the water off when required. What kind of fish do you think would be best to put in the pond?

ESTHER PETTIT, age 12.

Belmont, Ont., Can., June 28, 1883.

My little friend Esther, I am inclined to think you have struck on something very important. It is true, a little further observation may be needed to verify the matter; but at first glance I believe you are at least partly in the right. When the basswood first blossoms, the flowers have a bright, fresh, sparkling look; and who has not admired the bright flashing honey, looking like thousands of dewdrops sparkling from the snowy petals? Well, this honey from the freshly opened blossoms, according to my theory, would be the purest nectar. To-day is the 12th of July, and last night, toward dusk, I took a look through the apiary, to see if the boys and girls had given room in all the hives. The first hive I opened I found crammed full to repletion; not only was every little cranny between the combs filled up, but little fins of snow-white comb appeared about the ends of almost all the frames. These bits of new comb were filled with bright sparkling basswood honey that seemed to me, as I put the little chunks in my mouth (just to get them out of the way, you know), about as near the definition of nectar as any thing I know of. It was the first basswood honey! Well, now, if you look at a basswood-tree just at the close of the basswood season, you have perhaps noticed that the flowers look old and dull; all sorts of bees, bugs, and flies buzz over them, and the bees scattered over the tree have a sort of sorry look, compared with those that came

when the bloom first opened. Now, then, is honey gathered from a tree in this last condition, equal to that of the first-opening blossoms? Who will tell us?—I am glad to hear about the fish-pond, Esther. I do not know much about fish: but of late the German carp seem to be attracting more attention than almost any other fish.

### A NEW HONEY-STAND.

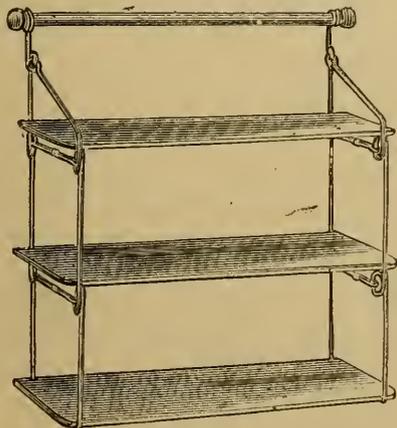

ONE THAT CAN BE DOUBLED UP AND SENT BY MAIL.

**A** FEW days ago we received a neat little package by express. After we took the wrappings off, we found something that looks about like the cut below.

HONEY STAND IN THE FLAT, READY FOR SHIPMENT

After taking the pieces apart, and looking at them a little, we found it was intended for a honey-stand or book-shelf; and when we got the pieces together, it looked something like this:

HONEY-STAND READY FOR USE.

The three shelves are 22 inches long by 6½ wide, and they stand about 9 inches apart. The framework is made of wire, so heavy that it would stand 100 lbs. or more; and yet the whole is so light as to come within the prescribed limits to be sent by mail (four pounds). The whole is made of hard wood, neatly varnished. Price \$1.00; or sent by mail for \$1.64. We can furnish them, if desired. Not only is this a splendid thing for displaying honey for sale, but there are only a few families but could use one or more of them to most excellent advantage for book-shelves, or a sort of bracket for curiosities, etc. Most children (besides some other people) are prone to fall into the habit of scattering things about, when a neat little shelf might induce them to form habits of putting things away. I suppose you know how it is in your own homes. Now, I can not think of any thing much nicer for a child's sleeping-room than a shelf like the cut above, to hang up in it. I thought, when I

first saw it, that they ought to be furnished for rather less than \$1.00, and I think so yet; yet that is the price fixed on them by the friend who sent it, Mr. A. W. Stuart, Belleville, Ill.

### JESSIE'S LETTER.

HER ACCOUNT OF THE WAY THE MEN MANAGED WHEN THEY CAME AFTER THE BEES.

**W**E live on a farm five miles from any town. My mamma keeps bees. She sold 6 colonies yesterday, and the men came to get them last night and the bees stung them. There were three men and one boy. They all had mosquito-bar over their faces. They looked very funny running around in the moonlight with the mosquito-bar sailing out behind them. A bee crawled up under Mr. Ladd's coat, and stung him; he jumped as if he had been shot, and yelled *murder*. The men asked him where it stung him; he said, "Right on the bustle." They did not get started away till midnight. They seemed to have a great deal of fun; when one would get stung all the rest would laugh at him. We watched them from an upstairs window, till we grew tired and sleepy, then we went to bed, and left them to fight it out.

I have been making section boxes, and filling them with *fdn*. I can make a hundred section boxes every hour. I like to do it. I think it is more fun than playing jackstones, and I like that very much. Jackstones are some little iron things. There are five of them; you throw them up and catch them on the back of your hand. One way you catch them is called "riding the elephant;" another way, "making the beds;" another, "setting the table;" another way you throw them and catch them five times, etc.

My big sister Minnie goes to school in Ipava, and all the children in that school play jackstones, and when Minnie came home she bought me some for a birthday present. My birthday has not come yet. I will be 11 in July; but Minnie did not wait till my birthday, to give me the jackstones. They cost only 5 cents. If I were a rich little girl I would buy jackstones and give them to all the poor children I know. They would be good to amuse them, while their mothers went away from home to wash for other people. Mamma bought her *fdn*. of Mr. Dandant; it is so nice that I keep wanting to eat it; but mamma won't let me. She says if I want to eat beeswax, I must go in the kitchen and eat the home-made kind. If you like this letter, I will write you one every month.

JESSIE CHADDOCK.

Rose Park, Illinois, June 19, 1888.

Your letter is a very good one, Jessie, and I should like to have you send one every month. And you love to play jackstones too; and well do I remember it, since you tell us about it. Such games are very well for small children, and perhaps occasionally older ones, if they do not neglect important duties when they get much interested in the play. I do not believe it a good plan to take very much time for games, because, after you get through, nothing, or comparatively nothing, is accomplished. If you play with a hive of bees, or a garden, or silkworms, the result of your play is something healthful and valuable; and I, for my part, would not want to take much time for any thing that

did not leave some tangible result afterward. I want to see something built and finished and accomplished — some “value received” for every hour I expend my energies.

### ANOTHER DEVICE FOR FASTENING FDN. INTO WIRED FRAMES.

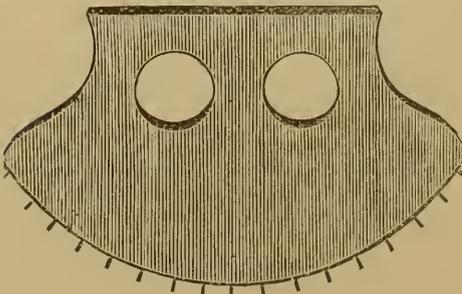

FRIEND EASTERDAY'S INVENTION.

**I**T seems, friends, there is going to be no end to the implements devised for fastening fdn. into frames. A few days ago a queer-looking implement came with the mails, and with it the following card:

When visiting neighbor Sanford he showed me the machine you sent him for pressing the wires into fdn. It made me feel sorry for him, as well as your other customers, so I concluded to send you a device like the one I use for that purpose. It goes in the same mail with this. E. S. EASTERDAY.

Nokomis, Ill., July 9, 1883.

The implement which we show you below, or, rather, a little modification of it, made by Mr. Gray, was carried to the girls, and they at once pronounced it ahead of the carpet-stretcher. The latter requires so much power to imbed the points all at once, they find it quite tiresome on the arms, whereas friend Easterday's machine is used with a rocking motion, so that only one or two points are sunk at a time; it therefore requires but very little power to work it, and can be used even faster than a carpet-stretcher. Mr. Gray's improvement was to make the machine large enough so that the curved part would just reach from the top to the bottom of an L. frame.

EASTERDAY'S FDN. SETTER.

The machine is made of  $\frac{3}{4}$ -inch basswood; the points are exactly the same tin points as are used in putting the glass into honey-boxes. The length of the curved surface is about  $8\frac{1}{2}$  inches, and the points are perhaps half an inch apart. We can furnish the machines for 10 cts. each; sent by mail, 5 cts. additional. Now, for fear somebody will think of a wheel in place of this machine, I will say that wheels with points in them were used a long while ago; but we find this “chopping-knife”-looking implement to answer far better than any of the wheels. I think I shall not give friend Easterday more than \$1.00 for this invention, because somebody will be sure to have a better thing for the purpose in ten days or less.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Oil, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-room.

“A chief's among ye, takin' notes;  
An' faith, he'll prent it.”

**C**HILDREN, just now I have only two things in my mind. The first thing is business; and business, so much of it that it almost buries me up. The other thing in my mind is that baby I have been telling you about. Now I just want to tell you one more funny trick of his, and then I will let you write your letters. Almost everybody, young or old, has some way of expressing his displeasure; and how do you suppose our baby expresses his displeasure? He does it in a way I can express only by saying that he “grunts” his displeasure. When he wants somebody to take him up, he grunts; and when he is hungry, he grunts; and when Blue Eyes and Caddy kiss him so many times he gets tired of it, I tell you he makes known his displeasure by a series of grunts that sound almost like “m-m-m-m.” Well, now comes the funny part of it. He has a pair of chubby little hands that he thrashes around at a great rate sometimes; and yet he does not seem to know that they belong to him. Sometimes he claws his nose and face with them, so that he makes great scars, and has even made the blood come. Well, he has hurt his face with his hands so many times that he has got to be afraid of them; and when these mischievous little hands come up before his face, of late he squints and dodges, and then grunts and scolds to have them go away. Don't you think he is a smart baby?

A FIVE-YEAR-OLD “TOOT.”

MY NAME IS TOOT GROWN. A BEE STINGED ME. I WAS TOO NEAR THE BEE. THAT BEE WAS MAD. I AM FIVE YEARS OLD.

Yorkville, Ont., Can.

TOOT GROWN.

GOOD NEWS.

My papa does not use tobacco. The bees do well; papa and mamma have extracted 300 galls. of honey this year. Papa sent you a sample of palmetto honey.

CARRIE BELL FROSCHER.

La Grange, Fla., June, 1883.

Well, Carrie Bell, that is good news indeed, both on the tobacco matter and the

honey; 300 gallons would be over a ton and a half. I suppose you will all keep sweetened at your house, won't you?

KITTENS, BEE-HIVES, AND PEACHES.

I am a little girl 7 years old. My old cat has 5 kittens. Pa has 40 bee-hives, and lots of peaches.

Brookston, Tex. DOLLIE FITZGERALD.

STRAWBERRIES, WITH SUGAR AND CREAM.

My papa keeps bees. We wintered 11 swarms in chaff hives. They swarm nearly every day. I have a swarm. Manma has to watch them. We have strawberries, sugar, and cream, for supper.

FANNIE MATHEWS, age 7.

Kinsman, Trumbull Co., Ohio.

I am a little girl. I have three sisters and one little brother. I still bake for mamma. My sister and I sometimes wash. My papa has six stands of bees. I still live at grandpa's in the summer. I have no bees, but papa says that on my birthday he will give me a swarm for a present.

Newburg, Pa.

FLORA S. BRECHBIEL.

It has been quite a while since I wrote to you; it was in the fall. Papa had 8 stands of bees in the fall, and he brought only two through, very light. He bought 6 and now has 12. They are doing pretty well now. They are working on white clover mostly, now, as there is lots of it here. Papa is thinking strongly of coming over in the fall to visit you.

ALMA MATHEWS, age 13.

Kinglake, Can., Ont., June 25, 1883.

We shall be glad to see him, Alma.

I saw your kindness in giving the little folks books for writing letters, and I thought I would try to earn one too. My father had three stands of bees last fall, and this spring they were reduced to one, on account of not having honey enough. The swarms were too late in the season, and they did not gather enough to winter them; so the earlier they swarm the better for the bees and me, for I love honey. We have had two swarms this spring, and they are doing finely.

ROBERT G. MCCLELLAN, age 13.

Tusseyville, Centre Co., Pa., June 28, 1883.

BELL-RINGING TO STOP SWARMING.

My father has three stands of bees in the new patent hives, and when they swarm we take pans and hammer on them so that they can not hear the noise of the queen, and then they will settle on the first tree or bush they come to; and if the limb is high that they settle on, we saw it off, and then we take them to the hive.

ELMER R. MCCLELLAN, age 11.

Tusseyville, Pa., June 28, 1883.

Well, Elmer, I do not see but that we shall have to give up, and let bell-ringing and tin-pan beating go on. After what friend Virgil tells us about it, I suppose we can call it a sort of celebration, to welcome in the swarming season.

AN OBSERVATORY-HIVE.

Pa made me a hive with two sides that let down; and on each side, where it lets down, is a glass so we can see the bees and queen on either side, for there is but one comb in it. The queen has been out today. Why do the bees hold her fast when she comes back?

WILLIE F. MOOREHOUSE.

Mombaccus, N. Y., June 25, 1883.

Your question is a hard one to answer, friend Willie. It has been suggested, that

when the queen goes out and meets the drone she acquires a different scent, and the bees therefore sometimes grab hold of her as an intruder; but I believe that, as a general thing, she is not harmed, unless it be during a great dearth of honey, when the whole hive seems to be in a demoralized condition.

ELI'S UNCLE.

Now I am going to describe one of my uncles, and the luck he has in raising bees. He has always lived with us. He is getting along in years, and he thinks it is best to keep bachelor's hall. He has two stands of bees. They swarmed last summer; we all got out in the yard, and beat the dish-pan and all the tin pans we could get hold of. They alighted on a small plum-tree, close by. We laid a sheet down on the ground, sawed the small limb off, and put them into another hive, without any trouble. This last winter he stood up fodder all around them; and if there came a warm sunshiny day he would take the fodder away from the entrance so they could fly out. They kept nicely all winter.

Wilmington, O.

ELI L. BABB, age 11.

HONEY-COMB WITH THREE LAYERS OF CELLS.

I have a little brother about 2 years old, and another 3 weeks old. Papa has 19 hives of bees, and I have one. He had 9 hives last spring; he had 12 in the fall, and lost 2 by wintering. A mouse got into the other. They increased to 19 by natural swarming. They made 1500 lbs. of extracted honey and 200 lbs. of comb honey. My little brother Harry is an awful mischief. He knows all his letters. Did you ever see a comb of honey with 3 layers of cells, one between the other? I never saw more than one. Here is some poetry I wrote about Harry, last summer.

BABY-BROTHER HARRY.

A POEM BY HIS 11-YEAR-OLD SISTER.

I have a baby-brother, a darling little elf;  
He is busy all the day, a playing by himself.  
And, oh! it's cute to see him eat, right out the sugar-bowl,  
And now I s'pect he's mining, out in the bin of coal.  
He'll go into the pantry, and drag down from the shelf  
The oat-meal, graham, buckwheat, and mix to suit himself.  
He went out to the bee-hives, when no one else was nigh,  
And, oh! it was pitiful to hear his piercing cry.

Kempton, Ill.

C. B. MORRILL, age 11.

HOW TO MAKE A CAPON TAKE CARE OF CHICKENS;  
BY ONE OF THE JUVENILES.

My mother lets her chickens stay three days with their mother, then she takes a capon and pulls the feathers from his breast, and then stings the place with nettles until it is red, and then wets it with strong salt and water. This is done after dark. She then sets him in a dark place, and then puts the little chickens under him, and keeps him there until he clucks like a hen, then takes him out, and puts him into a coop, and treats him just like a hen, and he will raise them better than a hen.

J. P. ISRAEL, JR., age 12.

Point Loma Light-House, San Diego, Cal.

Very well told, my little friend. I am not much posted on capons, but I suppose the idea is to keep one of those big fellows caring for the chickens, so the mother may make herself useful by raising more chickens, or laying eggs. I have heard something of the kind before, but I confess I do not quite see what pulling off those feathers, etc., has to do with the matter. Won't he take care of the chickens if this were not done? You see, my little friend, that you know all about something of which those ever so much older are entirely ignorant.

We have kept bees since 1875, and have at present 42 swarms. We got 1800 lbs. of white-clover and basswood extracted honey. Pa never raised any comb honey, but will try this summer. Our bees are in Langstroth hives. We bought our first bees of Adam Grimm, of Jefferson, Wis., where we used to live.

EDDIE BAUERNEFELD, age 13.

Menasha, Wis.

I have so much to write to you, I don't know which to write first. We have had 9 swarms, and have 11 yet to swarm, besides the second swarms. The first swarm we had, the queen got killed in the hive, and we took a frame out of another hive that had a queen-cell, and put it in with the new swarm, and the bees went to work all right.

New Milford, Pa., June, 1883. ROSE SMIT II.

I am not quite a blasted (grass) hoper, as my brother calls me, but very near one. I had one colony of bees to put up last fall, and they all died in the winter. My brother lets me have one colony on shares this season. He gave me a tested queen to send to you. She is one year old, and a good one.

ALICE I. DEYO.

Homowack, Ulster Co., N. Y., June 13, 1883.

#### 1000 LBS. OF NEW HONEY.

My pa keeps bees. He had 8 before they swarmed, and now he has got 14 stands. They swarmed so much that he almost ran out of hives. He thinks he will get 1000 lbs. of honey this season. I like honey very well, but I don't like stings. We have all Italian bees. They will sting when he tries to take their honey.

HARRY HUSTON, age 12.

Dayton, Ohio, June 12, 1883.

#### HOW TO RESUSCITATE A FROZEN SWARM OF BEES; FROM ONE OF OUR SOUTHERN JUVENILES.

I see in the JUVENILE that you sent us, the little girls up North are telling what they can do. I can help my papa to puff the smoker when he looks in. He had a stand of bees last winter that was so nearly frozen to death they couldn't move, and he warmed ma's old shawl and put it on the bees, and then he put on the honey-board, and heated the oven-lid, and put it on top of the honey-board, and they came to life, and now they are as good a hive as he has.

JOSE DAVIDSON, age 12.

Pisgah, Jackson Co., Ala., June 13, 1883.

#### DON'T KILL THE TOADS; A POEM BY ONE OF THE JUVENILES.

I write to thank you for the book you sent me. There has been so much rain here this spring that bees have done but little. Do the toads trouble the bees in your apiary? Sometimes they are very troublesome here; but we do not kill them. We think that too cruel. Boys, remember this:

Don't kill the toads, the ugly toads,  
That hop around your door;  
Each meal the little toad doth eat  
A hundred bugs or more.  
He sits around with aspect meek,  
Until the bug is neared.  
Then shoots he forth his little tongue,  
Like lightning double-coared,  
And then he soberly doth wink,  
And shuts his ugly mug,  
And patiently doth wait,  
Until there comes another bug.

Pinson Station, Tenn. SHEPPY SIMMONS.

That's right, Sheppy; spare the toads, for the good they do is far more than the evil. Your poem is going the rounds of the press, and strikes us as very funny. Didn't you copy it from your paper?

#### HIVES FOR A DOLLAR.

Pa's bees have not been doing very well. We have no swarms yet, and no honey. We have got buck-wheat blooming; the bees have been working on it well. Bees work on persimmon-trees here. Pa makes hives, and sells them at \$1.00 apiece. He makes the hives, and I paint them. Pa did not lose any bees this winter, but he had to double some to make them stronger. Bees do not need any protection here in winter. Pa feeds his bees on sweetened water and syrup.

NETTIE BRYAN.

Rome, Ga., June 14, 1883.

#### STILL MORE ABOUT SWARMING.

Papa had 26 stands of bees this spring, and has 37 stands now. One day the bees swarmed all the forenoon. Papa had just started out to plow the corn when one swarmed, and he had to come back, and then he went a little further and had to come back again. He said he would let me have the first swarm I hived. The bees go up in the trees every time I want to hive them. There is just lots of white clover, and the bees work on it very much. Papa puts salt around the entrances of the hives to kill the grass.

JOHN WILSON, age 10.

Penrose, Ill., June 25, 1883.

#### SWARMING, AND SUNDAY-SCHOOLS.

We have Sunday-school in our house. It is not a very large one. Only a few of the neighbors come to it. Yesterday the bees began to swarm, just as Sunday-school commenced, and swarmed till a while after dinner. Papa makes his own bee-hives with a circular saw and horse-power. Sometimes Johnnie and I help him. We like to read the little children's letters.

IRENE WILSON, age 8.

Penrose, Ill., June 25, 1883.

I have sometimes thought it a little funny, Irene, that bees so often seem to have a fancy for swarming while the folks were gone to meeting or Sunday-school. I suppose one reason is, that we usually have our Sunday-school and meetings in the middle of the day, and the bees also choose the middle of the day for their "celebrations" and emigrations.

#### A REPORT FROM THE PELHAM FDN. MACHINE.

My sister Em is 14. We make comb fdn. by ourselves, on the Pelham machine. We have the lower roll in starch, and one or two turns backward lubricates both rolls. Em extracts honey, and puts fdn. in frames. I make section boxes, and put fdn. in frames too. I watch the bees to see when they swarm.

ESTA WILLIAMS, age 11.

Vanceburg, Ky., June 13, 1883.

I am very glad, my little friend, to hear a report from the Pelham fdn. mills, especially as they are so much cheaper than ours. You did not say how the fdn. works in the hives; but I suppose it works all right, or you would have said something about it. I was a little afraid that it might be expensive, on account of receiving more wax in the bases of the cells than would be the case where the base was made the natural shape.

#### HARRY'S UNCLE WALTER.

My uncle, Walter Poudet, keeps bees. He has 19 swarms, and some queens. Walter used to be one of your "neighbors," so you know him, don't you? I go to Sunday-school, and Walter is our secretary. He writes for a newspaper about bees, and then it

doesn't cost him any thing to advertise. Lots of people write to him and ask questions, and they think he is a big man, and he is only 20 years old. I have three brothers, and a little sister called Elsie. What do you think of the name? We live on a farm about a quarter of a mile from Groesbeck, and we have plenty of work to do all the year. Pa will not keep bees. I guess he is afraid they will sting him; but when I get old enough to tend to them I will have some.

HARRY CRAGG, age 13.

Groesbeck, Ham. Co., Ohio, June 25, 1883.

To be sure, I know your uncle, Harry. I am very glad indeed to know that he is secretary of the Sunday-school, and making himself useful by writing for the newspaper; and I hope he will get to be a "big man," in the best sense of the word. We are very glad to hear from him.

#### WHITE POLLEN; WHERE DOES IT COME FROM?

As I did not see any letters in the JUVENILE from the boys or girls in the Black Hills, I thought I would write and tell you how we are getting along out here. Papa has one colony of Italians; and though he is not much of a bee-keeper, we think they are doing quite well. They have a large brood of young, and eat a great deal. I should like to know what kind of a flower bees get white pollen from. We live in the country, 35 miles from Deadwood, and pa is postmaster here.

Empire, Dak.

IRVIN CRAIG.

Well, Irvin, I can not tell where your white pollen comes from, but we sometimes get it here from a weed that grows in the woods, called white snakeroot. It does not bloom, however, until later in the fall than this time.

#### HOW TO STOP LEAKY COVERS; BY A NINE-YEAR-OLD JUVENILE.

We bought a queen and ten frames of bees last August of J. L. Scofield, and fed them all they could eat. They swarmed May 18, and swarmed the 5th of June. They are filling up the one-pound boxes. If your hives are leaking, cover the roof with duck, and paint it well, and it will last as long as tin. They cover cars and steamboats with this kind of stuff, and they never leak.

Yonkers, N. Y.

JAMES J. DOWLING, age 9.

Thank you, friend James. I believe that a duck cover answers very well if kept well painted. The idea was suggested, and many of them were used, a good many years ago; but for some reason or other, I hardly know why, they have been mostly abandoned in favor of tin. I rather think I should prefer the tin; but that, as well as the duck, should be coated with paint.

#### THE SWARMING-TIME THEY HAD AT MARY'S HOUSE.

I will tell you about our bees. We have 41 swarms. We have 19 young swarms, and 22 old ones. We had 4 go off; 2 of them were large, and 2 were not so large. Our hired girl found a queen in the grass, and papa and I put some more bees with her. We have one swarm that always goes back. It has swarmed 3 times. It swarmed to-day, and went back. What do you think is the matter of them? When they swarmed they stung those who helped. Pa would not let me help with them, because he said they would sting me. Bees are cross sometimes. Our hired girl gets stung a great many times.

When pa and I put the bees with the queen that the girl found, my brother ran from the bees. I got stung by them. I do not like honey, but I help all the rest. My brothers and sisters are afraid of them. One of our swarms alighted on the plow; and when we got them hived we went to dinner; and while we were gone they went off.

Buena Vista, Iowa. MARY A. BINFORD, age 11.

Very good, Mary. I should think a plow was a rather novel thing indeed for a swarm of bees to alight on. I think if you had given them a frame of unsealed brood before you went to dinner, you would have found them all right. I think the swarm that went back so many times must have had a queen that could not fly, for some reason or other.

#### LIZZIE'S STORY.

My papa's bees have kept us all busy the last two weeks. Papa had 9 colonies last fall, and wintered them all. They have all sent out a swarm apiece, some of them two; but papa cut out the queen-cells, and put the second swarm back.

#### A NOVEL QUEEN-NURSERY.

Mamma put two queen-cells in an egg-shaped gourd under a hen, and hatched two nice queens, one in two and one in three days.

Some boys cut a bee-tree on papa's farm, and left the bees and comb. Papa took a hive to the tree, wired the combs into frames, put the frames into the hive, and the bees went in so fast they looked as if they all wanted to get in first. Papa brought them to the apiary, and gave them an Italian queen, as they had lost their own. The bees are on white clover all day, and night too, I suppose, as I saw one little worker go from her hive the other evening to a white-clover blossom, a few feet from her home. It was so dark that I could hardly see bee or clover.

Mamma says she likes your paper very much, and could not do without it.

LIZZIE WOODRUFF.

Greencastle, Ind., June 22, 1883.

#### DRONE-CELLS THAT LOOK LIKE QUEEN-CELLS.

My sisters and I made a very curious observation the other day, of which I have never read before in any of the bee books or journals. When we opened a hive and took out a frame of worker brood, we were astonished to see what at first sight seemed a great number of queen-cells sticking out horizontally. On closer examination we found them to be drone-cells built on the surface of the worker brood. They were about half an inch long; their apices touched the surface of the adjoining comb. On lifting out the frame containing these curious cells, some broke loose, so that in this way we were shown that we could easily knock them off with the screw-driver. This we accordingly did.

LILLIAN E. MILLER.

Savannah, Ga., June 18, 1883.

I have noticed something of the same thing, friend Lillian, only I do not know that I ever saw the drone-cells so long that they would break off. I suppose it is only a freak of the young bees, that had nothing else to do, so they amused themselves by elongating the drone-cells a great deal further than they needed to be — something as they elongate the cells to contain honey when it comes in a great flood. Perhaps some one else can tell us something about it.

## GETTING DOWN A SWARM OF BEES BY SHOOTING OFF THE LIMB.

Pa has had very good luck with one hive of bees this spring. They swarmed twice in one week. He put them in what he calls patent hives. One hive had comb in it that the bees made last year. Do you think it is a good plan to put bees in a hive where comb is? One of our neighbors had a swarm that settled on a branch of a tall sugar-tree. He shot the branch off with his gun, and hived the bees.

Shermanville, Ky.

ANNA B. BUTT.

I should think that was pretty sharp shooting, friend Anna. I have heard of bringing down swarms of bees by shooting; but I always thought it was a sort of "yarn." I suppose you wouldn't tell us a yarn, would you, Anna?—Use the old comb *always*.

## LAMP NURSERY AND THE TELEPHONE.

My brother takes GLEANINGS, and keeps bees; he hatches queens in a lamp nursery. He went away on a month's visit last September, and left me in charge of the lamp nursery, and partly in charge of his apiary. We had some trouble with the bees coming out and leaving some of the hives. We have a telephone which extends from our house to my married brother's, so when the bees swarmed out I could call him to hive them. One day when he was in town the bees swarmed, and there was no one to hive them but myself. When they settled I took a queen-cage, and asked my mamma if she would not hold it for me. I hunted among the bees until I found the queen; then I caught it, and put it in the cage and mamma shut her up; but the lid did not fit tight, and the queen flew out; but after some trouble I caught her again, and put her in another cage, and put her in a hive that did not have any queen.

MAGGIE DUVAL, aged 12.

Spencerville, Md.

## HELP FROM THE JUVENILES ON THE TOBACCO COLUMN.

My papa keeps bees; he has 5 swarms of blacks. He is going to get some Italian queens, and put with them. He has chewed tobacco 40 years, and has now stopped and is not going to use any more. I want him to have a smoker, so that he won't have to smoke them with tobacco, for fear that he will get to using it again. Papa is not very well, and I have to help him all I can.

MAUD A. BACON, age 11.

Brookfield, Madison Co., N. Y., June 29, 1883.

That's right, Mand. Why! I shall be real happy to think that the children all over our land are going to turn in and help in this tussle with tobacco-using. May God bless your good old papa, Maud, and help him to feel that, although he has used tobacco for 40 years, he has done a grand good thing in leaving it off. We have sent him a smoker, and have plenty more to send in the same way. Surely no one would ever break a promise made to "one of these little ones."

## THE QUEEN THAT WAS LOST, AND WHERE SHE WAS.

My father had three stands of bees last fall; he had them all in chaff hives; lost one Italian stand. He had one Italian and one black swarm in the spring. The Italians swarmed the first day of June. They are waiting for a pleasant day to swarm again. He sent to you for one untested queen. He introduced her, and let her out of the cage. He went out at night to look after her, and he saw a bee in a

drone-cell; he didn't know that it was the queen; he thought his queen was gone. He said he felt pretty blue; but two days afterward he found her crawling around on a frame. He supposed that it was she in the cell. He told me to tell you to put him in the Smilery. I am at work washing dishes for mamma for ten cents a week. When I get money enough I am going to buy a pound of bees. I am going to be a bee-man, like you. I have a corset lamb and two sheep, and a black hen and a black chicken.

Clinton, Me.

GEO. F. GREELY, age 11.

I think, friend George, the queen crawled into the drone-cell because she was frightened, or afraid of the bees. I have often seen them crawl into a deep cell and stay some time when they had been just let out of the cage. I wonder how many of the children can tell what George means by a "corset" lamb, and why is it so called?

## HONEY FROM THE FUCHSIA.

Mamma, my sister Nellie, and I, have some house-plants; and among them a little red fuchsia, whose blossoms dripped with honey all summer. Nellie caught a bee and put it on the blossoms, and it sipped eagerly. Our Warrior and Anabella fuchsias have honey also, but not so much as my little red one.

Papa sometimes gets in a hurry, and then the "Trio," as mamma calls Nellie and me and my brother Johnnie, help him wire frames, and put together sections. We each had a wooden mallet for the sections; but one is broken, and I don't know where the other two are; but papa is not going to raise any more comb honey, so we shall not make any more.

We have seen the bees come in with honey and pollen; and when they had pollen they would dance on the comb to shake it off. We saw a bee last summer with eight flakes of wax oozing from the segments of its abdomen. Nellie and Johnnie can catch a bee on the window, but I can't, for they always sting when I try. Nellie is 12 years old, Johnnie 7, and I am 14.

EFFIE J. OLSEN.

Nashotah, Wis., Feb. 1, 1883.

Thank you for the facts you furnish, Effie. I think your papa might feel happy for having such a trio.

## BEES AND STRAWBERRIES.

Our bees wintered very badly. We lost 5 out of 54 stands. The remainder came through very weak; but now they are in fine condition. One day we had five swarms, one right after the other. Papa clips the queen's wings, so when a swarm comes out he goes to the hive, catches the queen, puts a cage over her, and puts her in the hive again. Papa has a little pair of scissors to clip the wings, in the shape of a crane. In its eye is the Lord's Prayer. Papa makes ever so much fun. He got his mill from you. He has got nearly one barrel of clover honey this season, 50 lbs. of locust, and 100 lbs. of comb honey. Papa and I have been so very busy packing strawberries that we can hardly tend the bees. We picked about about 100 gallons. Oh how our backs did ache! During the last two weeks, it has been raining almost every day, so that the bees could hardly work.

CARRIE S. HARTMAN, age 14.

New Harmony, Ind.

That must be a funny pair of scissors your pa has, to have the Lord's Prayer in it. I

suppose it is what they call a microscopic photograph, is it not? I am glad to know that your papa likes his fdn. mill. His plan of having different kinds of honey kept separate, I think is tiptop. I shouldn't wonder, Carrie, if your backs *did* ache, after picking 100 gallons of strawberries.

Carrie has just written to you, so I thought I would write too. I go to Sunday-school. I take music lessons of my sister Carrie. I have a little yellow kitten, a black and white shepherd dog, and he got stung the other day, and he just howled. One got in my hair the other day. Please send me Blue Eyes' picture. MAMIE HARTMAN, age 12.

New Harmony, Ind.

Very good, Mamie. I just told Blue Eyes what you said about the picture, and she said she hadn't any pictures. I think she will have to get some, and then we will send you one. Blue Eyes works in the office every day. Shall I tell you what she does? She opens the letters for Aunt Mate. You see, when they come from the postoffice they are put right before her. She has an ivory-handled paper-knife with which she opens one corner, and then just slits it across one end, and turns back the corner so that Aunt Mate can pull it out easier. She got tired the other day, and said she wished the folks would not send her so many letters. It took Aunt Mate till after dark to get them all opened; and Uncle Amos had to get up next morning before 5 o'clock, so that the clerks could go to work when they came.

I have sent the song. I have given those cards away. Will you send me 100 cards more? Our bees are making honey, now. I sat and watched the bees work yesterday. CARRIE E. SHULTS.

Viola, Richland County, Wisconsin, May 30, 1883.

#### ANTI-TOBACCO.

BY JAMES G. BISHOP.

*Tune—Oh come, come away.*

Oh come, come away, all you that would be freemen,  
The battle brave, don't be a slave—oh come, come away;  
Let the professor smoke and puff,  
The zealous bigot take his snuff,  
We'll ne'er touch the filthy stuff,—oh come, come away.

Oh come, come away, and I gather round the standard,  
Our flag's unfurled for all the world,—oh come, come away;  
Resolve of once, and lay your plan,  
Throw off your shackles, be a man,  
Don't say, "I can't," you surely can,—oh come, come away.

Oh come, come away, you younger men take warning,  
There's danger lying in your path,—oh come, come away;  
Oh! pause, and make a sudden stop,  
Your sweet-scented pipelet, fine-cut drop,  
Or you may die a drunken sot—oh come, come away.

Oh come, come away, the day-star now is rising,  
Upon us here, we've naught to fear,—oh come, come away;  
Relinquish every vain desire,  
Throw your old meerschaum in the fire,  
Give us your hand and come up higher,—oh come, come away.

Oh come, come away, progressive wheels are rolling,  
Drop your cigar, jump on the car,—oh come, come away;  
Tobacco-slaves may chew and smoke,  
And spit and sneeze, and cough and choke,  
But we've cast off the heavy yoke,—oh come, come away.

Oh! throw, throw away, those filthy shorts you're chewing,  
They're sweepings from a dirty floor,—oh come, come away;  
You need not plead for Jackson's best,  
'Tis just as filthy as the rest,  
There's not a brand can stand the test,—oh come, come away.

Oh come, come away, the rising generation  
Will imitate, there's no mistake,—oh come, come away;  
Young men just coming on the stage,  
Some hardly fourteen years of age,  
In this vile practice do engage,—oh come, come away.

Oh come, come away, for no pure-hearted Christian  
Can e'er succeed and use the weed,—oh come, come away;  
Oh man! how can you worship God,  
And think to gain that blest abode,  
With this narcotic in your blood,—oh come, come away.

Oh come, come away, don't tarry any longer,  
Leap o'er the hedge and take the pledge,—oh come, come away;  
If you'd just look behind the door,  
And see that puddle on the floor,  
I think you'd never use it more,—oh come, come away.

## KIND WORDS FROM OUR CUSTOMERS.

The smoker is a fine one. I believe I could capture a bumble-bee's nest with it.  
Letts, Iowa. A. H. L. STABLEY.

My shears arrived safely, and gave such excellent satisfaction that I will order some for mother; so please send me \* \* \* \* \*  
Wheatland, Cal. MRS. E. W. MANSFIELD.

The Favorite scale you sent me came nicely, and we think it a little beauty for the money.  
Hartland, Mich. G. E. LINCOLN.

I have received the smoker, and have tried it. It is splendid. I return thanks for it.  
Moab, Va. MRS. M. KESNER.

Inclosed please find — for one of the new-style Waterbury watches, the kind that we can see the time by moonlight. I presume then there will be no excuse for lingering too long at the "garden gate," on the bright moonlight nights in summer.  
Philadelphia, Pa. F. HAUMAN, JR.

I live 4 miles from Vanceburg, and honey is coming in so fast I can't take time to go to the post-office. Whew! don't those Clark smokers beat every thing? All parties are well pleased with them, and more wanted. All want me to send for them.  
Vanceburg, Ky. M. L. WILLIAMS.

Your letter with inclosure of check for \$29.75 was duly received to-day. Thank you. Your prompt correction of error was quite like you, and worthy of you, and that, I think, is saving a good deal. Honey is still coming in. I hope now to get over 200 lbs. per colony. Have 16) now. (GEO. E. BOGGS.  
Morgan, Ky., July 7, 1883.

Your beautiful Italian arrived in best order. A few hours after, one of her retainers was seen entering the hive with a load of Canadian honey. From this you may infer that the introduction succeeded perfectly well. Receive our best thanks for your promptness in filling our order.  
General Hospital, Quebec, Can., June 28, 1883.

The "measly" smoker is liable to run us as well as the bees out of the yard; it makes so much smoke after it once gets started we have to trot it off one side to "calm itself down" a bit. Still, we think we can maintain control of it. Thanks for so good an article for the money.  
Galena, Ills., June 23, 1883. T. HILLET.

#### BLUE-EYED NELLIE.

I will take this opportunity to thank you, in behalf of our little blue-eyed Nellie, who died the 15th of Nov., of diphtheria. She loved to read the JUVENILE, and she loved the bees. She was always on hand when I was working with the bees. Oh how I shall miss the dear child when I work among the bees next summer, if my life is spared until then! But she was a good little girl, Mr. Root; she loved to go to Sunday-school, and she loved to say her prayers. God grant that I may so live that when my work is done here I may meet that dear child in that bright land to which we all hope to go.

Kingsville, O.

H. H. PEASE.

[Thank God, my friend, for the memories you have.]

I think GLEANINGS worth too much to take it in a club, as I have formerly. I get more and better reading for the money than I can any other way; and now you have added the JUVENILE too. I am much obliged for promptness in filling my orders; though small, they received prompt attention. I do dearly love to read the Homes. It is the first thing that my wife or I look for on the arrival of each number; and I pray that they may be a blessing to all who read them; and may the Lord bless and keep you.  
WM. LUDLAM.

Oyster Bay, N. Y.

[I am inclined to think, friend L., that small orders have received better attention and more promptness than large ones, for the reason that we can set a clerk at work on a small order, who would not be capable of managing a large one. It seems to me I shall be the happiest one of the lot when we get into shape again, so as to give both large and small orders promptness and attention.]

Please send me 4 Clark smokers. The others you sent me I sold before I left the express office.

MIKE WININGER.  
Glasgow, Barren Co., Ky., May 30, 1883.

Thank you a thousand times for writing that A B C book. It is well named, as it is as easily understood as the A B C's.

MRS. CHAS. HOPE.  
Coulterville, May 2, 1883.

#### OUR FOUNDATION MACHINES.

The fdn. mill works all right. I have made 30 lbs. of fdn. to-day, and I will send you a sample of the second sheet I made.

Parish, Ill.

C. M. DIXON.

We received the fdn. mill and sections, and other articles, in good order; the freight charges were only \$1.55. We have tried the mill, and are well pleased with it.

Durango, Iowa.

CHAS. HERMANN & BRO.

The fdn. machine arrived the 9th inst. Of course, I have had no time to try it as yet. I was greatly disappointed, however, in one thing: I was looking for directions on gold-edged paper, tied with a blue ribbon, perhaps, and filled full of all mysteries, etc.

Amboy, Ill.

R. H. MELLEN.

We received the fdn. machine in good order. We are well satisfied with the selection, although it has cost more than we expected. The expressage was \$11.50. It came on Wednesday A.M. We made some comb fdn. Thursday, and put some in the hive Saturday. One comb weighed 1 1/4 lbs. We tell you this to show you how much of a hurry we were in.

G. C. PACKARD & SONS.

Santa Barbara, Cal., June 10, 1883.

I must say I like the 12-inch mill well. I tried the boards that dipped just one end, and I failed; then I tried the Jones system, dipping one end, then reversing and dipping, then I did *immense*. I like the cell; the bees take to it tiptop. I have done better with the thin than I anticipated.

St. Davids, Ont., Can., June 15, 1883.

#### FRIEND O.'S INK.

Do you yet have for sale the celebrated Oldroyd inks? I purchased a box of you a year or so ago, and was well satisfied with it. I want the ink for my scholars. I am a teacher of public school.

J. H. KILMER.

Winesburg, Holmes Co., O., Jan 12, 1883.

[Yes, friend K., to be sure we keep friend Oldroyd's ink, and have kept it all these years since it was first made known. We use it in our office by the gallon, and have never yet found any thing better.]

Handkerchiefs received some time ago, and they are a wonder for the money. Looking over the copy of GLEANINGS you sent me, I was attracted by the title, "Another Grateful Pupil," and write this to thank you for the very same kindness—sending me a specimen copy of GLEANINGS in 1878, then reminding me of bees, with a catalogue in the latter part of 1880. The following winter I sent for the A B C, got a hive of bees in the spring of 1881, and now have 10 colonies.

ANDREW DURWARD.

Spencer, Wis., Jan. 15, 1883.

It would be hard indeed to estimate the value of services rendered to our house by GLEANINGS. If I am not mistaken, its monthly visits to us have continued almost from the first number; and very many times when the way seemed dark and forbidding to us, GLEANINGS, with its bright cheery face, came in to encourage us to renewed exertions. Especially has this been the case since the "Home Papers" were started. We have been helped out of many perplexities by your kind, brotherly, wise words.

Kansas City, Mo. E. M. HAYHURST.

[Many thanks; and may the good Father continue to bless you, friend H.]

The fdn. machine came to-day (being six days on the road), all in good shape. I put it up and made me a dipping-board. I had an idea that one came with the machine. I put it in boiling water, which will answer better than soaking several days, as you advise; then melted some wax, and in one hour I was running off fdn. as nice as one could wish. Samples of the first sheet are inclosed. I consider the mechanism of the mill fine. Bear in mind, I never saw a mill, nor even any fdn. dipped. Oh! I take

part of that back; for I saw some mills in the "dormant state" at your place when I was there some two years ago or less.

H. M. MORRIS.

Rantoul, Ill.

Since reading your editorial in the JUVENILE, I think I ought to apologize for indulging in a complaining mood, in not receiving that attention which I thought I ought to have received for delay in sending the goods, especially GLEANINGS. I can appreciate your situation, as I have had similar experience.

N. A. PRUDDEN.

Ann Arbor, Mich., June 21, 1883.

[Friend P., you do not need to make any apology at all. I have not felt a bit hurt this season at any thing our customers have said, for I do not blame them a bit. Very likely I should have talked harder than they did. But to a certain extent I was unable to help myself. Thanks for your kind concluding remarks.]

I have one copy of A B C. I received it last winter. It has proved exceedingly valuable to me. I would not do without it for ten times its value. I am a beginner in the bee business. I find them a very interesting study. By instructions from you in A B C, I have been able to increase my bees from 2 to 6; they are worth to me at least \$35.00; so you see my investment in your book has been a good one. I have charge of a congregation here at Cuba. I find the bees a help to me for illustration in sermonizing. I can show how diligent the little fellows are in the performance of their duties; how much more we should be in following our Master, who have the light of the gospel.

N. A. WHITEHILL.

Cuba, Mo., June 2, 1883.

#### DOES GLEANINGS PAY?

I see by the printed slip on the wrapper of GLEANINGS that our subscription is out, asking us to renew, if it has been profitable. I will tell you what GLEANINGS and A B C have done, so you can judge for yourself. We wintered 8 stands of bees in Simplicity hives, bees coming out strong. We worked them for honey. On the 15th, we extracted over 400 lbs. nice white-clover honey, and sold it to dealers here at 15 cts. per lb. At the rate honey is coming in now, I think we shall get as much more in two weeks, and give the bees plenty of time to lay in their winter stores. By striking a balance with A B C and GLEANINGS, we shall come out in debt to you.

T. T. DAVIDSON & SON.

Parkersburg, W. Va.

#### STOPPING FOR WANT OF A HONEY-KNIFE.

I received Novice's honey-extractor, sent by you. This morning I extracted 100 lbs. of nice clover honey. It works well. I think it a grand invention. I have more to extract; but for want of a honey-knife I stopped.

E. H. BLANCK, M. D.

Hatfield, Pa.

[Why, friend B., I am astonished at you. When we first commenced extracting we never thought of a honey-knife. A common case-knife or a butcher-knife will do almost as well as a honey-knife, only you are in danger of getting your fingers daubed on the honey. If I had honey that needed extracting, I should extract it, honey-knife or no honey-knife. If I could not do any better, I would take a sharp piece of tin and scrape off the caps to the cells. Of course, a good sharp keen honey-knife is a much more expeditious way, and every bee-keeper should have one. But I would by no means let honey go to waste because I did not happen to have one.]

You are the only man among all the manufacturers of bee-fixtures from whom I have always gotten exactly what I ordered. I only wish you were nearer, so freights would not cost so much.

Tyler, Texas.

P. E. GASTON.

[And you, friend G., are almost the only man I know of among our 150,000 customers who can, especially at just this present crisis, truthfully say what you have just said of us and our business. I have been feeling sad about this very matter for many days past. The rush and roar of business for so many months on a continued stretch has broken up and demoralized all my nice plans and arrangements for system and order. Well, I am looking forward longingly to the time when business subsides a little, and our new factory gets ready for occupancy, that we may have once more a place for every thing, and every thing in its place. And still more, have a good stock on hand, ready for emer-

gencies, of every article we keep in our price list; and then good trained experienced clerks who won't send the wrong thing instead of the right one.]

Inclosed is a selection from the *Young Folks' Monthly*, by Thomas Aird. I think it is very good. You may have seen it before. I would read the last line like this: "The safety of their Root-built citadels."

HERBERT LANGDON.

East Constable, N. Y.

But, let us see our bees,  
Before we turn into our ivied porch.  
The little honey-folk, how wise are they!  
Their polity, their industry, their work!  
The help they take from man, and what they give  
Of fragrant nectar, sea-green, clear, and sweet,  
Invest them almost with the dignity  
Of human neighborhood without the invasion.  
Coming and going, what a hum and stir!  
The dewy morn they love, the sunny day,  
Softened with showery drops, liquoring the flowers,  
In every vein and eye. But when the heavens  
Grow cloudy, and the quick-engendered blasts  
Darken and whiten as they skip along  
The mountain-tops, fill all the nearer air,  
Seized with the gloom, is turbid, dense, and cold,  
Back from their far-off foraging, the bees  
In myriads, saddened into small black notes,  
Strike through the troubled air, sharp past your head,  
And almost hitting you, their lines of flight  
Conveying, thickening as they draw near home;  
So much they fear the storm, so much they love  
The safety of their straw-built citadels.

#### A NEW USE FOR THE FOLDING TENT.

You might tell your juvenile readers a new use for the mosquito-bar house, as described in August GLEANINGS, 1880, page 369. I hived a swarm of bees; and just as I finished, a lady called on me to put her bees in a hive. I just set the frame over the new swarm, and ran down and attended to her bees as soon as possible. On returning I found the new swarm had all swarmed out and clustered on the inside of the top of my little house. Again, a swarm issued about one o'clock. Having just finished hiving a large swarm, the buzz of which was not yet quiet, the last swarm was making for them. I just clapped my frame over my first, when they clustered right on the end of the frame, and as near the entrance as they could get. Yesterday a nice swarm issued; and before I could get the frame about, they went and joined a weaker swarm close by.

We are, in this part, having lots of swarming, and swarming *fun*; but up to this date we have not a pound of honey capped over. I think it a sorry outlook for honey thus far. Rain, rain, rain; cold nights, and wind; sunny one day, then rain; clear up, and windy; and thus it is. It makes my mouth water to hear of the large yields of honey elsewhere. But then, the cattle all have long horns a good way off.

C. S. BURKE.

Albion, N. Y., July 11, 1883.

As you don't often hear from this corner of the "vineyard," you need not think we have forgotten you. Your name is almost a household word, and you are spoken of betimes by the very endearing name of "daddy" Root. I believe you are popular enough in the United States, to run for \* \* \* I for one will promise to support you, not knowing your politics, but believing that you are more zealous in your religion than in politics, which is politics enough for me, not ignoring the latter altogether. But, I want to say a few things about *bees changing sex of eggs* — not that I can throw any light on the subject, further than theory. Entomologists say, "It takes the most highly concentrated food to develop the female in insects." Among bees we have a subject for each degree of comparison. Do you know of others that are not *abnormal*? I do not infer from the above, that food produces the different sexes, although some might. If I did, it would be, drones, concentrated; workers, more, etc. It hardly seems reasonable to suppose that a queen *knows* what eggs will produce drones; for if she does, we should have to attribute to her as much or more knowledge than to any other species of animated nature. She may be actuated by instinct, but is no more cognizant of the result, than a dog is of making a better nest in straw by turning around several times. But, if a knowledge of *how* the drone is produced is of any benefit in bee culture, and it can be attained, let us devise some plan to have it done as soon as possible.

JAS. SOMERVILLE.

Bradys Bend, Pa., Dec., 1882.

["Every man to his trade," friend S.; and if I fit my place, and my place fits me, I think I am all right where I am, thanking you for your kind words at

the same time, even though they are so fearfully extravagant. There is a large field for experiment and study in this matter of queens, drones, and workers; and the more one tries to conjecture on that he does not know, the more I conclude that I don't know.]

#### THE REASON WHY WE CAN NOT SEND THE JUVENILE ALONE, ETC.

My little six-year-old boy says, "Pa, I want you to write to Novice to send me a bee-journal." The words are quoted correctly. He puts in the same plea morning, noon, and night, and will take no denial or substitute. He must have JUVENILE GLEANINGS addressed to him, and he pays for it with his own money. He has one colony from which he sold \$5.60 worth of honey. He has just been in my room during recess to see if I am going to write to-day. Can you appreciate my feelings when I tell you I am anxious to have my boys become enthusiastic bee-keepers before I am gone, that they may be prepared to commence where I left off? And do you think the juveniles would understand if I should record a wink as I inclose the stamps, as this little boy so much desires? And can you imagine the knowing glances that will be exchanged by his pa and ma when they see him in possession of a copy of his own JUVENILE GLEANINGS?

Mt. Zion, Ill.

J. S. HUGHES.

[Friend H., your kind letter has a world of truth in it. One might almost be tempted now to think that this JUVENILE is a sharp trick of mine to get subscribers; but when I started it, my only thought was, to help lead those little ones in wisdom's ways. The reason why we can not send the JUVENILE by itself is, that it would necessitate another expensive subscription list, and an extra set of clerks to manage it. Only a very few among our 5000 subscribers have objected to the JUVENILE; and I believe they took back their objections when told it cost them nothing, not even a penny for postage. Tell your little six-year-old that Uncle Amos sends his best respects, and rejoices to know that he is already a prosperous "bee-man."]

I don't know but I am intruding in the company of bee-keepers, as I am only a railroad man; but I claim relationship to yourself on other grounds, and I write because I want to give in my testimony. Some months ago a friend of mine here who keeps bees loaned me the 1879 volume of GLEANINGS. I wanted to study up on bees a little, as I have always been somewhat interested in them; but I was very much surprised to find something in GLEANINGS that helped me so much in my Christian life that I am constrained to write this letter, and let Bro. Root know that there is one railroad man, at least, who is praying that God will continue to use him, and make him a blessing in the future as he has done in the past. I refer to the Home Papers, which, it seems to me, are the grand feature of the book. How good it is to have a business, and run it in the interest of Christ and his cause! I have been a Christian since Dec. 3, 1876, and now I am encouraged to be a more faithful soldier of Jesus Christ. There is that in Bro. Root's writings that helps us business men to carry our religion into our business. They are very practical, and that is just what we want.

My friend J. J. Ochsner has over 100 hives of bees, and I have one, which I bought of him this spring to experiment on. The bees are doing well. The spring was very cold and backward here; and when the dandelions first began to display their gold, many hives had not a pound of honey in them; but since white clover began, every thing has been very favorable, and now the hives are as full of bees and honey as they can stick, and a good surplus is being stored. Owing to abundance of rain, the white-clover season will last at least two weeks longer than usual, and we think will continue fully until busswood, which is almost ready. I hope soon to join your A B C class, and become one of the family; and if I am not disappointed, I expect to spend my vacation next month at my father's farm in Ohio; and then, if I can slip away from mother for a few days, I will visit Bro. Root's bee-farm, and attend the noon prayer-meeting.

HARRY LATHROP.

Prairie du Sac, Wis., July 9, 1883.

[Many thanks for your kind words, friend L.; and when you call to see us, be sure to let us know that you are the man who wrote that letter for the JUVENILE, and then we shall be sure to know you. Thank God that there are at least a few railroad men who are in the army of the Lord.]

Art thou for us, or for our adversaries?—JOSHUA 5:13.

THOSE desiring the blank books referred to by Mrs. Gray in Our Homes this month should address "Headquarters W. C. T. U., Y. M. C. A. Building, Cleveland, Ohio." Some have written us that the address then given was not full enough, and hence we give it in full.

ORDERS are now all filled, very nearly up to date; and with the large force we have at work, we hope soon to be able to say they are *e'car* up. Last week we sent out 600 smokers in five days, and this did not quite fill all orders, even then. Who could have supposed that the smoker business would have assumed such proportions? We are a little behind on extractors, fdn., and sections; but almost any thing else can go about as soon as the order is received.

D. A. JONES, Becton, Canada, has sent us his "Circular and Price List" for the spring of 1883. It contains 48 pages, 4 x 7. In his interesting remarks about terms to students, we find the following plain English relative to the personal habits of apprentices at his bee-farm:

The use of intoxicating drinks, tobaccos, and profane language, is prohibited. These are unnecessary elements in bee culture, and will not be tolerated.

It is gratifying indeed to see such an influence as that which friend Jones exerts, thus resolutely on the side of correct habits. It strengthens us all.

### UNTESTED QUEENS.

For the present, we shall pay \$60.00 a hundred for untested queens; and we expect to ship them promptly by return mail, guaranteed, postpaid, at the old established price of \$1.00 each. We can furnish you queens of any grade as soon as the order is received, with the exception of select tested and select imported. We have plenty of imported queens on hand that are select in every way except color, and are probably just as good as any. An importation of 50 more is now on the way, and we expect them daily.

### ADDITIONS TO ORDERS.

SOME way our business is, of late, getting into a shape so that the many friends keep continually sending additions to orders previously made. Now, we have no objections to this, only that, during this busy season, it keeps one clerk pretty busy to find out whether certain orders have gone or not; and as the mail, express, and freight are in the hands of different departments, it will aid us greatly if you will state, when making additions to orders, which way they were to be originally shipped.

I TELL you, friends, we have had a boom since you last heard from us. Instead of a slack-up about the

Fourth of July, as we usually have, business seemed to go all the other way this year. When overburdened clerks got sick, and had to take a rest, new hands were pressed into service to fill up the ranks; and, as a consequence, more tangles and misunderstandings arose. Quite a lot of them are probably unsettled yet, although most of the orders have been filled.

In order to place the things in your hands when you needed them, we have divided orders, substituted, and done almost every thing that we in our judgment thought to be the lesser of two evils; and in the absence of old clerks who could explain intelligently, a good many things have been sent without explanation. Do not be uncharitable enough, however, to let the idea get possession of you that we do not intend to explain, and fix every thing as near right as can be. Where money was coming to me, I have passed it by for the present a good many times, preferring to give attention rather to those cases where money or goods were due somebody else; for I would much rather lose myself, than to have any of you suffer, where I was obliged to choose between the two. We have now a short-hand writer in our office (besides one in the type room), and if you will tell us what is amiss, I will try, through him, to make things right—or, at least, tell you that we are disposed to make them right.

I WONDER if all of our little friends are enjoying their vacation. Now if you will let me advise, I feel sure you will enjoy it better if you have something to do. There is almost always some work that children can do where bees are kept. They will enjoy their play a great deal better if they have work enough to do until they are just a little tired. We find some of the children in our factory who seem to consider their work as play; and they seem to prefer work to play when they can have their choice; and then where they work, every Saturday night they have their wages in the shape of clean dollars or half-dollars. We have them here as young as ten or twelve years; and on some kinds of work these little chicks will do as much, and do it better, than a grown man or woman will. Isn't that funny? You ought to see them now, busily at work making queen-cages, cages to send bees off in, tying up frames in bundles, putting frames and sections together, picking and shelling peas, etc., etc. You see, here in our factory everybody, or, at least, almost everybody, commences when he chooses, and stops when he chooses. Some of the children are here with their dinner-pails, as early as 5 o'clock in the morning; and then, perhaps, toward night they get tired, and stop early, and have a playspell; or if they choose, they can stop any time during the day and have a rest. If they get hungry or thirsty they can go down to the lunch-room and get any thing they choose, by paying for it. Thus, you see, they are in the habit of doing business as men and women do, and men and women they are, on a small scale. We endeavor to give them the utmost liberty consistent with doing their work properly. There are no rules or regulations to be observed that I think of now, except against swearing, drinking, and tobacco. I believe they generally consider me quite an easy man to work for; only some of the boys think I am terribly hard about tobacco. But I am sure they will all thank me for it when they grow up. In fact, a good many have thanked me already for being the means of causing them to break off from the use of tobacco.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

## \$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \* use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

Borodino, N. Y., Aug. 15, 1882.

Cyprians Conquered.—All summer long it has been "which and 'other" with me and the Cyprian colony of bees I have; but at last I am "boss;" Bingham's Conqueror Smoker did it. If you want lots of smoke just at the right time, get a Conqueror Smoker of Bingham & Hetherington.

Respectfully, **G. M. DOOLITTLE.**

# HOLY - LAND AND CYPRIAN QUEENS

AND

# Farm Implements!

I have a fine lot of pure Holy-Land and Cyprian queens which I will sell for one-fourth more than Root sells his Italians. Also a few pure Albinos; they are light-colored, and very gentle.

I keep on hand, and can ship from the factories where made, a stock of Farm Implements, a two-horse corn-planter, with drill attachment; one-horse corn-drills that will plant in hills; a steel-toothed harrow in three sections, with lever to clear from trash, or pass over obstacles; spring-tooth harrows; common harrows, with 40 or 50 teeth; sulkey hay-rakes; sulkey cultivators, plow-sulkeys, etc. Send for Circular. tf

**H. B. HARRINGTON,** Medina, O.

# BEE-HIVES FOR SALE!

I manufacture every thing needed by bee-keepers, made of wood, not patented. I make Simplicity and Langstroth hives a specialty. My work is as good as the best, and my prices always please my customers. Send postal card for my illustrated catalogue. 4tfd

**H. E. SHADBOLT,**  
WINOSKI, - - SHEBOYGAN CO., - - WISCONSIN.

# HOLY-LAND QUEENS.

Dollar queens, single queen, \$1.00; six, \$5.50; twelve, \$10.00. Safe arrival guaranteed. 7-8d  
**JACOB E. GOOD,** Nappanee, Elkhart Co., Ind.

# LOOK!

A Perfect MORSE Telegraph Instrument for beginners. Send for catalogue. 5-12d **P. B. KINGSLEY,** Greeneville, Greene Co., Tenn.

SEND postal for my 20-page price list of Italian, Cyprian, and Holy-Land Bees, Nuclei, Queens, and Aparian Supplies. 4tfd **H. H. BROWN,** Light Street, Col. Co., Pa.

## Honey Column.

Under this heading will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

### CITY MARKETS.

**CLEVELAND.**—*Honey.*—New honey is beginning to come, and with it a fair demand is noticeable. Best white 1-lb. sections of the new crop sell at 18 to 20 c.; no 2-lbs. now received. Old 2-lb. sections are selling at 15 cts. Old extracted, in bbls., has all been closed out at 8 to 9 cts.

*Beeswax*, none in market.  
Cleveland, O., July 19, 1883.

A. C. KENDEL.

**MILWAUKEE.**—*Honey.*—The first receipts of new comb honey within the past day or two are very fine, and sold at 20 cts. per lb., readily. The old stock is well cleared off, only a small quantity of poor and dark left; hence quotations for choice may be considered for new. Comb, in small sections, 19@20c. Comb, in large sections, 16@18c. Extracted, in cans, 11@12c.

Milwaukee, Wis., July 16, 1883.

A. V. BISHOP.

**DETROIT.**—*Honey.*—The honey market is still unchanged and lifeless. A good article is quoted at 15 @16 cts.; but little is offered, and almost none wanted. *Beeswax*, scarce and firm at 28@30 cts.

Detroit, Mich., July 24, 1883.

A. B. WEED.

**CINCINNATI.**—*Honey.*—The demand for extracted honey is very slow for the last two or three weeks. Only occasional sales are made. Arrivals are bountiful, a large crop having been raised all over the country. It brings 7@9 cts. on arrival. Prices may be brought to a point from which they will be hard to recover. Comb honey brings 14@16 cts., with no demand. Arrivals of *wax* are fair, and demand is good at 32 cts.

Please state that we are of 2-lb. square honey-jars of green glass, and that we will have a new supply after Sept. 1st. We have a full supply of flint jars, which are only \$1.00 higher per gross than jars of green glass.

Cincinnati, O., July 21, 1883.

CHAS. F. MUTH.

**CHICAGO.**—*Honey.*—The new crop is coming into market very freely for the season of the year. Sales are being made at a wider range of prices than usual; 1-lb. comb, when perfect, 18c.; imperfect, 15@17c.; 2-lb. combs, 15@16 c.; Extracted is slow sale at present, owing to its being in many instances unripe. Sales at 8 and 10c. *Beeswax* 30@35c.

Chicago, Ill., July 26, 1883.

R. A. BURNETT.

I have for sale one barrel of fruit-blossom and clover honey, and three barrels of white-clover and basswood. It is ripe and nice. If you want it, send barrels, and I will pay freight one way.

St. Johns, Mich., July 26, 1883.

M. S. PRAY.

I have for sale a fine lot of clover and linn honey, crop of '83; honey warranted of best quality, and well ripened. Price 10 cts. per pound.

Ada, Ohio, July 20, 1883.

J. B. MURREY.

I have for sale some extracted honey of different grades, and also some white-clover and basswood. How much do I hear for it?

Delta, O., July 26, 1883.

O. L. MILLER.

Would you want any honey? If so, what will you pay? I have got nearly a barrel.

Delta, O., July 24, 1883.

HERMAN MILLER.

[We have all the honey we can dispose of at present, friend H.]

I have 2½ barrels of honey on hand which I want to sell. It is fall honey. My health is so poor that I can not do much business. I will deliver it on board the cars at Pewamo for 8 cts. per lb., or less, if it is not worth that; 1 full bbl., 3 half-barrels.

Sethton, Mich., June 4, 1883.

D. GARDNER.

Five hundred pounds white-clover honey for sale in 100-lb. tubs. Address  
Bordentown, N. J. W. M. DEWORTH.

Who can deliver me about 10 gallons of pure extracted white-clover honey here the cheapest? Would like to see sample. No extracted honey around here. Want to give it a retail trial in our (Keller & Kline) store.  
HENRY KELLER.  
Wrightsville, York Co., Pa., July 17, 1883.

WAX is now down to 28 cts. cash, or 30 cts. trade; and fdn. after Aug 1st, will be at the same price it was before it went up on the 14th of March at midnight. I presume it will be safe to let the price down without any such "ceremony" as we had in raising it up. Average wax for sale at 34 cts.

WHO has not been troubled by tipping over his ink-bottle? We have just got some neat strong ones made of glass; they hold ink so you can easily get it with a pen as long as there is a drop in them. You can not spoil the pen by pushing it to the bottom, either, for the point touches a rubber cork. And when you want to shut it up to keep the dust out, just set it upside down. If you want to give it to the baby to play with, you can do so, and it won't hurt him, nor will he hurt the ink. Price 35 cts.; by mail, 50.

ONE of the bee-friends, whose name I have forgotten, has invented a most ingenious letter-clip, or file, for papers. It will file any number of papers or letters in regular order, according to the dates received—holds them securely, and yet you can in an instant open it like a book, separate any letter without tearing or mutilation, and when you are through with it you can put it back in its place, and you don't have to lift those over it off from the wires either. It is a most convenient thing for any one who has much correspondence, and wants to keep his papers in proper order. Price 50 cts.; by mail, 16 cts. more. We have purchased a lot for our bee-keeping friends. We will have an engraving of it next month.

## HONEY LABELS.

Labels for Extracted Honey, size 3x4, ungummed, in blue and bronze, or in two colors, 1000, \$2.25; 500, \$1.50. Same, gummed, 1000, \$2.50; 500, \$1.75. White paper, black ink, 1000, \$2.00; 500, \$1.50. Labels for Muth honey-jars, same price.

Labels for sections, gummed, 2 colors, or blue and bronze, 1000, \$2.15; 500, \$1.60. Ungummed, 1000, \$2.00; 500, \$1.50. Black ink on white paper, 1000, \$1.75; 500, \$1.25.

Labels 1½x2¼, gummed, 250, 50c; 500, 75c, 1000, \$1.00. The above prices include your name and source of honey.

ALL LABELS SENT POSTPAID BY MAIL.  
SEND FOR SPECIMEN BOOK OF JOB PRINTING.

Geo. M. Gray, Medina, O.

Our friend "George" has, as you see, "swarmed out," and started a shop for himself. We take pleasure in recommending him to our bee-friends. A. I. Root.

## DOOLITTLE

Believes queens reared from cells produced by natural swarming are superior to any; hence rears the most of his queens that way. As such queens cost more, the price is consequently a little higher.

Tested Queens (Italian) \$3.00  
Untested Queens (Italian) 1.50

The tested are in every respect such as I use for breeding purposes. If you want a first class queen, address

C. M. DOOLITTLE,  
Borodino, Onon. Co., N. Y.

NOTES FROM THE BANNER APIARY.

No. 45.

MR. ALLEY'S BOOK ON QUEEN-REARING.

**M**R. ALLEY has very kindly sent me his new book, "The New Method of Queen-Rearing;" and, with his consent, I will tell what I think of it. It is well bound, well printed on good paper, and well illustrated; but I consider the price too high. One dollar would be about right. Mr. Alley uses small frames, about 5 inches square, for his nuclei. For one reason, I should like this, as there would be more spaces *between the combs*, for the amount of comb used, than if larger combs were used, and thus fewer bees could care for more brood; but, aside from this, I should not like the arrangement. I can never consent to have two sizes of frames in one apiary; it brings in too many "traps and calamities." To get these small frames stocked with bees and brood is too much trouble; and to get the bees back into full colonies, upon large frames, in the fall, is too much trouble. Mr. A. tells us how to stock these nuclei by driving the bees from a *box hive*, cutting up the comb and fitting it into the small frames. A pint of bees is given each nucleus, and they are confined 48 hours. How he gets bees and brood for them when frame hives are used, he does not say. Does he proceed in the same manner? How much neater and quicker it is to simply take full-sized frames filled with brood, and covered with bees, and carry to the nucleus hives! I was almost persuaded last winter to adopt Mr. Heddon's style of nucleus (see page 74); but as I

thought it all over while on my homeward trip, I concluded it was "too many oats for a shilling," and that when I had to use a different-sized frame for my nuclei than I did for my full colonies, I should quit the business. When full-sized frames are used, the nuclei can be made quite strong, and will store considerable honey. If in a locality where there was but little honey to gather, and queen-rearing was made a specialty, there would then be some excuse for using small frames for nuclei; but even then I would have *all my frames* about 8 in. square.

Mr. A. keeps his breeding queens in miniature hives, as he considers the risk of killing them, in securing eggs as too great, if kept in full colonies. One must be very careless indeed to kill queens while securing eggs. I have yet to kill a queen while handling the bees. He objects to taking eggs from standard combs, as it mutilates them. Of course, it does; but the bees soon fill the holes again.

Mr. A. places much importance upon the ease with which the *exact* date of the laying of eggs can be determined when the queen is kept in a nucleus. With his method of queen-rearing this is of importance; but where a lamp nursery is used, and the cells are removed 3 or 4 days before they hatch, it amounts to nothing. He says that a queen is almost certain to lay *at once* in a comb inserted in a nucleus, while it may be 3 or 4 days before she lays in a comb inserted in a full colony; and, to a certain extent, I agree with him. I keep the colonies containing my breeding queens rather weak, and well supplied with empty combs; thus the queen is almost certain to be laying in *some* of them. I sanction his advice to use strong colonies for cell-building.

Instead of drumming out the bees, taking away the queen, keeping them shut up 10 or 12 hours, and then giving them eggs, I prefer taking away their queen and unsealed brood, and then giving them a comb of eggs, the oldest of which are just beginning to hatch, cutting a few holes to give the bees better opportunities to build cells. I doubt not but that friend A. rears *good* queens by his method; but there is too much "fussing" about it, and I don't wonder that he can not afford to rear queens for \$1.00. It would be less work to rear queens under the "swarming impulse" than it would with the Alley method; and queens reared under the swarming impulse are usually considered good enough for anybody.

Friend A. has his cells built in rows. Now, this is convenient, I admit; but with me it would "cost more than it comes to." I do not destroy more than a dozen cells, by cutting them open when built close together, in rearing 500 queens. Are those dozen cells worth all the "fuss and bother"? I put the frame of comb upon which the cells are built into the lamp nursery, let the young queens hatch out when they get ready, and then introduce them to nuclei. By examining the nursery every hour or two during the day, and holding the cells up to the lamp light, about 9 o'clock P.M., and putting each cell that shows signs of hatching, in a cage by itself, not more than another dozen of cells are lost in rearing 500 queens. Perhaps friend A. would consider *this* too much "fussing;" but no more, I fancy, than his plan of cutting out cells and putting them into a queen nursery in the center of a colony of bees. His advice to feed when forage is scarce is good.

He condemns lamp nurseries in unmeasured terms, calls them artificial devices, and adds that, "When one digresses from the paths of nature, in this business, the more unsuccessful will he be." How would this method of reasoning apply to friend Alley's method of queen-rearing? What one step in his method is *not* artificial? Do not infer that I think his method will produce inferior queens; for, as I have said before, I think it *will* produce *good* queens; but to argue that some method is inferior because artificial, when the methods advocated are also artificial, is, to say the least, inconsistent. My lamp nursery contains four pailfuls of water; is kept in a close room on the north side of the shop, and I can control the heat so that it does not vary 5°. The heat inside a bee-hive varies much more than this, as I have learned by placing a thermometer in the hive.

I agree with friend A., that virgin queens can be introduced to both nuclei and full colonies, as I introduce hundreds of them every season; but to leave the bees queenless *three days* before introducing the queens is unnecessary and unwise, *unless* no honey is coming in, and then it would be advisable to feed; and then, as when honey is coming in, virgin queens can be introduced at the same time that the laying queens are removed; at least that is my experience, and the three days' time gained more than compensate for the occasional queens that will be killed.

Friend A.'s assertions, that his queens are "reared in full colonies, and none are ever queenless," is misleading, to say the least; for the colonies are queenless while building queen-cells. I like his plan of allowing the same bees to build only one lot of cells, and then shaking them down in front of a hive containing the combs from which the bees have just

been removed for cell-building, and then giving them the queen from this same colony.

The queen progeny of some queens, so says friend A., is much more liable to be lost when upon their "wedding trip" than that of others. This is something I have never noticed; but if such is the case I can readily see its importance. He places great importance upon leaving none but the best of drones in the apiary. With this I heartily agree. I also agree with the following: "An inferior queen, in gnawing through, leaves a little ragged hole, instead of cutting a large clean cap." Friend A. says that queens of medium size are generally best; that color or size has no effect on their fertility; that an experienced breeder can judge of the quality of queens before they hatch; that cells having a blunt point and thin walls generally contain poor queens; that queens that delay long in becoming fertile will not prove of first quality, to all of which I agree. Friend A. considers the Syrians the best for cell-building, and the Italians the poorest, and I shall not dispute him. I also agree with him in thinking that queens should be reared from the egg. Friend A. gives some excellent hints in regard to the care required in handling queen-cells; in fact, it is the best advice upon this subject that I have ever seen. Several of "us breeders" have noticed that queens taken from full colonies do not bear transportation so well as those taken from nuclei, and that queens that have been caged a day or two also go safer; well, friend A. has tried caging the queens from full colonies in his nursery a few days before shipping, and has found it an advantage.

He thinks tested queens should be tested for the qualities instead of the "stripes" of their progeny. Here, again, we agree; but when he condemns "dollar queens" in such severe terms, we do *not* agree; but I have not the space here to go into any argument upon the subject; besides, I have time and again given my views upon this subject. He says, "Clear honey can not be safely fed, no matter how much precaution is taken, and should not be used, even though the honey costs nothing, and sugar fifteen cents a pound." He gives this advice because honey incites to robbing, more than does sugar. Perhaps, with his small nuclei, each one of which contains a handful of bees, this advice is all right; but I have several times fed diluted honey in the open air, and I have yet to have a nucleus hive robbed.

Under the heading of "Who should keep bees?" friend A. says: "People who are incapacitated from hard labor; men well advanced in years; clergymen; doctors, lawyers, and ladies;" he also says, "The business can also be well adapted as an auxiliary to some other light employment." As a comment upon the above, read E. E. Hasty's article, "Popular Misapprehensions in regard to Bee Culture," p. 370, July No.

In many of friend A.'s operations, tobacco smoke is used. I do not know that any harm results from its use; but I *do* know that I have never used it, nor had any occasion to use it.

FRIEND ALLEY'S PART OF THE BOOK occupies a little more than two-thirds of the volume, the remainder of which is occupied by essays by Geo. W. House and Silas M. Locke. Of course, with my limited experience in the production of comb honey, it is presumptuous in me to criticize Mr. House's essay; but I will venture to say that, were I obliged to follow the method laid down by Mr. H., my experience would remain *right where it is*. Friend

Locke discusses upon "The New Races," and considers the Syrians the best. I have never tried them, and hence will say nothing.

Although disagreeing in many instances with friend A., yet, could I visit him, and see him putting his methods in practice, I might think better of them; but, be that as it may, I wish him success, and advise bee-keepers to get his book, and read it, as it contains valuable hints.

W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich., July, 1883.

## BEES AND RAILWAY TRAINS.

DO BEES FLY 90 MILES AN HOUR?

I HAVE been very much interested in the articles in GLEANINGS relative to the wing power of our little pets; and from some little experience of my own I am inclined to side with friend Doolittle. Having occasion to visit Cincinnati a few days ago I concluded to take some bees along, and, if possible, test the ninety-mile theory. Accordingly I caged about a dozen, and boarded the fast day express, scheduled at forty miles per hour. Going into the baggage car, the "smasher," being an acquaintance, agreed to assist me in the experiment. We took some oil cloth and covered the side and rear windows, leaving the front window open; and going to the rear of the car when the train was making a speed of not less than 45 miles per hour, being a little late, turned one loose. The little fellow circled around a few times, apparently bewildered, and then made a straight shoot for the front window, in as little time, seemingly, as if the car were standing still; others would circle back, but reach the window from 10 to 15 seconds — the light having been shut out by covering the side windows, no light appearing except at the front window, which, of course, caused the bees to fly in that direction (according to my thinking). Now, they would certainly have to double the speed made by the train to reach that window, and those that circled back so much would be compelled to fly three times as fast. We now went to the rear of the train and turned the rest loose, some flying the same direction as the train, while others were left in the distance. Now, I must beg to differ from Mr. Ewing's statement on page 314, June GLEANINGS. With due deference to his opinion, I am not satisfied with his explanation as to bees keeping their positions over the train, and he must be mistaken. A train does not cause a vacuum overhead during its speed, no difference how fast or slow. Vacuum exists only underneath and at the rear of a train of cars. If Mr. E. doubts this statement, let him get on top of a fast freight train, and ride on the rear car, then let him turn his hat loose (especially if he wants to buy a new one), and see if the vacuum will cause it to follow the train, and I think he will come down hatless. Then he may tear some paper in small pieces, and see how quickly they will disappear in the distance behind; and for safety sake I would advise him to hold fast to something while making these experiments, or he himself will be blown off behind. I have railroaded for 11 years, and this is my experience: Paper and light articles will follow underneath a train, and within two feet of the track, in the rear, by suction, or vacuum, but never overhead; I am of the opinion that Mr. Elwood's bees followed overhead the train altogether by their own exertions.

Somerset, Ky., July 10, 1883. A. T. SHOTWELL.

I am very much obliged indeed, friend S.; but did you fly the bees *inside* or *outside* of that car? In regard to the vacuum, or, more correctly, the *partial* vacuum produced by

the movement of a train, I am inclined to think you are correct in that also, although when the matter was first suggested I did not stop to consider it very carefully. There seems to be more credit due to the bees than we supposed when the subject was first taken up.

## VIALLON'S APIARY.

ONE OF THE ENTERPRISING BEE-MEN OF THE SOUTH.

WE take pleasure in showing you, on the opposite page, a beautiful sketch our artist has given us of the apiary of friend Viallon. I hardly need tell you that friend V. is not only one of our most wide-awake and go-ahead bee-men, for I presume you all know it already; but, what is still more to his credit, that, although perhaps he has done as large a business in rearing and selling bees and queens as almost any other man in the world, no one has yet, so far as I can remember, ever written a word of complaint in regard to his ways of doing business. We also append a description from Mr. Viallon himself, which accompanied the photograph. And in another article, written by friend Flanagan, we have some additional "sidelights," as it were.

My nuclei are in a row along the fence, and two rows opposite; and if you look well you may see some of the nuclei; though the pickets obliterate them a little. If all the hives in front of the honey-house had been painted white they would look better. My bee-hive factory is mostly hidden by the trees, but you can see a part of it. I am glad to hear that you were pleased with the photograph; but I don't see why you should go to the expense and trouble to have it engraved, as there are so many others having better-looking apiaries than mine. At any rate, do as you please, my friend, and may God bless you and family for your kindness to all of us.

P. L. VIALLON.

Bayou Goula, La.

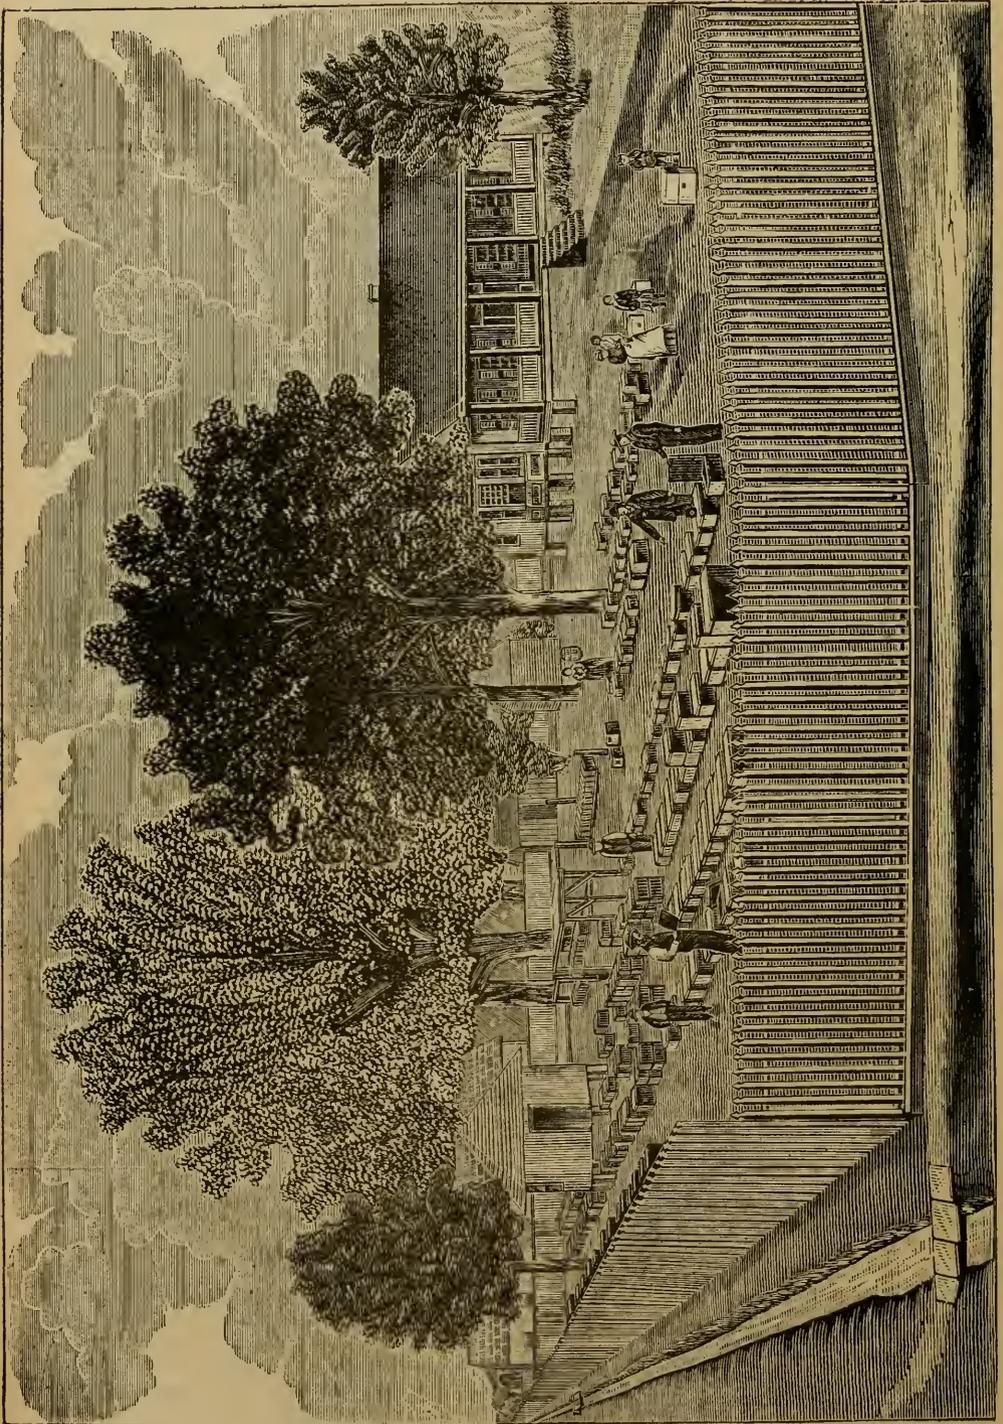

Below are a few words from one of our hands who has been with friend V. for toward a year past.

The cut shows the apiary and home of Mr. Paul L. Viallon, of Bayou Goula, La. I am aware that many readers of GLEANINGS will cast careless glances at this little plate, while others, who have become acquainted with or visited Mr. Viallon, will say not half has been told. This picture is very dear to the writer, because of the beauty of the place; dear, because of the loving, kind hearts of the occupants; and doubly dear, because it has become the home of his only son, J. M. Olin, who has the charge of the large and extensive apiary, which is situated above New Orleans, and has a fine view of the Mississippi River. The beautiful shades are live-oaks and tropical fruit-trees.

This photograph was taken about the last week in January. The number of stands at that time was between 400 and 500. After sojourning with them for the past 8 months, and noting the thrift and shrewd management, I must say, "Excelsior!" Mr. Viallon is every bit a true Southern gentleman. The most of us know something of Southern hospitality, and we truly realize it when we visit him.

Medina, O., July 26, 1883.

### THE MAN WHO WINTERS HIS BEES WITHOUT LOSING ANY.

241 COLONIES THROUGH THE WINTER OF 1882-'3, AND NO LOSS.

**L**AST spring we received the following postal card from a bee-keeper in one of our neighboring counties:

If you would like to see how the man looks who winters his bees successfully, I will send you his picture. Two hundred and forty-one colonies in good condition, without the loss of a colony.

H. R. BOARDMAN.

East Townsend, O., Apr. 23, 1883.

Of course, we replied at once, "Do so by all means, friend Boardman." And so you

to tell us a little more about how he does it? and a word or two from some of his neighboring bee-men might give us some "side-lights" on the matter. Now do not be bashful, friends, but let us know all about it, that we may be able to "do so too."

### AN A B C SCHOLAR'S TROUBLES.

HE ASKS SOME QUESTIONS.

**A**S I am under the impression that, as the season of furnishing hives is about over, you may have a little spare time to answer a question, I promise that I will ask as few as possible. I had a couple of hives of bees, and got 4 hives from you,

H. R. BOARDMAN, THE MAN WHO DOESN'T LOSE HIS BEES IN WINTER.

see, friends, we submit you his picture above: I confess, friends, I expected to have prepared a little personal history of friend B. before his picture was received and sent to the engraver's; but it was not attended to, and all I can tell you is, that he has been an enthusiast on bees for a good many years. Of late he has a sort of queer fashion (?) of wintering his bees every winter with no losses. If I am correct, he did have, eight or ten years ago, some experience in Blasted Hopes, like the rest of us. I think he winters principally on natural stores.

He writes again later as follows:

The bees are all right to date, *without loss*, and in fine condition.

H. R. BOARDMAN.

East Townsend, O., May 21, 1883.

So I presume that he has escaped the spring dwindling that so many of us have in May. He paid us a visit but a short time ago, and I had some conversation with him; but the roar of business has driven it pretty much out of my head. Will friend B. please

one of which I put over another, making a 2-story hive of my first swarm, and got two more swarms, so that I have now five. I got your A B C, but, like all other scholars, learning from books alone without practical suggestions from a teacher, is slow and *painful*, and sometimes unsatisfactory; although I have learned a great deal from your book, which, for the amount of money it costs, and the simplicity of its arrangement, I consider the best compendium of bee knowledge I ever saw.

SIMPLICITY HIVES, TWO STORIES; ATTACHMENTS BETWEEN UPPER AND LOWER STORIES.

In the two-story hive, I find that the "blessed bees" have built up from below, and attached their combs to the frames above (in the second story), so that I can not move them. Will it be advisable to take off the entire second story? and how can I prevent them attaching the upper frames to the lower?

Friend B., this is a matter that has been very fully discussed; but there seems to be room for discussion on it yet. If the hives are so made that the space between the up-

per and lower frames is not more than  $\frac{3}{4}$  and not less than  $\frac{1}{4}$ , most colonies will leave this space and build in comb between. There are, however, exceptions. While going through the apiary yesterday I found that I could lift almost all of the combs easily in the upper stories; but once in a while I would find a colony where every upper comb was attached to the one below it, so that when I attempted to raise one I raised both. The sheet of perforated zinc, illustrated in our price list, will probably remedy this. But if I were working hives for extracted honey, I should prefer to get along without it if I could. I think I would leave all colonies without this sheet of zinc, that would not attach the combs. Where they persist in so doing, I would scrape the wax from the top and bottom bars, and put in the sheet of zinc.

#### ATTACHMENT OF COMBS.

In these new hives I find that the frames are crowded, although I have fewer frames in than you forwarded in the hives, and they built so that two frames are sometimes attached to each other. How can I prevent their attaching two frames together? and how many frames shall I put into a Simplicity hive?

Bees, as a general thing, bridge their combs across from one to the other, more or less; and a beginner is almost always sure to think these attachments prevent the combs from being movable. Such, however, is not the case. When you wish to lift out a frame from a full hive, select one of the central combs, and one containing considerable brood. Now move the combs on each side a little away from it, until the attachments are broken. You can now raise it carefully without any danger of injuring the combs or killing the bees. If a hive has not been opened for some time, and the bees build the combs all together solid, apparently, it may be best to move nearly all of the combs a little, so as to make room for the one you wish to take out. Much depends on the combs being straight and true. Also where the combs are bulged, by leaving the bees some time without space in which to store their honey, the matter of opening the hive is rendered very much more difficult.

#### HANDLING HYBRIDS, ETC.

From the way the bees sting and go for me, I should judge, after reading your article, that they are hybrids. Now, I am not sufficiently expert yet to introduce Italian queens and remove the hybrids, and do not want to go to the expense of buying new bees, Italians, and disposing of my present stock. Can I, by getting an Italian nucleus, raise queens sufficient for my hives, so that I can introduce them next year, when I shall have more practice? and can I add to this nucleus, frames with brood from my present stock without danger of hybridizing the nucleus?

Even if your bees are hybrids, you should be able to handle them without being stung. Use smoke, and a little more care, and never mash a bee. You can easily build up a nucleus to a full colony by giving them combs of brood; and even if these combs do come from hybrid stocks, I should not think it would matter materially.

#### CYPRIONS AND HOLY-LANDS.

Are Cyprians or Holy-Lands any better than Italians? Are they less liable to be ferocious?

At present, all things considered, I am inclined to give the preference to the Italians over either the Cyprians or the Holy-Lands, although the latter have qualities that make them much more desirable than Italians. As a general thing they are not as easy to handle. Very likely a cross between the two races mentioned and the Italians will be found superior to either of the three races pure.

#### WAITING UNTIL I HAVE TIME.

If you have not time to answer all of the above queries now, lay them aside until you have leisure. I will not be offended.

C. L. BAUMANN.

Dayton, O., July 14, 1883.

Friend-B., I very seldom wait until I have more leisure. Experience has taught me that it is cheaper and easier to dispose of every letter I receive, when it is once in hand; for after I have given my mind to the consideration of any subject or letter, it is a waste of time to lay it down and then take up the whole thread again at some future time. My answers are often brief, but they are, I believe, as a general thing, pretty prompt.

#### SOME OF A BEGINNER'S TROUBLES.

REARING QUEENS, GETTING BEES TO WORK IN BOXES, ETC.

IN July No. of GLEANINGS you ask the question, "Has any one else had bees work on lilac?" I have lilacs in front of my house, and while they were in bloom, they were alive with bees all the time that was suitable for bees to work. I have a mixed multitude of bees, Italians, blacks, and mongrels, or hybrids. I did not observe which race worked on them the most (if there was any difference), as I supposed it a common occurrence for bees to work on them.

Has any one succeeded in raising queens on the improved H. Alley system? I bought a book, worked according to directions the best I could, with good faith, but got *not a cell*, and injured three of my best stocks very much by the experiment. I feel to exclaim with Josh Billings, "Egsperiens iz a gud skule, but the tuishun iz purty hi." If I keep bees I shall need to raise queens, as the loss of queens seems to increase every year. I have had a greater loss this season than any one for thirty years.

My bees have done but very little thus far. Clover has yielded but little honey. We have had a great deal of cold rainy weather. Basswood is now in bloom, and to-day they seem to be doing a driving business. Still, they are very obstinate about working in 1-lb. boxes with tin separators. I have six broad frames in upper story, and one at side of brood-nest, and a frame of brood or a frame of fdn. in center of upper story. They will fill the frames of fdn., but never a bit the boxes. Now, Bro. Root, may the Lord bless you in the work he has intrusted to your care, and be surely will; for he has promised, "He that is faithful over a few things, I will make him ruler over many things." S. B. SEAMAN.

Harford Mills, N. Y., July 16, 1883.

I am very glad to hear that bees do work

on lilacs, for I shall now have an excuse for having a little lilac garden on the honey-farm. Can any one tell us how many varieties of lilac there are? and can we not develop those that especially bear honey? I never saw or heard that bees worked on lilac till friend Cook called attention to it.— I hardly think, friend S., that Alley's system is at fault in any way, for very many of us have been working on almost the same plan for years. The same with the loss of queens. I think, after a little more practice you can raise queens just as surely as you raise chickens. I suppose you know some folks don't have any "luck" in getting chickens hatched. Neither do I think that the weather has been greatly to blame this season. An expert in almost any kind of business nowadays will succeed in spite of circumstances. Very likely you are right in deciding that separators are a detriment; but how can we get along without them?

#### A BRIEF REPORT FROM OUR FRIEND R. WILKIN.

1000 COLONIES OF BEES, AND 24 TONS OF HONEY.

**I** PRESENT to you, at his request, the compliments and report of Mr. R. Wilkin, San Buenaventura, Cal., with whom I was working through the month of June.

The season of 1883 has been, with us, a peculiar one. Early rains in the fall of '82 raised the hopes of farmers and bee-keepers. A great deficiency of rain-fall during the winter nearly destroyed them. The last week in March found the ground dry, the crops suffering, and the people fully expecting a dry year. A good rain about the last of March and the first of April, with showers in April, and the rare event of a heavy rain in May, again changed the outlook; bees began to prosper, increase, and store. This state of things continued till the latter part of June, when unusually hot weather suddenly put a check upon proceedings. While bees can easily gather winter stores after this, little surplus will be taken from them. Mr. Wilkin has 1000 colonies of bees, present count, in two apiaries. He has 720 colonies at his Sespe apiary, where he started with something less than 500 in the spring, and where there are upward of 2000 colonies within two miles of one point. He has 280 colonies at his Matilija apiary, where he started in the spring with about 190, and where fewer bees are kept. From the former apiary he extracted 15 tons of honey, and from the latter, 9 tons. If room would permit,

would gladly enter at length into a description of the systematic arrangements at the Sespe apiary. I will only say, that everything works smoothly and perfectly. Mr. Wilkin uses an eight-frame extractor; i. e., one that empties eight frames at once. One person can run it easily, and I think it demonstrates the fact that time can be saved by emptying a larger number of frames than two or four. Mr. Wilkin both devised and constructed it.

Of course, in so large an apiary, various anomalies will occur, such as bees swarming with a virgin queen when they have an old clipped queen in the hive; bees swarming when they have only a caged queen (just introduced) in the hive, and finally returning, etc. But are we not disposed to make too much of these occasional circumstances, and state

them in a way that would make a beginner think them liable at any time to happen? For instance, instead of every man who has ever known a swarm to leave without clustering acquainting us with the fact (and we have heard from many already), suppose that those who have known one per cent of all the swarms they ever saw to thus depart report to us, and we will see if the number does not decrease materially. I have known swarms to apparently leave without clustering, and then have found them clustered, after all, a long way from the apiary. While admitting that they sometimes go directly to the tree, I think that merely seeing them depart is not conclusive evidence.

I will add, that results at Mr. Wilkin's apiaries may be taken as a fair average for Ventura County, a few apiaries having done much better, and others not so well, according to location. A. NORTON.

Gonzales, Cal., July 10, 1883.

Many thanks for your report, friend N., even though it be a brief one. I have often wished for something more definite from friend Wilkin, and have, I think, said as much. I will gladly pay you, or any of his assistants, for information in regard to his bees, management, etc. If I am correct, 24 tons of honey is the largest crop ever reported by one man. If anybody else remembers its equal, let him stand up. I am very glad indeed that my old friend is prospering. If he should feel inclined to circle around among his old friends here in the States again, he will meet a most hearty welcome.

#### BEES AND BEE-HIVES.

WINTERING BEES IN EAST TENNESSEE.

**I** THINK you need to publish a Southern GLEANINGS, as about one-fifth of the present edition is filled up with reports and methods of wintering. Now, this no doubt is very interesting to our Northern friends, who find wintering a difficult matter; but with us it is only "filling," as wintering is never a difficult thing — that is, with those who are somewhat versed in the business. If the colony is in any thing like a healthy condition, the bees will winter in almost any condition.

Our friend J. A. Galbraith, of this place, told me a few weeks ago to bring a "sitting" of my Improved Holy-Land bees, and transfer a hive for him. Well, I procured a fine queen, and went to "do the job." On arrival, I found they were in a "bee-gum" — a gum in reality, as it was a hollow gum-tree log, about 2½ ft. long, without any top, except a cracked board lying loose on top, and the top edge, or end of the log, had decayed so badly that one could stand twenty yards from it and see the whole top of the comb. Friend G. said it had been in this condition for several years, and yet I found a most powerful colony of bees in this old log. I have repeatedly wintered two-frame nuclei with success; and in my queen business I unite no colonies in the fall, but winter them on their summer stands, all of them being two, three, and four frame colonies; neither do I use any protection, except a piece of cotton quilt laid on top of the frames under the cover. However, I would like to say here that

THE WOOD FOR HIVES

has a great deal to do with successful wintering. We use poplar, and of this we have two kinds —

white and yellow, which get their names from the color of the wood. Poplar, you know, is the greatest wood known to swell and shrink, which is due to the open texture of the wood absorbing and expelling moisture; and while this is an objectionable feature on account of its being hard, to keep the cracks stopped, it is also a decidedly favorable feature, as it takes up the moisture and keeps the cluster nice and dry. Especially is this the case with the yellow variety, it being more porous, but not so bad to shrink, as the white. I think the "coming and going" of the wood keeps the propolis inside the hive broken enough to allow the wood to receive the moisture.

#### TWO QUEENS IN A HIVE.

I was just on the eve of writing about a young fertilized queen laying nothing but drone eggs; but to-day upon opening the hive the first thing that caught my eye was two queens, one the above mentioned, and another young unfertile queen, one evidently feeding the other. The unfertile queen had faulty wings, which accounts for the drone eggs; and on further examination I found that the other queen had begun laying properly. I simply write this to illustrate how a great many things might be misrepresented. I might have written, stating that I had a young queen that had been fertilized, but laid nothing but drone eggs, as it really seemed to be the case.

CHAS. KINGSLEY.

Greenville, Tenn., July 11, 1883.

#### PREPARING BEES FOR SHIPMENT.

##### FRIEND CARROLL'S WAY.

**I** PREPARE bees for shipment in metal-cornered frames, on metal rabbets, and I do it in 5 minutes. I take a thin strip 3 inches wide, and just the length of the inside of the hive across the frames. I nail this across the frames in the center of the hive, by using two  $\frac{3}{8}$ -inch wire nails to each frame in the outer edge of the 3-inch strip, and two nails driven in the ends into the hive at an angle of about 30°. I now take common lath and saw four strips, and nail at each corner of the hive from top to bottom, raising the cover one inch or more. I tack a strip of wire cloth around the hive, where I raise the cover, and your bees will go safely any distance, and can be unpacked in 3 minutes. No sticks are needed at the bottom of frames. No turning up the hives to screw on the bottom. Of course, the entrance is also covered with wire cloth.

B. F. CARROLL.

Dresden, Texas, July 7, 1883.

Very likely your plan will answer, friend C., providing the bees bulged the combs pretty well, and made attachments from one comb to the other through most of their length; but unless they have, I should very much fear the frames would get swung around, or the bottoms get to swinging against each other. Two wire nails only three inches apart, or a little less, it seems to me could not very well fasten the frames very firmly, while our spacing-boards make them positively rigid throughout their whole length. You may be able to make a hive ready for shipment in five minutes by the plan you suggest; but I think it would take an average bee-man larger half an hour, and I have had a pretty large experience in the matter. Another thing, I would not want

to risk a very large colony during the hottest summer weather with the small surface of wire cloth you mention. Even where the whole top is covered with a sheet of wire cloth, when a strong colony gets on a stampede (if that is the right word), they will cover this wire cloth so densely with nothing but the heads of bees with their tongues out, that suffocation ensues. I know of no plan absolutely safe, except to have the whole top and the whole bottom of a Simplicity hive covered with wire cloth. Then we are all right, no matter how many bees are inside, nor how hot the weather is.

#### A QUESTION OF MUCH MOMENT TO MANY OF US.

WHAT SHALL WE DO WITH OUR BEES AFTER THE HONEY SEASON IS OVER?

**T**HIS is a question of considerable importance, and not so easily answered either. The honey season is practically over with us here now, unless we should perchance get a little from buckwheat, which we have never done yet. They will bring in a very little for a week or so yet; then for a month they will not get as much as they consume; then in September and October they will fill up pretty full for a winter's supply.

If we can calculate from past experience, how to manage them for the best results is the query. They are at this time all strong; only about one-third of them have swarmed, and will well cover from 15 to 30 frames. Quite a portion of them are, of course, old and nearly worn-out bees; and if left just as they are until time for winter quarters, will not contain more than one-half as many as there are now, even if the queen did an average amount of her duty; and there is no use trying to set them to fetching in honey by smoking, for there is no honey to be found to fetch in.

If we divide and increase our stocks, and then from any cause our bees do not winter well, we shall be accused, "both at home and abroad," of "making haste too fast."

In previous years I have tried dividing after swarming-time, and mixing in empty frames, but have found it "no good," for there was not enough honey to permit them to build new comb in the empty frames. But this year I think it will be safe to divide moderately, and give empty combs and a laying queen at once, as I have a lot raised for that purpose, and have had about 80 lbs. of fdu. worked this summer.

I have had no second swarms, as I have learned a good way to prevent it. As soon as I can, after a swarm has issued, I just go to the parent stock and cut out every queen-cell, "every last one," and then let a laying queen, taken from a nucleus, crawl in at the entrance, and give her a parting salute with the smoker, and put a cell into the nucleus she came from; that is all. I haven't lost one yet, and no queenless parent hive for a week or ten days. A good way, isn't it?

A. A. FRADENBURG.

Port Washington, O., July 17, 1883.

Friend Fradenburg, my answer to your question would be, divide the bees, and feed. But I advise this with the understanding that they can be wintered and sold at a good profit in the spring. But I think it very

likely that those who have had luck in wintering will be very much safer if they do the feeding without dividing. Go into winter quarters with monstrous stocks crammed with stores of granulated sugar. As for ourselves, we sell bees by the pound almost every month in the year. Of course, we do not want to sell old bees, nor try to winter them, and therefore brood-rearing should be kept constantly going, until October at least. I know a great many are thinking about the matter you suggest, for bees are offered me at almost any price I see fit to give.

### OUR GOOD FRIEND L. L. LANGSTROTH.

HE TALKS TO US ABOUT WORKING OUR HIVES FOR EXTRACTED HONEY, AND OTHER MATTERS.

**T**HANK you for your kind comments on my letter in the July No. Lest any of your readers should give me credit for suggesting, more than 31 years ago, the possibility of bees removing the spermatic filaments before they enter the egg, I will quote from my book:

"In the summer of 1852 I examined a brood-comb which had been given to a queenless colony. It contained eleven sealed queens, and numbers of the cells were capped with a round covering, as though they contained drones. Being opened, some contained drone and others worker nymphs. The latter seemed of a little more sugar-loaf shape than the common workers, and their cocoons were of a coarser texture than usual. I had previously noticed the same kind of cells in hives raising artificial cells, but thought they all contained drones. It is a well-known fact, that bees often begin more queen-cells than they choose to finish. It seems to me probable, therefore, that, when rearing queens artificially, they frequently give a portion of the royal jelly to larvae which, for some reason, they do not develop as full-grown queens, and that such larvae become fertile workers."

While I still think that many fertile workers are thus raised, it seems almost certain that those reared in the normal way may, in the absence of a queen, become fertile.

You have such a multitude of matters constantly pressing upon your attention, that, if you say any thing about them, you can not, in some instances, help "going off at half cock." In the proposed changes in the upper story of your chaff hive, would it not be better to give them an actual trial before condemning them? Make the trial at my expense. Bear in mind that, having tried such an arrangement, I speak from experience; also that I have tried strong-storing colonies in their upper stories with great success. I now have chaff hives of this kind, in which the bees never became overheated.

#### UPPER ENTRANCES AND VENTILATION.

Let me explain how, years ago, my bees were kept so comfortable in the hottest weather, even without the shade of trees, that they rarely clustered outside. I made large use of hives of my regular pattern, having communicating holes in their bottoms, and piled one on top of another until three and sometimes four or more stories were used by a single strong colony. In hot weather, when the entrance-regulating blocks were all removed, very few bees left or returned, except by the lowest entrance, making use of those in the upper stories only as ventilators, for which nothing could serve better.

During the last fortnight the thermometer has often been above 90°, and even as high as 94°, and I have fully tested the sufficiency, with thin upper

stories, of upward ventilation, in my double-story chaff hives. To let a good ventilating draft through hives which have no flight-holes in the upper story, I propped up their roofs as though they were hinged, the opening in the rear being some two or more inches high. Even in play-time, and with the drones in fullest flight, not enough bees came out from above to give any annoyance, and none clustered outside of the entrance proper. At the same time, colonies without what I shall call upward summer ventilation were distressed by the heat, clustering before their flight-holes, and wasting much precious time in laborious fanning.

#### WORKING HIVE FOR THE EXTRACTOR.

Friend Root, I hope at a future time to point out some of the many ruts into which the wheels of apiarian progress have so deeply sunk. Let it do for the present, to say that great changes are needed in many of our manipulations—more especially those used in extracting honey. My cardinal principle, not to require of bees or men the smallest unnecessary muscular effort, is specially important while extracting is carried on; for at this season the work in a large apiary is most exacting; therefore I condemn the directions usually given, always to keep the bees below the tops of the frames. While the extracting season lasts, I want nothing over the frames but the hive-roofs; to "work to the best advantage," I must get access to the frames the moment the roof is lifted. No time can be spared for tearing up propolized coverings of any kind, however important these may be in their proper season. A moment suffices for lifting off the roof; another, for a few puffs of smoke, and I am lifting out the frames to be set into a tight box, or on the ground around the hive. I often remove the frames from several hives before extracting, so that the bees on the first set of frames having had time to gorge themselves while the others are removed, are easily shaken or brushed off, the others being ready in due succession. When all are emptied they are quickly replaced, not a second being wasted in driving the bees down, and in replacing what keeps them down.

But I seem to hear some one cry out, "If the frames have nothing over them but the propped-up roofs, how can robbing be prevented?" By using Italian bees, or such varieties as, in a full flow of honey, can be tempted only by the grossest mismanagement to seek it anywhere except from the natural sources of supply.

I know that these bees came to us with the reputation of being extra bad as robbers; also that some of the ablest European bee-masters still affirm that this is their habit. But I found, very soon after trying them, that they were far less inclined than the blacks to rob during a full flow of honey, and so informed our American bee-keepers. This point is now so generally conceded among us, that there is no occasion to argue it.

"But," says another, "would you have the bees propolizing every thing above the frames within their reach?" Italian bees at least (I have never given the blacks a trial) do nothing of the kind. They seem to see at once that it would be far too large a contract. Try them, and you will find them gathering much less propolis than when, after each ripping-up of the coverings that confine them below, they strive the more to make them immovable.

"But, who would have them clustering under the roof, and comb-building wherever there is a vacant space?" Friends, they leave this clustering for

comb-building above and away from the frames, to the blacks. "Yes; but do they not show less refinement of instinct than the blacks, when they attempt to build combs upward from the tops of their frames, so that, when sufficient space is given them, these combs soften and bend over, unless braced as in the photograph I send you, copied from combs taken from one of my colonies?"

Now, this disposition when proper storage room is not given to build on the tops of their frames, is a virtue, if we know how to use it aright. Tilting up the roof, as though it were hinged — for to lift it off before I know that I *must*, would be against the cardinal principle already laid down — a bare glance at the tops of the frames whitened by their new foundations, tells me that the extractor is needed, as plainly as though I had lifted out the frames to learn how heavy they are.

Now compare this easy and swift manipulation with the methods so frequently practiced by our leading bee-men — the lifting-off the roof, and carefully setting it down, and the bee-provoking practices which have already been described, only in many cases to find that extracting is not needed, and that more precious time must be wasted to replace things as they were!

If such useless manipulations are common among our best apiarists, with our style of hives and frames, what must be said of the foreign side-opening hives, in which bars are preferred to frames by Germany's greatest bee-master, and where, even when frames are used, little can be seen but the face of the first comb, and in the use of which the thin boards which cover both bars and frames must be pried loose before even a single comb is ready for removal; and when all this is done, both frames and slats running in propolized grooves must be pulled toward you by the pliers, forks, or hooks, described on pages 294, '5, '6, of Dzierzon's "Rational Bee-keeping." These methods truly seem to me like the preference of horses to locomotives for use on railroads.

If I stood alone in this opinion I might think it almost presumptuous to express it; but it is well known that Messrs. Wagner, Grimm, Dadant, and other great leaders among us have said the same thing. The former, who was wonderfully well posted up in the history of German apiculture, thought that the dearth of land in the old country seemed almost to necessitate the use of side-opening hives, piled one on top of another, notwithstanding the tedious and difficult manipulations which such hives necessarily compel, while the comparative rarity of circular saws, planers, etc., all moved by steam, and which may be found in our nearest settlements, reconciled Dzierzon to the slow work of splitting out the pieces which covered his bees!

If it shall be thought that Mr. Wagner and myself were very naturally prejudiced in favor of our own methods, surely there could be no reason why Adam Grimm and Charles Dadant, the one from Germany and the other from France, should condemn, as inferior, the hives which they had used in their mother countries.

What a digression! But I can not close it without paying, as I have often done before, my tribute of praise to the honored names of Dzierzon, Berlepsch, Kleine, and others, to whom in all that pertains to the habits and physiology of the honey-bee, we are under the deepest obligations. Who will hesitate to say, that the discovery, by Dzierzon, of parthenogenesis, is the greatest that has ever been made in

apiarian matters, and was the "open sesame" to the mysteries which defied the subtle acumen of Aristotle, Swammerdam, Reaumur, and all who succeeded them?

L. L. LANGSTROTH.  
Oxford, O., July 19, 1883.

Friend L., if you will excuse me, I think there is one important point you overlook, or pretty nearly overlook, all the way in your kind article, and that is, that bees will be greatly hindered in honey-storing if they have too much ventilation, or if the space where they are storing is too open or exposed. As it is some warmer in your locality than it is here, that may account partially for the fact that you notice it less than we do. Excuse me if I repeat somewhat what I have gone over before. In the hoop hive we found the bees averse to filling combs next to the hoops or open slats. Again, in our experiments in the house apiary, we found very much more honey stored in the sections that were blanketed or covered with cushions than in those left entirely without protection or covering. Especially was this the case when the bees were gathering honey in August and September. We tried the matter over and over again.

Only a day or two before your present article was received, I went through our apiary of about 300 colonies, making a careful investigation to see how the boys had prepared the hives in which was stored the basswood honey, which is now in full blast. Part of the hives had the frames closely covered with enamel sheets, strips of duck, or pieces of burlap, while quite a number had nothing over the upper frames at all. With weak colonies, many of them had nothing over the lower combs. Before I was one-fourth through I was satisfied the bees were storing much more honey where the mats were sealed down close, than where the combs had a partial covering, or no covering at all. The reason for this, I take to be this: That if the covering is complete and entire, but few bees, comparatively, are required to keep the requisite temperature to build the comb and ripen the honey; whereas, with exposed combs a large body of bees are obliged to stay at home to keep the requisite temperature for both these purposes. After that I took pains to have the space made tight and close, so not a bee could get above the combs, and it seemed to me a larger force went to the fields immediately. Now, I may be mistaken in my position here; and as this is a very important matter indeed, I would ask others to make experiments at once, and decide as far as we can what is best to do about it. I know combs can be worked nicely for the extractor with no covering during the honey season. I, too, have learned to tell at a glance at the top of the frames when it is necessary to extract.

While I think of it, I might mention that I tell by this very plan, when a colony has a laying queen. I have frequently gone out into the apiary and puzzled the boys a good deal by telling them that they would find laying queens in colonies where the slates indicated them to be queenless. In every case I was right; and the new eggs and brood would be found right under the white caps on the upper edges of the combs.

There is one more objection I would mention to leaving the frames without any covering. I never knew a bee-keeper yet, or at least I do not think of any now, who did not occasionally get careless, and then the whole top would be built full of comb. Perhaps you might say the honey would better be stored in that shape than to be lost, so I will not lay any great stress on this point. But another trouble, and a worse one, is, that these colonies will be left until the honey-yield is over, then the bees will go up on the cover to loaf, and great quantities of propolis will be daubed all over the cover and edge where it shuts down (for I presume, of course, you will not keep the covers propped open after the honey-yield is over), and then the cover will always stick fast, making it necessary to pry it up with a snap; for it is next to impossible to clean the propolis off so as to prevent this, after it once gets well coated. For these reasons I feel like saying I never want any bees above the tops of the frames, and certainly none where they can be mashed when the cover is shut down.

And now I hope, my dear friend L., you will not think I am taking a liberty in differing with one so much older and so much wiser than myself in all these matters. We have, I trust, both of us thrown out the facts and suggestions in our possession before this great class of A B C scholars, and doubtless they will soon give us abundant facts in the matter.

#### HOW FAR DO BEES FLY?

SOME INTERESTING AND VALUABLE FACTS IN THE MATTER.

I HAVE been much interested in the various articles, headed "Ninety Miles an Hour," published in GLEANINGS. One of your correspondents aptly says, "Arguing in regard to matters concerning which our knowledge is incomplete, is very apt to lead us into error." My knowledge is very incomplete on this subject; but having hunted bees considerably, and timed thousands of them, I should think they flew from 12 to 15 miles an hour when at ordinary work. It is very easy to mark and time bees when working at a box. Just take a little flour and water, make a thin paste, take a spear of grass, touch the end to the paste, step up to the box carefully, and touch the bee somewhere on the body. If your paste is just right, you have a mark that will last all day. When he starts toward home, note the time. When he returns, see how long he has been gone. If he comes in less than ten minutes, you ought to find the tree without moving. If he is gone ten minutes, his home is about half a mile away; 15 minutes, one mile; 24 or 25 minutes, two miles; 30 minutes, 2½ miles, which is, I think, the usual limit. The furthest I remember to have had any work was 3¼ miles, and they were gone from 33 to 36 minutes on as fine a day in July as you ever saw.

This rule is not invariable, nor do I know of any that is, where bees are concerned. Some claim a great deal of the time is spent in unloading; but when your box is near the tree, a bee will go, unload, and return in 4½ minutes; and occasionally, but very seldom, in 3½. Some claim that bees go seven miles to gather stores; but judging from my ex-

perience, that is one of the imaginary facts. Because you see bees seven or fifteen miles from houses or trees, proves nothing about the distance they came. I once found a swarm in a woodchuck hole, within 40 rods of hollow trees.

East Freetown, Mass.

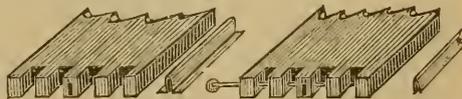

C. E. CHACE.

#### DEVICE FOR PREVENTING BOTTOM-BARS FROM SAGGING.

SOME SUGGESTIONS FROM FRIEND BLOOD.

WHILE we want bottom-bars that can not sag or bend down in the middle, we also want something that is light, and occupies but little room. The bottom-bar to a frame one inch in thickness would be altogether too heavy and too bulky; and I believe most bee-men would consider that one a half-inch in thickness would be more than could be tolerated. The bottom-bars to our frames are about 9-32 inch in thickness, and this answers very well, providing it is supported in the middle by the usual diagonal wire. This diagonal wire, as you all know, is out of the question in a wide frame to hold sections. Diagonals have been suggested, to be attached to the separators, but this supports only one edge, and gives the sections a tendency to fall out of the frames. We have but little trouble about the sagging of bottom-bars to wide frames, by making them of basswood (which we find stiffer than pine), but friend Blood proposes to stiffen them with folded tins. We will let him tell it.

For some time I have been expecting that you would do something to prevent the sagging of the bottom-bar of the wide frames for honey-boxes. We have been troubled with the sagging of the bottom-bar in some cases to such an extent as to press the boxes very much out of square. Our remedy is as follows: run the frame over a thin saw, allowing it to cut nearly through the bottom-bar; then press into the saw-kerf a strip of tin folded in this manner:

We nail the ends only, and can scrape the bottom-bar without trouble, if we want to; try it; and if you like boxes kept true and square, you will use it, if it does not suggest something better.

Quincy, Mass.

A. H. K. BLOOD.

#### A BEGINNER'S TROUBLES.

A VERY SAD (?) TROUBLE INDEED.

AS I am a novice in bee-keeping, I am constantly meeting with difficulties. Here is one: Some time ago I had an exceedingly large swarm. In fact, it almost filled my hive, and in a few days it filled it with honey. Then great numbers of bees clustered on the outside of the hive in front, and on the shady side; so I nailed together a rough box, and capped it. In four days of cloudy weather this box was filled with comb. In a few days that were

sunny it was filled with honey. I then removed the box and brushed the bees from the honey in front of the hive. These, together with those that had clustered on the outside, made about half a bushel of bees that could not get into the hive. A heavy rain was coming up, and I feared that my "blessed bees" would be drowned. So I ran and got another hive and set it square upon this one. In a short time the bees were all safely housed. Now they have filled this upper hive from bottom to top with combs, and partly filled them with honey. Here is the difficulty: If I wait until this honey is capped, and then remove the upper hive, what will become of my bees, for they can not get into the lower hive? Thousands of young bees are hatching below.

Would it not be best to remove the upper hive immediately, or divide the bees in the upper from those in the lower by placing a board between them, and give the upper the means of making themselves a queen? A word of advice would be gratefully received.

JACOB TATE.

Gilead, Ind., July 18, 1883.

Well, I declare, friend Jacob, you are in trouble, *aren't* you? I do not know that I ever before had a *complaint* just like yours. It is really too bad if they all bring in so much honey that you can not find boxes, frames, or any thing else, to hold it. Fill your hives with sections on the most approved plan, and then take each section out as fast as it is capped. Or if you want to get extracted honey, get an extractor and take it out of their way, even if they *do* fill every thing again in three days or less. If you want increase of stocks, just take out the frames as fast as they are filled and capped over, and put in wired frames filled with fdn. In fact, I do not know any nicer way to take care of surplus honey than this latter. Do not, in any circumstances, let your bees loaf on the outside of the hives. Supposing that thousands of young bees *are* hatched out every day below, is it not that exactly which you want? You can divide the colony if you choose; but so long as they don't swarm, but just keep raising bees and honey — why! just let them keep on. Boys, what do you think of friend Jacob's predicament? Don't you think he is really to be pitied? Hadn't some of us better move into his neighborhood and help him a little, especially if he has found a place where honey comes in like that every season?

### SEEING THE WORLD.

SOME PRACTICAL HINTS FROM FRIEND HARRIS; ALSO WHAT HE SAW WHEN HE WENT VISITING.

**I** WROTE you about a month ago about my lunatic bees; and as I think, or, rather, *thought*, I had found a remedy for their lunacy, and I have seen some of the world since then, I will trouble you again, but hope I will do no harm thereby. How did I cure them? Why, simply by giving them plenty of ventilation from the bottom. My hives are made close, with bottom-board nailed tight, with no air-vent except the entrance, which is  $\frac{3}{8}$ " x 4 inches.

Well, those bees kept up that idiotic dance for several days after I wrote, even when honey was coming in; and as I had effectually cured some of lying out by downward ventilation, I thought I would experiment on the lunatics the same way; so, after

preparing some empty hives I transferred them, and I have seen none of their scraping since. But for a few days I have noticed the bees of another colony, whose hive was ventilated some time ago, have been at the same trick. So it seems that what cures one does not prevent another.

You say, in your foot-notes to my communication, "I suspect we get more honey in the North, because of the men, the locality, and the influence of the climate on the men" (p. 375). Well, you may have smarter men, and you may have a better locality for honey; but what "the influence of the climate on the men" can have to do with bees gathering honey, seems to me a little funny. I said I had seen some of the world, and so I have. On last Friday I went by rail *away* over to Rockmast, *fourteen miles* from here, thence with a friend in his buggy, as per previous arrangement, five or six miles, to friend J. S. Davitte's. My buggy friend, Mr. Hoge, who is a relative by marriage, is no bee-man, though always read to accommodate a friend to a buggy-ride. We found friend D. at home, and expecting us. He is a well-to-do farmer, and keeps — well, I don't know how many colonies of bees, and he said he didn't know either. But he said, "When you write to friend Root again, you may tell him that there is one man who runs a house apary successfully." His house has just 50 hives, but not all occupied. Friend D. has a good locality, but does not give his bees the attention necessary to make them very profitable. He has two large farms, three or four miles apart, which require a good deal of his time.

Friend Davitte cuts no aristocratic didos, but is quite social. This is enough for me to say of a bee-man; you can imagine the rest, as to our entertainment. After spending about five hours with him at his home, he took a seat with us in the buggy, and went with us to his *other* plantation, and to his brother's *other* plantation, where I saw his extractor, which is the only one I ever saw, except the one I made myself, which was a success, though more trouble to manipulate.

I have a friend here who has a vineyard. He is a temperance advocate, and does not want to make wine, but wants to know how to save his grapes in a dry state. Can you, or any of your correspondents, tell him how? How are raisins made? I did not tell how I ventilated my hives. Bore four or five one-inch holes, and cover with wire cloth.

J. M. HARRIS.

Cedartown, Polk Co., Ga., July 19, 1883.

Friend H., I do not believe you are right about the lunatic bees. Giving them more ventilation might start them out to work, and I suppose that would get them off from their queer notion of scraping their hives. — What I said about the climate, etc., was intended to suggest that men get lazy by going to Florida, even if they *are* naturally energetic. I really hope I am wrong about it. — I congratulate you on having seen so much of the world in just one day. And I am glad, too, to get a report of the house apary; but how long has our friend been using it? — I can not tell about the raisins, but I suppose some of our California correspondents can. I know some beautiful raisins have been sent us from California. — I really hope your temperance friend will find some way to make his vineyard profitable without dealing with any thing that can in any way intoxicate.

## COMBINED CASE AND CRATE.

ALSO SOME OTHER MATTERS.

**I**N reply to Byron Walker, page 368, I will say that I will, of course, never refuse the task of trying all new things sent me by friends, gratis. I have not, however, forgotten the Deane case, which no sooner breathed than it died. Though illustrated and praised by its inventor, and by Prof. Cook, where is it? A sample was sent to me. I think of no words fitting with which to express my dread of such complication. I like friend W., and his honest zeal; but my honey-dealers have made me believe that they could never get my price on comb honey sent to market with the glue on the sections. I still believe that we shall gain by giving all our sections a cleaning before sending to market. I think the glue "combined" looks too antiquated on our markets of to-day. Friend Walker's comparison on the Given press is not appropriate. Had he tried wires imbedded in the septum of foundation in as perfect a style as any machine could put it there, and then could not make it work, well might he exclaim against the press, though he had never seen one. Now, I have seen gluey sections rejected, and we know the combined case and crate does not prevent gluing. I think it a mistake for any one to think that either of us write the praises of our preferred sections because we sell them. Friend Walker has no patent on his, and I have not one cent, even, invested in the manufacture of mine. I buy them to sell again. It would be no loss to me to find out that the one-piece section was best, for I can buy that cheaper. Let us not be so uncharitable as to shut our eyes to reason, which says, we use and sell our style of goods because we like them best; not, "like them best" because we use and sell them.

Now, Mr. Editor, I was never more shocked than to read your comment on my article in the last number; most, at your closing sentence, where you, after your prejudicial remarks, infer that your columns are closed against any explanatory defense; also shocked at your lack of knowledge pertaining to the quotation I made, or terrible one-sidedness in giving all great men their due. My quotation was not from the book that you revere, the Bible. Such words are not there; and though the same sentiment was put forth in other words by the loving and sacrificing Christ, that does not detract any from the merits of the great and noble Confucius, who exclaimed them 500 years B. C. I consider it very wrong for men to idolize one great reformer, to the utter ignoring of another. If you really thought this well-earned compliment to the heroic dead was going to hurt any one's feelings, why did you not draw the editorial pen across the part that was of no special importance to the subject, and which would not change the sense of the matter, rather than hurt my feelings as you have?

\* \* \* \* \*

In regard to your list of names, if you furnish them at 50 cents per 1000, you virtually give them away, and I have not one word to say regarding any exclusiveness in the matter on your part.

JAMES HEDDON.

Dowagiac, Mich., July 4, 1883.

Friend Heddon, it was the words "glad tidings of great joy" that I objected to, and not the golden rule. I did not cross it out of your letter, because I did not feel sure

that you would want me to publish your article with a part omitted. Since you have been so kind as to give me this liberty, I will take you at your word, and cross out a little over a page of your present article, which I think much better left out. Now to come right down to the point, decidedly but kindly, I can not think it my duty to let any thing go into print, taking the ground that Jesus Christ the Son of God was a "great reformer." I know there are those who claim to have a different opinion in the matter; but as for myself and the journal which God has seen fit to put into my hands to guide and direct, God helping me, all men shall know that I am on the side of Christianity and the Bible. Any words or writing that would seem to encourage the idea of putting Christ on a level with Confucius, or any other human being, I shall consider out of place in GLEANINGS.—I am very much obliged to you for your kind words in regard to our printed list of customers. We certainly agree on that point.

## DRONE FOUNDATION FOR SECTIONS.

SOME PRETTY HEAVY EVIDENCE AGAINST ITS USE.

**S**INCE W. D. Higdon, in June GLEANINGS, has written so emphatically in favor of drone fdn. for sections, I think it is time for a little evidence on the other side of the question.

In August, 1881, I sent to you for 5 lbs. of thin fdn., without specifying which kind I wanted, as in your price list you say that worker will be sent unless drone is ordered. You sent drone fdn., however; I presume because you were out of worker. Now, I did not want drone fdn.; but as I needed foundation at once, I concluded to give it a fair trial, so put it all on the hives.

There was little fall honey, however, and but a small part of it was worked out. In the spring, these sections were put back on the hives, thoroughly mixed with sections containing fresh worker fdn., and starters of natural comb—about one-third of each kind in most hives. Now for results:

The worker fdn. was drawn out and finished first; the natural comb next, while the bees seemed very averse to working the drone fdn., drawing much of it out but a short distance, and then contracting the mouths of the cells with heavy rims of wax, as though they wanted to make worker comb out of it. At the close of the white-clover season, a large part of the sections containing drone fdn. remained unfilled.

In the fall we had such a yield of honey that I was unable to take it away as fast as the bees gathered it, being also short of sections, fdn., and other supplies, and nearly every swarm had the spaces between upper and lower frames, and between the ends of frames and sides of hives, filled with honey. Out of over 40.0 sections on the hives, less than 300 remained unfinished at the close of the season. Among these unfinished sections were many containing drone fdn. still unworked; and in preparing for this season's work I put out a great deal of this fdn., which had been in the hives during the whole of an excellent honey season, and which the bees had done nothing more than to propolize a little.

It may that the reason the bees did not work it better was, that it was old and hard; in fact, I think

that had much to do with it; but I have little inclination to experiment further with drone fdn. — at least, not on so extensive a scale, as I think that the use of that 5 lbs. of drone fdn. cost me several hundred pounds of honey.

J. A. GREEN, 140.

Dayton, Ill., June 21, 1883.

Many thanks, friend G., for the important facts you furnish. This is indeed a matter that demands careful investigation. I have been a little surprised to hear so few reports in regard to the matter, especially while we have so many orders for drone as well as worker. I had thought it quite likely that during a moderate flow of honey, the bees would give a preference to the worker fdn., and I am a little surprised to hear that they did not use drone, or at least give it the same preference during a heavy yield of honey, such as you report having had. Your point, also, that old fdn. is not as good as new, is an important one. I have before suggested that it is probably owing to the fact that wax, when exposed to the air, loses an oily portion of its substance, making it harder to work. It is for this reason that bleached wax has been quite unsuitable for fdn. Will those who have experimented with both kinds of fdn. for surplus honey please report in regard to the drone? Has your experience been like friend Green's?

### FOUL BROOD.

SOME FACTS FROM A SUFFERER.

**T**HE winter of 1880 was the hardest ever known in this section for bees. Fully 95 per cent of all the bees left out unprotected died, while the loss was about 20 or 25 per cent of those packed in chaff, buried in clamps, or wintered in cellars. I had 3 stands buried, which came through alive — one good colony, and two weak. Lost one by spring dwindling; bought 3 more, 2 of which died, leaving me three stands. Friend S., whose bees had all died, gave me his combs, which I wired into frames; and when the bees swarmed, I put the new swarms into hives filled with empty combs, which enabled me to increase my stock to 8 colonies, and I got about 200 lbs. comb honey. My 8 colonies were all strong, and in fine condition, and came through the winter all right. The spring of 1882 proved cold and wet until July 5, when a drought set in, which lasted 7 weeks, and every thing got so dry that very little honey was secreted. Basswood, which usually blossoms here about the first of July, did not blossom till the 26th, and then lasted only about a week. Last year's honey-crop was small, most bee-keepers reporting only about 20 lbs. surplus to the original colony.

About the first of June I noticed one of my colonies dwindling, and went to my strongest colonies and took frames of hatching brood, and exchanged them for frames from this weak colony. They still continued weak, and I got an experienced bee-keeper to examine them, and he pronounced it foul brood. The cappings were shrunk, and turned brown and black; and on picking them open they were found filled with a foul, offensive matter.

We examined the frames that I had taken from this hive, and put into 3 other colonies, when I exchanged and found them filled with foul brood in various stages of advancement. June 24, at night,

after bees had ceased flying, I took the weak hive from its stand and put an empty box in its place, and brushed the bees off in front of it, and let them crawl in. I burned frames and combs, and burned out inside of hive; kept them three days, and then put them in the hive on foundation. They built up to a fine colony by fall, and are apparently sound. The other 3 affected colonies which were full of bees, I left to swarm. One did send out one a few days after, which I hived on fdn., and they appear healthy. The other two would come out almost every day in great numbers, and buzz around and make a great ado, but failed to swarm. Those two matured no queen-cells. As queen-cells are a temporary structure, and are not made of an original secretion, but are composed of "odds and ends" picked up through the hive, may not this account for the fact that hives having foul brood so rarely swarm? In a few weeks they began running down, and I noticed, in front of them, black scales something like those we see from a blacksmith's anvil. Closer examination showed it to be composed of cappings and contents of those diseased cells, the putrid matter having dried down to a hard black sediment, which the bees threw out in front. Seeing that those hives were doomed, and liable to spread the contagion, I applied sulphur, Aug. 21, and extracted the honey, and rendered the combs into wax. The parts filled with rotten brood I burned. It was a sickening job; and were I to have it to do over again, I would burn bees, honey-combs and all. The bees would some of them revive; and as they would be liable to carry the disease to other hives, if they went back, I had to kill hundreds of the poor fellows by crushing, and then sealed the floor of the room in which we operated. On reflection, I will say that, if foul brood is found in the fore part of the season, it may possibly pay to save the bees (and bees only, burning the rest); but if later in the season, destroy the whole; it won't pay to fuss with it.

Now the question arises how I, a beginner, got foul brood. Did it generate spontaneously, or was it introduced from without? By close inquiry I found that none of the parties of whom I got bees or combs had known of any foul brood among their bees. But a neighbor of Mr. S., whose bees were only about 100 rods distant, lost several colonies by foul brood in the summer of 1880; and as Mr. S. lost all his bees the following year, he doubtless had foul brood among his bees, but was not conscious of it. As for the remedies for foul brood, I have had no experience, and am faithful of their efficacy. A correspondent of GLEANINGS tells us that we can destroy foul brood by spraying the combs and bees with a solution of salicylic acid and borax, or alcohol. Surely that remedy is very simple; any clohopper ought to succeed with those simple directions. The theory is fine; but how do we find it in actual practice? On opening a hive containing foul brood, we find empty cells from which the larvæ have repeatedly perished; others capped, which are filled with corruption from the larvæ that died; and again, other cells filled with honey or propolis, sealed and unsealed, which had formerly been occupied by the diseased brood. Now, if salicylic acid can penetrate through all that wax, honey, propolis, corruption, or dried sediment, to the bottom of those cells, and destroy those spores, then it surely possesses antiseptic properties beyond anything I have seen or heard. Possibly the writer designed that the cappings should be shaved off, and the combs

emptied by the extractor before applying the remedy, even then; and admitting the disinfecting properties of this acid, I think the cure doubtful. Would not the putting-on of new fdn. be the safer plan?

DR. J. E. FERRY.

Fabius, Onon. Co., N. Y., Feb. 13, 1883.

Thanks, friend F., for your practical facts in the matter. Now, I really do not see why you should take such a discouraged view of the matter when you have succeeded in securing three colonies by what would seem to me to be a comparatively easy process. If driving out the bees, and hiving them on fdn. will do the work, we can surely manage it. Very likely the best thing to do with the old combs will be to melt them up into wax. And a great many of the old combs in common use could be melted up profitably in the same way, even if there were no foul brood about it. The loss then would be the brood contained in these combs. Now, if this is a great part of it dead, the loss is but trifling; and I am not sure but that a great many old hives would well repay for melting up the old combs and setting the bees at work on nice new frames of fdn. It seems to me that even if I did use salicylic acid, I would start the healthy bees working on new fdn. in new hives.

### HIVING A SWARM FIVE TIMES.

LETTER FROM AN A B C SCHOLAR.

**W**ELL, Uncle Amos, here is one of your A B C scholars writing out of doors on a bee-gum, all alone. Now, I want to tell you that I have just hived the crosslest lot of bees I ever handled, and that is not all; this is the *fifth time* they swarmed out. The first time, I hived them all nice and snug; in about half an hour they scampered out and went home. The next day they came out and clustered in the same place, and I took them in my swarming-box, all nice. I shook them gently on the table, and they immediately took wing and "scud" for home. In two days after, they swarmed in the morning, alred themselves for a long time, and then went back; did the same in the afternoon. To-day, the 14th, at one o'clock they came out again, and I had a hard time to save them. They were about 30 minutes in the air before they came down, I throwing water all the time. About a pint cupful came and went into the gum that I had ready; yes, went right in, and the sheet was covered, and bees all swarming around my head, and were just in the act of settling down, when there came a heavy puff of wind and blew them back, and then they arose and settled a few feet above the gum. I am confident they would have gone in if it had been still. I tell you, I felt vexed when I found they were so very cross. Now, if any A B C boy can beat that, let him stand up.

#### ECONOMY IN HIVES.

There are only 3 swarms out of 20 stands wintered, and in good shape. Yesterday I had a chat with our old-fogy bee-keeper, who wintered 40 stands in common box gums, all painted nicely, with a hole on top for boxes, that cost him 25 cts. apiece to make. His bees are booming — from one to five swarms a day, when the sun shines. He has lots of honey, and the best luck of any one in the neighborhood, while I, with my "*patten fixens*," am not getting any swarms

nor any more honey, nor wintering any better; and look at the difference in the cost of gums: his, 25 c.; mine, \$2.50 to \$3.00 per gum. Are not you bee-gum makers putting it a little strong on "*patten fixens*,"? Of course, Uncle Amos, I believe in progression; but if a cheap thing will do just as well, why go to heavy expense? Let economy be the watchword.

#### HIVING BEES WHERE THEY CLUSTER.

Old Fogy says he hives his bees and lets them stand as near where they cluster as possible. He claims they do much better. What do you think about that? I hope to hear from some of the brethren on this point.

J. W. C. GRAY.

Atwood, Ill., June 14, 1883.

Friend G., I watched anxiously through all your narration, to see if you did not finally try putting a frame of brood in your hive. But I think you say nothing about it at all. Now, under such circumstances I have found a frame of unsealed brood so sure that it seems almost impossible the bees could have deserted it. Surely you have heard it recommended over and over again, have you not?—You say your neighbor with the old box hives has lived from one to five swarms a day. If one's object were to get swarms and nothing more, perhaps a 25-cent bee-hive would do very well. But how about getting your crop of honey, raising your queens, improving your stock, etc.? If you could see how badly we are crowded with orders in trying to supply the friends with what you term "*patten fixens*," perhaps you would not think we were "*putting it down too strong*." By all means, let economy be the watchword. But do not let it be a foolish or thoughtless economy. — In regard to letting bees stand where they are hived, I am not sure it makes any particular difference, although you will see that friend Peters, in the A B C book, gives some very sensible suggestions in regard to the importance of moving them to a different locality as soon as hived.

#### BEES AND SUNDAY.

SHALL A BEE-KEEPER STAY HOME FROM CHURCH DURING SWARMING-TIME?

**I** HAVE a question to ask, or, rather, I want your opinion on it. My wife is very conscientious about keeping the Sabbath holy, and doing no work on that day; and last Sunday she reprimanded me for swarming my bees. Now, you and I both believe in keeping that day strictly, and my wife says I have no right to keep any thing that will keep me from the house of God, or that requires labor on that day. I referred her to the ox that fell into the ditch, etc.; but she sticks to it, that if I work with my bees we shall not prosper spiritually. As you and I keep bees, and they are not particular about keeping the Sabbath, but swarm at any time, is it right to stay at home on the Sabbath to swarm our bees, or have our hired help do so in swarming-time?

Watska, Ill., June 25, 1883.

W. H. SHEDD.

Friend S., you are striking on an old question; and if you will excuse the liberty I take, I will suggest that disagreeing with your wife may be a worse sin than staying at home and working with the bees on Sunday. While suggesting a reproof, I take in-

to consideration that we are, very many of us, liable to this very weakness. I should infer from your statement, that your wife is taking one side of the question, and you the other, and I fell to wondering if in your zeal to carry your point, you did not forget the real spirit of the Master, who told us that "the Sabbath was made for man, and not man for the Sabbath." If you are really forgetting your religion in your zeal for bee culture, of course your wife should remonstrate; but the remonstrance should be in the spirit of great love and kindness, should it not? And you on your part, if you think differently, should present your views with this same spirit. Candidly, I do not know whether one ought to stay at home from church or not to look after his bees. Doolittle, who has written pretty fully on this subject, seems rather to think he should; and if I raised comb honey as he does, it is possible I might do the same. And yet for all that, I am afraid my conscience would trouble me sorely, if passers-by on their way to church saw me, Sunday after Sunday, with my coat off, flying around among the bee-hives. I think I should try very hard to go to church. I believe that the way I should try would be to ask God, on bended knee, to help me to plan some way by which my influence might be thrown strongly and constantly on the side of Christianity.

#### OBITUARY.

**W**E take the following from July No. of the *Exchange*, and we hope our friends will not fail to gather the moral contained in the sad notice.

Died at Denver, Colo., June 16, of hasty consumption, Theodore Houck, of Canajoharie, N. Y., aged 26 years and 3 months.

We are reminded, in the death of Mr. H., of the frailty of this life. Up to the first of last January, Mr. H. was a perfectly healthy man, having passed an examination just prior to that for a life insurance. On the 2d of January he attended the meeting of the Eastern N. Y. Bee-Keepers' Convention, held at Albany. He put up at a hotel that night, and was assigned a room and bed that had not been used for some time. The consequence was, he took a severe cold, which settled on his lungs, and hurried him to the grave with quick consumption.

Mr. Houck was a thorough bee-man, beginning when a boy, and continuing until health gave out and death came. He loved the bees, and was never happier than when among them. His public career was short. About 18 months ago he purchased the *Bee-Keepers' Exchange* from Mr. J. H. Nellis, and conducted it up to within a very few weeks of his death, his failing health compelling him to place it in other hands. He leaves a widow, bowed down with grief, having in one short year buried her husband and little boy, their only child.

We extend our heartfelt sympathies to her in this hour of affliction, and pray that He who doth not let a sparrow fall to the ground without his notice will comfort and sustain her, and give to her that grace which will enable her to say, "They will be done."

Thus you see, friends, a valuable life was lost by a little carelessness in regard to a sleeping-room. Carelessness and heedlessness are bad enough; but when it comes to result in the death of a fellow-being, it seems awful to think of. As many valuable lives have been lost in this way, we trust that the importance of this matter of bed-rooms and bedding may receive the attention it demands. Poor friend Houck, full

of business, and full of zeal and work, as we are all of us now at this time, was obliged to lay down his life, and bid adieu to his friends, almost without warning. We echo the concluding sentiment, "May He who watches lovingly over all, comfort that bereaved wife!"

#### OUR OWN APIARY.

ITS CONDITION THIS 6TH OF JULY, 1883.

**I**T seems that GLEANINGS has lost one of its most interesting features — to us at least, for we often used to meet with an article with the heading, "Our Own Apiary," right from your honorable self, which was of great interest to us, and, we presume, to all your readers living outside of your limits. So, please take the hint, and do so again.

S. D. HASKIN and others.

Chandler's Valley, Pa., July 3, 1883.

Well, friend H., I shall be exceedingly happy to accommodate you, but very likely you and some "others" may be a little disappointed. Perhaps not at the amount of the business done in our apiary, but at the condition in which you would find it, if you were to visit us just now. For some days past I have been wondering if some of the friends would not feel a little disappointed on making us a visit, after what I have taught in the *A B C* book about system and order. I presume you all know what I told you in our June *JUVENILE*. Well, our constant aim has been to deal justly with our patrons, rather than to take valuable time and skill in putting things to rights, as we should do if it were not for the great rush of business. Our apiary to-day comprises about 200 colonies. The bees in the 200 hives, however, ought to be in 400, according to my notion. Were you to take a peep into the hives, you would very likely find quite a number building combs back of the division-boards. In some places you would find odd-sized frames of combs, sent us by those who have sold us bees, standing in divers shapes in the chaff hives, waiting to be transferred, and some of them have been waiting so long that they are now bulged and heavy with clover honey. Only yesterday our apiarist lifted out four such combs, and stood them against a chaff hive, and then began to consider where he should put them. But before he got a place for them, the sun swung around, and one of them tumbled down in the grass, in a heap, a nasty, squashy mess. The poor daubed and dragged bees buzzed into a hive not their own, at the risk of stinging the queen. I wonder how many of you know what an intolerable nuisance it is to have hives in the apiary, containing odd-sized combs.

Even though our apiary does not present a very tidy appearance, the hives are full of bees and full of clover honey. On last Monday we filled an order for 50 two-frame nuclei, and it did not seem to thin off our bees, or queens either. One of the boys is just now at work pulling out the grass and weeds around the hives and fixing a nice foothold for the bees around the entrance, by packing down a little shovelful of sand made

by pounding up white sandstone; a couple of little girls are engaged in tying up the grapevines, and clipping off the shoots that push out in the way. A young lady who is learning bee culture goes through the hives, and takes out the queen-cages where queens have been introduced. After that she marks the slates as fast as she finds the queens laying, and then gathers up the cages in a basket. We have plenty of bees, plenty of queens, and plenty of every thing to fill orders as fast as they come,—only lacking plenty of skilled, competent help. What a great thing in this world is skilled and intelligent help! Did you ever think of it?

Bees are going out of the apiary every day, and are also coming in every day. One morning a farmer's boy brought us some swarms of bees before five o'clock, and so they come stringing along almost every hour of the day. Frequently some of our friends in the country bring us a load before dark, and we have to fix the hives and combs, and dump them in, weigh their boxes, give them their money, and off they go. We pay \$1.00 per lb. for Italians, and frequently the same bees are sold the next day for \$2.00 per lb. Don't you think this is a money-making business? There is one little drawback to it. A new swarm of bees is heavy with honey, while those we shake off from the combs and send off are frequently just the other way. As a proof of this, a new swarm heavy with honey when put on to empty combs just at night will often have a pound or two of honey in the combs before they start out to fly in the morning. You see, this kind of traffic—loads of bees coming into the hives, and going out daily to fill orders—rather breaks our apiary up, so there is no order, system, or individuality about it. By the way, I might mention that most of the bees now brought in are beautiful Italians. Italian blood has become so thoroughly disseminated in Medina County, that the blacks are becoming almost crowded out.

If you want to see a scene of din and bustle and stir and burrah, pay a visit some time in July to "Our Own Apiary."

### BEE-NOTES FROM THE SOUTH.

#### TWO QUEENS IN ONE HIVE.

**T**HIS has occurred with me on several occasions. I have closely watched them, and my opinion is that there is *always* some good reason for the phenomenon, for such it really is.

Upon one occasion I could see no reason whatever for the bees desiring the additional queen; but as she was laying, and looked quite lively and fine, I concluded to put her (the old queen) in a nucleus hive, leaving the young queen in charge of the colony. I did so, and the old queen went on laying as nicely as could be desired; but, lo! when the bees hatched out they were diminutive drons, all of them, and reared in worker comb.

This was two years ago; and 4 weeks ago the same thing occurred, and I now discover the queen lays nothing but drone eggs, and only a few of them. To sum up, I am quite positive that, whenever we find an old and young queen, or two queens in one hive, something is wrong with the older one. The

bees seem to possess this knowledge, or instinct, and rationally make preparation to supply the defect in the old queen by rearing a new one. Query: Would it not look reasonable to suppose that they might put this off too long, until no eggs for queen-rearing remained, of the right kind? It certainly does to me; but I suppose in that case, the discovery being made that them other was laying drone eggs only, in worker-cells, would be the evidence sought by the colony that she was getting to be of no further use as a queen; in that event, they could, if necessary, I presume, immediately resort to the larvæ on hand, for a new queen.

The new queens *look* well, and do as good work as those raised by best methods; and, taken all in all, I don't see but it is a right good thing, though of course much valuable time is lost.

#### STORING DURING A HEAVY HONEY-YIELD.

We are at this moment in the midst of a heavy honey-yield, and I am running my bees for extracted honey only, although having no extractor, having sold mine a year or so ago. On some of my colonies I have *six* Simplicity hives at this moment, and all of three top ones are full of honey. Strange to say, that only the top or upper story is sealed over. Upon the front of every other hive I have an inch auger-hole bored, through which the bees can pass.

#### EXTRA ENTRANCES.

I think, in using as many as six hives tiered up, some other entrances besides lower ones are badly needed; this is my reason for having the auger-holes bored. As a rule, I wouldn't bore holes in my hives. In my six-story hives there are four entrances, and they pass in and out in a stream at each. Oh, it's delightful to watch them hurrying in and out of these monstrous big hives!

If I had an extractor *now*, I would extract largely; but I shall defer it until fall. I was fortunate enough to buy a couple of hundred L. frames filled with empty comb, and these are going to be "stacked up" over the strong colonies till filled, and shall stay till I get ready to extract. I expect to make a report of an extra large yield to the colony, this fall. I was so sorry to hear, through friend Doolittle's last article, of the death of the "invulnerable bee man"! I am firmly convinced that this "style of man" is *scarce*, though of course I do not doubt every word that Mr. Doolittle says; and I believe if his bee-man's equal can be found in the United States, I for one shall start on an excursion to see him at the earliest possible moment, bringing with me a colony of Cyprians to try him on. R. C. TAYLOR.

Wilmington, N. C., June 6, 1883.

Friend T., your fact in regard to the hives storied up six stories high is quite an important one. I, too, have thought of the extra entrances, and have tried them to some extent; but I rather caught the idea that these entrances induced the bees to neglect the combs below them; that is, if we put an entrance in the second story, the bees seem a little loth to use the lower story, unless they were obliged to. Friend Doolittle, or some one else, suggests that the bees which bring in the honey never carry it into the upper stories or boxes, but that they deposit it in the cells quite near the entrances, and that the wax-workers, or bees that can not fly, carry it up where wanted. Even if this be the case, I presume some labor is lost, unless it is a fact that these "youngsters"

would do nothing else if they did not carry honey upstairs. Who can tell us more about this matter? I like the tiering-up plan because you do not need to extract your honey until you have time to do it. Another thing: The honey that has been stored in June, and stands in the hive covered with bees until August, has an extra flavor and consistency, as you may have found out. Simplicity hives seem to be remarkably handy for this kind of tiering-up, when one is so crowded that he could not secure his crop of honey in any other way. I do not believe that I quite agree with you, friend T., that where an extra young queen is raised, the old queen is necessarily failing. I once thought so; but since then we have had several queens that did good service for a whole season, after being found with a good-looking daughter, helping in the business of egg-laying. If I am correct, several similar cases have been reported. You know we have had some talk of getting our extra queens by this method; and some one said that a good queen that would constantly get her workers to raise others while she was present was worth \$25.00.

#### FROM DOOLITTLE, AGAIN.

RAILWAY TRAINS RUNNING SIXTY MILES AN HOUR.

**O**N page 376 friend Root asks, "Have we an experienced railroad friend among our number who has seen this thing tested by actual, careful test?" Although not a railroad man, I can tell what I know regarding the matter. Friend Root will remember that I visited him in the fall of 1876. On my return home I arrived in Rochester, N. Y., in time to take the special New York express train, which is made up at that place. As we commenced to move out of Rochester, I looked at my watch to see the time, for I had often heard of that being the fastest train on the N. Y. C. & H. R. R. R. There is at this time a train called the "limited express" which runs still faster, so I am told. It is 81 miles from Rochester to Syracuse, and the special New York express makes but one stop between the two cities. My observation showed we were an hour and 28 minutes going from Rochester to Syracuse, including the stop, which gives about 55 miles an hour as the average time; and if we take out the time lost by the stop, it would not be far from 60 miles an hour for the whole distance. The distance between the mile-posts was made several times in from 52 to 55 seconds, and many more at from 55 to 57 seconds. The knowledge of the above was what led me to compare the flight of the bee with this train.

SWARMS CLUSTERING TOGETHER; CLIPPED QUEENS.

On page 375, H. J. Schrock wishes me to explain how I manage swarms, having queens whose wings are clipped, which cluster together. In a large apiary, one of the most annoying things which happen when natural swarming is allowed, is the clustering of two or more swarms together, if the queens have their wings, and the apiarist desires to have only one swarm in a hive; but when the queens all have their wings clipped, the clustering of several swarms together need give little if any more trouble than if they came separate. I usually manage in this way: Have several cages made of wire cloth which are an

inch in diameter, and four inches long, having a permanent stopper in one end, while the other is movable. As a swarm issues, the queen is caught in one of these cages; and when they begin to cluster, the cage is secured to a pole by means of a bent wire, when it is raised so as to rest just where the bees are clustering. This is done so the bees will not return before you are ready for them to do so. Now prepare your hive, and get all in readiness for their return (if you wish to have them do so), when you take your pole, and what bees adhere to it, and the cage, and carry them to the hive, when the rest will soon return. By winding the pole with old black rags for a foot or more in length, till as large as your arm, the most of them will cluster on it. If you wish to hive them on a new stand, you can get the whole swarm to cluster on the pole by moving it up a foot or so, where a half or more are clustered. Those in the air will cluster with the queen, and the rest will soon resort thither, when you can carry them where you please.

Now having explained how I manage with one, I will suppose I have one after another keep coming, till I have 8 all in one pile, as I did once. The one queen will hold the whole, so there is no particular hurry. The queens are caged as they come, and hives got in readiness, till the last one is out. No fear of the whole lot going to the woods; for if they should start they will soon come back for the queen, and cluster again. You see, I had three swarms try it once, so I know. They went off out of sight, and were gone ten minutes or so, when they came back to the queen. I supposed when they came back they would, part of them at least, return to the old stand; but not one did so. But, to return: Having the hives all in readiness, and the caged queens (except the one with the swarms) in front of their respective hives, go to your cluster and get what you consider a fair swarm, by dropping a portion of the cluster into a tin pail, using a piece of a shingle to cut off what you want. Throw a cloth over the pail to keep the bees from flying, when you can carry them where you wish. Let them settle a moment in the pail, when you are to hive them like any swarm, letting the queen out of the cage so as to go with them, of course. Keep on in this way till but one swarm remains with the queen, when this is hived as first given for a single swarm. If you have too many bees left for one swarm after you have given bees to all the queens, carry your swarm on the pole along by each hive, and cut off a pint or so till you get them to suit you. This one item of hiving swarms which cluster together with such ease, more than balances all that has been said against the practice of clipping queens' wings.

WHAT MADE THEM GO OFF?

On page 397 I am asked where "Maggie" erred in her management, and if I have large early swarms go off in the same way. No, sir; I have lost but one swarm of bees in my life, after which I resolved two things; the first of which was, that all fertile queens should have their wings clipped; and the second was, that no brood should be given a swarm having an old fertile queen. Begging your pardon, friend Root, I opine it was that brood which caused Maggie's bees to go to the woods, as neither swarm deserted till given brood. I had never lost a swarm up to 1871, when I had been reading that, if a frame of unsealed brood were given a swarm it was sure to keep them from going off. I tried it, and the very first trial caused me to lose a splendid large first

swarm. The next year after, all my queens had their wings clipped. I tried again, and 4 out of 5 thus treated tried to go to the woods, since which I give no brood, and do not have one in 25 make a trial to go off. After losing the one in 1871 I talked with friend Betsinger about it, and he said that it was the brood which caused them to go; "for," said he, "bees swarm to get away from their brood, leaving their brood behind, not having any need of it, as they have the old queen. By placing brood in the hive they are to occupy, they were placed in a similar condition to that which they had swarmed to be free from;" and I believe Betsinger to be correct. That brood is not a prevention to going off, is proved by the many reports in back volumes of GLEANINGS. If Maggie will clip the wings of her queens, and put only empty comb foundation, or nothing at all in the hives she puts her bees in, I think she will have no more trouble.

Borodino, N. Y.

G. M. DOOLITTLE.

Friend D., I agree to pretty much all you say, except your concluding words. In regard to the rate of railway trains, I think we shall have to consider it settled, that they do run at pretty nearly the rate of a mile a minute; and the article on another page by a railway man shows that bees do move at the rate of 90 miles an hour, or about that, at times.

Now in regard to the frame of brood: You and I don't agree, or our experiences seem to have been unlike. All through the swarming season we are buying swarms of bees of the farmers almost daily, and we divide them up and put them into hives in quantities all the way from 1 to 10 lbs. Sometimes they have queens, and sometimes they have not. Surely, under such circumstances you would advise a frame of brood. Well, now, after trying the experiment hundreds of times, I can hardly remember of one case where they deserted with a frame of unsealed brood. When some green hand puts in a comb containing only capped brood, of course they go off; and where put on empty combs or frames of *fdn.*, every little while a swarm will decamp. If they have no queen they usually scatter into neighboring hives; but a comb of unsealed brood, in our experience, "pins" them every time. Suppose we advise the A B C scholars to try it both ways, and see how they find it.

### SOME QUESTIONS.

SWEET CLOVER, FIGWORT, BASSWOOD, ETC.

**W**HICH do you prefer as a honey-plant, sweet clover (*mellilot*) or carpenter's square (*figwort*)? What is the quality of honey of each of the above plants?

What is the best plan for getting out seeds of the basswood (*linden*)?

When is the best time to sow seeds of the *linden*?

Can the *linden*-tree be propagated successfully from sprouts, or suckers, and will trees propagated in that way produce flowers as profusely as from seeds?

When is the best time to put out sprouts, or suckers, for trees?

I never learned to chew tobacco, so don't you think I ought to have a smoker as well as the men

who have been poisoning themselves, and every one they come near, for years?

I have no information to give, except if the tops of the sweet clover are clipped off, the plants will be stockier, and produce more blossoms, and will not sway about so much, hindering the bees from alighting on them when the wind blows; it must aggravate them to *speed* for a blossom, and find they have missed it.

I was at your place before you bought the old fair-grounds; took you 2 bbls. of beeswax, and paid you 60 cts. per lb. for *fdn.*, yet I found you so busy you did not have time to speak to me; and as your business has so increased, I do not suppose you would have more time than formerly, if I should again visit Medina, as I should very much like to do.

DANIEL SPEAR.

Cardington, Morrow Co., O., July, 1883.

The quality of the honey from sweet clover is reported good, but I do not know that I have tasted any. That from the *figwort* is fair, although it has been scattered through the hives so I could hardly speak definitely in regard to it. With us, many more bees are found on the *figwort* than on the sweet clover; but even this is governed by the season very much.—In regard to gathering the seeds from basswood, and also about raising basswoods from cuttings, see p. 398, July No., and what has been written in our back numbers. The matter has been very fully discussed, and it will pay you to follow it up by means of our copious indexes. I believe the spring is the time generally chosen for sprouting trees from cuttings.—In regard to offering a premium to those who do not use tobacco, I think, friend S., the best answer is to ask you to read the parable of the prodigal son.—Thank you for your suggestion about clipping the tops of the sweet clover. I believe it is a good way. We have now some of the Jones Bokhara, but it is so tall, and swings about so much in the wind, it would be funny if the bees could get the honey at all, in a windy day. I think I will run the mowing-machine over them, having it set up very high.—Now in regard to spending but little time with visitors: Friend S., my time, and all I have, belongs to the Master. I want to use it in such a way as to please him. During the busy season, when matters of great moment are constantly being deferred to me, and when many might be greatly wronged did I stop to talk and visit, where does my duty lie? There are times when I can stop and be sociable, without very much inconvenience; but at other times I should feel guilty if I let my work remain undone longer than to briefly shake hands and then take it up again. I know you better now than when you called before, and may be I could be a little more courteous if you should make me another visit. Of late, Ernest has taken charge of visitors pretty well; and as he is now a little over 21, may be you will enjoy a visit with him just as well as with myself. Come and see us, any way, when you can. To look after visitors properly, it takes one of our best men, and one thoroughly conversant with every part of the establishment. In the summer time we usually have visitors all the while—sometimes several parties of them.

## FROM THE WEST INDIES.

NOTES FROM "THE LA FE APIARY," ST. DOMINGO.

I HAVE just completed the fixing-up of the above-mentioned apiary, after some months' experimenting with different kinds of hives, and finally settled upon the Van Deusen-Nellis-Tobother's West-Indian Simplicity hive, which is the same as the Van Deusen-Nellis, with a few improvements in ventilation, roof, and frames, which I think gives me the privilege of adding my name, especially as the hive in its present state answers all that can be claimed for it as a model West-Indian hive. These alterations I had made by Mr. Theo. Houck, of Canajoharie, N. Y., to suit our very hot—sometimes wet—climate, after studying the matter for several years past, and from which I am in hopes of getting very good returns in the shape of extracted honey, as my intention is to tier up several stories, and work the extractor.

I have received 100 two-story hives, and am so well pleased with them that I have ordered and am expecting 100 more by return steamer, and my intention is to work up on an extensive scale by degrees. I have transferred 50 colonies within the last month past, from hollow palm logs, into these hives, and they are actually working 50 per cent better. I have still 50 more colonies to transfer. Competent help is not to be had here; consequently I get along slowly but surely, having to do it all myself. I find the easiest way to transfer is as follows: I have a lot of  $\frac{1}{4} \times \frac{1}{4}$  pine strips prepared,  $\frac{1}{2}$  inch longer than the width of the frames (which are the Hofman-Langstroth) with the top-bars split open to receive the comb foundation; one end of these strips is fastened with fine wire about 1 inch apart, and the other end has a piece of wire attached to twist it fast into the natural comb and frame, to keep this in place until the bees fasten them properly, which they do in 24 hours. I then lift up the log to be transferred, on to an empty barrel, which stands on end, and place immediately under it the lower story of a hive in which I have 2 frames with comb foundation drawn out, and in the center one frame of brood taken from another colony. I then put the smoker at work briskly at the other end of the log, at the same time striking it with a club, which causes the bees to get up and out of the end of the log resting above and over the hive. I then brush them down into the body of the hive, when they immediately go for the three frames; and as the hive is exactly in the same spot where the log stood, all the fliers come into the hive, mount the frames, deposit their spoils, and go out again, apparently undisturbed. I then cut out whatever worker brood there is in the log, cut them to suit my frames, which I have one by one put upon my transferring-bench, and with the pine strips fasten them into the frames. I place all the brood together in the center of hive, and all the other combs with honey and pollen on either side of these. Sometimes the natural combs of a strong colony will fill 18 frames with natural comb, which makes it then a two-story hive; when the last frame is put in the hive, the few bees left on the wreck of the log are then brushed off into the hive; top or roof put on, and the bees scarcely know the difference at the moment; but in 24 hours they show a most perceptible difference in work. They have then the combs all fastened in the frames, eggs laid in the two frames of drawn-out foundation, and the general work going on at a great rate. I

then take off the body of the hive and clean off the bottom-board, detach the transferring-sticks, and examine all the frames to see that they are in proper order. I have not as yet had the bad luck to injure a queen in transferring, although I work pretty quickly so as to avoid robbing, as I am working in an open outdoor apiary where one is very much exposed to such mishaps. Should I find no signs of a queen in the hive 24 hours after transferring, I would give them a comb of eggs and larvæ to get one from, and the moment they attempt to build queen-cells, I should take the frame with them on from them, give it to my queen-rearing nuclei, and would give them a prolific queen at once; but as yet I have been saved this trouble. I am trying to have queens on hand for such emergencies.

This apiary is very pleasantly situated, about an hour's drive from the city of Santo Domingo, West Indies. It is not in any of the very best localities for bee culture; but as other circumstances prevent me locating in a better district, I shall have an opportunity to judge of and report the difference of this and other localities. These is, however, no apiary within three miles around the "La Fe," and therefore I think the pasturage quite sufficient for about 500 colonies, which I intend to put on gradually.

I saw in several of the bee-papers that the bees did not work on tin; but this I beg to contradict, as I now have on hand two tin separators on which the bees have worked entire combs filled with brood. This was done in a Quinby standing closed-end hive. I put in some tin separators between the top of the frames, and in a hurry put in a swarm of bees, without putting guide-comb or fdn., and they started working on the sharp edge of the tin; they fastened the comb on both sides of the tin, so as to get it the full thickness for brood, with which they filled it the whole size of the frame. So this is proof that bees *will* work on tin—yes, and even so far as to fasten two pieces of tin together, either with comb or propolis, as I have both cases in this apiary. The bees here are the common brown-black German. They are great hands in using propolis; every crack that is under  $\frac{1}{4}$  inch open is securely sealed up by them; and even the frames that are close fitting on top and sides a couple of inches, they fasten quite close.

Our prospects for the expected honey season are rather poor. We have had very dry weather; the spring opened wet, and has been followed up by a hot and dry season. Flowers have been scarce, and the palms are late in blooming; but as long as there is good life in the bees, there is hope. No old bee-keeper can afford to go into Blasted Hopes, and I am one of those who say never die, although apparently every thing seems to come to an end. But, I forgot. I am just beginning here on a scientific principle, and feel proud to say I am the first in this island to do so. By next mail you will receive No. 2.

L. IDA TOBOTHER.

Santo Domingo, West Indies, June, 1883.

We are much pleased indeed, friend T., to get so favorable a report from you in regard to this part of the world. It has long been an enigma in the minds of many, why a clime so highly favored by Providence as yours doubtless is, should make so poor a return for the "ten talents" it has received. Properly worked up, it does seem as though apiculture in the Antilles would give us some statistics in comparison with which ours would seem small. When known to be

a source of revenue, the government there would be likely to foster the industry, and thus give it a sure foothold. With our sister-continent of South America waking up to the importance of this subject, especially in Brazil, under the progressive Dom Pedro, what may we not expect of our heteroscean neighbors? Please give us something more, by all means, especially in regard to the flora of your island.

### HOW TO BUILD UP AN APIARY.

WHAT JUDICIOUS FEEDING MAY DO.

**I** NOTICE in June GLEANINGS that several tell how smart their bees are. I think mine are smart too. My two swarms came through the winter in good shape, with a great quantity of honey to begin business with in the spring — so much that I swapped with them an empty comb for a full one just as winter was closing. Hive No. 1 appeared to be almost full of bees, and No. 2 about one-third full. At the suggestion of a friend I made a feeder and put it on top of the frames quite early; in fact, before the snows had ceased to come, and gave them just a little sugar syrup to encourage them, and also a little flour just outside the hives, on such days as they could fly out. The result was, they began to bring in pollen before I supposed there was any thing to find, and filled that empty comb right away — built comb up into my feeder, so that I had to take it off. When I took the comb out of my feeder I found eggs in every cell. Seeing that they were getting crowded, on the 10th of May I put on an upper story of sections to No. 1, and a half-story crate of small frames to No. 2. On the 20th of May, No. 1 swarmed — a good one too; May 29th they swarmed again; and on June 1st, swarmed again, and quite a respectable little swarm. June 2d, No. 2 swarmed. This makes four swarms in 13 days, from two hives, and I find that No. 1 had worked just a little on the fdn. in upper story, and No. 2 had filled the half-story with comb, and had begun to cap some of them over; and to-night I see that the first swarm has filled their hive, except part of one frame, and shall have to put on suplus arrangement immediately.

DANIEL H. JOHNSON.

Danielsonville, Ct., June 5, 1888.

### THE TORONTO CONVENTION.

SOMETHING FROM FRIEND JONES ABOUT IT.

**T**HE National Bee-keepers' Association will hold its annual convention in the City Hall and Council Chamber, in the city of Toronto, on Tuesday, Wednesday, and Thursday, the 18th, 19th, and 20th days of September, during the second week of Canada's great Fair. All the railroads in Canada will issue tickets during this week, good to return up to Saturday night, the 22d, at single fare for the round trip. Special excursion rates will be arranged from various parts of the United States, of which due notice will be given. Those who intend being present may be kept posted on the latest excursion rates by addressing me, and also that I may arrange hotel accommodation. Private lodgings will, if possible, be secured for those who desire it, and every effort will be made to make everybody comfortable. A grand meeting is anticipated.

D. A. JONES,  
President.

Becton, Can., July 3, 1888.

## Humbugs & Swindles

Pertaining to Bee Culture.

We respectfully solicit the aid of our friends in conducting this department, and would consider it a favor to have them send us all circulars that have a deceptive appearance. The greatest care will be at all times maintained to prevent injustice being done any one.

**T**HREE years ago I sent to N. C. Mitchell \$5.00 for the privilege of using his patent bee-hive. In his circular he proposed to send a treatise for beginners, and one queen in nucleus box (Italians). I received nothing, except his patent-right to use his hive; and as I know nothing whatever of the business, I have had quite a lonesome time.

F. R. COLLARD, M. D.

Wheelock, Texas, May 25, 1888.

No doubt you had a lonesome time, friend C. I rather imagine that most of the folks who have been waiting for any thing except promises from our old friend Mitchell have found it quite dull, waiting year after year. We have had so few reports regarding friend M. of late, that the heading, "Humbugs and Swindles," was getting dusty, as our proof-reader remarks. As your report was a three-year-old one, it does not give us any thing fresh, after all. Well, I think we will try to stand it, if we *don't* have any H. and S. department for a year. But perhaps it might be well to hang out the "shingle" occasionally, for the benefit of those similarly inclined. Such a warning "is not a terror to good works, but to the evil."

## Bee Botany.

OR HONEY-PLANTS TO BE NAMED.

**I**NCLOSED I send you samples of two honey-plants, or weeds, which I think, from the way the bees work on them, must be good. Bees worked on them both all day, and after sundown on the 23d day of last May, and while clover is in full bloom too. I consider the small red flower a very bad weed to have on a farm, or any place except on the roadside. It grows here on the town commons. No stock will interfere with it. The black flower with broad leaf grows in the woods on very rich land where stock do not tramp about much. I never noticed either plant before this year, as a honey-plant; and as they are new to me, I should like to find out their names.

Bees are doing well; have had no lack of forage since fruit-trees bloomed.

TH. S. CHAPMAN.

Rocheport, Boone Co., Mo., May, 1888.

Relative to these flowers, Mr. Devo! says:

BURR-FLOWER.

The flower inclosed ("found on rich land") is the "Waterleaf," or "Burr-flower" (*Hydrophyllum appendiculatum*). It is a very common plant here, found mostly in rich, moist woodlands, as stated by Mr. Chapman. It is an herb with alternate, sub-palmately 5-lobed leaves, the lobes dentate, diverging. The whole plant is covered with rather soft, spreading hairs. Sepals subulate, with a small appendage between the lobes. Corolla bell-shaped, 5-lobed, with small appendages inside; stamens 5, in-

serted on the corolla. Stem 12 to 18 inches high, watery, branching; leaves roundish in outline, with the lobes pointing outward like a star. It blooms in May and June, the flowers blue. It is a rather rough plant, and is of no economic importance. It is easily broken down by stock tramping among it, and readily killed by mowing.

#### HOUND'S-TONGUE.

The second plant is *Cynoglossum officinalis* or common "Hound's-tongue." It is a hairy perennial plant growing in waste grounds, 1 to 2 ft. tall, leafy to the tops, with lance-oblong leaves, sessile or clasping at the top, petiolate near the base; calyx 5-parted, silky pubescent; corolla funnel-form, dull red, orifice closed by 5 scales; achenia 4, covered with hooked prickles, catching on to the clothing, and fur of animals, when mature, thus being widely distributed. Leaves 6 to 10 inches long, 1 to 2 broad, pubescent. The whole plant is of a dull green color, with a disagreeable smell. It is a native of Europe, but is now widely disseminated in this country, found principally in pastures, by roadsides, and in waste places; blooms in May and June. It is a vile weed, and should be destroyed by cutting off at the surface of the ground in spring and early summer.

W. S. DEVOL,  
Botanist Ohio Ag. Ex. Station.

#### FRIEND HARRISON'S EXPERIENCE.

SUGGESTIONS IN REGARD TO COVERING THE FRAMES  
IN WINTER, ETC.

I WENT into winter quarters last fall with twenty swarms of bees on summer stands, Italian, all but two in chaff hives; these latter were in the Simplicity hives. Those in chaff hives I gave no further protection than what the hives afforded. Those in the Simplicity hives I protected by setting a shock of corn fodder over them, the fodder being securely bound with two bands near the top. They all came out strong and in good shape this spring. On the 27th of March last I sold them all at public sale. I use bagging for covering over the brood-chamber. I buy Stark A grain-sacks. These sacks cost from 20 to 25 cts. apiece. One sack will make four covers, if properly cut; this would make the price of each cover from 5 to 6 cents, which is as cheap as any other cover now in use that I know of. I like them much better than any I have ever tried. I have never been troubled by the bees cutting holes through them. The bees will go to work and soon cover them over between the frames with propolis. And I have observed for a long time that bees are not apt to gnaw through any thing that they have once covered over with propolis. Before putting on these covers for winter I first lay a thin cake of candy (about  $\frac{3}{4}$  of an inch thick, made according to directions given in A B C) on top of brood-frames, and then put on the cloth or bagging, tucking it well down at the edges, so as to leave no chance for any bees to crawl above; then I put on chaff cushion, and after having put them in this shape with plenty of stores, I consider them pretty safe for any emergency. You may perhaps wonder why I give them all candy in the fall when they have plenty of stores. I do this to prevent dysentery; for I am a strong believer in coffee A sugar as a remedy for dysentery; and I also believe in the maxim, that an ounce of prevention is better than a pound of cure; and that most, if not all remedies, if used at the proper time, will also prove a preven-

tive, is a well-established fact. Since adopting the above plan, I have no trouble with the bees spotting their hives. I believe that bees will do their own doctoring, if the means are only placed in their reach.

I experimented last winter with one of my colonies by removing the bagging, and using in its stead a frame made out of laths  $1\frac{1}{4}$  inches wide, with a strip across the middle of the frame; to keep the wire cloth from sagging, I tacked it on top of this frame, and then place it over the cluster. This frame should be made so it will go easily inside of the upper story of the chaff hive. I like this device better than any other that I have seen yet, for the following reasons:

It makes feeding in the upper story very convenient. All you have to do is to lay your cake of candy on the comb-frames; drop in your frame covered with the wire cloth; put on your chaff cushion, and the work is done. Or, if you want to feed syrup, just raise up your cushion, take out your wire frame, and set a tin pie-plate on the brood-frames; put on your wire frame, and pour the syrup right through the wire cloth; and when the plate needs refilling, all that is needed is to lift out the cushion, pour in the feed, put back the cushion, close up the hive, and the job is done. This operation can be performed in so short a time that but little warmth will escape, which is a very important thing in cold weather.

This device has the same advantages that are claimed for the Hill device; viz., it forms a warm-air chamber over the cluster during cold weather, giving the bees a chance to have free access to all their stores without having ugly holes punched through the combs to accomplish the same end.

Another advantage is, you can always see just what condition your bees are in by simply raising the cushion, and without the possibility of a single bee coming out and getting lost. This arrangement may perhaps be very old to you, and may have been in use long ago; but if it has. I am not aware of the fact; and if it has ever been in use before, and has been discarded for good reasons, I should like to have them from some practical bee-keeper, for I am always ready and willing to learn. You may perhaps find fault with this arrangement on account of too much upward ventilation; but if this should be the case, I must beg leave to differ with you on that point. I think that more mischief is done in wintering by not giving upward ventilation enough, than by giving too much; but, of course, both extremes should be avoided as much as possible. I can show you some old box hives right here in this neighborhood, with cracks in them from top to bottom, over  $\frac{1}{2}$  an inch wide, and the top of the hive so cracked and warped that the bees can go in and out where they please. These cracks were once chinked up with mud or putty; but this has dropped out long ago, and yet their owners tell me that the bees had wintered well for years in these same hives.

I am a strong believer in furnishing bees with water, and especially during the brood-rearing season; but I do not believe in obtaining the supply by the perspiration, or sweating process.

Bee-keeping on the improved plan has been very much neglected in this locality. There are a good many bees kept here, but most all in box hives and hollow logs, or bee-gums, as they call them here. The bees are about all blacks. I have not seen any pure Italians since I came here. But it looks to me

as if there were going to be a regular waking-up among the bee-keepers here, and that, too, before the present season is over.

I think this a very good locality for bees. I bought a new swarm the other day from a neighbor, and the way they are bringing in the honey is enough to make any bee-man feel well. The fields here are just covered with white-clover; there is also a good deal of alsike clover raised here for hay and pasture; there are also a great many honey-bearing plants growing wild here, such as motherwort, wild mustard, catnip, smartweed, Spanish needle, etc. This is also a great basswood country. If your supply for section boxes should run out in the eastern part of the State, just let us know, and we will supply you with all you may want. G. W. HARRISON.

Wharton, Wyandot Co., O., July 9, 1883.

### HONEY IN OLD APIARIES.

SOME WORDS OF WISDOM FROM FRIEND MORRIS.

"He that observeth the weather shall not sow, and he that regardeth the clouds shall not reap."

I NEVER fully realized what Solomon meant by that "wiser" until to-day. This spring I regarded the clouds, and I observed the winds, and I saw that it did rain, and was very cold and backward; so I did not sow, nor feed my bees, and therefore they did not increase and wax strong in numbers, and, lo! when white clover came in great abundance, and the perfume did fill the air, yea, even into our houses, my harvesters were few, therefore my crops not great. Whereas if I had observed that white clover was not winter-killed, and was promising a big yield, I would have taken Solomon's advice, and would have sown, otherwise fed, crowded my bees to their uttermost; then when the harvest came I could have raked it in. I calculate I have lost just one ton of white-clover honey by not feeding up in spring.

All springs are not alike, however. Last spring, one year ago, I fed, and was ready; and, lo! white clover was "ausgespielt," and 3 or 4 colonies died from too much "muchness" of bees, and too much emptiness of honey, before I knew what was up. Now the point is, we must govern ourselves in spring management by the prospects; and I think we can tell pretty well what white clover is going to do, whether it is winter-killed or not.

DO BEES FLY 90 MILES AN HOUR? WHY NOT?

There are some of the migratory birds that fly at the rate of 75 miles per hour for 48 hours. That wonderful bird called the albatross is said to fly at the rate of 100 miles per hour. I saw an article not long ago to this effect: A sportsman in England laid a wager that he could pick six hounds from his pack that could run past a railroad train at full speed. Accordingly a flat was hitched behind an engine, and the train started out, the sportsman standing on the open car in full sight of his dogs, with gun in hand, the dogs following on the track. The throttle was pulled out at once, and the engine "pawed the dirt," so to speak, and when speed was attained of one mile a minute, he pointed his gun ahead, and fired it into a wood. Instantly the dogs sprang from the track, past the car, into the wood, and out of sight, like a flash. So goes the story.

Now as to trains running 60 miles an hour, they certainly do, and faster. The train that carried the lamented Garfield from Washington to Elberon at-

tained the enormous speed of 70 miles per hour. I am well acquainted with a retired passenger engineer of 15 years' run on the Illinois Central R. R., and he said to me, on inquiry, that he had often run specials at from 50 to 65 miles an hour. There are several instances on record where, during the late war, trains were run just as fast as fire and water could make them go. So far, I think friend Doolittle is "kerect."

Now, on the other hand, philosophy says that tornadoes travel from 40 to 90 miles per hour, and that wind blowing 40 to 50 miles destroys barns, houses, haystacks, etc.; while a wind blowing 70 to 80 miles destroys everything in its path. Now again, one can not stand within 3 or 4 feet of a train of cars going by at 60 miles per hour without being blown down, and perhaps sucked into the vortex. There is a vast difference between a bee going 80 miles per hour, and a tornado or cyclone with their greater force. The progressive motion of a cyclone is from 18 to 40 miles, while the rotary motion is 40 to 120. If a wind blowing even 60 miles per hour, low down, should strike friend Doolittle, I am afraid he would never write us any more articles.

Rantoul, Ill.

H. M. MORRIS.

It seems to me, friend M., you do not bring out the true meaning at the head of your article, as I see it. The way I understand the text is, that one who stands with his hands in his pockets, looking at the clouds when he ought to be pitching his hay on the wagon, would not be apt to turn out a very successful farmer, and I guess it is so with bee-keeping.—I think I should advise feeding every spring, and then if the bees got their hives so full of young bees that provisions ran out, I would just feed them white sugar, and sell them off by the pound.—I think I shall have to give up about the speed of bees, railroad trains, ducks, and I do not know but hounds also; although I feel very much inclined to object a little to that "yarn" of yours about the hounds beating a railroad train.

### NEW HONEY BY THE TON.

HOW FRIEND ECKMAN MANAGES AWAY DOWN IN TEXAS.

BEES are doing finely. I started in the spring with 120 swarms in good condition. I kept down swarming as much as possible, but had to hive 40 swarms; commenced extracting June 4; have taken out, up to date, 9500 lbs. extracted, and 1200 1-lb. sections. I am still extracting, and have three months to run yet. I did all the work myself, except my better half, who winds up the buckets and draws the honey in small vessels for me.

Neighbor Johnson and I took a flying visit last week out to Luling, 160 miles west, to see friend Tadlock. We found him a very pleasant gentleman, and well up to the times in bee-keeping; but his bees are in poor condition, on account of extreme drought, he having to feed until a short time ago. Bees in Northern and Western Texas are all in the same condition as his. I have already sold 4000 lbs. of my crop, and am getting orders nearly every day. I put up my honey in nice neat packages, and put attractive labels on them. My packages run from 2 to 60 lbs., extracted. Could I have had more help, I could have gotten more; but am very well satisfied.

J. W. ECKMAN.

Richmond, Ft. Bend Co., Tex., July 16, 1883.

## Heads of Grain, From Different Fields.

### HOW FAST CAN A BEE FLY?

**O**N page 301, June GLEANINGS, John Phin argues that a bee can fly as fast as a pigeon, because it is stronger in comparison to its size. This is not a conclusive argument by any means. I have seen a jumping mouse, about six inches long, including three and a half inches of tail, leap four or five feet at a time, eight or ten times his own length, and yet I could outrun him. So with the bee and pigeon; though the bee is stronger and swifter in comparison to its size, yet I think there can be little doubt but that the actual speed of the bird is much the greater.

BURDETTE HASSETT.

Howard Center, Iowa, June 25, 1883.

### A QUEEN THAT WOULD STING WORKER BEES.

I received the queen all right, and put her in a one-frame hive that I had made for a queen a few days before, but they had killed her. They were mostly all young bees, as nearly all the old ones had returned home. I put the queen in, and the old bees that were in the hive commenced to bite her. Whenever one bit her she turned round and stung it. Some caught hold of her by the legs, but she soon stung them to death. Do not say I am mistaken, for I saw her curl up on them and thrust her sting into them. As soon as they were stung they fell down on the bottom-board. This is the first case of a queen stinging workers that I ever saw.

JOHN DALLAS.

Sharpsville, Mercer Co., Pa., June 26, 1883.

I know, friend D., that we do occasionally have a queen that will sting worker bees; and it has been suggested that we might have one that could be turned loose in any colony of bees, and fight her way through. It seems, however, that yours did not succeed in doing this, after all, for she was killed finally. I have known only one or two cases where a queen would deliberately sting worker bees.

### BASSWOOD; AT WHAT AGE IT BEARS HONEY.

Please tell us how long it takes basswood-trees that are grown from the seed, before they will bloom. Bees are doing A 1 now. There is an abundance of feed—white clover, alsike clover, and red and black raspberry. Basswood looks well; and with favorable weather I see nothing in the way of our getting more than an average crop of honey. Although the spring has been cold and wet, our bees have not ceased to breed; so at this time, the hives are full of workers, ready for business.

### APPLE-BLOSSOM HONEY.

A few of the colonies stored 30 lbs. of the very whitest kind of comb honey from apple-blossoms.

A. W. OSBURN.

Water Valley, N. Y., June 23, 1883.

Basswood-trees will bear at a very early age, perhaps five years from the seed. But it will perhaps be ten years before the bloom will amount to any thing for honey, and very likely ten more on top of that before it is ready to give a full crop. Our basswood orchard is about ten years old, and many of the trees were three or four years old when

transplanted; but even now there is only here and there a tree which can really be said to be full of blossoms.—I am very glad indeed to see the reputation of apple-tree honey coming up. The great drawback in harvesting the crop seems to be in having the bees strong when it comes into bloom.

### UNITING BEES.

I had a small swarm the first of the week. I had a weak colony, and after taking out the old queen I united them. Any thing wrong in doing this? The next day I looked at them, and they were trying to kill the queen, and did do it. What was the matter?

Zanesville, O., June 23, 1883.

L. GRAY.

And they did exactly as I should suppose they would, friend G. It is never safe to put bees in with another colony, no matter how few or how many, under any circumstances, without at first caging the queen or watching her to see if they molest her. It is true, bees are often put in thus, without the loss of a queen. But there always is liable to be danger. Smoking them well at first when they commence will many times make them behave. Where bees are lifted from combs, and all from one hive, and put in another, there is, perhaps, less danger; but if the queen is a valuable one, it is always best to look after her for a few hours.

### AN OLD-STYLE BEE-KEEPER.

I have had bees all my life, and have 50 stands now. I know nothing about frame or improved hives, but I can handle bees as I please. I have had but one sting in handling 50 or 60 swarms. I would like to have my bees in good shape, and make a business of it. My bees are in nail-kegs, cracker-boxes, flour-barrels sawed in two, log gums, and any thing that I could pick up.

W. D. WERNER.

Prairieville, Ark.

Friend W., I do not know but it would be lots of fun to handle bees in your nail-kegs, boxes, etc., but it seems to me I would rather have a few more stings, and get a little more profit from my bees than you probably do by your present mode of management. We send you the necessary information in regard to the modern style of working with bees.

### NEW SWARMS ABSCONDING.

We had our first swarm of bees come out on Sunday, June 17, 1883, at half-past 9 o'clock A.M. We hived them without any trouble, and then let them stand on a sheet on the ground, under a tree. It was a very warm day, and the sun shone on the hive most of the time, and about two o'clock the bees came out of the hive and went to the woods without saying good-by, or any thing else, and so we lost them. Now, please tell me if you think it was our fault that they went off; if being in the hot sun; or do you think to clip the queen's wing would have saved them? I don't want to lose any more. The bees begin to hang out some on the other hive.

MARTIN V. HOTELLING.

Dansville, Liv. Co., N. Y., June 19, 1883.

I think it was the heat of the sun, principally, friend H., that made them come out. Besides putting them in the shade, I would put in the comb of unsealed brood I have been telling so much about; but in any case don't let the sun shine on a colony just hived.

If you do that, they will likely come out, brood or no brood. Only yesterday one of the girls in the apiary was picking some bees off from a comb to put into the queen-cage. While she did this she had left the hive uncovered, and the sun shone in against the side of a comb. Before I could get the hive covered, the comb dropped out, fell against its neighbor, and that would have dropped out in a moment more, and so with the contents of the whole hive. You see, friends, what mischief a few minutes' shining may do in a hot summer's day. Perhaps you like the business of mending up broken comb, and resuscitating suffocated bees; but if you do, I do not. One reason I do not like it is, because it consumes valuable time; and neither combs nor bees are ever quite as good again after being broken down or partially suffocated.

DO BEES STEAL EGGS, OR CARRY EGGS FROM ONE COMB TO ANOTHER?

I have settled that matter in my own mind. Last summer I had two black stocks and one Italian nucleus. These were all the bees I had at the time, and there was not another Italian bee within 14 miles of me that I know of. Well, I had the misfortune to set the chaff cushion on fire in the nucleus hive. It did not burn much (only the top was burned off), but it made smoke enough to drive all the bees out of the hive; and before I could induce them to return, my black stocks had robbed it completely, not only of honey, but every egg was gone, and the larvae were starved dead. I did not think much of it at the time; but some three weeks or more afterward, I had lots of young Italians in my black stocks. Now, where did they come from? I leave you to answer the question for yourself and others. I am pretty well satisfied.

HERBERT SHAW.

Broadhead, N. Y., June, 1883.

Friend S., you have given us a most important fact, and I see but one possibility of your being mistaken. This is, that bees mix to a considerable extent from one colony to another. For instance, if you have one colony of pure Italians, and five colonies of blacks, you will, in a very little time, find Italians sprinkled all through your black colonies. I do not know why this is, unless because it is the young bees, when out playing, come to the wrong hive. In your case you say you had *lots* of Italians in your stocks. Now, if you saw Italians hatching out of the brood-combs of hives containing black bees and a black queen, your proof is conclusive. Did you look to see if the young bees were Italians? If you did, we may consider the matter settled. It will be pretty difficult to make such an experiment, because robber-bees seldom take a notion to carry home eggs and larvae, as you think bees must have done. Can we have any more facts in regard to this strange matter?

RAISING WAX INSTEAD OF HONEY; A NEW IDEA.

Inclosed you will find some drone-cells containing wax. This, I think, was derived from the honey which the cells contained. Has there ever been a process to make artificial wax? I think, before many decades bee-keepers will be wise enough to make their own wax. If the bees can make it from honey, why can't we, with the proper utensils? These cells

you will see are fair samples of wax, very likely made from dark honey. They were out in the beehive all winter, which probably had a tendency to transform it into wax. One cell I found which contained honey, but began to crystallize along the walls, and resembled wax. What is your opinion in regard to it?

H. J. SCHROCK.

Goshen, Ind., June 24, 1883.

It is an actual fact, friends, that the piece of comb sent by friend S. contains drone-cells filled with very fair wax. The wax has very much the appearance of having been melted and poured into it. How it came there, I am unable to tell; but I can not yet quite accept the idea that the honey the cells contained had turned to wax. Even if it did, as the established rule is, that it takes from 10 to 20 lbs. of honey to make one of wax, the cells should contain only a small portion of wax. Friend S., is it not possible that some melted wax had, at some time or other, been run into these drone-cells by accident or otherwise? I do not think we are quite ready to go into the business just yet, are we?

FOREIGN BEES.

The following comes from the *Transcript*, Lexington, Ky.:

Yesterday some bees were brought into our office that had just been imported from Italy. They had been sent by express in a neat little hive, with honey in it. They can not speak a word of English, but they sting in the American language. The importation was solely for the sake of the queen that was in each little hive, and the few common bees sent along with them were simply a retinue for their royal highnesses; the queens, like royalty, queenly preferring to starve to death rather than do any menial service for their own sustenance.

BEES THAT CARRY LEAVES.

I received the bees to-day noon, and guess they are all right. There were a few dead ones — no more than I expected. Mr. Root, did you ever see bees carrying leaves? There are some bees working in the gable-end of our house, in a knot-hole, carrying leaves in. They look like the Italian bee. I never saw any carrying leaves before. Several came and saw them carrying, but would not believe it.

JOHN N. CORBETT.

Malden, Bureau Co., Ill., June 27, 1883.

The bees you allude to, friend C., are not honey-bees. They are a species of wood-bees, or borers, and the leaves they carry are for making nests for their young. Some of these borer-bees are very prettily marked, and are not unlike bright Italians, if one does not take a very close look at them. They gather little if any honey, however; and, if I am correct, they visit the flowers mostly for pollen.

USING WIRED FRAMES FOR NATURAL COMBS.

We extract the following from *The Kansas Bee-Keeper*:—

Last season we ran short short of comb foundation; and having no frames at the apiary but wired ones, we put in some two hundred of them, when, much to our surprise, the bees not only readily accepted them, but seemed delighted to find the wires so convenient for supporting the newly made comb, and in every frame left the wires exactly in the center of the comb. It worked with us to our entire satisfaction; so much so that, when we came to extracting honey from those newly made combs, we found them worth at least twice as much as the unwired ones.

## HOW MANY BEES MAKE A HIVEFUL?

It strikes me that when the bee-mathematicians have attempted to tell us how many bees do or ought to constitute an ordinary swarm, they have left many interesting points still in the dark. As I am a mathematician myself, I will tell what I know; or, rather, what conclusions I have arrived at.

A Langstroth main frame being  $16\frac{1}{4}$  inches long and  $8\frac{1}{2}$  inches deep, inside measure, the surface measure both sides of comb would be  $284\frac{1}{2}$  inches. This, if all worker comb ( $\frac{2}{5}$  to the inch), would contain 7100 cells, or 71,100 for a hive of 10 frames. But a bee, after she is hatched out, being about  $\frac{1}{8}$  of an inch long, covers the space of 3 cells. Therefore if we open a hive and find all ten frames covered as thickly as the bees can stand on the combs, there would be just 23,700 bees. If in layers 2 bees deep, 47,400. It is needless to say, that such a swarm could spare half of the bees above to work in surplus boxes, 50,000 bees; then in a good working swarm, 20,000 to 25,000 would be sufficiently large to winter safely; and I am induced to think that our swarms average even less than this during the winter season. Again, if the bees consume 20 to 25 lbs. of honey during winter, it would be at the rate of one pound to each 1000. Many other interesting things could be figured out; but this will do, I think.

T. L. RIGGS.

Portland, Oregon, May 29, 1883.

## WM. F. CLARKE, AND A WORD IN REGARD TO HIS PRESENT WHEREABOUTS.

The ways of Providence are mysterious, but always wise and kind. For some not yet manifest reasons I have been pitchforked away up into this far-away region, where I have been editing a daily and weekly paper for the past nine months, and have been busier than I ever was before in my life. How long I may stay is at present uncertain; but the path of duty was made plain to come, and I doubt not it will, in due time, be made manifest whether I am to remain or depart. I have been knocked clean out of bee-keeping for the time, having felt both too unsettled and too dubious about this climate to do any thing in that line. But after an experience of the steady dry winter weather, and a sight of the gorgeous prairie flora in summer, I am inclined to think that, even so far north, bees will do well in the hands of skillful manipulators. If I stay here I shall certainly give them a trial.

WM. F. CLARKE.

Winnipeg, Manitoba, June 23, 1883.

## HOW TO TELL WHEN THE SECTIONS ARE FILLED, WITHOUT OPENING THE HIVE.

How do you tell when sections of honey are capped, without looking previously? J. F. KLINE.

Grigsby's Bluff, Texas, July 1, 1883.

At first thought, friend K., I should have said there was no way; but it now occurs to me that I did find a bee-keeper last summer, Mr. George Carrington, of Weymouth, Ohio, who had a plan of telling which sections were filled, and which were not, in the  $1\frac{1}{2}$ -story hive, without opening it. I saw him raising the covers to his hives, and going about, rubbing the sections with his finger, as if he would test the smoothness of their basswood tops. I finally asked him why he did it; but almost before he could reply, I noticed that some of the sections gave back a different sound while his finger glided over them, from what some others did; and it

soon transpired that those solid with the chunk of honey they contained seemed to have a different feeling, as it were, by simply passing a finger over them almost as fast as you could touch them. Try it, friends. Just raise the cover to your  $1\frac{1}{2}$ -story hive with one hand, and with the forefinger give the tops of the sections a little brush. The empty ones give back a hollow sound, while the filled ones have a dull "thud," as it were, when they are touched.

## GOING OFF WITHOUT CLUSTERING.

Last summer, about the middle of June, while at a hive taking off comb honey, a large swarm of black bees just in front of and to the left of me began coming out. I went immediately to the hive, thinking that I could find the queen as she came out, but did not. After I had looked for her until I thought she was out and on the wing, I looked up to see if the swarm had begun to settle. To my disgust, I saw they were not alighting, and did not intend to do so. The swarm was all out, and they were in a compact bunch about 10 or 12 feet in front of the hive, and about 6 or 8 feet above the ground. It appeared that not a single bee ever looked back toward the old hive, but they kept their heads turned toward the woods, which was just across the run bottom, hardly one-fourth mile away; and for that timber they immediately started, and I kept them company almost to the top of the hill, where they entered a hollow in a small oak-tree that bees had been in a few years before, and had died. This was a first swarm; queen one year old; came off at eleven o'clock A.M., and left 56 one-pound boxes nearly finished. Cut the tree that evening; brought them back, and made them finish that honey, and make me nearly 56 lbs. more. J. A. BUCKLEW.

Clark's, O., June 11, 1883.

## SWARMING WHILE IT RAINS.

I have but just commenced in bee culture, and find myself deeply interested in the little workers. I started with three colonies, May 6th, and now have an increase of three—two by artificial swarming, and one natural swarm. All are strong, and doing finely. Have taken 25 lbs. comb honey from original swarms. My natural swarm acted a little differently from your theory in A B C, and I should be pleased to have your opinion on the subject. They came out right between two showers of rain and clustered within 50 yards of the apiary, on a willow; and although I was not longer than 10 minutes in hiving them, they were, as well as myself, pretty well "soaked" with rain before it was completed. If I mistake not, the A B C says they are not likely to swarm during any thing like threatening weather; and after coming out, often go back to await a better day. They were not at all crowded for room, having 3 frames almost entirely empty. It puzzles me. Please help me out. I have started my apiary after the style mentioned in A B C, as the Vineyard apiary. A. T. SHOTWELL.

Somerset, Ky., June 9, 1883.

## AN ENTHUSIASTIC A B C SCHOLAR; CHAFF HIVES, ETC.

Here is my report for the winter and spring. I packed 30 colonies last fall with chaff on their summer stands; 29 came through safe, and as bright as a new dollar, with no signs of disease, and they gathered considerable honey from fruit-bloom; but

the cold wet weather through May caused me to go to feeding to keep up brood-rearing. But to-day, June 18, they are just booming on white clover and poplar. I tell you, it does me good to see how they rush out to work these bright warm mornings, and to see how fast they can fill up. I have all of my bees in the Langstroth frame, but have been using the Langstroth, Simplicity, and chaff hives. I am working them into the chaff hive as fast as I can get them made, for I can get better satisfaction from those kept in chaff hives. I will give you my report at the end of the season. JNO. R. CROOKS.

Keiths, O., June 18, 1883.

One of the greatest yields of clover is in progress in this locality that I have yet seen. There is an enormous crop of white clover here. Every old idle field looks almost like a white sheet, and it seems to be thriving everywhere, where it has got rooted. For this locality the yield of honey is very great, where swarming is kept down. Bees have the swarming fever terribly, and I can not control it with boxes; but the colonies with full upper story for extracting seem to be getting down to business.

I have extracted up to date about 100 lbs. of clover honey from 4 colonies. I could do much better; but I am not a muscular man myself, and could get no one competent to help me. I have got behind, and can not catch up. The orders for brushes come pretty slow, and I am of the opinion that bee-keepers do not put much faith in our brushes, or else they are overlooking the matter. I must say, if it is I who am advertising them, that I have been using one that was put up to sell, and no better than those we have been sending out, if as good, and I would not do without it for \$1.00 now. I find it second only to the smoker and veil. I have to use a veil, as I can not stand stings in my face. Here is an extract from our good friend Chas. F. Muth's letter, after using a sample brush I took him, May 25: "I gave a fair trial of the one you left with me. They are nice-easy brushes; I mean, easy on the bees, and answering their purpose first rate. \* \* \* \* \*

It would be an improvement, I think, to have about double the amount of manilla on." This last is on a par with my own opinion, as the brush gets softer after using awhile. I hope to get a perfect brush for next season, as improvements are being added every few days; but those that go my mail must have the handles left out, as they can not stand the rough handling of the mail-pouches, except bunches of 1/2-dozen and upward. T. J. COOK.

Newpoint, Ind., June 18, 1883.

#### NOTES FROM THE BACHELOR APIARY.

I went into the winter just passed with 44 colonies; 10 buried, and 34 on their summer stands. All came through the winter in good condition. You know, "no upward ventilation" is my hobby, and, after practicing it three successive winters without loss, ought I not to be satisfied with the result?

#### DECAPITATE ALL WORTHLESS QUEENS.

The queen of every colony that does not prove to be superior workers, is removed. I think it bad management to keep a worthless queen longer than her place can be supplied with a good one. Suppose each colony in your apiary should store as much honey as you obtain from your best stock, what would your profit be?

#### NATURAL STARTERS FOR SECTIONS.

I think I shall never again use fdn, for sections. I

find it a very easy matter to obtain all the natural starters I need; and my experience is, the bees take to the boxes much quicker where they are filled, or partly filled, with natural comb, than where they are filled with fdn. M. J. HARRIS.

Calhoun, Ill., June 15, 1883.

#### SOME QUESTIONS ABOUT FOUNDATION.

I sent for your special foundation-mill circular, and didn't receive any, so I want to ask a few questions, as I expect to buy one next season.

1. How much will the wax waste in making?
2. How do you manage to save the odd pieces to advantage, when a customer orders an odd size; for instance, 10x14, your size 12x18?
3. How much paraffine would you dare mix with wax for your own use, if you use wired frames?
4. How wide a sheet will a 12-inch mill roll conveniently?
5. How much could one expect to sell, if he should advertise in two or three papers, and did business on the square — 100, 500 lbs., or a ton?

I don't intend to sell paraffine foundation, but if I could mix in, say one-third for my own use, it would be quite a saving. C. J. SANFORD.

Unionville, Ct., July 10, 1883.

I do not know just what the waste is. In some specimens of wax it should be comparatively nothing, while with some others there might be 10 per cent of waste. Some very bad lots of wax would perhaps waste 25 per cent; but such we always take at a low price, trying not to pay too much for it, as a matter of course. Wax rendered from cappings with a wax-extractor ought not to waste any, unless you drop scraps on the floor and trample them in the wood.—We melt up our scraps, as a matter of course; but as it is good economy to have as little scrap as possible, we have dipping-boards of many different widths; and for special orders of an odd size, we manage to dip so as to make a certain number of sheets, with but little waste in trimming.—Your last question is a hard one to answer. One who does business on the square ought to have his business increase every year of his life; but please bear in mind, friend S., there are but very few men in this world who can be said to be strictly on the square, in spirit as well as in letter; and it also takes a little time to build up a reputation. Be patient, and take good care of every customer you get; and sooner or later you will find your reward.—I have never yet tried paraffine for wired frames, for we have been too busy; besides, I am a little afraid to try it.—A 12-inch mill will roll conveniently a 10-inch sheet of wax. Any thing much wider will be apt to trouble by running out at the sides, unless it is handled very carefully.

#### BEE CULTURE ON THE OLD PLAN.

I have 121 very large colonies of hybrid bees in Simplicity hives, or about the same hives, except the bottom is permanently fastened. I have never given my bees much attention, but have let them wag along, usually starting in the spring with about 80 hives which yield me some \$500 the following year, besides as many more hives which I usually lose the next winter. When taking honey I just cut it out of top boxes, carry to a press which I made, and press the honey into barrels. I then boil the wax, and ship. I was tolerably well satisfied with my botch

work until I picked up your A B C, as you practically explain things. I seem to now understand that money can be made. What I want is tools for making frames, section boxes, and comb fdn. My boxes, I think, will answer, if I can use frames, as they are the exact size of L. boxes.

W. L. SHANKLE.

Omega, Madison Par., La., June 29, 1883.

Well, I declare, friend S., you are a novelty. Just imagine, boys, a man with 121 very large colonies of hybrids, getting honey out of the upper stories, and then pressing it out of the combs by means of a press! Just think of it, and then imagine the difference our friend would find after having used the best modern honey-extractors. Surely, friend S., there is a chance for you to improve some, it seems to me. No doubt you get a pretty large crop of wax, which may net you something at the present prices.

#### HONEY AN ANTIDOTE FOR MOSQUITO-BITES.

Several years ago I discovered that liquid honey applied to mosquito-bites cured them effectually; every subsequent trial gave same result. Being aware that most remedies produce different effects upon different individuals, I should like to have the bee-fraternity test this simple remedy upon the stings of this national foe. On my flesh, mosquito-bites swell and itch for 6 or 7 days, unless cured with honey, while bee-stings affect me scarcely at all.

A. C. KENDEL.

Cleveland, O., June 21, 1883.

You may be right, friend K.; but you know I am a little skeptical in regard to antidotes. It may be, however, that honey has some property for neutralizing the poison of the mosquito-bite. I presume that this season is the part of the year when many of our friends can give the matter a test without very much trouble.

#### WHITE-HEADED DRONES, ETC.

I find something strange. I have had some white-headed drones that I can not account for. I should be glad to hear from you about them. I took 12 queens from one stand last Saturday that was just hatching. I had a fine time with them. I made some division-boards, and put them into some of my strongest hives. I lost 4 of them.

Pisgah, Ala.

F. M. DAVIDSON.

Friend D., your white-headed drones are nothing new. The matter has been reported and commented on several times in our back numbers. Not only do we occasionally find drones with white heads, but we find them with heads of a cherry-red color; again, of a bright green, and at other times yellow. I confess there is something very wonderful and mysterious to me in this matter. Why queer old dame Nature should decide to single out the heads of drones to sport with in this way will, it seems to me, be a pretty difficult matter to explain. Why should this peculiarity show itself in the drones more than in the queens and workers? Again, why should heads be the subject of these bright rainbow colors? Is there really any purpose or design in it? or is it just because it happened so? I presume there are few among our readers but will say there is a purpose and a design in it; and the next thing is to decide why it should be so. Here is a question for scientists. A queer feature

in regard to this whole matter is, that we find many of these colored drones in one hive; that is, where you find one red-headed drone in a hive, you will probably find more; and a queen that produces them once will do so again. If I am not mistaken, I have seen hives where all the drones were colored in this strange way; and their heads were all alike — of one color.

#### INTRODUCING ITALIAN QUEENS TO LOG GUMS.

We all agree that we want the Italian queens; but as we use round gums about 2 feet long, with no conveniences to get out the old queen, we want some more advice on the subject, if it can be done; if so, how? Or can we use the Italian bee to any advantage with such gums? There are as many bees in this neighborhood as anywhere, I reckon; but they are put in gums, or boxes, when they swarm, and that is about the last attention they get.

Bentonville, N. C.

W. B. JAYNES.

Friend J., I think you will have to transfer your bees before you can use Italians to any advantage. It is true, you can drum out the swarm and hunt up the queen, and you might possibly succeed in introducing your Italian queen; but the chances are so slim of your getting her introduced without any trouble, that I think we might practically call it an impossibility. By all means get your bees into movable-comb hives. Without them a bee-keeper is, to my mind, as helpless as a woodman would be in going into a forest to get out logs without an ax or a crosscut saw.

#### BEES HANGING ON THE OUTSIDE OF THE HIVE.

In reading A B C this morning I came across this counsel of yours in capitals, at the head of a paragraph: "Never allow bees to hang outside the hive." It reminded me of a circumstance which may be worthy of record in GLEANINGS, and certainly would prove valuable, if confirmed by larger experience. A colony in an old box hive had been clustering for a long time on the outside. As the weather was exceedingly warm, the thought occurred to me that they lacked ventilation. The front of the hive was therefore raised  $\frac{1}{2}$  or  $\frac{3}{4}$  in., and they have not clustered outside since.

J. A. G.

Tuscaloosa, Ala., June 28, 1883.

Thank you, friend G. I think it very likely that we often lose heavy yields of honey by giving new swarms insufficient ventilation. I have observed the same thing that you mention. I have seen bees go into hives and go to work, after doing nothing more than simply giving them plenty of air. This is one reason why I prefer the Simplicity hive with a loose bottom. You can in an instant give any colony, no matter how strong, all the ventilation they can possibly require, by moving it forward on the bottom-board; or if that will not do, raise it up as you suggest. Two years ago we had a first swarm weighing over 11 lbs. that gathered over 18 lbs. of honey in a single day from basswood-bloom. Had such a powerful colony as this been put into a hive with a small entrance, the whole body of bees would have been very likely to have clustered on the outside, idling away their time. Thus you see how 18 lbs. of honey a day may be lost, from so simple a matter as insufficient ventilation,

TO PREVENT BEES FROM ABSCONDING AFTER BEING HIVED.

When bees have selected a place to go to, before swarming, it is very difficult to retain them. I had a swarm this spring that I hived three times — giving them a frame of brood; but they continued to swarm out as often as hived, and finally got away. My remedy is to hive the bees in a Simplicity, and to use, for a bottom-board, a Simplicity flat top, over which is placed a zinc honey-plate. Saw down a place in the end of the bottom-board for entrance of bees. When the bees begin to work in earnest, take out the bottom-board, and remove the zinc plate. The idea is, the queen can not pass out through the zinc board, and is necessarily a prisoner. The worker bees can pass in and out, however, and so the work can progress. W. E. H. SEARCY.

Griffin, Ga., June 28, 1883.

Friend S., I suppose your idea is to confine the queen by means of the zinc honey-board. The Jones entrance-guard is intended for this purpose; but I presume you object to it because the holes are too few to allow the working force of a colony to get out and in without hindrance. I would suggest, as a similar way, that you tack a piece of perforated zinc on the under side of a Simplicity hive, large enough to cover one-half of the bottom. Now slide the hive forward on the bottom so far that the worker bees can go out through this perforated sheet. In this way, any size of entrance desired can be given, proportionate to the working force of the colony. All such devices, however, will, I think, prove to be only a temporary remedy; for after the bees have tried to swarm a few times, and find the queen can not go with them, they will be apt to kill her and raise another. Another point: Has it been fully proven that an average queen can not get through the Jones perforated zinc?

IS IT THE QUEEN OR THE WORKER BEES?

Does the young queen or the worker bees destroy the superfluous queen-cells? I can give you some definite points on this topic, which I see in this month's GLEANINGS. I had a stock which I knew had a large number of cells, and I opened it just in the nick of time, to find out whom to blame for the slaughter of the unhatched queens. One had hatched, and she was on a distant part of the same comb, mounted on a cell, chewing away for dear life to get at the inmate; but she had help, for three or four workers were on the same cell, doing the same thing. I held them up quite a while, and closely watched to know just what they were at; then upon examining other frames I found worker bees tearing open the cells wherever they could find them, even on combs that the one queen had most probably never yet visited. Some cells were nearly opened; others were not perceptibly touched; yet every bee seemed determined to devour them as soon as possible. Now, some writers claim that the queen does all the mischief, because they have seen her in the act, while others claim it is the workers, because they have caught them at it, while the one queen is crawling, apparently unconcerned, over the combs. Now, I am fully convinced that both the queen and workers have a hand at it, and I believe the workers tear away many cells that the queen never sees, and she helps to destroy all that she comes in contact with. But I have noticed that they are sometimes

left as long as 24 hours before all are destroyed, as I have cut them out and saved them the next day after I have seen a hatched queen. No blasted hopes this season. A. A. FRADENBURG.

Port Washington, O., July 9, 1883.

I think you are right, friend F.; and the singular part of the whole performance is, that the worker bees never commence this tearing-down process until the queen is hatched. Now, is it possible that they have sense enough to say to themselves, "There, we have got a good queen hatched out, and there is not any further use for these great bungling queen-cells in the way; let us tear them all down so there won't be any jangling among the royal blood, if another should happen to hatch"? If they do not think this, what do they think, and why do they do it?

ANOTHER BEE-DISEASE.

I have noticed in GLEANINGS, pages 256 and 398, present volume, a disease of the brood, which is and has been very troublesome in this part of the world. What to call it, I don't know; but I will tell what I know about it. I bought one colony of black bees in September, 1882, and I soon discovered that there was something the matter with it. They threw out quite a lot of the young bees, such as were about to hatch, and down to the egg, and during the winter it died. In February, 1883, I bought another one from a neighbor, and I soon found that they had the same disease; so in May I transferred to a movable-frame hive, and I soon found that they would amount to nothing if allowed to go, and I did not know what to do. So in a few days I took a look at them, and found they were queenless, and the bees were weak in numbers; and I came to the conclusion that I would let them go, as I had no other bees to raise a queen from. So I ordered a 3-frame nucleus from Mr. Flanagan; and when it arrived, the brood had all hatched in my old black colony; and as soon as I could get eggs and larvæ from the nucleus I inserted it in the black, and they succeeded in raising a queen from this, which became fertilized in due time; and since then I have noticed no more throwing out of brood, and they have increased to two good strong colonies. Now, here is the question: Was this the fault of the queen being too much worn out, or was it because they were bred from the same strain of bees that this neighbor's grandfather had on the same farm 100 years ago, without changing or increasing? I think the latter is the cause, the same as it is with sheep or hogs, if kept without change too long. Now, please tell these friends to destroy all the queens in colonies thus affected, and let the brood all hatch, and then give them a queen from some other race that is not affected, and see if it won't cure the disease. It did with me, at least.

Staner's, Pa.

P. D. MILLER.

I am inclined to think, friend M., that the disease you mention is something pertaining to a particular queen. I, too, have seen something quite similar, when destroying the queen and giving a new one would cure the matter entirely. I do not agree with you, however, that it was caused by in-and-in breeding, for the reason that the same rule can not apply to bees as to other farm stock. You see, the queens fly out to meet the drones from several miles distant, very

often; and this peculiarity would constantly counteract the tendency you allude to.

#### BASSWOOD, ETC.

My bees are doing finely. The basswood is coming in bloom. We must have 100 old trees. We have 3 acres of ground where we can not plow. There are several hundred young linn-trees and sprouts. I never knew them to be so full of blossoms as they are now. Killbuck Valley is an excellent place for them to grow. I have a young queen raised from the one I got of you. She began to lay on the 8th day after leaving the cell. Have you ever known them to lay so soon? C. F. UHL.

Millersburg, O., July 16, 1883.

Yes, friend U., we have had many queens to lay in 8 days. You will see by back numbers that they are reported to lay sometimes as soon as 5 days; and, if I am not mistaken, even three days are on record. Very likely the latter has been a mistake somewhere, for it is not impossible that young queens, in flying out on their wedding trip, may change places, and an older one get into the hive than the one that went out. All young queens lay in about 9 or 10 days, as a rule; and I have had several to lay in 6 or 7 days.

#### SECTIONS PARTLY FILLED WHEN BASSWOOD CLOSES.

When I come too often, give me a hint. I don't know where else to go. I have several hundred pounds of honey in sections, cells nearly filled even to cap, but I guess they will leave them so on clover. Would you extract, or leave till fall bloom, goldenrod, etc., to finish? Hard to sell extracted honey here. WM. M. YOUNG.

Nevada, O., July 21, 1883.

Thank you, friend Y. I am always glad to have you come, all of you, when I can help you in any way, and I am glad to have you come when I can *not* help, only I shall feel sorry to send you away "empty handed." In regard to partly filled sections of white honey, I would by all means endeavor to get them all filled, by some hook or crook. The usual way is to feed back extracted honey; but while the bees are getting some honey from the fields, this will hardly do, for it stops outside work almost at once. A better plan is, I think, to greatly reduce the space for surplus; that is, after you take out the filled ones, close up the space with a division-board, and crowd the bees on to a few sections. In this way they will often fill them out when they would not otherwise. When they stop work entirely, then feed extracted white honey. I would endeavor to get the white honey all closed up before the dark comes in. You can easily do it by feeding back, and one or two colonies will easily fill and cap over a great many sections.

#### BEEES AND TEMPERANCE.

I have been instructed as well as amused by the reports of the brethren; but I have seen but little from our State, and this makes me feel like saying something on the subject of our honey resources. I have been keeping bees six years. Carelessness is the cause of most all our bee mortality. We winter on summer stands, with little or no protection. I have not lost more than three per cent per annum, on an average. A few years ago I was made sorry to read of so many bees dying in the North, after so

much expense. It made me better satisfied to live in the South. In 1882 I began the season with 45 colonies; increased to 85; taken 5000 lbs. honey. I sold nearly out at 1½ cts. retail, 10 wholesale, for extracted; 20 retail, 18 wholesale for pound sections. I did not fix up my bees last fall for winter, not even taking the sections, and top comes off of but few. I lost only two.

I am well pleased with GLEANINGS. Our Homes, I think, is doing much good. On temperance, in July number, it is hard to beat. I see in your State that temperance men are engaging in a hard struggle against free whisky and license. All temperance men should unite on prohibition. If we can not stay in our party and put down the great evils of alcohol, let us go out of all into a strong, united majority, and give it such a blow that it never can raise its head again. Brother Root, I will pay for and send some 60 or more copies of the *Kansas Prohibitionist* to you if you will promise to circulate them where you think they will do the most good in favor of prohibition. I will send the "big edition." It will be published July 18. I am concerned for the cause in Ohio. I do not know whom to send to; but you please let me know soon, if you can comply with my request. A. B. KIRK.

Columbus, Cherokee Co., Kan., July, 1883.

Thank you for your kind words, friend K.; but I would suggest that, instead of sending the 60 or 70 copies to me, you send them to the temperance friends who take GLEANINGS, and each one will send his name on a postal card, telling how many he can distribute. We get such quantities of printed matter here daily, that it is almost impossible to give it away, and great loads of it are sold for paper-rags, because we do not know anybody who will read it or make use of it. I sometimes think of it sadly. But in the rear and whirl of business here there are few of us who have time to read much but what we are obliged to.

#### PEACE IN AFFLICTION.

Died near Tullahoma, Tenn., July 10, 1883, Mary E. Good, daughter of I. R. and Anna Good, aged one year and twenty-one days. You see, Bro. R., while you have your baby with you to give you joy and comfort, we have laid ours away to sweetly sleep in Jesus until he shall come again, when little Mary shall be raised to life and immortality. There is a peace and joy in laying our children away that I had not known of before. We are comforted. Blessed is the name of the Lord. May the good Lord bless you and all yours is my prayer. I. R. GOOD.

We extend you our sympathies, friend G. I rejoice with you that you have found peace, and that balm for the afflicted that nothing but a hope in our Savior can give. Truly, "great peace have they that love thy law," even in an hour like this. May God comfort you, and may this trial be the means of drawing you nearer to him.

#### WHAT SHALL WE DO FOR DRONES?

The fine queen and half-pound of bees you sent me the 8th of June I stocked up good and strong with worker brood, and about ten days ago I put in a drone comb, but the queen failed to deposit eggs, and the bees filled it with honey. In a day or two I put in another, and she laid in part of it, but they are now capped over, and are worker bees. Hoping

they were drones, on the 18th inst. I took from the Italian hive 4 combs, full of brood in all stages, mostly capped, with a good supply of fresh eggs, and to-day I find 10 or 12 fine queen-cells, one or two capped; but there is not a sign of a drone in this apiary of now four hives. Two blacks (new swarms, one of them), had drone brood which I destroyed, and from those four I can build up about five fair hives with as many queens; now, all the chance I see is for you to send me a lot of good drones from your best bees as soon as possible, and send me your bill. The queen is a good breeder for workers, but lays no drone eggs so far.

J. B. RIDENOUR.

Woodhull, Ill., July 21, 1883.

Friend R., just go on raising your queens, and I think you will find they will all become fertilized in due time, although they may meet only black drones. I am sorry to say we have not Italian drones enough in our apiary so we could send you a lot; and, for that matter, we have no drones of any kind, except scattering ones, a few in a hive. Who can furnish friend R. a good strong nucleus of nice Italian drones?

#### COLOR OF IMPORTED QUEENS.

In JUVENILE for July it is stated that you have plenty of dark imported queens. If you still have them, send me one. I really care but little about the color, as some of the best imported queens I have ever had were nearly black.

West Lodi, O., July 21, 1883.

JAMES BOLIN.

I am very glad, friend B., to receive such a statement from a man of your experience and ability as a honey-producer. I have long been satisfied that color has nothing to do with the amount of honey produced; but for all that, our light-colored imported queens are being constantly picked out, even when we charge a dollar or two extra for them, and yet color is only an accidental property. I am sorry to say that we are just now out of imported queens of all colors; but a lot of 50 are expected soon from Italy.

#### WHY FRIEND ROSS KEPT A QUEEN SO MANY MONTHS, WAITING FOR HER TO LAY. [SEE P. 398, JULY NO.]

I saw in the *Kansas Bee-Keeper*, on page 25, Feb. number, a suggestion that queens that cease breeding early in the fall, and do not begin again until late in the spring, always do most and best work during the breeding season proper. Now, according to my experience I do not believe it, as I think I gave justice to her. I fed that swarm to make it strong, and gave it brood to keep her in bees. I lost one swarm of bees trying to see what I could do in experiments. However, I learned something by her. She was not worth the postage. I lost about two swarms, and you lost the queen.

Ibaton, Kan.

DAVID ROSS.

The idea you suggest may have some truth in it, friend R. I remember queens that were so late in starting to lay in spring, that I was about to destroy them; but that afterward built large colonies, and gathered a good crop of honey. It may be that a queen that has not been raising brood all winter will have greater endurance; but as attention has only recently been called to the matter, perhaps we had better wait for further facts in the case. You certainly showed

a praiseworthy zeal in the cause of science; but I am afraid your queen was rather poor material to work on.

#### CATCHING QUEENS TO SEND OFF BY MAIL.

Did you ever try caging a queen on the comb, without handling her? I have; and with one of your Peet cages it works like a charm. Place the cage, with slide partly withdrawn, quietly over the queen and a few workers, allowing any bees that chance to be under the edges, time to escape; then with the thumb push in the slide carefully, and there she is, attendant bees and all. If there are too many, a few can easily be allowed to escape by opening the slide a little. It can be done in half a minute, with one hand, and no danger of hurting the queen either.

BURDETTE HASSETT.

Howard Center, Ia., July 4, 1883.

We have tried the plan you mention, a little, friend H., but found it slower and more trouble; besides, it seemed to stir up the bees more than to quietly pick up the queen by the wings.

#### FLORIDA.

I shall have to give in my testimony about bee culture in Florida. We came here last Oct., and brought 20 nuclei swarms; landed them on the bank of the St. John's River. They did well all winter; gained up fast, so they came out strong in spring. They commenced swarming, and threw out a dozen good swarms.

#### MOSQUITO-HAWKS.

And then the dragons, or mosquito-hawks, took them. We fought hawks, and they ate the bees until they were reduced as low as when we landed. In spite of all we could do they destroyed all of our working force, and half a dozen young queens. They soared about 6 weeks, all through the saw-palmetto, so we got no profit from that; then they left; and since that the bees have built up quite strong, so that I am in hopes of getting some returns from the cabbage-palmetto. Now, I am not quite as enthusiastic as our friend of the Garden of Eden apiary, for I find many things to pester and torment me, as well as the bees.

J. A. GREEN.

Volusia, Vol. Co., Fla., July 10, 1883.

#### UNITING BEES.

Is there any drug which can be used in uniting small colonies? Will you also inform me how much honey it would take to winter a colony of bees hung up in the air, without any bottom-board?

Wooler, Ont., Can.

W. SCOTT.

Chloroform and puff-balls have been used for uniting bees, friend S., but I think they are pretty much discarded now. Watch them carefully, follow the directions laid down, and they will *seldom* need any thing. If they begin to quarrel, a little smoke will make them unite, if they are watched and smoked occasionally when they need it.—I have never tried wintering a colony prepared in the manner you state. If all upward ventilation were closed, I shouldn't wonder if they would winter almost as well without a bottom-board; and many times I think it might be the saving of them.—As for the amount of stores for a good strong colony, I would suggest 25 lbs., although I do not think I ever knew a colony to consume that amount.

## HOW FAR WILL BEES WORK TO ADVANTAGE?

I see considerable is said in GLEANINGS about the distance that bees will work profitably, some claiming that they will work several miles, and store considerable honey. My experience leads me to think that about two miles is as far as they work to make much gain in stores. My apiary has no berries of any account within  $1\frac{1}{2}$  miles in any direction; within  $2\frac{1}{2}$  miles they are quite plentiful on two sides (opposite); not enough bees to interfere any with berry-blossoms until I get  $3\frac{1}{2}$  miles away. When fruit-blossoms fail I always have to feed to keep up brood-rearing until clover opens; stocks from 2 to  $3\frac{1}{2}$  miles either side of me commence swarming and storing in boxes from berry-blossoms, while I am feeding mine to keep up brood-rearing, and are from a week to ten days ahead. In the fall I have buckwheat nearly equally on all sides for  $1\frac{1}{2}$  miles; from 3 to  $3\frac{1}{2}$  miles away are about 100 stocks with buckwheat on one side of them only. My bees average much better on buckwheat than they do, and work in that direction nearly if not quite as much as any other. Now, if bees fly so far as claimed, why so much difference in our bees working at the different seasons?

## CASE OF ABSCONDING WITHOUT ALIGHTING.

June 28th a swarm came out, and part of another swarm united with it; hived in a new hive on three frames of brood, three frames of fdn., and put on boxes, July 3d. This stock swarmed, rushed out of the hive, and, without clustering, went to the woods. I chased them a third of a mile; when coming to the woods they mounted so high over the trees that I could not see them, and gave them up; came home and looked in the hive; had cells; don't think they were capped yet; there was rather more bees than are usually left.

Oh! I nearly forgot. In front of the swarm, about as high as my head, were a lot of bees revolving around, and making a shrill noise something like a swarm when they are settling. This could be heard plainly above the noise made by the other bees; but I think the other bees were quieter than usual.

I think GLEANINGS (the old ma) is all right, but—hold on until the JUVENILE is grown up, eh?

Baptistown, N. J.

JOHN B. CASE.

Friend Case, your experience in regard to the distance that bees will fly just about agrees with my own. Although I have had bees work on basswood and buckwheat as much as  $2\frac{1}{2}$  or 3 miles, yet it seemed to me it was pretty tough work for the little fellows.—Thank you for your fact furnished in regard to the little band of buzzing bees in advance of the regular swarm. It corroborates what friend Peters has told us in the A B C book.

## NEW HONEY, ETC.

Bees are just booming the honey right in. I put in two swarms that came out and went together about the middle of June into one hive, and the fifth of July I took out 45 lbs. of honey, and left in the hive one frame of 8 boxes, which I judged had 7 lbs. of honey in it. From another two-story chaff hive that has not swarmed this season, I took out about 90 lbs. of honey; took it out yesterday. I began the season with 21 swarms; have now 36; have had 6 swarms that doubled up when swarming. There has been great mortality among queens. I have lost some 9 or 10 since spring; have drawn on

my 3-dollar queen I had from you, for brood for them to raise queens from; and, by the way, the bees from that queen are the most quiet ones to handle I ever saw; no need of a smoker to handle them, though I can't get them to work in boxes worth a cent. My brown bees and hybrids are the best honey-gatherers; the blacks and brown bees cap over their honey so that it looks a great deal whiter than the Italians, Cyprians, or hybrids. But the hybrids and Cyps are tyrants to handle, but perhaps not more so than the black bees. But with smoke I can bring them to know their duty. I don't know but I shall have to give up keeping bees, soon, for I am now in a few days 77 years old, and the work is too much for me; and, by the way, we are to form a county bee association in Piscataquis County the second day of next August. LUCIAN FRENCH.

Dexter, Penobscot Co., Me.

## QUEENS WRONG END UP.

Is it common to find young queens wrong end to in a cell? I have found two that way this year. I never saw it before. Perhaps that accounts for bad cells sometimes.

I had my first swarm get right up and "skip" for parts unknown this year.

## SPEED OF RAILWAY TRAINS.

If you were here you could see a train run a mile a minute. I timed them the other night myself, and they made a mile in a minute good. The way of it is, there is a heavy down grade west of here, with a straight track, and the train is one of the fastest express trains on the M. C. R. R. W. H. SHIRLEY.

Glenwood, Mich., July 16, 1883.

Friend Shirley, we have had several reports recently of queens being found in the cell as you state; but I am inclined to think the explanation is usually about this: The queen hatches out in the usual way; but being frightened by the piping of other queens, or perhaps by the behavior of the bees, she crawls back into her cell again as a place of concealment. In that case you would find her in the cell, with the end of the cell open; but as the cap to the cell is often left hanging, it may be that the bees shut it to and wax it up again. I suggest the possibility of this, because I have several times found cell-caps closed back, and waxed fast, after the queen had hatched out in the regular way. I suppose that some of the young bees do it just for fun, or for mischief. Was the queen you speak of a fully formed, live queen?—I give up on the speed of railway trains.

## AN APOLOGY.

I have read Bro. Heddon's remarks on my criticism of his ideas on overstocking, and I have also re-read my own criticism, and I feel that an apology is really due Bro. H. I would not for the world have intimated aught against his probity, honesty, or integrity, for I deem him truly a square man in every sense of the word. I find, however, on reading over my article, that it can be construed in a far different light from what I intended. Bro. H. has (right or wrong) been for too long a time asserting these peculiar views on overstocking, to be accused now of being wholly selfish and self-interested only in the matter. For myself, I hold still to the opinion that there is not that danger of overstocking the country that Bro. H. fears; but my reply to him was couched in language far stronger than the oc-

easion required, and conveyed a meaning which is far from being correct. I desire to beg his pardon for the language I used in my reply; and while I might have done so in a private letter, I prefer to do it in as public a manner as my reply was made. I intended simply to indulge in a little pleasantry at the expense of Bro. H., and joke him a little on his position, and wrote as I did without stopping to think just how it would read when written. I think too much of Bro. H. as a bee-keeper and a man, and have too strong a desire to retain his good opinion, to be guilty of personally assailing him, and I trust he will accept this apology in the same spirit in which it is made, and believe me when I say I did not intend to misrepresent him, or injure his feelings.

J. E. POND, JR.

Foxboro, Mass., July 7, 1883.

#### MRS. COTTON'S HIVE, ETC.

On page 424, JUVENILE for July, I notice part of my letter with your remarks. I hope you will correct the same in your next issue. By referring to my letter you will find that I stopped extracting on account of the loose large wheel accidentally falling on the floor and breaking in two, and not for want of a honey-knife. For this reason I wrote to you and asked your kindness in sending me another to replace the broken one, and, to my astonishment, here it came in less than one week, thereby enabling me to extract what I had to leave on account of the accident. Many thanks, friend Root, for promptness and kind-heartedness in sending it gratuitously, and paying postage out of your pocket besides. But this is just one out of the many thousand instances where you have done likewise, as shown in your much-valued journals.

This is the best honey season here for a period of ten years. I have 23 colonies, nearly all in your chaff hives, and a few which are in Lizzie Cotton's. I will sell those in Cotton hives in fall or spring, as I will not have them any longer in my yard. It is a clumsy and unhandy hive; and colonies in such fall short of Simplicity and chaff in storing honey, about 30 lbs. per hive in one season. I would by no means make or buy another such hive in future.

I shall get about 1000 lbs. of honey this season. Fred Alderfer, near here, has already that amount, and expects a good deal more from 30 colonies. He makes fdn., extractors, sections — in fact, all kinds of bee material.

A young swarm of my neighbor's increased itself to 4, but no surplus so far. Last year I got only about 6 lbs. comb. I had no extractor then. Had I had one, I might probably get extracted honey, say 25 or 30 lbs. I keep all queens clipped. About 3 days after the swarm has left the hive, I examine closely and cut out all cells save the largest. This puts a certain stop to second swarming. After the young queen is found laying, I clip, and thus have no trouble whatever in swarming. It's a certain cure for deserting, as well as for absconding in the spring of the year. Another advantage is, when 2 or more swarms issue at the same time, to prevent their clustering together. If the queens can not accompany the swarms, why, they will return to their old separate homes, where each will find their queen and an empty hive. I clip only one wing.

Hatfield, Pa., July 19, 1883. E. K. BLANCK, M. D.

Thank you, friend B., for your kind words. I certainly supposed that it was as you stated, that you stopped for want of a honey-

knife. Well, either you or I made a mistake; but we have too much business even yet to stop to see who was at fault; neither do I remember sending you a wheel without charge. But when I heard of your mishap I presume I felt an anxiety to help you, just as I like to be helped when I am crowded. I am glad of your report of Mrs. Cotton's hive, because it has been suggested, as an excuse for the great prices she charges for them, that they give greater yields of honey than other kinds of hives.

## Ladies' Department.

I WOULD say to "Maggie" (p. 396), I can not but think the greatest reason of bees leaving the hive is living them too near to where they clustered. I have kept from 30 to 70 swarms for the last eight years, and in that time have had but one swarm leave. My hives stand in a pear and peach orchard between two apple orchards; as they seem to prefer an apple-tree they usually cluster from two to six rods from the hives. I have my hives ready beforehand; and just where I want them to stand, I hive just as quietly and just as soon as possible. The swarm I spoke of leaving came out on a very windy day and clustered at the foot of a peach-tree. Situated as they were, I concluded the most convenient way for me would be to set the hive down by them; as I was very busy I took the old-time way, and let them stay there till night. The next morning they left for the woods, without clustering.

ALICE.

North Wolcott, N. Y., July 11, 1883.

I feel as if I must speak once, and let you know my luck with my bees. Well, one died last winter; the other, a nice swarm, came out two weeks ago. They alighted about 20 feet high on a cherry-tree. I had no one to climb that height, and they hung an hour. I thought when they left I could alight them again, or could find some one that could climb; but they left. Now, I have given up having any more. I will agree with Mrs. Harrison, that it is not too hard work for women, if the bees will only be accommodating enough to alight on my little trees, so I could hive them, as I do not feel afraid of them. Last year, with a boy's help, I hived a swarm. No sooner done, than a neighbor had a swarm, and they called on me, and I went there. A peddler came along, and I asked him to saw the limb off.

From your friend and well-wisher,  
Westport, Conn., June 25, 1883.

May I be permitted to make a brief statement with reference to a paragraph in Mr. Hutchinson's article in July GLEANINGS? With full appreciation of the kindness of Mr. Hutchinson's intentions, I am pained that he should have thought it necessary to make in our behalf a public defense against what was only an implied — or perhaps, rather, a hypothetical — charge. The defense being made, I am compelled to say, in behalf of the truth, that Mr. Hutchinson very much misunderstood me; that I did not make the remark he attributes to me, nor did I say any thing intended to convey to him the idea that we paid our girl "five dollars a week."

I may have said that we would gladly have paid that amount for competent help, and I, probably, did

say that I did not see how five dollars a week could transform poor help into good. Mr. Hutchinson, not having very clearly in mind the "advice" to which I was alluding, did not perceive the force of my reference to "five dollars a week." He must have understood me to imply that we paid that amount; and the mistaken notion, afterward, assumed in his memory the form in which it appears in GLEANINGS.

CYULA LINSWIK.

## Reports Encouraging.

### THE DAILY YIELD.

THE following is a specimen of the yield of honey this summer: July 3d, 6 lbs. 11 oz.; 4th, 10 lbs. 7 oz.; 5th, 15 lbs. 7 oz.; 6th, 9 lbs. 7 oz. The above was brought in by an ordinary colony of bees in a two-story Simplicity hive.

Moore's Hill, Ind., July 8, 1883. F. W. STEVENS.

Bees are booming; 150 lbs. of white clover per colony so far, and at least some more to follow.

Morgan, Ky., July 4, 1883. GEO. E. BOGGS.

We have 21 colonies, and all "busy as a bee." It is delightful to see them at work, and to hear their music.

MRS. CARRIE L. STALLARD.

Russellville, Ind.

Bees are climbing right over me on white clover, and for the first time in my life I've been obliged to tier up to give them room.

WALTER B. HOUSE.

Saugatuck, Mich., June 23, 1883.

Honey is coming in as I never saw it so early in the season. I extracted 76 lbs. from one hive, and did not take any from the lower story.

Bellows Falls, Vt., June 18, 1883. GUY CLARK.

The queen of the 26th ult. is fine. We named her "Sue." The bees are rolling in basswood honey. Although we live in "Linden Vale," this is the only year out of 6, that we have got any basswood honey. Let "3-513" rest as quietly as you can for a little while, till we can "let up" to sell something. "Save every drop of honey" was your "orders" for July. It takes work, "and don't you forget it."

Smithfield, O., July 15, 1883. D. H. TWEEDY.

The bees are doing nicely in this whole section of country. I have taken off a good deal of nice comb honey in section boxes. The combs are about as white as paper. The honey is as nice clover honey as I ever saw. I have had one swarm come off, and I thought that I had them all fixed so I would not have a swarm this year; "the best-laid plans of men and mice aft gang a'glee."

D. C. McLEOD.

Pana, Ill., July 4, 1883.

Bees have done well this season — far better than I anticipated, and have fully made up for last year's losses. My best colony gave me over 200 lbs. extracted, and a swarm. I shall get from 7 colonies in the spring, after selling two, about half a ton of honey, and increase to 15 colonies, which I think is doing well. I think well of the zinc queen-excluder when working for extracted honey, but not for comb; but in future I shall run for extracted wholly. My extractor works first rate; and if I had but two colonies I should want one, and it would pay well too.

J. E. POND, JR.

Foxboro, Mass., July 14, 1883.

I have got work enough for two men, and only one to do it. We have not got a saloon or grog-shop in our village, but have 3 churches, 7 stores, grist-mill and sawmill, tavern, 2 planers, 2 cooper-shops, 2 blacksmith shops, one agricultural-implement shop, etc.

JOHN CROWFOOT.

Bloomington, Mich., July 11.

Perhaps this is not the right place for your report, friend C.; but we should like to publish a similar one from every town and city in the United States.

### A GOOD REPORT FROM COMMON BEES.

In the fall of 1881 I bought 39 swarms in box hives, and took on shares 70, all blacks, in all kinds of common boxes. In the winter, 20 swarms died from being queenless. In the spring of 1882 I transferred to frame hives, 80; in the fall of 1882 I increased to 170; honey extracted, 8000 lbs.; sold at 8½ cts. per lb.; wax, 200 lbs., sold at 20 cts. per lb. I wish I had got one of your mills. I worked up my wax, as I have not used any foundation.

I must have some of your Italian bees when I get out of this partnership business.

JAS. BEATON.

Lompoc, Cal., May 8, 1883.

### A "REPORT ENCOURAGING" IN EVERY SENSE OF THE WORD.

As I am a beginner in the bee business, I suppose you would like to hear how I am getting along. I commenced this spring with 21 colonies. I have increased to 46, and took 42 gallons of extracted honey, and 430 lbs. of comb in 1-lb. boxes. This is just the amount of honey I have taken. I took out the boxes that were full. I have several hundred that are partly filled. The prospect is, that we will reach 2000 lbs. before the season is out.

Now, friend Root, I should like to hear your opinion about how that does for a beginner. I am well aware that I have not made as big a crop as some with that amount of bees, nor did I expect to learn all about how to manage bees the first year; but one thing I have learned, and that is, I knew scarcely any thing when I commenced last spring, about how to manage the bees, and of course I see where I have missed it in a good many points.

The fdn. mill and extractor give good satisfaction; in fact, all the goods I ordered from you came in good shape, and I am well pleased with them all. People in this part of the country are getting very much excited over the success I have had with bees. They think that a barrel of honey is an awful thing; they never heard of the like before.

### TOBACCO.

The prospect is now, that if I have good luck wintering, you will get to ship a good many goods to this county next spring. Now a little about my health, and tobacco. I wrote to you some time ago, telling you that I, too, had thrown the old pipe aside, and that I, with a good many others of the readers of GLEANINGS, never expect to have the filthy stuff in my mouth again. My health has been better since I laid the old pipe away than it has been for a good many years. I have had very poor health, as a general thing, ever since the war, but I feel very much encouraged since I quit using tobacco and got to working among the bees. My health is so much better, and I have gained so much in flesh this summer, that the boys say if I work another summer at the bee business I will have to run for "Squire," but I guess it will take a little better scholar to fill that

office than I am, or at least I guess you will think so when you read this letter. Please excuse my poor writing; and if you can find any thing in this worth putting in GLEANINGS, please do so. If you have a mind to send me a Clark smoker, I shall feel very thankful; but by the assistance of the good Being, I never expect to use the filthy weed again.

Grayesville, O., July 22, 1883. D. P. HUBBARD.

Friend H., your report is certainly a "report encouraging," and one of the kind I am glad to hear, especially where you touch on your experience in the breaking-away from tobacco.—In regard to your yield of honey of 100 lbs. to the colony, spring count, it ought to satisfy almost any of the veterans. I declare, it astonishes me again and again when I see how novices take hold, and, under the influence of an enthusiasm like yours, make a big success of it the very first season. It seems to me to indicate that a new order of things is coming about, and that, instead of taking seven years to learn a trade, our people now become pretty fair workmen, not in three years, nor in two years, but sometimes in even less than one year, where they go into it with a whole-souled enthusiasm such as is needed in any thing in this world. And, by the way, I can not help thinking that a man is smarter and brighter, and in every way better, after having broken in pieces the chains of a bad habit, put them decidedly under foot, and standing before God a free man. "Ye shall know the truth, and the truth shall make you free."

## Blasted Hopes.

Or Letters from Those Who Have Made Bee Culture a Failure.

**W**E all have blasted hopes! Bees are doing no good—not a pound of honey have I taken. What will you sell me a barrel of extracted honey for? I am entirely out. I got my barrels and extractor ready, but have cleaned up, and set them away, with no prospects of using them this season. Oakland, Texas, July 7, 1883. JOHN H. MULLIN.

Friend M., I have been looking for something for this department for a long while. I think you must be just the man, unless a great flood of honey has come upon you suddenly, since you wrote the above, so as to spoil your eligibility to this department.

## "Forgettery,"

Or Department for those who don't Sign Their Names, etc.

**Y**OUR letter is at hand, telling me to look over my goods once more for the rabbets, which I thought were omitted. But I am almost ashamed of myself to say that I have found them. I was just laying around those roofing tins, between which they were packed nicely. I had taken them out on a lump, and had laid them away. Excuse me for making such a mistake.

Kutztown, Pa.

WM. K. DEISHER.

## Notes and Queries.

**P**LEASE excuse my troubling you; but as you have published my communication about "Moving to Florida," page 393, July, I would like to call attention to two mistakes. I don't know if my bad writing caused them or not; but they change the meaning a little. The reading should be as follows: \* \* \* "If a man is willing to work, let him come if he is not already comfortably fixed where he now is; but" \* \* \* \* And again, \* \* \* "As for health, I think Florida will rank," \* \* \* D. L. ALEXANDER. Altoona, Orange Co., Fla., July 12, 1883.

I bought 6 swarms one year ago. I now have 50. But they haven't made much honey yet this season. Amboy, Ill., July 16, 1883. GEO. PEOPLES.

### BEES ON LILAC.

A. J. Cook spoke about bees working on lilac. I have one colony of hybrids, and they worked on it as long as it lasted. L. H. BARTRAM.

New Lenox, Mass., July 18, 1883.

### WHITE POLLEN.

Answer to question in last JUVENILE, "Where do bees get white pollen?" Ours are getting a nearly snow-white pollen from plantain, at present. Bees are booming with us this season. J. F. SCHAFER. Ada, Hardin Co., O., July 21, 1883.

### SUNDAY SWARMING.

If your bees happen to swarm on Sunday, do you hive them, or let them hang till Monday? Watson, Ill. JOHN CLINE. [Hive them, by all means, friend C. Doesn't the Bible plainly direct you to do so?]

### HONEY VINEGAR.

Mrs. Harrison is just right. It may do for week days and children, but will not answer for Sundays. We have used it for more than 20 years. I have seen many swarms depart without alighting. La Porte City, Ia. JESSE OREN.

Please say to Old Foggy, that I had a first swarm leave a box hive, and go off without clustering—May 18, 1882. I can vouch for its being a natural swarm, the bees having been at work in boxes for 10 days before the swarm issued. R. R. CUYLER. Rapidan Station, Va.

### DO BEES EVER SWARM WHEN IT IS CLOUDY?

I hear some say they do not, and I want to be certain whether they do or not.

Seneca, Kan., July, 1883. MALINDA A. WILKINS. [I believe bees usually prefer to swarm during warm sunny weather; but when they get a going in real earnest they pay very little attention to whether it is cloudy or not. Sometimes they swarm even during a light rain. See reports elsewhere.]

### BEES IN THE WOODS.

There are lots of bees in the woods here; and if I had the opera-glass I could do much better. I went to the woods to-day and found a fine swarm just leaving a tree I had found, and I let them settle on a tall tree; so I got my hive, saw, etc., went up the tree, sawed the limb off, brought it down, and put them in my hive, so to-night I have a fine swarm. How is that for a new hand? R. M. BOYD. O'Fallon, Mo.

## HORSEMINT, AFTER ALL.

We are just through a rather protracted drought; but now the rain has come, and the Texas horse-mint is booming, and the bees are happy, and so are we. But last night some vagrant thief stole a hive of bees, and strewed the honey along on the prairie. That's what I call low-down stealing.

Mexia, Tex., June 12, 1883. E. K. SWINBURN.

## A LESSON TO BE LEARNED.

Clover is slacking up a little, and basswood is just opening; but as trees are so very scarce here, no crop of basswood honey will be gathered. I still learn the old lesson over; that is, to be always ready. By being behind I have lost part of the clover crop, but got back some in increase of colonies by natural swarming.

T. J. COOK.

Newpoint, Ind., June 25, 1883.

## A SUCCESSFUL HOUSE APIARY.

Some time when I have more leisure I will send you a drawing and description of my new house apiary, and how I succeed with it. It is 42 ft. long, and I have 35 swarms in it at present; have room for 5 more. Bees have been doing well so far; and if we should have as favorable a fall for honey as it was last year, you will receive some large reports to record.

F. E. PRICE.

Nokomis, Ill.

## IMPORTING QUEENS.

A party of us, subscribers of yours, want information concerning Chas. Bianconcini, of Bologna, Italy. 1. Is he a square man? [Yes, sir.] 2. Does he deliver queens free of postage or expressage? [No, sir.] 3. What number of queens are liable to die in transit? [Perhaps a half, on an average.] 4. How long, probably, will it take to get them, after sending? [60 days.] 5. In case expressage is charged, what will it be on 8 queens? [From \$10 to \$15, and sometimes \$20.00.]

EDWARD BURR.

Rockport, Ind., June 8, 1883.

## The "Smilery."

I AM all smiles, gathering in so much honey, and my wife even "grins" too when she sees the sweet stuff dripping from porch to porch, as I have no honey-house; but I will by this time next year, I daily promise her. I think I learn enough from GLEANINGS to pay its way; and your goods, so far as I have used, are a success. For several years my wife has said she would rather have honey-bees than Italian bees; but now she rejoices that she has them "combined." I will write you more about my bees soon, if I am not drowned in this flood of honey.

D. F. WEST.

Hiseville, Barren Co., Ky., July, 1883.

I am glad to hear of the great flood of honey, friend W.; but may I not say just a word about the dripping on the porch, which you suggest? Although you do not say so, one might rather infer that you expect to have the dripping on the floor of the honey-house when you get one. Now, if I were you I would not have any dripping anywhere. It is true, it can be washed up; but as the honey soaks into the wood, it is a pretty hard matter to prevent it from leaving a peculiar stickiness; and by and by a peculiar rank smell is perceived — especial-

ly when the house has been closed up some little time. I know it takes time, to avoid getting honey on the floor; but I know many bee-men think it is cheaper to let it drip, and when they get around to it have a "good old scrubbing-up." There *may be* economy in such a course; but I do not quite agree to it. I have had a good deal of experience in caring for rooms, and the manufacture of many kinds of goods, as you may know; but the older I grow, the more I am impressed with the idea that true economy lies in the line of keeping things clean and in order as you go along. May be this little lecture is somewhat out of place right here; but you suggested the idea, and so I "got to going," you see. Now, then, boys and girls, when you get your new honey-houses made and ready for use, beware of how you let stickiness and sticky habits get in upon you.

## Bee Entomology,

## Or Enemies of Bees Among Insect Tribes.

## "QUEENS THAT ARE NOT QUEENS."

IN regard to this subject, mentioned on page 395 of our last number, Prof. Cook writes as follows:

They are all real genuine queens. They have no pollen-baskets, have a short tongue, toothed jaws, and curved sting. They are so dried up that I can not study the ovaries and spermathecas so as to determine satisfactorily whether they are virgins, or impregnated. They look small, and so appear like unmated queens. But queens long idle, like those just imported, are often small — as small as these. I received an imported queen a few days since, for my brother, so small that she might easily be mistaken by the inexperienced for a worker. These are certainly real queens, either virgins, or queens some time inactive, I should think.

A. J. COOK.

Lansing, Mich., June 23, 1883.

Friend Cook, I am glad you have touched on that point, that queens lying idle have much the appearance of unfertilized queens; and I hope the friends who have been so uncharitable and so unkind as to say that the queens they had received had so much the appearance of virgin queens that they did not believe they had ever laid an egg at all, will ponder well on the matter. Such words can not very well avoid wounding keenly any conscientious bee-keeper who may send out queens. Remember, friends, that writing back to a man who sells you a queen, that you do not believe she ever laid an egg at all, is equivalent to telling him that you believe he is dishonest. So much does a queen lying idle become like an unfertile queen, that I have hazarded the conjecture, that such queens sometimes fly out, and are fertilized again. I am led to this belief by having pretty positive proof that young laying queens sent from Italy have several times flown out and met the drones on their arrival here; and I am about as sure that friend Bianconcini sent me none but laying queens as if I had caged them and sent them all myself.

## Our Homes.

Blessed are they which do hunger and thirst after righteousness: for they shall be filled.—*MATT. 5: 6.*

A FEW days ago I was passing along the street, on my way to our young people's prayer-meeting. Many trials had come during the day, and I had not met them all as I felt that a follower of Christ should have done. Some things had been neglected and some forgotten that it seemed to me I had no business to forget or neglect. All together, I had a rather sad sort of feeling that I was not doing very much for the Master in any way. As I reviewed events, and my busy, tangled-up life, as it seemed to be, I was wondering if there were any good thing about me at all. I began searching, in my thoughts, of course, for some comforting Scripture texts — some places of solid rock on which I could fix my feet. Do you remember in the Pilgrim's Progress where Evangelist told Christian there are steps made through the Slough of Despond? And we are told afterward that these steps are God's promises. Christian and his companion Pliable blundered into this slough, and got daubed with mud, because they did not look for the steps; and these steps are Scripture texts — not only for our comfort, but for our safety in treading the straight and narrow path.

Well, that evening I was somewhat in the Slough of Despond, and I felt instinctively that the trouble was, I had neglected the steps. I tried several, but they did not seem to give much comfort or satisfaction until I struck on the one at the head of our talk to-day — "Blessed are they which do hunger and thirst after righteousness: for they shall be filled." That answered it surely. I do hunger and thirst after righteousness, God knows; and that, too, every hour of my life. Whatever sins may lie at my feet, I do not know that I can remember a time when I did not love righteousness; when the sight of it did not give me real, true, honest pleasure — the most abiding pleasure, in fact, that this world gives. Hungering and thirsting after righteousness! who but our Savior could have thought to put so much in a few words? There are many things we want in this world; but who is there who wants it in such real truth as one who hungers and thirsts? Sometimes people do not seem to see the sad need of righteousness in their own hearts, but they almost always see the need of it in others. Even when humanity is at its lowest ebb, it looks out upon the world lamenting the sad need of righteousness.

What is righteousness, friends? Is it God's law? Do you remember what David says in that first Psalm about those whose delight is in the "law of the Lord," and those who meditate on it both day and night? And then, again, away over in that long Psalm, do you remember that little verse, "Great peace have they which love thy law"? Well, friends, I want to tell you a little incident to illustrate some of my trials while hungering and thirsting after right-

eousness, and to illustrate, also, a fulfillment of the little text before us to-day.

Perhaps a half a year ago a man came to me, asking for employment. I told him I had nothing on hand then, but would consider the matter, and see what I could do for him, or something to that effect. Not long afterward I saw him with a great long pipe in his mouth; and feeling that, if I should employ him, it would only bring up a discussion on that old tobacco question, I mentally concluded it would be best, perhaps, not to engage him. I tell you, friends, I do have trials and discouragements in giving places to those who are strongly addicted to tobacco. Of course, they promise to give it up; but the temptation too often overpowers their sense of honor, and then I am accused of using my facilities for giving employment to so many, just to make hypocrites of them, or to induce them to tell falsehoods. Finally this same friend came to me and demanded why I had engaged others, and had found no work for him. I told him it was his pipe and tobacco that discouraged me; and I told him, too, that I feared he would not like to give it up just for the sake of having work; therefore I had not given him employment. His reply was, that he expected to conform to the rules of our establishment, and not use any tobacco around the factory, or during working hours. Of course, I explained to him that this was not the rule of our establishment, and that I did not hire people with that understanding. He argued, as so many others do, that he expected to do as well as the rest did, and that part of my boys used tobacco habitually when off from my premises. A discussion followed in regard to my right to dictate to my hands what they should do outside of working hours. I asked him if he would not concede to me the privilege of employing whom I chose. While he assented to this, he criticised my way of doing things pretty severely, perhaps, and I so far forgot one other of my favorite stepping-stones as to talk back a little harshly. Do you want to know what this other stepping-stone is, dear reader? It is, "Not by might nor by power, but by my Spirit."

After he went away, conscience began telling me that the conversation had closed with something else uppermost than "my Spirit" — than the Spirit of my Lord and Master. I felt uneasy, and went back to where I left him, but he was gone. I made inquiry for him; and a good brother, overhearing me, told him next day that I wanted to see him. I did not quite mean to have him do this; but next day he came down, quite a little piece from here, and said he was told I wanted to see him. What should I say now? I told him I felt sorry that the spirit I had shown toward him had not been a better one; and we pleasantly began again the discussion of tobacco. He said that he had used it all his life, and it would be a hard matter indeed for him to give it up entirely. During the conversation I asked him, while thinking of this struggle with a strong appetite, if he had ever been a professor of religion. He replied very quietly, and I thought, rather sadly,

that he was once a member of a Christian Church.

"And why, Mr. S.," said I, "are you not still a professing Christian?"

It was some little time before he replied. Then he said something about having lost all his property, and he got into a complaining spirit, and with his property went his religion. After that he went home, and I saw no more of him for several days. When he came to me again he consented to give up tobacco entirely, and said, in fact, that he had not used any for several days; and, of course, he went to work. I hope this friend will pardon me for saying here that others besides myself had been somewhat prejudiced against him. I gave him work in the saw-room, but it was not very long before Mr. Gray informed me that the foreman of the saw-room declared that, if this man was going to work there, he was *not*. I felt badly to hear this, on two accounts: First, I did not know what to do with our new friend, because I new it must hurt his feelings if I told what had happened. I also felt sad to know that the foreman of the saw-room should speak in that way; for he has a remarkably mild and gentle way, and I had never known him to make such a speech before in all my acquaintance with him. I turned away slowly and sadly. All I could do was to breathe the oft-repeated words, "God help me to do what is wisest and best for all parties." And then, as has happened so many times before, a place was opened for him in another room, where he is still at work. I met the foreman of the saw-room several times during the day, but I made no allusion to the incident of the morning, for the very good reason that I had not settled in my own mind what I had best do. Perhaps the very best thing in the world to do was to say nothing; for it transpired not very long afterward, that he came to me with his usual frank, pleasant look, and told me that he wanted to apologize for what he had said, and to assure me that he would do all in his power to help any one in the work, whom I might think proper to send into his department. He also added that he did not mean to forget himself so far as to speak as he did that morning. Do you see how it works, friends? "Not by might nor by power, but by my Spirit." To my great comfort and joy, pretty soon it began to be talked about, that, instead of friend S. being hard to get along with, he was remarkably pleasant to all, and unusually handy in any work he picked up, even though the work seemed new to him. When we had texts at the noon service, my heart was rejoiced to hear his voice among the rest, and to feel that his texts were generally well and wisely chosen.

Last Thursday evening I started for prayer-meeting again. Many cares pressed, and I was a little late; and to tell the truth, friends, so many things were on hand that needed attention, I felt a little as though I would rather not go. May God forgive me for giving way to such a feeling. When on the way to church, a good sister met me and pleasantly inquired if I was going to prayer-meeting. I told her I was, and was going to

ask her if she hadn't better turn around and go with us.

"Mr. Root, I have been reckoning on this prayer-meeting all the week, and I have been thinking much of going; and, in fact, I had got almost to the church when I felt that my health demanded that I should turn and go back home. It was a cross to bear, but I guess it is best. I will pray for you; in fact, I have been praying, and I think you will have a blessing to-night. Yes, I am sure you will."

I was a little surprised to see her so positive; and even with all my faith, if you will excuse the expression, I began wondering if it was not a little bit of a notion she had got. Satan had not quite let go of me, you see, and uncharitableness was lurking in my heart.

I think I shall make a little further confession here to-day. May be it will keep me from such sins if I do. Have you not noticed, dear friends, the tendency in me to think folks need not be sick quite as much as they are? My health is remarkably good, and I presume my powers of endurance are more than usual; and yet, instead of being thankful for this, and having a loving sympathy and charity for all those in ill health, I let this ungenerous, unchristianlike feeling come in. And I was wondering whether it were not a little bit of a notion she had that she could not go into the meeting and sit down, when she was almost there. If her eyes ever meet these words, I want to ask her to forgive me; and I hope God will forgive me too. The meeting passed off as our meetings usually do. When I got warmed up by the hymns and texts and experiences of others, I felt ashamed of my ungenerous thoughts, and began wondering if that blessing she spoke of were really to be ours. The meeting was so nearly out I had decided she was mistaken, when I noticed friend S., who was present at the meeting, look as though he was considerably agitated. To my great surprise and joy he rose up. I can not remember his words, but they were something to this effect:

"Friends," said he, "a few days ago a man asked me if I had ever been a professor of religion. I have been several years a resident of your State of Ohio; but I can not remember that any one has ever before spoken to me on the subject of religion. I was obliged to confess that I had once been a professor. The next question was a much harder one to answer: 'And why, then, friend S., are you not one now?' I finally attempted an excuse; but the utter flimsiness of that excuse troubled me still more. After thinking the matter over, I went home and took up my Bible. The first thing I opened to was another reproof; and, friends, I had no peace till I resolved to come back to my Savior."

I am quite sure that I have not used his exact words in the above, but it gives the leading thought, any way. He quoted a good text which he found on opening his Bible, but I can not recall it now. A breathless stillness pervaded the room while he spoke, and as he sat down, nearly overcome with emotion, I am sure an inward prayer

went up from many and many a heart for God's blessing for him who had spoken. A blessing had indeed come to our meeting, and a general hand-shaking took place after the meeting had closed. Our sister's prayers were answered. "Blessed are they which do hunger and thirst after righteousness: for they shall be filled." We had been hungering and thirsting, and the promise had come.

Now, friends, do not make a mistake here. Of course, I can not say positively that this man will renounce his unbelief, and be a consistent Christian from now on; but I think he will. If he holds on to that strong Arm, there will be no trouble, for one of our best stepping-stones is God's promise — "Him that cometh unto me, I will in no wise cast out."

I wish to call attention to two points brought out in this experience: First, the backwardness of professing Christians to talk with others on the subject of religion. Our friend said that, during the four or five years he had been a resident of the State of Ohio, he could not remember that any one before had talked with him in regard to the salvation of his soul; in all this time, no one had asked him the simple little question, "Are you a Christian?" Perhaps I should not have done so, if the thought had not come into my mind that, if he only had faith to ask God's help, the matter of breaking off from tobacco would be easy. I asked him, a little time ago, how he got along with tobacco. He looked up with a bright, honest look, and, dear friends, it was a pleasant, happy smile, too, as he replied, "Why, I do not have any trouble with it at all." One other morning he quietly remarked as he passed me, "Mr. Root, I dreamed of smoking my pipe last night."

"Did you? well, how did it seem?"

"Why, I dreamed it made me sick," said he, with a good-natured laugh. There you have it friends; when God's love fills the heart, these old appetites are crowded out, and are easily conquered. "And the truth shall make you free."

Now my other point: He laid considerable emphasis on the point of his feeling rebuked at the utter flimsiness of any excuse he *could* offer in answering the question, "Then why are you not a Christian now?" Is there any one whose eyes are resting on these pages who has been a professor of religion, and who knows the comforts of a faith in Christ? If so, I ask you, dear friend, to answer in your own heart, why are you not a professor of religion still? Can any excuse be offered that is not a flimsy one? Is there any reason to be found in the whole universe for ceasing to stand up for Christ and righteousness after you have once thus stood up? Who hungered and thirsted after righteousness, more than any one that ever lived? Who is it that, even in his childhood, showed such a depth of longing and craving to see righteousness in the hearts of men? Who but our Lord and Savior, our Master and Redeemer, was it that gave his whole life toward reproving sin and wrong and deceit, and to holding up righteousness? If you take the gospels, and study the life of

Christ, how quickly will you see where his whole heart and soul lay! "Blessed are the pure in heart," said he to the multitude, and then gave them a promise, "for they shall see God." Suppose, dear friends, you should put it this way: "I once hungered and thirsted after righteousness; but I do not any more; I gave it all up because something happened." How would that sound? Or suppose you say, "I once tried daily to be pure in heart, but I gave it up after a while. It was all foolishness and imagination." What do you think of such reasoning?

Why, it is awful; to be sure, it is. Now, to be a Christian is to be a follower of Christ. To be a Christian is to hunger and thirst after righteousness. Perhaps the greatest number of excuses is the inconsistencies of Christians. Suppose you give, as a reason for not caring any more for righteousness, or for not striving any more for being pure in heart, that nobody else does. If all the world should give up righteousness and purity of heart, and turn to wickedness, would there be any comfort in *your* doing so?

We all feel our unworthiness. Every one who stands up in meeting for the cause of Christ feels, as he never felt before, his inconsistency, for his life falls so far short of what it should be. It is well that it is so. There is nothing in this world that I know of that keeps a man in the straight and narrow path, like confessing Christ before the world, or like saying publicly, "I am hungering and thirsting after righteousness." The success of the Tobacco Column, that is doing so much good, is owing to the fact that each one who promises to give it up makes a public promise before the world. His wife and children read, what he has put down in his own handwriting. It was well that he wrote to me when he promised to use no more tobacco. His wife and children read it, his friends and neighbors read it; they say, "There, Jim has promised not to smoke any more. It is right down in print. If people see him, they will talk about it, and they will all report him." The truth is, friends, he dare not smoke. If he has more respect for the eyes of the world than he has for his own sense of honor, he might go off in the woods and smoke; but God would see him there. He knows it, and he believes in God. All men do. Now, mind you, I am not holding up tobacco as a great sin. That is not what we are discussing. It is breaking one's promise that is the great sin. You can not say that he is in bondage, because he voluntarily made the promise; he proposed to give up tobacco of his own accord; and perhaps he knew, poor fellow, that it would help him carry it out, if once that promise were in public print; and may be the sight of that innocent little smoker would be a help, too, when the battle was a hard one. May God help you all, my friends.

Now, then, let us drop tobacco. One who stands up in prayer-meeting, as did our friend, and asks the prayers of Christian people, has publicly avowed himself on the cause of right. They all heard him speak of his new resolution; they heard him say, too, that he was hungering and thirsting after righteousness. Those who attended the

meeting talk it over as they go home. Very soon everybody knows that "Jim," or whatever else his name may be, got up in meeting last night, and said he wanted to be a Christian. Who is there whose heart is not moved by such an event? And when a great strong man stands up before his friends, and, in a broken voice, and with tears in his eyes, announces his determination of following the Savior, who is there that can stand by and not rejoice? Why, the Bible says there is even "joy in heaven over one sinner that repenteth." Now, friends, do you wonder that I always find comfort in these words, "Blessed are they which do hunger and thirst after righteousness?" Do I hunger and thirst after righteousness? God knows I do. I rejoice and feel happy when any human being, no matter what his name, age, or station, takes up the cross of Christ; and I feel sadness and sorrow when any one goes in the opposite way. Do we not all love righteousness? and can we not all join this bright July morning in hungering and thirsting after righteousness? And still more, dear friends, that it may not be all talk and no deeds, can we not rise up together as a band of followers of Jesus the Son of God, who are unitedly hungering and thirsting? And may we not be afraid to stand up before the world and proclaim where we stand. May God in his great mercy and loving kindness look down upon us all, and help us!

## Tobacco Column.

**A** S I am indebted to GLEANINGS for the benefit derived from breaking off the bad habit of smoking tobacco, after using it for the past 20 years, I feel it my duty to let you know of it; not only for your encouragement, but also for those who are trying to overcome a bad habit that has almost overcome them. Now, I don't want you to send me a smoker, for I consider I am well cured of smoking, as I have not smoked this year; and besides, I am well provided with smokers.

Nokomis, Ill.

F. E. PRICE.

The smoker you sent me has come. I am obliged. If I ever resort to the "weed" again, I'll sorrowfully send you price of the smoker.

Wilmington, N. C.

G. H. LAMB.

I think I will lay claim to one of your smokers. I have used no tobacco in any form for one year, and it has been a hard struggle to break up the habit, and the want of it at times; but I have been true to my word, no tobacco for me. OLIVER B. PARISH.

West Worthington, Mass., July 5, 1883.

I have been cultivating the habit of smoking for 4 or 5 years. I have come to the wise conclusion that it doesn't add to my beauty, wealth, or fame, and have this day laid aside the filthy weed for ever. I don't need a smoker, friend Root, for we have lots of them.

Mazepa, Minn.

WILLIAM H. BRIGHT.

And may God bless and strengthen you in your wise resolve, my good friend, and may the influence of your example go far and wide.

### ANOTHER CONVERT.

In perusing your journal I find one column devoted to the interest of tobacco-users. I have been a slave to the weed long enough, and have laid it on the shelf, and told it I would be master the rest of the time. Now send your smoker; and if ever I resume my tobacco I will send you 4 times your price. I will send my forfeit, doctor or no doctor.

J. A. GREEN.

Volusia, Vol. Co., Fla., July 10, 1883.

### ANOTHER TESTIMONY.

I have been a dear lover of cigars — I quit about three months ago; thought I would take a smoker, as a seal of the covenant. If I go back I will pay you double price for it. I thought and was taught that, to smoke a pipe or cigar when handling bees was the right thing. Please allow me to say (as one who has tried it), that there never was a more mistaken idea about the business. I am glad you are doing so noble a work in this cause. Hope all beemen (we'll not mention women) will fall into ranks with us.

J. H. MULLIN.

Oakland, Colorado Co., Texas, July 7, 1883.

I see by GLEANINGS you are giving a smoker to every one who stops using tobacco. I stopped smoking Sept. 27, 1882, and if you have not withdrawn your offer, please send me a smoker.

Smithville, Jeff. Co., N. Y.

M. S. LORD.

Very good, friend L.; but I do not see anywhere in your letter where you promise not to use tobacco any more. Here in our factory I have, I think, a very good idea of how hard it is to get a fair and square promise from our boys. If I do not do so, some time when I find them using it they will say they did not promise not to use it. Not a great while ago a young man told me he did not promise; but when questioned closely he said I only asked him if he used tobacco, and he said he didn't. "Well," said I, "and is not that a promise?" "Why no," said he, "not exactly, for I commenced using it after we had that talk." And this all occurred while he was working for me. Now, friend L., we want to hear you say before all these friends, that if you use tobacco any more you will pay me for the smoker.

### JUST FOR SPITE.

I ordered goods of you June 5th, which I received all right in due time; but GLEANINGS, which I expected to receive right away, if not sooner, has not made its appearance yet. Now, I am real mad about it. I have been reading and re-reading GLEANINGS of the three years past, and want something new and fresh. Now, by way of spite I will just say, and that truthfully, too, which I can prove to your satisfaction, that about two months ago I quit the weed, both smoking and chewing. Now, according to your own bargain I am entitled to a smoker, and it ought to be a good large one too; for I have used the weed some 18 years, beginning when about 12 years old. Now to the point: I have a Clark smoker, but it is somewhat "out of breath," and a squeaker too; so just send it right along — a good large one that will hold half a day's rations to work with bees in spring and fall. Tell me what the smoker is worth when you send it, and do not forget GLEANINGS.

AMOS LOCHBAUM.

Chambersburg, Pa., July 10, 1883.

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE  
OF READING MATTER.

**MEDINA, AUG. 1, 1883.**

I have set before you life and death.—DEUT. 30: 19.

We have to-day, July 30, 6031 subscribers; and this would warrant us in raising our price for advertising to 30 cts. per line; instead of doing so, however, we shall continue at the same old price, 20 cts. per line. But advertisements can be inserted in the JUVENILE hereafter at the uniform price as above.

I AM notified that a paragraph has appeared in one of the French bee-journals, reflecting on the character of our good friend Dadant; and the worst part of it is, they have tried to attach my name to it. I hope it is a mistake in translation, and not any willful attempt; for of one thing I am certain—I have never written any thing against the business character of the Dadants, either home or abroad.

ALTHOUGH all hands in our factory are pretty busy, we can send most goods by return express or freight. We have clerks prepared to give especial attention to telegrams. In fact, we have sent more goods in answer to telegrams this season than in all previous seasons together. It is somewhat expensive, it is true; but there is some satisfaction in knowing that, by taking this extra expense, you can have what you want in 24 or 48 hours.

SELLING BEES TO MORE NORTHERN FRIENDS AFTER  
THE BASSWOOD FLOW.

ABOUT the middle of July, R. Stehle, of Marietta, O., sold us 40 lbs. of bees at 50 cts. per lb. He sold them thus low because the basswood yield was over in his locality. They reached us just in its height, and in two days after they were let out they gathered enough to pay for themselves, and a little more. Now, is here not an opening for an important branch of our industry? The bees went to work like new swarms, and worked thus for nearly ten days, at the expiration of which time we might easily have sent them to some friend in Michigan, and have the same thing repeated until we reached the limit of the basswood region. What is to hinder, friends? and why not start the thing going? As they were shipped in the light cages, the express charge was not heavy, and I presume one or two hundred miles' distance would be sufficient for each shipment. I will tell you more about it in our next issue.

A BRISK trade in queens is going on this year. We are sending out from 30 to 40 daily, and the supply just about equals the demand. Some write us, evidently thinking that we claim our queens to be extra. This is not so, friends. Our dollar queens are most of them purchased of good reliable men. But they have no *particular* recommendation, unless it is that they are raised from freshly imported stock. I am sorry to say that we are out of imported queens, although we have an order in Italy now for over 100. A shipment is expected daily. We can

usually send black and hybrid queens by return mail; but as we do not raise these, there is no guarantee on them whatever. Our select tested queens are all raised in our own apiary, or that of Neighbor H.; and we endeavor to have them all that we claim in our price list. I am sorry to say, that the demand is at present rather beyond the supply. With the exception of these and imported queens, we are prepared to fill all orders for bees or queens by return mail or express, with a few exceptions.

### OUR COLD-BLAST SMOKER.

YEARS ago I had a hobby of having a smoker that would work nicely while the door to take in fuel was all the time open and ready to replenish. I finally abandoned it as something to be desired, but hardly to be secured. A few days ago I saw one of the girls in the apiary using one of our smokers in just that way. Her rotten wood was a little long, and she was not strong enough to break it up readily, so she just pushed in long pieces, as many a good housewife has done on baking-day when the wood was too long. But in this case it did not seem to work badly at all, for no smoke came out of the door while the smoker was being used. As the fuel burned down, the long chunks were simply pressed down a little, and it seemed to work quite handy. One or two have complained because the doors to our smokers did not fit very closely. Why, friends, they do not need to fit closely. If you keep the soot scraped out according to directions, your smoker would do very well without any door at all. Keep the air-passages free, in any case. Perhaps I might tell you that we have, since July 26, 1882, up to the present date, sold a little over 10,000 of our smokers, and still they are going at the rate of nearly a hundred a day.

### OUR OWN MAKE OF FOUNDATION-MILLS.

VERY much to my surprise, I was informed by our machinists that we had made and sold, since Jan. 1, 1883, one hundred and forty-eight of our fdn.-mills. They have gone to all parts of the world; and although a few have complained because their rolls looked rough when they first received them, I think none have complained after giving a sheet of the fdn. to a hive of bees, and many are the kind words received in regard to them. Here is one from George Neighbour & Sons, London, Eng., who have recently had two of our mills:

We like your foundation-mills very much.  
London, Eng., July 13, 1883. GEO. NEIGHBOUR & SONS.

Now, you may think it a little singular when I tell you that the fdn. we have been making this season has not, until recently, been made on mills of our make. From the time the first mill was turned out until about the first of July, orders were so imperative that a mill could not be spared to go into our wax-room. Since we have got these new mills, however, we find we can make six or eight Langstroth sheets to the pound without any great difficulty. It is owing somewhat to the shape of the cell, and perhaps more to the superior hardness of the metal used in our mills. We are now prepared to ship, by first train, any mill of either size.

### TWO QUEENS IN A HIVE.

A FEW days ago our apiarist went to a chaff hive where he expected to find a select tested queen. To his surprise, she had somehow turned to a very indifferent one. A few days afterward he called on her again, and found her fully up to the standard,

as on his first inspection. This attracted his attention, and investigation showed two entire colonies occupying one hive and one common entrance. One was in the upper story on one side, and the other was in the lower story on the other side. Very likely this state of affairs would not have worked after the basswood season had closed.

A WORD TO THOSE WHO WRITE MATTER FOR GLEANINGS.

DEAR FRIENDS, although I would not for any thing have you cease giving us facts from experience because you have not the faculty for putting them in nice shape ready for print, I would suggest that you take a little more pains with matter intended for publication. It is true we can sift out what we consider to be valuable, and cross out the rest; but those who have tried this know that it is a very laborious process, and oftentimes unsatisfactory to either parties when done. Can you not, when communicating facts, separate them from each other by "small-cap" headings, such as you see we use throughout our articles and Heads of Grain? Keep business and personal matters on a different sheet from that which you intend for print. Bear in mind that space is valuable, and we want in nothing but that gives real value to our readers. Of course, we want pleasantry and good nature; for cheerfulness is as helpful as dollars and cents. But please bear in mind that we want to hear from as many as possible, and therefore we can not permit any single individual to cover any great amount of space unless he has something important to communicate. Let us have valuable hints, brief and to the point, from a great number each month. Will not that be the best way?

FRIEND FLANAGAN'S VISIT TO THE SOUTH.

C. O. PERRINE'S FLOATING APIARY — REMNANTS OF IT.

ON Feb. 1, 1883, I started on a trip south. When I left Belleville the thermometer was nearly at zero. When I reached friend McKenzie's, near New Orleans, 3 days later, it was 80° in the shade; bees were flying, and gathering honey from an early variety of willow. I saw and gathered many varieties of roses, blooming in the open air, and white clover and the dewberry (a species or variety of blackberry) was in bloom also. I saw no bees on any thing but the willow, which in all the lower Mississippi is very abundant. There are three or four varieties of willow following each other in their order of blooming, making or prolonging the honey-yield some 6 or 8 weeks. The white clover, much to my surprise, was very abundant. I learn that, though it blooms as early as the first of February, it seldom yields honey before May, and even then not with certainty. After the willow, maple, and white clover cease, there is but little honey gathered till in the fall; then the wild vines, among them the black-jack, the cow-itch, and others, always yield well; and the goldenrod, where abundant, can be depended on for an abundant yield. I found that very little comb honey is raised, as there seems to be no demand for it, even at as low a price as extracted honey brings; and besides, from some cause it is found to be very difficult to keep it in a marketable condition during the hot summer weather.

In company with friend McKenzie, near Carrollton,

I visited several apiaries, among them that of E. Stahl, of Kenner, who had as fine an apiary, consisting of nearly 200 colonies in L. hives, as one would care to see in point of strength of bees and arrangement of hives, etc. I found him eager and willing to adopt all modern improvements, and he intends to Italianize his stock, and thus improve his bees.

I also visited a remnant of C. O. Perrine's famous floating apiary. It is situated some distance above the city of New Orleans, in the midst of a willow and cypress swamp; and from the report of the man in charge (friend Perrine is generally either in California or Chicago), I learn they get considerable quantities of extracted honey, both in the spring, from the willow, and in the fall, from the goldenrod and other fall flowers. If proximity to pasturage is an advantage, they certainly should do well there, as it extends from the very hives, for miles in all direction. This apiary contains about 175 colonies in L. hives, principally blacks and hybrids.

FRIEND VIALON'S APIARY AND BEE-HIVE FACTORY.

From Perrine's apiary we went to Bayou Goula, the home of friend Viallon, one of the most extensive, progressive, and enterprising apiarists of the South. We found the factory in full blast under the management of friends Olin, father and son, who, I understand, learned and graduated in bee-keeping under friend Root, of Medina, Ohio. We received a most cordial welcome, and every attention one could desire, and discussed all points of progressive bee culture; and though friend V. does not entirely indorse the views of some of our leading apiarists in regard to *Apis Americana*, or the coming bee, he certainly raises and sends out bees and queens second to none. He has some 400 or 500 colonies in splendid condition, and a large number of nucleus hives, with fine tested queens. We shall not soon forget the pleasant and profitable hours we spent with friend V., who, by the way, has had a view of his apiary taken, which I ask you to give us an engraving of in GLEANINGS; but let the engraver or artist do his utmost, he can not possibly make it so beautiful as the original, with the grand old live-oaks and magnolias, and beautiful evergreen shrubs, many kinds in full bloom, while we of the North arc suffering from blizzards and zero weather. It was with feelings of regret that I turned my face northward. So busy were friend McK. and I, while I enjoyed the hospitality that is proverbial of the South, we did not look at a single colony of his bees, though he has quite a large apiary. On the morning of leaving, he and his worthy wife gathered a large number of roses, and magnolias; and with shrubs, and leaves of the sago palm, and Japan plums, and the long gray moss of the Southern swamps, made me a large package, which I carefully brought home; and when unpacked were found to be as fresh and bright as when gathered; and surely they formed a contrast to the snow and sleet that prevailed out of doors.

In conclusion, I must say that it does one a great deal of good to go occasionally from home (especially if he can combine pleasure and business), and see how the friends live in other parts of our great country; and I trust you, friend Root, will go to see some of our Southern friends another season, when the contrast in climatic conditions is the greatest and most enjoyable; and I assure you beforehand, on their behalf, that they will give you a cordial welcome, and bid you come again.

Belleville, Ill.

E. T. FLANAGAN,

# CLASS JARS

SPECIALLY MANUFACTURED FOR EXTRACTED HONEY.

- White flint, best quality and good shape to hold 1 lb., per gross (12 doz.) - \$4 00
- Second quality; very pale green; extra showy; 1 lb., per gross, - 3 50
- Perforated zinc queen-excluder, per foot, in 1000-ft. lots, - 4c

**THOS. EDEY & SON,**  
St. Neots, England.

7tfid

## M. G. KEENEY, - QUERCUS GROVE, SWITZERLAND CO., INDIANA.

Fifty full colonies of bees at 60 cts. per lb., in nucleus boxes, during August, or 75 cents per lb. in cages. A queen given with every hive taken up. Make money orders payable at Patriot, Ind. 8

# The Bee-Keeper's HANDY BOOK

Will be sent to any address, to be paid for if the reader considers it worth the price charged for it. Send for our 22d Annual Circular and Price List of queens and 3 races of bees. 8d  
HENRY ALLEY, - WENHAM, - ESSEX CO., - MASS.

## QUEENS! QUEENS! QUEENS!

We are now prepared to send you by return mail the handsomest and best queens, bred from our best honey-gathering strains of Italians and Albinos. Purity and safe arrival guaranteed.

- Tested queens, each .... \$2 00
- Warranted queens, each .... 1 00
- Warranted queens, 1/2 doz .... 5 50
- Warranted queens, 1 doz .... 10 00
- Untested queens, each .... 90
- Untested queens, 1/2 doz .... 5 00
- Untested queens, 1 doz .... 9 30

If you want queens for business, send us an order. We are breeding from an entirely new strain this season, which bids fair to outstrip any thing we have ever had before for honey.

Address **WM. W. CARY & SON,**  
Coleraine, Mass.  
**THE OLDEST QUEEN-BREEDERS IN THE UNITED STATES.** 8-9d

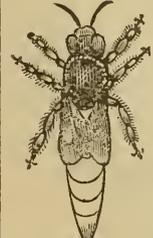

**FOR SALE! 40 COLONIES ITALIAN BEES,** each with tested queen; 10 L. frames, with combs and brood and some honey. Delivered in August or September. Single colony, \$6.00; 10 or more, \$5.00 each. 8d  
A. A. FRADENBURG, PORT WASHINGTON, TUS. CO., O.

**50** **SPLENDID COLONIES OF BEES FOR SALE.** Every comb straight; will average 4 lbs. of bees, 7 frames brood, and 20 lbs. honey. Price, with \$1.00 queen, \$4.50; tested, \$5.50. Five imported queens, \$3.75 to \$4.50 each. Dollar queens, 80c. F. L. WRIGHT, Plainfield, Mich. 8d

**FOR SALE.**—I will sell 5 colonies of bees in Simplicity hives for \$45: four have selected Italian queens, and one a tested Cyprian queen, bought of McKay Dougan, of Missouri. All queens of this year's raising, and all bought. Will ship by express or freight, as may be wished. 8d  
WALTER J. HUSSEY, Mt. Pleasant, Jeff. Co., O.

# Italian Queens AND Bees.

- 1 Untested queen .... \$ 90
- 6 Untested queens (one order), .... 5.00

Queens are bred from a very handsome and prolific Imported queen. Safe arrival by mail guaranteed. Also Nuclei and full colonies. Send for circular.

ALSO

RESIDENCE, NURSERY, FRUIT FARM, AND BEE BUSINESS FOR SALE.

Situated on corner of Maumee and Charles streets, at the western limit of the city, and contains 7 1/2 acres of land, nearly all occupied with fruit-trees, vines, plants, etc. Also 15,000 to 20,000 Apple, Peach, Pears, Plum and Evergreen and other ornamental trees in nursery, together with Grapevines, Raspberry, Blackberry, and Strawberry plants, etc.

Residence nearly new, two-story frame house over brick basement and cellar. The situation is all that could be desired for a suburban residence, within easy walking distance of the city, graded and high schools, and churches, and within 80 rods of Adrian College, thus affording church and educational privileges rarely to be met with, and a population of 12,000, affords a fine market for fruit, vegetables, etc. Title perfect.

Also 50 to 100 colonies of Bees and fixtures for sale. The location is a fine one for the Nursery or Bee business. The place will be sold alone, or with the Nursery Stock and Bees, as desired. Address the undersigned for prices and particulars.

**D. C. EDMISTON,** 8d  
ADRIAN, - LENA WEE CO., - MICH.

# LAND FOR SALE.

A CHANCE OF A LIFETIME.

A two-hundred acre farm for \$1000. A tract of land with good water and plenty of timber, in a good neighborhood, with good schools; said land, containing nearly 200 acres, can be had for \$1000 (one thousand dollars); the trade must be closed out before Sept. 1, or no sale. Terms, one-third down; remainder in six and twelve months.

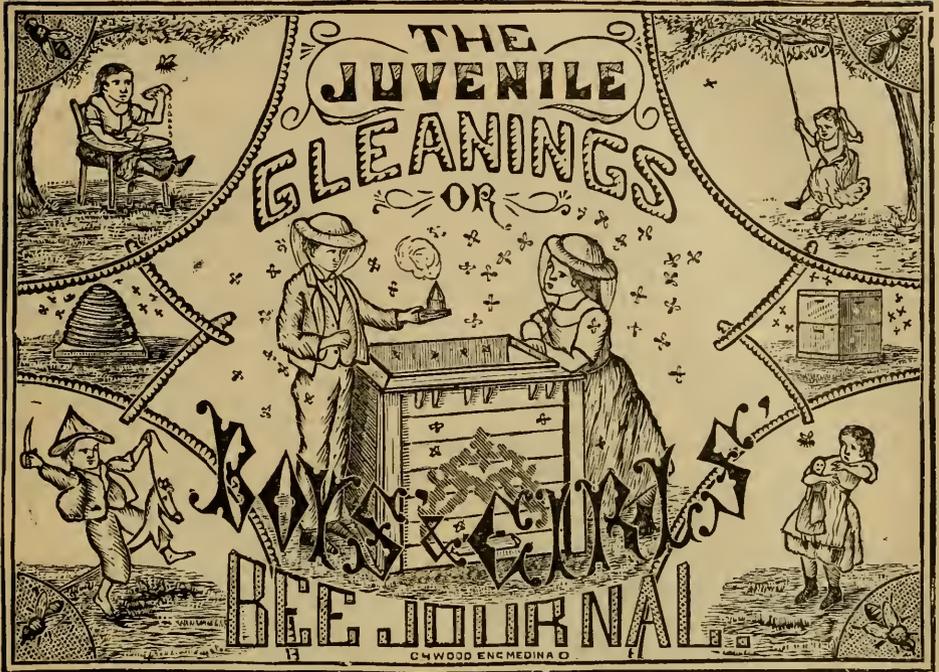

Address **CHAS. KINGSLEY,**  
8d GREENEVILLE, GREENE CO., TENN.

# A BARGAIN!

20 Colonies of Bees for sale, for only this month, in Nellis chaff hives, at \$5.00 each. They are on 8 frames of wired-foundation comb. Reason for selling, have too many in one locality.

WHO IS MY NEIGHBOR?—LUKE 10: 29.

Every one that asketh receiveth; and he that seeketh findeth; and to him that knocketh it shall be opened.—MATT. 7: 8.

IT must be eight or ten years ago, children, when I first concluded, after a good deal of faithful deliberation, that I wanted to be a Christian; or, at least, I decided that I wanted to be *with* Christians, and on the side of Christianity. I remember one Sunday afternoon especially, when my thoughts were first turned quite forcibly in that direction. The circumstances were something like this:

One of our townsmen had a cider-mill, and he made cider. I kept bees, you know, and the bees made honey, or gathered it for me, to be precise about it. Well, every fall I had trouble when he made sweet cider; the bees would come and stand on his "cheese," and suck up the sweet cider as fast as he could squeeze it out. In fact, they seemed to think that he squeezed it out on purpose for them. And finally my Italians came in such droves, that, when he turned on the screws to the press, they took every bit of the juice that was squeezed out, and he did not have any at all to run into the tub. After a good deal of hard talk about it, I decided to move my bees away until cold weather. So I hired a man with a team, and, after a great deal of fuss, we loaded them up and started off. I did not feel very happy

about it, because I took them away under protest; and at that time I was not asking God about all these things, and asking him to tell me what was the best thing to do. It rained that afternoon; and after we set them down in the field, off by a dreary-looking swamp, I felt rather sad and homesick. As it was pretty well along in the fall, the rain cleared off, and we had a frost that night, thus killing the flowers in the swamp, so that my bees were away from home, with no one to care for them, and no prospect of any honey being gathered. This was Saturday night. As I was not a church-going man, of course I went off to look after my bees on Sunday. To save expenses, I went on horseback, for I did not have any horse of my own; and as I expected to overhaul the hives, I went in my every-day clothes. As I neared the bees, well-dressed and intelligent-looking people stared at me as I passed them, to see me in my every-day clothes, so far away from home on the Sabbath.

I had a dismal day with the bees, and started back just in time to pass the people again on their way home from church. Then the question came up in my mind, Was I doing right to be thus attending to my week-day duties on the Sabbath? Was I satisfied that the public at large should class me as one who had no respect for God's holy day? I felt a good deal troubled. I wanted to be considered on the side of all good people; and I remember, as I rode home that Sun-

day afternoon on horseback, that I thought of my mother's teachings, and of my little prayers that I used to say at night when I was a child, before going to bed.

It was not many months afterward that I changed my life over, at least in a good many respects. I went to the prayer-meetings I had so often ridiculed and found fault with, and stood up and spoke in meeting. Among other things I spoke of was the comfort one feels in this world when lending a helping hand, and doing good to others. About this time a little girl came to me, asking for work. I did not have very much work to do then, for I employed only a few hands. I told her that I did not know of any thing that I had that she could do. Finally she came again, and this time it was just after I had spoken at an evening meeting the night before. Her words were a little singular, and attracted my attention. If I remember correctly, what she said was this: "Mr. Root, you *must* give me some work." I looked up at her, a little surprised to think she would say *must*. She returned my look quickly, and seemed to be in such real earnest that I finally concluded to set her at work at something, at any rate. She was the daughter of an old friend whom I used to know when I was a child, but I was not much acquainted with her when she was grown up.

Just about that time I was bothered and perplexed about the subscription list of GLEANINGS. Although there were only about 500 names then, as I kept all the books and set all the type, reading all the letters and doing all the correspondence, it was quite a little care to attend to it all with my other duties. Without any hope that she could manage it, I told her to take all the letters and all the names, and attend to the whole of it herself. She took hold of the work with eagerness, set the type, and set it correctly, almost at the outset, with scarcely a bit of showing from anybody, and in a very little time I thanked God for sending her to me. And I was glad, too, that she spoke with that very importunity; because if she had not, in my want of faith I should have sent her away. I had just begun to be a praying man then, and I prayed for her as I do for the rest of our workers, and she at once showed a wonderful aptness for every thing pertaining to letters and people. She delighted in letters from foreign countries, and soon knew more about the proper postage to all parts of the world, than even the postmaster himself. As GLEANINGS began to grow, and the subscription list increased, she showed herself perfect master of the situation; and, to make a long story short, has, during all these years, been one of the main stays of our whole establishment. To really appreciate our friend "Lu," for it is she of whom I have been talking, one wants to get somewhat acquainted with her. Through all our work and business she has something of that queer trait that first attracted my attention to her particularly, of telling folks what they must and what they must *not* do. I have sometimes wished our customers with whom she has had a large correspondence

knew her as well as I do, that they might know what a kind heart stands back of her abrupt and somewhat brief way of talking or writing.

Well, now, friends, when our new factory was first started, there was some talk of a corner-stone connected therewith. Lu, among others, prepared a paper for it. But the whole matter was postponed on account of sickness among the clerks. Perhaps I should add that the great business of the present year overtaxed her powers, and she is now away from us, with several of the others, to recruit. Well, a few days ago she asked me if I cared to see a paper she had prepared for the corner-stone occasion. And now this same little paper I want to submit to you. If it doesn't give you a friendly feeling toward Lu from now on, even if she should write short, to you, I shall be very much mistaken.

#### THE EARLY HISTORY AND LIFE OF GLEANINGS.

When Novice began to tell

His experience with the bee,

The story pleased so well,

"I'll be an editor," said he.

And GLEANINGS, of ten years ago,

Was a *tiny* sheet, indeed,

But it soon began to grow

With extraordinary speed.

Tho' "Barney" was a novice then,

And the "boss" was typo too,

And wrote his copy with a pen,

Still, GLEANINGS lived and grew.

Then the windmill ruled the day,

Or the press went by foot-power,

That there might be no delay

When GLEANINGS ruled the hour.

All hands were called to "fold"

When GLEANINGS went to press,

And the "paper-day" of old

Was one of pasty mess.

Soon the type-writer's click was heard,

And the pen was put in the rack;

The windmill flew off like a bird,

And an engine "took the track."

The subscription list grew longer,

And business multiplied;

Our Homes made GLEANINGS stronger,

"Twas "on the Lord's side."

We have garnered golden sheaves

Which steadily grew in store—

The A B C book leaves,

So rich in bee-man's lore.

The spiteful little engine steamed

And puffed both night and day,

And orders, more than we had dreamed,

Came from regions far away.

Two busy years went by,

And we found our space too small,

So we built a factory

That we *thought* would hold us all.

While an engine, stately, strong,

Drove an endless line of belting,

And the buzz-saws hummed a song

Whose accents were *not* melting.

From our large new printing-press,

Which filled so well its place,

Came GLEANINGS in new dress

("Twas worn with smiling face).

Her "Heads of Grain" did far exceed  
 The "Blasted Hopes" recorded,  
 And "Reports Encouraging" in leed  
 The "Smilery" rewarded.  
 The boys and girls wrote letters, too,  
 To say that "pa keeps bees;"  
 To a wheelbarrow load the letters grew,  
 And yet they did not cease.

So JUVENILE followed behind  
 And carried the letters along;  
 Impelled by a "Hasty" mind,  
 It soon grew large and strong.  
 But, alas! the factory's too small;  
 Oh, joy! we'll build again;  
 We now behold the rising wall,  
 Dotted with busy men.

Soon the cheerful buzz of "biz"  
 Will fill the new wing too,  
 And Novice's contented phiz  
 A broader field will view  
 At the dear old noon meeting  
 By the organ clustered round,  
 During the ten moments fleeting,  
 Which daily we have found.

So, long live GLEANINGS and JUVENILE,  
 With a fat subscription list;  
 May they always carry peace — good will,  
 And the helpless ones assist.  
 When Novice has grown old and gray  
 In the Master's service here,  
 May he hear the voice of the Master say,  
 "I'm with thee, never fear."

---

### PAUL PRICE AND HIS PETS.

---

WHERE HE LIVES, WHAT HE DOES, AND HOW IT  
 PAYS.

---

**W**E have been both instructed and amused by the many communications from bee-keepers in GLEANINGS; and seeing nothing from this part of our country, concluded to write. Bee culture was much neglected here until Paul Price, a boy of 15 summers, embarked in this fascinating pursuit, which has given it an interest and impetus of rapid and healthful growth. I wish to tell you of Paul and his "honey-pets;" but "writing in regard to matters concerning which one's knowledge is limited," may not be pleasant for your readers. I know nothing of bees, except what I have learned through GLEANINGS and Paul's instruction. But of *Paul* I know every thing. He is not an enthusiast, but an earnest, constant, watchful, hopeful worker, and is seen early and late among his pets. He is not only mamma's bee-man, but is and has been, ever since he could toddle, her chief help in housekeeping. On wash-days his time is divided between the washer and the bees; and with mamma's help in making up the "batches," he is as successful in the cleansing art as with his pets. He began last August with two colonies of Italians and one of black bees. The blacks did not live long, the Italians making war upon them, which we supposed was the cause of death; but now we think the queen was either killed or disabled in transferring. Besides, he bought one stand for the honey, giving away the bees; and from all these he sold 100 lbs. of the most delicious honey, besides having all they wished for the table, from August till the late win-

ter months — that from the black bees being by far the richest and most delicate in flavor.

So far as our experience goes, we find that the black, or wild bees, are the best workers, and produce the superior honey in the hives, but they are not so kind as the Italians. This may be accidental, or does it apply generally? I know so little of these interesting little creatures, I am almost afraid to write. He carried his two colonies safely through the winter, keeping them during the severest weather, in the store-room, up stairs, with the window open; finding them thriving and healthy in the spring, with an abundant supply of honey till long after they began gathering from fruit-bloom and other early flowers.

After giving the subject careful study, mamma and Paul are of opinion that the great problem of wintering is solved by bountiful stores of honey, and shielding from the north-western winds. We had quite a blow last night, and, amid our anxiety, the question was asked, "How does Mr. Root protect his bees from storms?" How does he? Paul finds that a brickbat does not always keep the caps on. Surely there is some better way.

But I am always flying off at a tangent. In addition to these two colonies, he bought in the spring three more, and now has a nice little apiary of nine hives, strong to overflowing, and the bees possessed of no other impulse than to collect and store the honey. One he formed by taking two frames from a full hive, with the queen and bees clinging to it, and placing in another. By further reinforcement this has become as strong as the others. He uses the Langstroth hive, and, by the help of Howard, his younger brother, makes all he uses. They have their tools and lumber in the upper hall, and they are as busy and happy as the other little workers. It is a very pretty and interesting sight — these colonies dotted about under the trees, each one with the name of its queen in bright blue letters on the front. His most beautiful young queen, a present, his queen of queens, he calls *Sue*, in honor of your wife; then comes *Blue Eyes*, followed by *Josephine*, *Stella*, *Vanessa*, *Marie Antoinette*, and others, with the only wicked one, *Beatrice Cenci*, on the outskirts. He opens the hives, takes out and looks over the frames every day, running his hands and fingers over and through the depths of workers, often without veil or smoker, and rarely ever with stings. It is wonderful how gentle he has made them. They have the lower stories filled with brood and honey. So far he has taken out but little honey; has never used an extractor; he has none, but will have next year, when he expects to buy 20 or 30 colonies more. I suggested to him greater ventilation during these hot days, but he found, on trying it, that the bees sought the darker and remoter places, and therefore concluded much air and light not desirable for them. He seems to understand transferring, and is pretty successful in general management. How closely he watches their progress! Several times a day he looks through and studies them up; and what a delight he takes in showing the broad white sheets of comb, filled and sealed!

This seems to be a splendid locality for bees, as there are plenty to be found in hollow trees in the woods. In this valley nature is so bountiful, and there is so constant a succession of nectar, that it would indeed be strange if the honey-bee found not a home here. The comb found here is very white, and the honey of a bright amber color, of fine flavor

and taste. Our home for this little worker is situated in Saline Valley, and, in its wild grandeur, is beautiful throughout, with hills on one side and a fine stream of pure water on the other. The whole vegetation seems to produce peace, sweetness, and honey. The locust is abundant in the grounds around the house, and this spring were a mass of snowy-white flowers, thrilled by the hum of the little workers.

Just here I will say that my sister is contemplating cutting away these beauties, and replacing with fruit-trees. But then, there is such an abundance of honey-bearing plants they would be no great loss in that respect.

Paul wishes to have some honey on exhibition at the Farington Fair in the fall, and would like to know the most attractive shape in which to present it. Will you be so kind as to instruct him?

#### POISON HONEY.

Is it not strange that bees will gather honey from poisonous plants? We have none here, but I have read of poisonous honey of the Southern States, and the effect it produces upon those who eat of it, and it is similar to that produced by the honey of many, many centuries ago, and in a country far across the seas. In Xenophon's *Anabasis* we read, "Having passed the summit, the Greeks encamped in a number of villages containing abundance of provisions. As to other things here, there was nothing at which they were surprised; but the number of bee-hives was extraordinary, and all the soldiers that ate of the combs lost their senses, vomited, and were affected with purging, and none of them were able to stand upright; such as had eaten a little were like men greatly intoxicated, and such as had eaten much were like mad-men, and some like persons at the point of death. They lay upon the ground, in consequence, in great numbers, as if there had been a defeat; and there was general dejection. The next day, no one of them was found dead; and they recovered their senses about the same hour that they had lost them on the preceding day; and on the third and fourth days they got up as if after taking physic." This was in Colchis; and that there was intoxicating honey in that country is attested by the ancients, as also by modern travelers and writers. Pliny mentions two kinds of it — one produced at *Horaclea*, in Pontus, and the other among the *Sanni*. The first came from the plant *æglethron*, or goat-bane, the other from *rhododendron*.

One request more from Paul: It is cards — motto cards.

I can not begin to tell you the pleasure and comfort we find in "Our Homes."

Coffman, Mo., July 13, 1883.

MRS. L. B. ROOTE.

Thank you, my good friend, for your very interesting sketch of one of our juveniles. While the honey made by the black bees may be whiter, in consequence of their not filling their cells clear up to the caps, as the Italians do, I never before heard that the flavor of the honey was any better or richer. Your idea, too, is a little singular, that the blacks are better workers. I think it must have been an accidental case. — Although Paul succeeded in carrying the bees up stairs during cold weather, I do not believe such a course advisable, as a rule. — We seldom have winds here that blow off the covers to the hives. Sometimes a thunder-gust

in the summer time displaces the roofs of the chaff hives; but this happens so seldom that we never think of fastening the covers down in any way. When they blow off, some of the boys put on a rubber coat and go out in the rain and put them on again. — I am sure there will be some smiling among the juveniles when they read the names of Paul's queens. My grateful thanks to him for remembering the name of my wife. Years ago my heart learned to bound at the sound of the simple little syllable, "Sue;" and God grant that the time may never come when those same happy old associations fail to spring up at just a sight of the name, even in print. — Paul, you and I are bound to be friends; and if we do not see and meet each other face to face, I hope we shall hear from each other often. — In regard to ventilation, I, too, have decided many times that too much ventilation was detrimental to rapid storing and comb-building. I found that the bees seem to crowd back to the corners and the less exposed places. — Thank you for your extract in regard to poisonous honey. You will find something similar in the *A B C* book. And is it really possible that the honey from the beautiful *rhododendron* is said to be poisonous? — I am glad to see that concluding line that tells us that Paul loves not only the bees, but the Sunday-school, and, I trust, his Savior.

#### A YOUNG BEE-KEEPER OUT IN THE WOODS.

BEES, HONEY, RAIN, ETC., IN MICHIGAN.

**B**EES have done well so far between showers. I have extracted as high as 105 lbs. of white-clover honey from some swarms up to July 15. After working two days on basswood they rested two or three days during a shower; but this morning they came in like a young robin alighting on the ground. I like to see them do that; it makes a fellow fly around and drive hoops, make bungs, and move brood to keep them from swarming. I have had but two natural swarms this season, having increased from 33 to 56, all in upper stories. Some fill two. I have also 14 two and three comb nuclei to keep queens in. I put these queens into hives that have just cast a swarm after moving queen-cells. I think I gain nearly a month. You see, they have a laying queen all the time then, so the bees can't fill the brood-nest with honey. When these nuclei get strong, say about five combs, I fill them up with combs of brood, and put on upper story all at once, making a good strong swarm. I want to increase to about 100, so you see I shall need that foundation-machine in about two weeks.

#### FERTILE WORKERS.

In the swarming season I have a swarm in with them, or change stands with them and some strong swarm, and introduce a queen or cell.

#### CHOOSING A LOCALITY.

This is my first season here with my bees. I moved 15 miles last August with 40 swarms, after extracting nearly all the honey out of the brood-nest. I got 1600 lbs. of honey after moving, and left hives full for winter — all fall honey. Thirty-three came through strong, out of forty, all in chaff hives. The deer-mice got in some and killed them, or disturbed them. I am surrounded by timber; soft and hard

maple, basswood, oak, willow, cherry, and pepperidge are the ones that yield the most honey. Plenty of improved land, swamp and hay marsh, all within half a mile. With clover, berry bushes, boneset, goldenrod, fireweed, and touch-me-not, hundreds of acres within reach, I think I will try to overstock if I can. It now rains soft water again. There are lots of places just as good as this, yet most bee-keepers locate near town, and in old improved country, for convenience, not honey. Why don't more boys learn to handle bees? I shall need one to help me when I get overstocked with work. I shall increase until I get all I can handle.

#### QUESTIONS I HAVE TO ANSWER VERY OFTEN.

Are there bees in all of those hives?

Do they swarm like that all the time?

Are those barrels full of honey?

Don't you get lonesome here alone? I should think a bear would come and knock them to pieces, and drum you out too.

They call me the bee-boy. Now, Mr. Root, I suppose you would get lonesome after being there with so many; but I, with all of my bees, and a garden to hoe, having a house and a wintering house to build, don't find myself alone much.

I should like to send a sample of honey-plants, but it would take a large box to hold them all. You may name my apiary, if you have a name handy.

It thunders again. Now it rains, or, rather, drizzles.

F. E. TOWNSEND.

Newark, Mich., July 24, 1883.

Friend T., I have put you among the juveniles, although you have not told us your age. But I judged from your letter that you must be a boy; if you are not, you have certainly given us a boyish letter. You ask if I would not get lonesome. Well, it seems to me it would be just about the nicest thing in the world to be away off in the woods with the bees — for just a little while, any way, so I could take a little rest. Is there a nicer thing in the world, anyhow, than bees and woods? I have been through your Michigan forests, and I know a little of them. Your idea of giving a laying queen to a colony that had just swarmed is a good one, and I guess your plan of managing fertile workers is about as good as any. I guess we will name your apiary the "Woodland Apiary." How will that do?

#### MAKING METAL-CORNERED FRAMES.

##### ALSO SOMETHING ABOUT THE MAN WHO MAKES THEM.

**T**HE hives and all the rest of the goods came to hand all right, and I am very much obliged to you for the extra comb-guides. I have all the frames made up, and ten of the hives. It is nice to work your stuff, for it is so true, and makes a good fit, and that is what I like. I will tell you how I make my frames. I took a 4x4-inch scantling, and sawed it off so it would stand on end, and come four inches higher than my knee, and put the iron in the end of it, and I was ready to sit down by the fire with those nice bunches of frames, and put the corners on. I made about 50 or 60 every night, and it was nice, for I was not in the road of any one, and no dirt to clean up, though I took them out of the box and cleaned the dust off, and bundled them up

again. I want to give those 50 hives two good coats of paint.

HUGH VANKIRK.

South Strabane, Pa., 1883.

Friend V., your account of the way in which you make your frames reminds me of something I shall have to tell the little folks. Some years ago, when I used to have a Sunday-school at our county Infirmary, I met there a poor man who was not only perfectly deaf, but had lost the use of his legs, so that he had to get around in a sort of a chair with wheels to it. Well, one day last winter I was surprised to get a letter from this man. He wrote a nice plain letter, and said he knew me well, for he had been at our meeting, and had heard me "preach." Perhaps he did not say exactly that, but it was pretty near it, and then I remembered that I had seen him in his rolling chair among the rest of the inmates there. When I went around after the school was out, I had shaken hands with him among the rest, and in that way he knew me. It sounded a little funny to hear him tell about hearing me preach; funny for two reasons; first, the idea of my "preaching;" and second, the idea of his hearing, when he could not hear a word that I or anybody else had said. But then, you know, he liked to come into the "meeting," as he called it, because he saw there a good many well-dressed people with smiling faces; and in some way it did him good to see them all look nice and happy. Well, what do you suppose he wrote about? Why, he wanted to come and work for me! He said he could write, or he could drive nails, or do almost any thing; and how he did tease and coax to have me help emancipate him from the bondage and stigma of being in a "poorhouse"! I told him when it got warm we would try to give him work, and to-day he sits over in the brown house where we used to live last summer, pounding away day after day with his little hammer, making metal-cornered frames. In fact, he puts together all the metal-cornered frames that all the bee-keepers use who order frames of us already put up. He makes all the frames for wired frames also; and he has become a great favorite among all the hands of our establishment. At noon-time, whole droves of girls go over there to see him and talk with him. He talks, you know, and they nod their heads, or write on the slate, and some of them talk to him by the deaf-and-dumb alphabet. I wonder if you know how that is done. It is done by making letters with your fingers. Some time may be we will tell you more about it. But I think you will find all about it in the big dictionary.

Well, now we come to the point of our story. Mr. DeLong makes all his frames by having the iron block driven in the end of a post, or piece of scantling, which stands up between his knees. I wonder what he will say when he sees what is told about him here. I should not wonder if he would write a letter for the next JUVENILE, for, he loves children, and he loves company. He says he gets awful lonesome when no one comes to see him. One other thing that makes him lonesome sometimes is, that he used to be a great smoker; and one of the condi-

tions under which he could get away from the poorhouse and earn his bread by the sweat of his brow was, that he should give up smoking; for you know we do not allow anybody to work here who uses tobacco in any shape. I suppose he misses his pipe sadly, and I have sometimes felt real bad to think he must be deprived of it. Shall we not remember him, children, when we say our prayers at night, and ask God to help him to be strong in a good cause? There, I have told you something about one of "my neighbors," without thinking of doing it, haven't I?

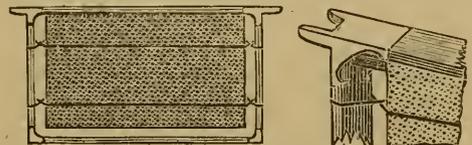

### A NOVEL METHOD OF FASTENING FDN. INTO FRAMES.

ALSO A HARPOON TO SPEAR WORMS WITH.

**R**IGHT here in the midst of the honey harvest I must stop and tell you of two inventions which we now use in our apiary. The first is a kind of spear which we use for picking drones and wax-worms out of the comb. We find it a very handy tool. The other is for fastening fdn. into frames, either wired or not wired. The spear is made by heating a fish-hook, and straightening it out; place this in a handle about four inches long, and it is complete. The barb is left on the hook.

The bees would not take the worms out, and we had to. This pulls them out "quicker." The way we fasten our fdn. in is the idea of "my pard," Mr. W. R. Bates. We use ordinary cotton string for fastening. I am a very poor hand at writing out a description of any thing, but I think by the aid of the accompanying sketch I can make it plain. I lay

the frame flat, then put the fdn. in place; next I take a piece of string long enough to go twice the length of the frame, and tie; pass one end under the end-bar of frame over the fdn., and under the other end-bar; now bring it back over the end-bar under the fdn., and over the first end-bar, and tie tight. Two strings are enough for each sheet of fdn. This puts the fdn. exactly in the middle of the frame. Now, to bring it tight against the top-bar, slip the string, indicated in the sketch, just a trifle toward the top-bar, and the frame is finished. This, of course, is not as good as wired frames; but when one's work is walking right over him, it is a splendid time-saver, and works just as well.

Barrington, R. I., May 22, 1883. A. C. MILLER.

Thank you, friend M. We have so few worms in the combs in our apiary that we would hardly find use for your spear. When we had many black bees I used to carry a fine-pointed single-bladed penknife in my vest-pocket. Your plan of fastening fdn. is indeed ingenious and novel; but we should have no use for it here, because we have our fdn. all put on wires. It may prove a valuable aid to those who use fdn. by hanging

it by one edge; but how about the expense of so many strings? Do not the bees bite off the strings so they can not very well be used over again?

### AN A B C SCHOLAR ONE MONTH OLD.

A GREAT ADO ABOUT A DEAD QUEEN.

**I** WONDER if you do not think that a pretty big "yarn," children. We have had letters from children six years old, five years old, and I do not know but that we have had some letters from some only four years old, and perhaps younger still. Now here is one from a "child" only one month old—in fact, not quite that; and if he is not a child in years, he certainly is in bee culture. Just hear him, will you?

*Friend Root:*

The sample copy of GLEANINGS sent me a few days ago pleased me so well that I inclose \$1.00 for a year's subscription. Please commence with the August number.

It is only a month ago that I concluded to try my hand at bee-keeping, and the manner in which my enthusiasm was fired up is somewhat similar to your own experience, related in your introduction to A B C, differing only in that my interest was first aroused by a dead queen being casually shown me by a friend in my office. I asked him some questions, and then dropped the subject. About an hour or so the spirit of that dead queen returned, and, like Banquo's ghost, it would not "down." I could not dispel the subject from my mind. I resorted to my library, took down Appleton's and also Chambers' Cyclopedias, and read the articles on "Bees and Bee-Keeping." This little taste excited my appetite for more. I consulted the Britannica and the German cyclopedias, reading with avidity and interest what they had to say. Now, my further search was stopped as far as my library was concerned. I went to a bee-keeping friend, and procured Cook's Manual. I flew over its contents, and re-read it carefully. I wanted more, and was told to read A B C. I sent to Chicago; and when it came, I read it through with pleasure. About this time my fascination for bees was so great that I secured two Italian nuclei, and set them to work, consulting constantly my A B C, as to what to do in certain cases. I have had them about two weeks, and everything looks prosperous.

Although a month ago I was entirely ignorant about bees and their habits, yet by the most incessant study I have obtained some little knowledge of this wonderful insect family, the acquiring of which gave me more pleasure than any thing I ever sought after before. I am afraid that I did not study law with such industry as I did bee-keeping.

I am not much given to hobbies; but this hobby is one which I am determined to stick to for better or for worse; and although I have been severely stung, I consoled myself with the Irishman's soliloquy, "Goodness! ain't his foot hot?" and put a good face on the matter, when my wife gravely inquired why I was blowing my finger.

There are about 1000 colonies of bees kept in this city, and I doubt if more than three bee-keepers understand the proper handling of bees. A bee-keepers' association has been formed, and it is the object to bring about better results. As far as my own efforts are concerned, I will try to disseminate bee

literature to those in need of it — not with any view of profit, but to place others in possession of necessary knowledge for their own good. I have already made a soul happy by inducing him to buy an A B C, which he has done, and is now reading it carefully. Although keeping bees for two years, he did not even know how the inside of a hive looked. Comb foundation, section starters, etc., he had never heard of. To bring the ignorant to the fountain of knowledge is a pleasure I never deny myself.

LOUIS C. SCHWERDTFEGER.

Lincoln, Ill., Aug. 2, 1883.

Friend S., I am very much obliged indeed for your kind letter. I enjoy it almost as much as you do, hearing how you followed up the subject, and saw it unfold before your eager eyes. Are not the little chaps funny and pretty too? And those stings, I suppose you took them with about the same heroic spirit that you would take a pull on your whiskers from your six-months-old baby. They hurt, to be sure; but suppose they do; the little chaps mean well, and really have not learned better yet. Go on, my good friend S., and let us hear from you again. When busy throngs make the air resound, and the honey comes tumbling in at the rate of a hundred pounds a day during the basswood bloom, sit down and think how it all came about, and raise your heart to God in thankfulness and praise that he has in his wisdom prepared these avenues and labyrinths of knowledge, ready to yield their rich stores to him who will work and study. "Knock, and it shall be opened unto you." Friend S., dare I take the liberty of asking if you are on the Lord's side too, as well as a devotee at the fountain of knowledge, as you so graphically put it in your closing sentence?

#### OUR LITTLE FRIEND VICTORIA FIELDS BY THIS TIME.

HER BEES, HER GARDEN, ETC.

**D**O not say "blasted hopes" to me before next spring, for I think our bees are doing so well that I do not know in what words to express my gratification to the "blessed bees." One colony has given us two good swarms, and a good lot of honey; I can not say just how much, as part of it was not weighed.

Now I must tell you something about one swarm that was new to me. They swarmed out and partly clustered; but before we could do any thing with them they returned to the old hive, and the next day they came out again and clustered; but before we could do any thing with them they returned to the old hive. So we left the hive and all ready, just as we had them, to put them in. On the next day, June 28, they came out and clustered on the same limb, and as they had each time before; and this time we got them in the hive. As we were hiving them, we found the queen as pretty a hybrid, with two bands, as you would wish to see. But now comes the mystery. As we had them nearly all in the hive, in crawls a young black queen. Now, papa says (he was helping me what he could), "They have two queens; that is the reason they went back, and were so hard to do any thing with." But they went to work nicely, and we put the upper story on,

and cover, and in the evening we went to look at them, and removed the cover, and by some means the black queen had made her way up past the cloth, and she and a few bees were clustered in the upper story. Papa said, as they had a couple of frames of comb we would hunt for the hybrid queen; so the first frame we lifted, here was our queen all right, and she had been laying eggs. We shut them up just as we found them, until morning; but in the morning all bees were below, and the black queen gone. She was found in front of the hive dead, and the bees are doing finely now. Our first swarm has their hive filled the lower story, and storing honey above.

I wonder if all the little bee-folks are as busy now as I. I have to hoe in the garden, and attend to the bees. I hoe corn sometimes, and potatoes, and attend to Myrtle while mother works. I suppose the little folks in the JUVENILE will not think much of a little girl who does such rough work. Well, one whom I honor and labor to assist says that honest labor degrades no person. Papa says, give his regards to Mr. Root, and to thank him for the many hours enjoyment he has afforded him in perusing GLEANINGS and the A B C, while unable to work.

Valley Point, Pa.

V. J. FIELDS.

Your case is a little hard to explain, Victoria. I should have said that the queen was crippled, and unable to fly, as an explanation of the bees going back so many times; but when you tell us about finding two queens in the swarm, it becomes a little more puzzling. Is it not possible that a small swarm with an unfertile black queen united with your swarm without your observing it? This would explain matters fully. When you found the young black queen in the top of the hive, she, with her retinue of bees, should have been given some combs, and a new colony started somewhere else. It is always unsafe to leave two queens in a hive. In your case it happened luckily for you that it was the small black queen that was killed. It might have been otherwise. We know the hybrid queen was an old one, for you say you found eggs which she began depositing immediately.—Do not feel sad, friend Victoria, because your circumstances happen to be such as to oblige you to work every day, and some days pretty hard, perhaps. I have often thought it a sad misfortune to those who are brought up where there is no necessity for steady and constant work.—Thanks for your very kind words; and may God's blessing rest with you and your little household.

#### QUEENS SOMETIMES STING.

POSITIVE PROOF GIVEN US BY ONE OF THE JUVENILES.

**I** WILL give you my experience about queens stinging, as you do not think they sting. We divided a stand of bees the 28th of May; when the queens hatched they swarmed; and when we had hived them, we opened the hive where the swarm came from, and found one queen and two queen-cells. We took them out; and when they ran on my hands, I laid my hand across my arm so she should not get under my sleeve, and I suppose I must have hurt her, for she stung me. You

may think it was a bee that stung me, but it was the queen; but she did not leave the stinger; but the hand swelled as badly as a bee-sting that I got the same day. We put her into a hive, and she is laying now. Another tried to sting father the other day, but did not succeed.

We get swarms faster than we want them. We have had a good honey season so far. Father had a fire the other day; he did not have the damper shut. He burned his veil and hair a good deal, but did not hurt himself much.

BERTHA M. LARSEN.

Fairview, Sanpete Co., Utah.

Many thanks, Bertha, for the important facts you have given us. I have never been stung by a queen, but I have seen young ones sometimes put out their "stingers" as if they meant to sting.—Be careful about getting your clothing on fire when working with smokers. We hope your caution will prove a timely one. Sometimes a little fire may drop out of the smoker, and we should always be on the watch to see where it goes, and that it is safely extinguished.

### A NEW LETTER-CLIP.

A CONVENIENT IMPLEMENT FOR FILING AWAY LETTERS, INVOICES, OR OTHER PAPERS.

**T**HE implement we illustrate below consists of a walnut board 9x12 inches. Near the top, as you will observe, are two stout rigid wires. The ends are sharpened to a slope, and on these upright wires the papers are to be pressed down, making

two holes in each paper. The sloping points to the wires, however, go through the paper in such a way as to turn back a sort of a cap, as it were, like the cap to a queen-cell, somewhat; and as this cap comes back into position as soon as the paper is removed, none of the writing is obliterated. Now, besides these two upright wires is another pair of wires something like a fish-hook, and these latter spring back when the papers are put on. After the papers are all on, these hook-shaped wires come forward so their points strike the sloping point of the stationary wires before mentioned. As the stationary wires are considerably the largest, any portion or all of the papers may be at once thrown over on to them, enabling you to take out any paper you choose, without changing the relative position of any of the papers. Below is the inventor's description.

#### DIRECTIONS FOR USING THE BILL-FILE.

Open it by pushing back the wire bows; stick the bills, etc., on the two front spindles, using the small middle spindle as a gauge; shut the bows back. If you wish to refer to any particular bill, letter, etc., throw the others over on the back of the wire bows till you come to it. In case you wish to put one on in any particular place, do it in the same way as when getting one off. If you wish to index them, put some stout sheets of plain paper on the file, and mark on the upper right-hand corner the letters of

the alphabet, the names of different firms, or the names of the different kinds of papers on the file, such as bills, letter receipts, etc., whichever way you wish to index them. Now place your bills, etc., in between these sheets by throwing them over on the back of the bows, and opening it at the proper place.

C. M. RULAND.

### VIRGIL'S TREATISE ON BEES.

CONTINUED.

**W**ELL, children, the bill of fare this month consists of very tough beef—parthenogenesis and pantheism. If you can't chew such articles, you may run away and play till next time. Can't apologize much for the dinner, because I'm not responsible for the victuals, but only for the cooking of them. Waiter, ring up the first course!

#### PARTHENOGENESIS.

One law thou wilt admire among the bees  
That doth the man of wisdom greatly please;  
They lead their lives the call of sex above,  
Nor waste their bodies in debasing love; (1)  
Nor bring forth offspring by the throe that grieves,  
But gather children from sweet herbs and leaves. (2)  
A king and little Romans they create, (3)  
The halls and waxen cells repopulate.

#### AGE, AND CAUSES OF DEATH.

Often, indeed, on daily wanderings borne  
Upon the jagged rocks their wings are torn; (4)  
And oft beneath a load they give their lives,  
And struggling fall, and fail to reach their hives; (5)  
So great a passion for the flowers they bear,  
For making honey such a pride and care.  
Therefore how soon soe'er life's narrow bound  
May interrupt them on their busy round  
(Truly, not more than the seventh year is led), (6)  
The race, by wondrous reproduction fed,  
Remains immortal, and, through many a year,  
Grandsires of grandsires on the rolls appear.  
Though seasons come and go with good and ill,  
The fortune of their house abideth still.

#### LOYALTY, AND THE RESULTS OF QUEENLESSNESS.

Not Egypt, furthermore, nor Lydia great,  
Nor Parthian people, nor the Medean state,  
So bow in humble reverence to their king,  
Or to his throne in such allegiance cling. (7)  
The king preserved, one mind is unto all;  
He lost, all laws in broken ruins fall; (8)  
Wide ope they tear the honey sealed so well,  
And of the combs destroy each dainty cell. (9)  
He owns the works, and him they all adore;  
Thick they press round him with unceasing roar;  
Upon their backs they raise him off on high; (10)  
And cast themselves before in war to die; (11)  
For his dear sake grim death by wounds they meet,  
Nor rue the loss, but trustful count it sweet.

#### FREE RELIGION.

Some have declared, by these examples led,  
Part of the mind divine in bees is bred; (12)  
Such wondrous signs denote a wondrous birth,  
And sips of heavenly spirit not from earth.  
For God, indeed, pervades, as they declare,  
All lands and seas, and heaven's unbounded air; (13)  
From thence, they say, the flocks and herds and men,  
And all the beasts in forest glade and den,  
Each one, as birth it's mystery unrolls,  
From God's own essence draws him subtle souls; (14)  
And all things afterward, they say, 'tis clear,  
Borne back again into their proper sphere;

All things dissolved, the sparks of heavenly flame  
Return and merge again whence first they came.  
No death exists; there is no place to die,  
But only living through all space to fly;  
To take one's lot where lofty heaven appears,  
And join the harmony of starry spheres.

(1) He gets it a little mixed, our author does, but he is on the track of the truth. The worker bees are entirely free from sexual impulses, and that is the main thing claimed. Furthermore, reproduction without generation does exist in the hive under certain conditions. How much better is Virgil's stumbling pursuit of truth, in ancient twilight, than the stubborn ignorance of the modern editor of my volume of the poem! Just hear him. "This account of the production of bees here given by the poet, is justly exploded. It is found that no animal is produced without the concurrence of the sexes." If bees only were subjects of investigation, some minds would continue to deny; but examination of the aphides, or plant lice, has knocked the breath out of the negative party. Among these latter insects, parthenogenesis exists in a more perfect form than among bees, and is their usual mode of reproduction.

(2) The original reads, "*By mouth* they gather children." Observations in Virgil's time seem to have noted the royal jelly, and the fact that bees put it into the cells with their mouths. That the jelly is a product of digestion and secretion, they failed, seemingly, to find out. No theory was then open but that they gathered it direct from the plants they visited. Overlooking the fact that the queen-cell, before the royal jelly is put in, contains an egg, they probably regarded the jelly itself as nature's seminal fluid, out of which the larval queen sprang, like their own Venus from the foam of the sea — a fine illustration of how easy it is to get near the truth and yet miss of it. Had they examined the development of larvæ in the worker cells, they could hardly have missed discovering the existence and hatching of eggs; so I guess they stopped short of that point, merely noticing that a similar jelly was sometimes seen in worker cells. Or perhaps they saw the eggs, and thought they were little pellets of royal jelly rolled up by the workers.

(3) Calling the young bees "little Romans" is an extra good hit.

(4) Here there is exact agreement with good modern authority — that many bees perish simply by their wings getting too ragged to fly with.

(5) The death of these poor little fellows is pathetic, is it not? It happens usually, I believe, when night is approaching, or a shower. They have found plenty of honey, and, forgetting that they can not carry quite as much as they once could, they take all they can hold of it. A chill is creeping upon the air. They feel a little benumbed and stiff; and on trying their wings for home they settle to the ground. It is still colder down there, and they never rise again. Before warmth and brightness return to earth, all is over.

(6) The queen's usual term of life is three or four years, and its extreme limit probably about seven years, just as stated. It is comparatively easy to mark a queen and see how long she lives, but very hard to keep track of an individual worker. I presume, therefore, that the ancients made some successful experiments determining the age of queens, and then *guessed* that workers would live about the same, if no accident befel them. A worker's usual

term of life is about six weeks in midsummer, and six weeks plus the length of time that he remains quiet in the hive at the other end of the year.

(7) There is some "stuffing" in both ancient and modern talk about bees' loyalty to their sovereign; but a good solid basis of fact is left after the stuffing is shaken out. I suspect that the Egyptians and Lydians, and the rest, revered their kings largely because they dared not do otherwise; while the regard of the bees for their queen is not enforced but voluntary.

(8) A little exaggeration creeps in here also. Utter recklessness and hopelessness is not reached at once when the queen is lost; that is, in ordinary cases it is not. If they have larvæ to raise another queen from, the disorder and hurry-scurry is soon quieted, and things move on tolerably well again.

(9) Careful economy in the use of stores, and great reluctance to uncap sealed honey, are prominent in well-ordered colonies. I rather think queenless colonies do sometimes get very reckless about such matters. The general rip and tear and ruin in a queenless hive comes, however, in an indirect way. Robber bees come in, and the inmates are too indifferent to fight them; and robbers tear combs to pieces, rather than take the trouble to crawl into deep cells. Wax-moths and other insects and worms come in, and little resistance is made. After awhile the bees take a short spasm of energy, and try to get rid of the worms by tearing away the combs; but they soon give up again. So matters go on until a hideous mass of rubbish and webs and worms is all that remains of the beautiful structures within.

(10) This, I believe, is correct.

(11) Perhaps some non-bee-keeping reader has already picked upon this as some of the stuffing that ought to be got rid of. I am not ready to consent. I think there is sometimes a genuine readiness to shield the queen by putting themselves in front. It is true, that when a frame is taken out, both queen and bees at times seem to take pride in behaving just as they do in the hive; and you pick up the queen without any one's so much as saying "why do ye so?" But let them be a little suspicious and excited, and you grasp at the queen and suddenly find workers in the way. Am I right about this, friend Root? You have handled many more queens than I.

(12) This doctrine is what is called Pantheism. It is still a very attractive form of belief for those who want a religion for the intellect, that can not by any possibility touch the heart anywhere. It is certainly very remarkable that the qualities displayed by bees should be chosen as a chief evidence that God is incarnated in all creatures.

(13) This strikingly shows how near beneficent truth and destructive error can come to each other. Few can deny that these lines sound plausible as well as beautiful. But, the God of the Bible is *present* among all things. The pantheist's God is an *ingredient* of all things. The God of the Bible is a person, and can be loved. The pantheist's God is scarcely more than a bi-chemical; and chemicals can neither love nor be loved. Pantheism is a very ancient doctrine; and the passage of Scripture found in I. Kings 19: 11, 12, is probably intended as a direct denial of it. Pantheism tricks us with a promise of future life; but anon we discover that our future condition is to be neither more nor less than what it was ages before we were born. Pantheism is a beautiful guess, unsupported. Christianity is a beautiful system with evidence behind it. Notice, also,

that Virgil avoids saying that he believes the doctrines as he recounts them. It is but just to remark that there are two forms of this doctrine. The milder and less objectionable ones tries to preserve some personality to God by considering him as the soul of the universe, and all things else as different members of his body; but, unless I am sadly astray, both forms tend inevitably to slide down into atheism.

(14) That is to say, when a snake is hatched from the egg, a small portion of God becomes an ingredient of him; and when a child is born, a larger portion of God becomes an ingredient of him. When the snake dies, the divine portion goes back again to its former place, as an atom of vapor goes back to the ocean; and when the child dies, the divine portion of him goes back, as a raindrop to the ocean. The ancients were inclined to speculate on man's having more than one soul, which probably accounts for the curious plural here.

#### LAST MONTH'S COMMENTS.

I did not for a moment mean to deny, or even ignore the method of reducing thin honey cited from A B C. I thought of it at the time, and was on the point of mentioning it. I was restrained by the thought that Virgil had mentioned only the fanning, and that, as commentator, I had best not branch off and talk all over the subject.

The reduction of thin honey to a condition in which it will keep is one of the most difficult parts of their work, although this particular difficulty is seldom thought of. Witness the fact that thousands of species of insects visit flowers and gather nectar; and yet the hive-bee stands almost alone in the ability to keep it in any quantity. Several means are resorted to. First, the nectar of many species of flowers, for having poor keeping qualities, or for being too thin, is left to bugs and flies, *except when there is a dearth and they want a little for present use.* Second comes the means you mention. The bee, having filled his sac with the best nectar within his range, the urinary tubes commence drawing off the water of his blood, and throwing it away, while the water of the nectar in the sac passes through and makes good the loss. I judge from the plate in Cook's Manual that the urinary tubes of the bee are quite large compared with the size of the insect. For obvious reasons this process must come to a full stop at nightfall. To take its place comes the third means which I spoke of last month, — evaporation from their bodies, percolation from the sac going on as in the previous method. Fourth, the liquid is put in open cells that some more of the water may evaporate. A fifth means is also claimed. The principles of attraction, they say, draw the heavier portions to the bottom of the cell, while the more watery portion occupies the mouth, and is taken off by drones and others for current use. With all the means in operation they often get some of their precious sweets damaged, as one may readily notice by tasting of their unsealed honey after a few days of showery weather. Fresh rain water seems to be one of the greatest provocatives to fermentation.

I do not wish to be dogmatic, although, to save verbiage, I have left out qualifying terms in the above. Let the reader sprinkle in the perhaps and may-bes to suit himself. E. E. HASTY.

Richards, O., Aug. 8, 1883.

Friend H., I follow you without trouble, and indorse all you say until you come to number ten. I do not quite understand

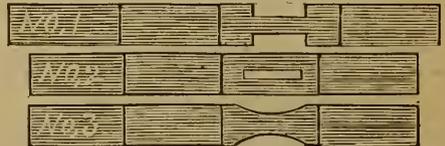

about the bees raising their queen "off on high." I know that bees sometimes press around their queen and raise her up from the comb in a bunch or cluster. Perhaps this is what you and Virgil mean. And in the same connection I can answer your query at the end of No. 11. I have seen bees, after the honey-flow had ceased, seem furious when I attempted to take hold of their queen. She would run and try to hide, and great droves of them would follow after her and cover her up; and when I did finally get her out I was rewarded by getting my hand covered with stings. Colonies having a dash of black blood are most apt to do this; and if I remember correctly, full-blooded blacks sometimes resent any attempt to capture their queen. — In regard to my comments, no apology is needed at all. Your explanatory notes are all right just as they are, and we do not want any "verbiage." We know you, friend Hasty, and know that you are an honest worker to dig out the truth; and we feel so thankful for what you did get out, that we have no disposition to find fault with what you did not get; and if you did not get hold of the wrong thing now and then, you would be more than human; and if that were the case, a lot of us would be jealous of you. So go on, and do not forget that you are among a crowd of good, kind friends.

#### SOMETHING MORE ABOUT ONE-PIECE SECTIONS.

HOW LONG HAVE THEY BEEN PRACTICALLY IN USE?

**S**INCE Our Homes was written I have seen my attorney, and he has furnished me the following letter from friend Fiddes, for publication:

*J. A. Osborne:* — As you request me to give particulars regarding section honey-boxes made of one piece of wood, I will say that I gave a description in GLEANINGS for April, 1876, of a box that I then made. I know that it was the first that I ever heard of made of one piece of wood. I inclose you 3 pat-

ONE-PIECE SECTIONS MADE IN 1873, 1876, AND 1877. terns of boxes that I made of one piece. You will find them No. 1, 2, and 3; No. 1 I had used for three years before 1876; No. 2 I had used for one year before 1876; No. 3 I made in 1877. Nos. 1 and 2 are made of strawberry-case covers, ripped into narrow strips, and sawed at the corners half through, as described in GLEANINGS, much the same, or so near that it would take a smart man to tell the difference between the ones now made and patented by Jas. Forncrook and others; for when my little girl saw in the bee magazines the one-piece sections she said, "Oh pa! they are making your frames for honey now." The No. 3 is made of strawberry boxes, of one piece also, but much thinner stuff, which I now almost entirely make, as they please much better.

I do not know of any one in this place using the same one-piece sections but the Rev. Mrs. Cotton.

I made some 100 for her some years ago, and she made the rest herself after that; but she is now in Florida.

If I can find any more soon, I will let you know.  
Centralla, Ill., May 11, 1883. ALEXIS FIDDES.

Friend Fiddes, we bee-keepers surely owe you a vote of thanks for your invention. I presume your letter which was given in our journal was what turned the attention of so many to this subject; and as it appeared so long ago in public print no one can very well say the matter was not fully understood by bee-keepers generally; and for one I feel like saying, "Many thanks."

We have also, in addition to the above, the following from friend McGonnell:

*Friend Root*.—I have not heard from my brother yet; he is in the oil regions somewhere, and hard to reach; but the latter part of the year after I sent him the plank, his shop burned down, and the coming winter he lost all of his bees, so it is doubtful if he ever made any of the one-piece sections. From what I can understand from your letter, Fornerook claims cutting the entrance in the plank before ripping up. Now, if that is the case, I think we have something of some value. I made sections in the spring of 1875, and I always cut the entrances in the plank before ripping up. I followed that plan up to the spring of 1879. I have the bits that I cut the grooves with yet, and I think I can furnish some pieces of the sections that I cut eight years ago. I have some that I cut 6 years ago, which I will send you. The pieces that I send you were on a hive that I had at the Pennsylvania State Agricultural Fair at Erie, in 1877. You ask me how much you would have to pay me besides my expenses to come and make deposition to what I know about the case, to which I shall say, nothing besides expenses, which would include railroad fare and board while there. I would not ask that if I could afford it. If what I know is of any value to you, let me know, and I will do all I can for you. J. MCGONNELL.

Waterford, Pa., Aug. 13, 1883.

Many thanks, friend M., for the facts you give, and also for the kind offer of services without any charge for your time. Should we need you, I will most gladly avail myself of your offer. Mr. Fornerook does not claim any thing in particular; but it is the combination; and the entrances for the bees without being cut clear across the bottom-piece is one of the special things enumerated.

---

### MRS. LUCINDA HARRISON.

TAKING BEES TO CHURCH; HER TRIP TO NEW YORK CITY, AND WHAT SHE SAW.

**B**RO. ROOT:—I never take my bees to church with me; but I certainly should if I left them during the swarming time, with no one to care for them. I know a bee-keeper in a small town who persists in going, and the services are hardly commenced before some of his neighbors come in and inform him that his "bees are swarming." The congregation nudge one another, and with knowing looks whisper, "His bees are swarming." This disturbs and diverts the attention of the audience; and would it not be as well for him to remain at home four or five Sabbaths, or take turns with other members of his family?

A minister came to me last summer saying, "I'm afraid I shall lose my bees while we are away at church; we all go, and I'm not willing that any one shall stay and watch them." I told him to get Jones's queen-guards, and put them on while they were at church, as he had but five colonies. He did so, and told me since that he lost none.

I'm in New York City, and all the way here I was watching for bee-flowers, and did not see enough to make a bouquet until I reached New York State, where goldenrod is blooming plentifully. There is a drought all the way, and the corn is small, some not more than a foot high, while again it is in tassel. While it is of good color, and very clean, it does not appear as though it were going to have cars.

When I went into the "Ladies' Waiting Room," at Indianapolis there was a lady there who had a dog tied under her seat. He was a white bull dog, with a stumpy tail. He had been taught his manners, and was very well behaved, and seemed to think it was his duty to protect his mistress. I asked the lady if he traveled with her in the passenger car. She said, "Oh no! He was tied in the baggage car, and I had to pay for him." Poor fellow, how lonesome he must have been out there! I took the cars pretty soon again for Cleveland; and when we stopped at a town, two young men came into the car cursing and swearing. They had been playing with "brain thief," and he had stolen almost all the brains they had. When the conductor came along, I told him that my ticket was "1st Class," and I didn't think I was getting what it called for, when I was put into a car with drunken, profane men. He quieted them, and I noticed that they occasionally stole a glance at me. How much better the dog would have behaved than those drunken fellows!

When we came through New London, Ind., I saw a very pretty home, and I thought I caught a glimpse of bee-hives as we bowled by. Do any of the juveniles live there? I hope so; and these were all the hives I saw on the journey, though I looked for them all the time. We came pretty fast, though; from Cleveland to Buffalo there is a double steel track. Why! the tops of the rails are as bright as our knives and forks. What pretty homes you would have, if you could grow flowers as beautiful as those in Cleveland park on the lake shore. I hope our bee-children will some time enjoy as delightful a ride as I had from Cleveland to Buffalo, with the pure lake breezes coming in at the windows, free from smoke.

MRS. L. HARRISON.

New York, Aug., 1883.

Thank you, Mrs. H., for your good advice in regard to going to church during swarming time. I presume the children know it as well as the older people, that where a person wants to do any thing he can generally find an excuse for doing it. If any one wanted an excuse for staying home from church, I presume the need of looking after the bees would make a very good one. But suppose, children, a person wanted an excuse for going to church when he knows very well that he ought to be at home. How would it be then? Our religion ought never to lead us to neglect duty, for the whole spirit of it should be right to the contrary.—I am very thankful that Mrs. Harrison gives the idea of Jones's entrance-guards. I think very likely they would control the bees, until church is out, any way.—Another thing: I do not believe I should have very much fear

but that the boy or girl would prosper who loved God and his holy sanctuary more than they loved their bees.—I am very glad, Mrs. Harrison, that you had independence and courage enough to talk right out to the conductor. If more people would talk right out and remonstrate about these things, conductors, as well as passengers, would soon be under the necessity of doing something.

### FEEDING EXTRACTED HONEY TO GET THE BEES TO STORE IT IN BOXES.

#### A CAUTION.

**I**T is very dry here. Bees are not doing any thing just now, but trying to rob one another. I tried to feed back some extracted honey to one hive, to get them to store it in boxes, but the robbers came and took the hive by storm, killed the bees, and cut the combs out of the frames.

WILL A. HAMMOND.

Richmond, Va., Aug. 10, 1883.

Friend H., your experiment turned out just about as I should have expected, unless you took very great care and watched the matter closely. We are having quite a drought here now, and the bees are getting in a mood where it is a little dangerous to let them get started, especially on pure honey. If you are going to feed to get them to store it in boxes, or even to get the boxes filled, you want to choose a strong, vigorous colony—one about whose entrance a robber would hardly dare buzz. The entrance even then should be made pretty small. The hives should be so tight that no crack or crevice can give outsiders a "sniff" of exposed honey on the inside. While I think of it, there is something queer about this. A dish of honey in the hive will attract robbers, while the same quantity in the combs, even though it be unsealed, will occasion no disturbance. I have used a Simplicity hive made three stories high, for the purpose, or a chaff hive will do very well, if you have your feeder in one side of the upper story, and the frames of sections to be filled, on the other side. In the latter case you will have to be careful that the bees do not build combs around or in the feeder. The cover to the hive must fit so closely that no bee can by any possibility squeeze under it. The lower story should be pretty well filled with brood. In fact, I would remove all the combs of honey, and leave only those that contain brood. Put the frames of sections in the place of those you took out, if you choose. Having it all fixed, now commence feeding moderately. Feed at dusk, after the bees have stopped flying, and be careful about opening the hive at any time during the middle of the day. If a single bee should dodge in under the cover, get his fill of honey, and then slip out of the entrance, it would be pretty sure to start a muss. Do not let any single bee do this. I suggest that you feed moderately at first; because if it comes on the inmates of the hive too suddenly, they will gorge themselves with the honey, in which condition they are unfit to repel robbers; and a good strong colony may be injured, if not destroyed, in the way in

which yours was. However, it can be done safely if you work slowly and carefully. Take one colony first; and when you make a success of this one, commence again with the others, and so on. I have been thus particular, because many times quite a profit can be made in feeding back extracted honey, especially when comb honey is worth 18 to 20 cts., and extracted 12 to 14. Perhaps it were well to add that, before you can get much honey in the sections, you will have to feed enough to get the brood-combs crammed full, and bulged at the corners and ends of the frames. These remarks, of course, are for localities where they have a drought, and no honey is coming. Where bees are gathering honey, of course you do not want to draw their attention off from it, by feeding them in the hive.

### SOMETHING FROM OUR FRIEND GEO. GRIMM.

#### HOW MUCH VENTILATION WHEN BEES ARE STORING HONEY, AND OTHER MATTERS.

**F**RIEND ROOT:—As I do not want to make a full report (accurate records and inclination both lacking), but still don't want you or any other bee-friend to believe me lost, I will write you a letter, and you may print *that* if you choose. I have never kept an accurate account of all the details of my bee manipulations. It is sufficient for me if I know at the end of each season exactly what my net profits are; and this I usually do. I work my bees for profit exclusively; and during the busy humdrum of the summer season, bee-papers are quietly laid aside, with scarcely a glance for things of importance. With the sole object of profit in view, you will hardly wonder that reports, discussions, theories, and advice to beginners, do not interest me. True, sometimes a very bad error, a one-sided view, or theories and deductions entirely contrary to my experience and observations, will at most draw out an answer; but I always think better of it, and let others judge for themselves, as I do.

How long this letter will be, or how many points I shall bring up, now that I am started, I don't know; but one thing I will endeavor not to forget, and that is a criticism on *you*. But wait in suspense a moment till I tell you a little about how things progress here.

Last season I wintered in over 500 colonies; just how many, I don't know; but it was over 500. Outdoors in chaff hives, I had 35. In the spring, when I brought those in the cellar to their summer stands, I found dead in one cellar eight; in another, three; and in the other, one; a total of twelve, or about 2.25%. I lost about that many more during the spring. Those outdoors did not do as well, owing in part, however, to lack of seasonable attention in the fall. There were, if memory serves me right, 17 weak or dead (mostly dead). And now right here let me tell you that, though I do not, as a rule, go much on luck, I am sometimes inclined to believe that, as a matter of fact, that element enters frequently as an important factor, and that I am frequently more "lucky" than prudent. Let me explain:

It happens to me of late every year, that about this time business demands my attention in Dakota; and I am frequently unable to return till within a week or two before the time when bees should be

cellared. I can not, therefore, give them the attention and winter preparation considered so essential to successful wintering. What feeding there is to be done is done late, and in a rush. Brood being scarce, queenless colonies often go in with the rest; and weak ones are rarely doubled up. Last fall my bees received no attention whatever. I saw that they were supplied with honey sufficient to carry them through to spring; then I hurried them into the cellars. Those in chaff hives needed considerable feeding, but it was too cold; so I watched my chances during the winter. To this winter feeding the loss is probably in a great measure attributable. And yet, in spite of these facts, those in the cellars wintered well. They were strong in spring, even stronger than usual; and had not the severe and protracted cold weather during spring checked brood-rearing, they would have eaten up their stores far too soon for my satisfaction.

Of course, summer management has a great deal to do with the condition they are in the fall; and raising comb honey, as I do, leaves them in better shape than raising extracted. Yet I feel that, as with many others, a great deal often depends upon luck; and it would not surprise me if some of our most successful winterers would some time come out at the "little end of the horn." I make this prediction now while my record is good, so that if, at some time, bad luck does overtake me, you will know the cause of it. The fact is, that, though we know the requisites to average successful wintering, or think we do, we are not always able to do that which we wish to; and often, too, are careless when we could do better.

Speaking of carelessness reminds me of your answer to Mr. Langstroth's letter; and I feel, with due deference to you, like offering an apology to Mr. Langstroth for differing with one so pre-eminently above me in knowledge and experience; and yet, if I understand him rightly, I agree rather with your answer. It is impracticable with me; it would take too close watching; I am too careless, perhaps; have too many to look after, and scattered too far over the country; a very heavy flow, or a sudden dearth of honey like this year, would demand quicker attention than I am always able to give them; besides, I am convinced it *doesn't pay*. The bees do not work as well, or seal as quickly, near the opening. The latter may not be objectionable to some; but to me it is, for I want my honey sealed before extracting. In fact, I never extract during the busy honey season, but simply give more room. I thank Mr. Langstroth for his kind recognition of my father, Adam Grimm; the more so, since I remember so well the high estimation my father had of Mr. L. to the bee-keeping world. He is right when he says my father condemned as inferior the hives used in his mother country. In fact, I have frequently heard him remark that *no* hive that he has ever tried (and they were many) could nearly equal the "Langstroth." And as to bees above the tops of the frames, and plenty of air above, I will say this: He was quick in his manipulations, and cared little for labor when connected with bees; but he kept the cover raised for the sake of *ventilation*, and allowed openings around the honey-boxes for that purpose. But he did not do that in later years, and I'll tell you why. When he got so many bees, it became impossible to get around in time to prevent building inside of the cover. That this could not fail to happen in those days when the honey-flow was sometimes so great

that the bees built comb and filled it with honey *outside the hive* in the portico, you will readily understand; and when we got to lifting off the covers, and found every space between boxes and cover filled with honey, and dripping, well, it was provoking; the blessing was too great.

But that was not the only reason why he shut down. In those days we used the glassed boxes, six to the L. hive, and the bees in an ordinary honey season would not seal as well near the glass, especially when the cover was raised. So he first reversed his boxes, and placed them glass inward, and found that *they sealed better*; and finally he also shut down the bees out of the cover, and was better satisfied.

For my part, I say as you do, friend Root: Bees work better where every thing except the entrance is tightly closed and dark. Where ventilation is needed, shade is all that is necessary. The little extra work of lifting off a cover is well paid for.

A while ago I read an article from Mr. Heddon upon overstocking, and somebody's reply. I wanted to answer then, but did not get time. It is an important question to those bee-keepers who are obliged to keep a number of apiaries; and when I get time later along I will "chip in" a trifle to the general fund of experience for GLEANING'S readers. Perhaps I shall to some extent draw upon my father's experience as well as my own.

Well, now, I forgot that I promised to lecture you, and my letter is already too long; but, wait! it will keep and some day you'll hear it.

A word about the season, and I will shut up. It is poor. White clover, medium; basswood, almost a failure. But still a fair credit balance will be chronicled at the end of the season. GEO. GRIMM.

Jefferson, Wis., Aug. 13, 1883.

Now, friend George, that is really tantalizing. You start by saying you are going to criticize me, and keep me shaking in my shoes until I get to the end of the article, and then very coolly declare you haven't time, because your letter is too long! There is one satisfaction in it, after all; and that is, that you will have to write again for us; because if you do not, ever so many will be inquiring what it was that I had done that was wrong. I am very much obliged indeed for the results of your experience in regard to keeping the apartments closed where honey is being stored. This is indeed a most important matter, and I hope honey-raisers will give us their experience quite freely in the matter. I hope that our good friend Mr. Langstroth will not feel hurt at all, even if we have given our objections to his plan so freely.—A word about succeeding by luck, as you express it: I know that we often succeed because we have neglected something; but, of course, you would not recommend developing that system of management.

## DRONES THAT CAN STING.

SOMETHING NEW UNDER THE SUN.

**I** SEND you a cage containing bees. Look at them, and see what you make of them. We have been taught that drones could not sting; but if there are not some bees in the cage that have drone heads and bodies, with stings, then I am mistaken. I also put in a few worker bees from the same hive. There are some of them that have worker bodies

with drone heads. They are from a young queen whose bees are just hatching. I found them out on the ground, and saw bees dragging them out of the hive about noon to-day. It seems that some of them have queer marks. I don't think that I ever saw any with the light spots, or rings, so near the end of the body before. I have killed 2, as above, and found stings. I could see them plainly, but could not see any proboscis, or organ for gathering honey.

M. L. SPENCER.

Little Genesee, Alleg. Co., N. Y., Aug., 1883.

Friend S., you are right in one respect at least. The bees you send have drones' heads and the worker bees' sting, and some of them have a queen's body. But they are nothing more than a queer malformation, or freak of nature. The queen is a curiosity indeed, and I would advise you to keep her, to furnish specimens of these "three in one," for the benefit of entomologists and others who may be interested in such matters. The most lively one in the cage looks like a very fair queen, until you give her a very close inspection; and then you see she has a drone's head, and the three distinct bands of an Italian worker. Some of these have the fourth and fifth band, something after the fashion of a hybrid queen. We will forward to Prof. Cook the specimens you send, for further remarks, if he thinks proper.

#### A "REPORT ENCOURAGING" IN A DOUBLE SENSE OF THE WORD.

A WONDERFUL INVENTION COMMUNICATED BY AN A B C SCHOLAR.

**D**EAR friends, I may be mistaken, for I have been mistaken many times; but the closing part of the letter below seems to indicate an advance in queen-rearing beyond any one step heretofore made. As my eyes ran over the pages, my memory ran back at galloping speed to the time when I proposed doing the same thing by having the queen-cell in the hive covered by a wire cage. Those who have taken GLEANINGS since its infancy will remember the reports I have given on the subject. Quite a number of the queens hatched were kept caged until they were six or eight days old, then allowed to fly, and a few of them were fertilized, and caught before they got back into the hive. They were introduced immediately, and did good service. The principal trouble in the experiment was the mischievous habits of the young bees. They will reach through the cages and get the queens by the leg or wing, and thus worry them. And they also worried them after they came back from their excursion, unless they were watched constantly. Now, then, the friend who writes below tells us of dispensing with bees entirely, by a bold stroke. But we will let him tell it.

The honey season has thus far been very good here. From my five colonies in the spring I now have 14, and have taken off 391 lbs. of honey, about half comb and half extracted. Several about here have taken over 100 lbs. per colony. I visited Mr. L. D. Ormsby, of Pierrepoint, on Saturday last, and found him the same genial, good-hearted young man as usual. He has 97 swarms at present, and

about 8000 lbs. of honey, two-thirds of which is comb. Mr. O. is a live, wide-awake bee-keeper, and will make a big report this fall.

#### SOMETHING NEW ABOUT QUEENS.

Some time ago friend Phelps had some queen-cells about ready to hatch, which he carried in the house, and put under some tumblers. They hatched out; and when I saw them they were one or two days old, and seemed to be taking care of themselves all right. I suggested to friend P. that he let them fly some fine day, and see if they would get fertilized, and return to the tumblers; so one fine morning they were turned loose. They flew away, and were gone a few minutes, and returned to the window, both fertilized. Now these two queens had been entirely alone from the time they were hatched until they were fertilized. I wish I could tell you more about them, but I can not at present. Mr. O. S. Bugbee has one of them, or did have; perhaps he will tell us more about the one he has. The other, I believe, was lost.

H. H. PEASE.

Kingsville, Ohio.

Now, friends, how many of you will hatch queens, and get them fertilized, without being put into the hive at all, before another number reaches you? The principal difficulty will be in keeping these young queens at the proper warmth, without any attendant bees. They must also be fed on fresh honey, right from the hives, and some should be ready for them when they first get home. This will make it necessary to look out for robbers where the honey-yield has ceased. I once thought of letting the queens loose, one at a time, in a hive of drones. The drones would not worry them much when they returned; but as drones would not protect themselves from robbers, I was obliged to look for a location where no robbers would interfere. Of course, to have queens get fertilized and get back quickly, we should want a great army of choice drones flying at the time. One man could easily look after 100 queens under their respective tumblers. I presume it would make no difference if they got into the "wrong box," providing the manager took care they did not get to fighting. After a queen returns with marks of fertilization, she is ready to be introduced at once, where a queen is needed. Perhaps it would do to ship her at once with a lot of young bees taken from some very gentle queenless colony. Now, who will report in regard to this wonderful short cut?

#### DO RAILWAY CARS GO 60 MILES AN HOUR?

INCONTROVERTIBLE SUBSTANTIATION OF THE MATTER.

**I**HAVE just read Doolittle's article on bees flying 90 miles per hour. In your remarks you seem to doubt that railway trains ever do run 60 miles per hour. I have had over 15 years' experience as telegraph operator, and in the employ of several of our principal trunk lines, in positions where I was obliged to keep a record of time and speed of trains. I most cheerfully corroborate Mr. Doolittle. There are one or more trains on each of the great trunk lines of the United States (N. Y. C., Erie, L. S. & M. S., B. & O., etc.), whose card time is 45 miles per

hour; this includes stopping at stations. It is impossible to make this time, unless every advantage is taken of every straight piece of track that is well ballasted, and safe every way; then they do run 60 miles and over per hour. I have ridden a mile a minute many a time. If you want to do something that is real exhilarating, sit on the front of a locomotive; sit on the pilot, and let your feet hang down; hang on to this brace. Here we go; you won't fall off—you can't; the wind holds you fast to the boiler-head. You can scarcely raise your eyelids; the fence is a gray streak; the telegraph poles look like the teeth of a fine comb. What is that ahead? Smoke! a train! Oh! why doesn't he stop? Will any one know me when I'm gone? Swish! there! it was on the side track, after all. There, Johnnie has shut her off. Hear the valves click, right in your very ear. On go the air-brakes. Why! he is pulling the engine out from under us; hang on. Now we have stopped, sure, and there are Ida, Edith, Laura, Maude, and the rest of them. You laugh, and laugh; you can't stop laughing. Why, Mr. R., what is the matter with you? Small boy, *sotto voce*, "He's drunk." Yes, drunk with excitement. You won't forget it for many a day. J. J. LAWRENCE.

St. Mary's, Ohio, August 8, 1883.

**THE NATIONAL BEE-KEEPERS' CONVENTION TO BE HELD IN TORONTO.**

Some suggestions from friends Poppleton, Cook, Jones, and others.

ARRANGEMENT FOR REPORTS FROM VICE-PRESIDENTS, ETC.

OUR friends will notice that the following letters were addressed to different individuals, and the whole of them sent to me for publication. I think the idea an excellent one, to have some previous arrangement in regard to these reports from different States, and I am sure that our people will all turn in and help in regard to the matter of furnishing statistics, or whatever other matter may be asked for.

Friend Jones:—What is the arrangement about reports from vice-presidents of our society at its next session? Are they expected to present reports from their respective States, or was the report from the Committee on Statistics intended to take the place of any from the vice-presidents? I find the statistics business a difficult one to do much with. Last year I issued a call through the journals, asking bee-keepers in our State to send me reports so I could make some kind of a report to the society; but I received only 15 or 20 reports from the entire State—just enough to give some idea of the season's operations, but not enough to be at all valuable. Now, if it is the intention to have vice-presidents report, would it not be a good plan for your ex-committee to have published in the different bee papers between now and the time of meeting of the society, a request to all bee-keepers to send reports to their respective vice-presidents, giving, at the same time, a list of the vice-presidents with their P. O. address, and a short list of questions to be answered. These last to be just as few in number as possible. I simply suggest this matter to you, hoping that some course will be pursued that will secure more uniform and more general reports.

We are very much afraid we shall not be able to get to Toronto this fall, but will do so if possible. I wish you would keep me posted in regard to excursion rates, etc. O. O. POPPLETON.

Williamstown, Iowa, July 16, 1883.

Prof. A. J. Cook:—I think that the way friend Poppleton suggests is the best method of getting statistics. It is a hard matter to get a satisfactory report. I inclose friend Poppleton's letter; add any suggestions you think would be advisable, and forward all to friend Root, who, as secretary, can prepare the questions and see to their having publicity through the journals. This should be done at once, as the time is now very near. Prospects bright for a good time. D. A. JONES.

Beeton, Aug. 4, 1883.

Friend Root:—I like this. I would also suggest that each vice-president be requested to correspond with reliable, candid apiarists, in the different parts of his State, as to season and crop. He can thus give a fair judgment. A. J. COOK.

The names of the vice-presidents as we had them at the Cincinnati Convention last year are as follows:

VICE-PRESIDENTS FOR 1883.

A. E. Manum .....	Vt.	J. D. Davis .....	Mass.
G. M. Doebble .....	N. Y.	J. A. Vandervort .....	Pa.
J. Hasbrouck .....	N. J.	F. Della Torre .....	Md.
J. L. Bowers .....	Va.	Dr. J. P. H. Brown .....	Ga.
W. S. Hart .....	Fla.	Dr. O. M. Blanton .....	Miss.
Paul L. Viallon .....	La.	J. T. Wilson .....	Tenn.
Rev. S. Johnson .....	Ky.	Dr. H. Besse .....	Ohio.
Prof. A. J. Cook .....	Mich.	J. M. Hicks .....	Ind.
Dr. C. C. Miller .....	Ill.	Christopher Grimm .....	Wis.
O. O. Poppleton .....	Iowa.	E. M. Hayhurst .....	Mo.
Peter Scoville .....	Kan.	W. Muth-Rasmussen .....	Cal.
W. K. Marshall, D. D. .....	Tex.	Judge Harriman .....	Ark.
James B. Mason .....	Maine.	Harry Hammond .....	S. C.

Will the above friends please take notice of what is expected of them, as indicated in the letters above? In regard to the questions mentioned, we do not know any better ones to suggest than those used by friend C. C. Miller on page 26 of our last Jan. No.

SUGGESTIONS TO THOSE WHO MAY BE DESIROUS OF VISITING NIAGARA FALLS.

Friend Ellis has kindly furnished the following facts, which we condense from his letter, for the benefit of those who wish to take in Niagara Falls, in going to and from the Convention:—

It is 35 miles from the Falls to Toronto by boat, and 15 by rail. Those crossing the river at Ft. Erie, and taking the Mich. Central from Buffalo to Niagara, will have a fine view while passing. If you come by the Suspension Bridge, from New York, you will cross that to Niagara Falls town, two miles from the Falls. When at Niagara Falls town, Can., you can take the Grand Trunk road to Hamilton, and then change cars for Toronto; or you can take the Mich. Central to Niagara, then boat to Toronto. The Whirlpool is one mile below the Falls, and one mile from the Suspension Bridge. A word to the wise: If you wish to go sight-seeing at the Falls, always pay your money before you go, or you will pay more than you expect to when you come out. I do not wish to say that there are no honest men there; but if you do as I say, you will be one to say that you were well and fairly treated while here.

WILL ELLIS.

St. Davids, Ont., Aug., 1883.

Friend E., we are very much obliged to you indeed, and many will doubtless profit by your kind hints.

Stand fast, therefore, in the liberty wherewith Christ hath made us free.—GAL. 5: 1.

We will pay 10c each for March GLEANINGS for 1884.

REMEMBER the date of the Toronto Convention, September 18, 19, and 20.

We have as yet received nothing in regard to half fare to the National Convention at Toronto. We hope to be able to state definitely in regard to it in our September issue.

### WAX.

WAX is now offered so plentifully that we can pay only 28c cash, or 30c in trade. As quite a little which we have in stock cost us 32 and 33c, we can not sell for less than about 34, and save ourselves.

### FOUNDATION.

We have foundation now in stock, ready to ship by return mail, express, or freight, and are very glad indeed to see orders, either large or small. For that matter, we are now prepared to fill orders for almost any goods.

### HONEY.

We are well supplied with a nice article of extracted honey that cost us about 9c per lb., and we could not very well use any more unless we should extend our trade by an offer of still lower prices. If any one should have any nice extracted honey that he could deliver to us as low as 8c per lb., we could perhaps use it, but would not care for any more at a higher rate.

LEST some of our readers do not have our Jan. No. on hand, we reprint friend Miller's proposed method for sending in statistics on a postal card:

F. Torrens, East Liberty, Pa.  
 21 colonies in fall of 1882.  
 18 " " spring of 1883.  
 25 " " fall of 1883.  
 400 lbs. of comb honey.  
 300 " " extracted.  
 3 " " beeswax.

### A SUCCESSFUL IMPORTATION.

DAY before yesterday we received 50 imported queens, of which 48 were in splendid condition. They were all introduced by the Peet cage, and at present only two have been lost. Two of the 48 were laying the next morning, which is something I have never known before; viz., a queen that had crossed the ocean to be found laying within 24 hours, or

less, after being put in the hive. Present orders would take almost every one of these queens at once were it not that the greater part are for select, or \$6.00 queens; and there are not more than twelve in the whole 48 that will come up to the standard. However, another 50 will be in shortly, and still another 50 soon after. Unfortunately, the greater part of our orders are for best grade. So we can send you a fair queen at once if you want one.

### FOUL BROOD.

TWICE lately I have found specimens of foul brood lying on the table where the mail is opened, near an open window. If one of our bees should have happened to come and get a sip of it, where do you suppose our apiary would be, kind friends? Now, please do not send any more foul brood to me. I am not a judge in the matter; and if I were, I should not want it sent here. Mail it to friend Muth, who knows more about it than I ever expect to (at least I hope so), and he will tell you whether it be real foul brood or not.

### OUR NEW FACTORY.

THE floors are down, ceilings mostly in place, and the masons are at work to-day plastering. The men who are to put in steam arrangements for warming both our old and new factory are expected here this week. Instead of doors to the rooms, we have passageways under broad brick arches, so that the crowds of clerks can pass to and fro without getting in each other's way. Mr. Gray has been away up to Saginaw, hunting up pine and basswood lumber, and we are now making preparations to enable us to be ready for the siege when it opens next season.

### MAPLE SUGAR.

We purchased so largely last spring that we have quite a quantity of maple sugar on hand unsold. We now offer the best for 12c; next best, 11; fair, 10, and poorest, 9c. As we sell any of the grades one cent less where a barrel of about 200 lbs. is taken, this last grade costs only 8c. It is pure maple sugar, but rather dark. This grade answers nicely for feeding bees, for the purpose of keeping up brood-rearing, or rearing queens, etc. All you have to do is to lay lumps of it on the tops of the frames. It will be taken up quickly, and yet the bees are not so eager for it as to incite robbing, as almost any kind of honey is sure to do. Very nice maple molasses, in tin pails holding 3½ quarts, 90c. As this was soldered up just as soon as made, it should be little if any inferior to that fresh from the camps.

### BLACK AND HYBRID QUEENS FOR SALE.

INASMUCH as it hardly pays to buy and sell queens for less than a dollar, we have decided to let all those who have blacks or hybrids that they will furnish at a uniform price of 25 and 50 cents each, to do so, under this head. It will also be an excellent exercise for those who have not had experience in shipping or introducing queens, to try their hand at it in these. Here is what one friend says:

I intend, within the next two weeks, to Italianize 20 colonies of black bees. Would you like to purchase my 20 black queens? If so, at what price? Will send them to you if you want them.

J. MCKINSTRY.

Nelson, Lee Co., Ill., Aug. 12, 1883.

Who comes next? Here is one already:

Do you want any black queens? If you do, let me know at once, and send me ½ dozen shipping-cages, with sugar in, to ship them in to you.

H. H. MONROE.

Waterton, Luzerne Co., Pa., August 13, 1883.

## JONES HONEY-PAILS.

It is really amazing to see the trade that is springing up in these pails. Not only is our tin-shop going full blast on them, but since orders have mostly ceased for fdn., we have turned our wax-room into a tin-shop, and taught the girls the mysteries of melted solder instead of melted beeswax. Orders of from 300 to 500 are matters of almost daily occurrence, and to-day we received one for 1000 pails, and one inquiry for our best figures on 10,000. We still make the Dadant pails where wanted; but the covers shut so much more closely on the Jones pails, and there is no possibility of the honey leaking around the edges, while they are more easily opened than the Dadant pails, that we have mostly ceased making the latter. Jones pails can also be sealed with wax, while the Dadant pails can not.

## WHOLESALE RATES AND COMMISSION.

So many are the applications for goods at wholesale, or goods on commission, that I have decided to make a general answer here. We have no goods to send out on commission at all; our prices are not sufficient to warrant it. Neither have we, as a general thing, any better rates to give than those in our price list. On many of the goods we make, there is no wholesale; that is, if you want to sell the goods, your only way is to get machinery and make them. This applies to bee-hives, fdn., and other goods of like nature. If you want to sell fdn., you will have to get a mill and make it. We give wholesale rates on extractors, knives, smokers, etc., but the conditions and terms are all given in our price list. We can not give any better prices unless you want to purchase in larger quantity than we have there mentioned. Where a customer buys largely of a certain line of goods, and but a few of another line, we sometimes, in consideration of the large amount of money he has paid us, given him small shipments at 10s or 100s rates. But as a rule we do not deviate to anybody from the terms and conditions laid down in our price list.

Just as we go to press, we hear of excitement north, south, east, and west. The saloon-keepers in many of the large cities have formed associations, and drawn up resolutions declaring they will sell what they choose; and in St. Louis we understand they have called on business men in general to unite with them in their scheme of doing away with the Sabbath entirely, or having it a day of drunkenness and debauchery. They do not state it just in that way, but they do complain of having restrictions that should prevent any from so doing if they choose. Of course, the authorities are considering the best way of bringing these rebellious citizens to their senses, and it is possible that bloodshed may ensue. The excitement is not altogether in large cities either; for in our own peaceful, quiet suburb of Medina, a new saloon has been opened right across the track from us. They painted the house all over, and put new porches around it; and when it was completed they commenced by giving beer to whoever would take it. This is going on while I write, if I am correct. I am glad to say, however, that not a very brisk patronage is seen about, even if it does not cost any thing. I have been over to see my neighbor, and remonstrated; and as remonstrance did not avail, we are about to try something else. What are you doing in your town, my good brothers and sisters?

## ARTIFICIAL PASTURAGE.

In our locality there are only three plants that can be sown at this season so as to produce honey. Buckwheat, if sown now, will produce a nice crop of blossoms, and may ripen grain. Seven-top turnip is just in season, and we are able now to furnish fresh seed of our own rearing at 5 c. per oz., or 50 c. per lb. By mail, 18 c. per lb. extra. Bokhara, or sweet clover, if put in good rich ground, will make a nice growth this fall, and produce a good crop of honey next season. Both the sweet clover and turnip should have good deep rich soil, or the frost will pull them out during the winter. A sandy soil, or one underdrained, will be better on this account. Last spring our seven-top turnips were thrown out of the ground so badly by the frost that the smell of their decaying roots was, for a few days, decidedly a nuisance.

## LETTERS WITHOUT NAMES OR ADDRESSES.

OUR mailing clerk says the matter is getting to be worse and worse. A great heap of letters is now before us without names or addresses. Is everybody getting in such a hurry, or what is the matter? I can not think of any other remedy, except to have your name and address printed on your stationery, and I do not know but that I shall keep on talking about it until more of you adopt something of the kind. I presume gummed labels would not do, because you would forget to put them on. Even where they are written on, they are often so badly written, and the counties are so often omitted, that we have a regular standing quarrel, almost all of the time, with some one or other, because valuable goods have gone to the wrong place simply because of these omissions, or because your name or address is written so poorly that the average clerk can not possibly make it out. What shall we do in regard to this one great source of trouble and trial? I really believe I would print the addresses free of our 150,000 customers, if I could be sure they would all use them every time they write to us.

PERHAPS it may interest our friends to know what kind of a label Chas. Dadant & Son use, as I suppose it is generally known that they sell honey in exceedingly large quantities, and they were some of the first to introduce its sale in tin pails. Below we give a copy of one of their labels, only it is reduced in size, and printed all in one color. They have the border red.

11-4 Lbs. 11-4Lbs.

*NOTHING IS BETTER FOR BREAKFAST THAN HOT CAKES*

AND

**HONEY**

FROM THE APIARIES OF  
Riverside, Sonora, Nauvoo, Warsaw, and Hamilton.

**Chas. Dadant & Son,**  
PROPRIETORS AND IMPORTERS OF BEES,  
Hamilton, Hancock County, Illinois.

The candying of honey is the best proof of purity. This honey will candy if kept at a temperature of under 70 degrees. To liquify candied honey, put the pail in warm water.

CANADA ONLY. Dollar queens by return mail.  
H. SMITH, Box 102, New Hamburg, Ont., Can.

## Reports Encouraging.

**I** WINTERED 18 colonies without loss, on their summer stands; sold two; commenced with 16 colonies; have increased so far to 41 fair to good colonies, all Italians and hybrids; have taken so far 400 lbs. honey, mostly extracted, besides running a 100-acre farm; would have taken more than twice as much surplus, had I given my entire attention to the bees. I have seen a bee go from dandelion to ground-ivy flowers the same visit. My bees worked on the lilac this spring. What the species of lilac is, I do not know; it is our common kind, and the only kind I have ever seen.

North Robinson, O., Aug. 5, 1883. J. H. EBY.

I have shipped \$770 worth of queens to date.  
Mortonsville, Ky., July 30, 1883. J. T. WILSON.

Honey crop is most excellent here this year. Hives are full, inside and out, so to speak.  
Cairo, Ill., Aug. 3, 1883. M. R. KUEHNE.

We are about the middle of basswood, and are having the heaviest yield from it that we ever had here.  
Algona, Ia., July 28, 1883. E. LOOMIS.

The past year has been a very good honey season. I extracted 9 barrels of honey, and got 676 lbs. of comb honey. I have now 41 stands, for which I owe many thanks to bee papers.  
HENRY W. SCHMADAKER.

We are having a good yield of honey, the first for 4 or 5 years; but I have had my dish right side up all this time. Clover, clover, clover; I never saw it more plentiful.  
Columbus, Ind., June 19, 1883. JOS. M. BROOKS.

I have just extracted all my honey, and the "big 6-story hives" didn't do quite as well as I hoped. The average from the large hives was 16 gallons. The honey, though not sealed, was very thick.  
Wilmington, N. C., Aug. 3, 1883. R. C. TAYLOR.

### IMPORTANCE OF FEEDING WHEN THE HONEY STOPS.

I started in the bee-keeping business last spring with 2 colonies; now have 4, and have extracted 140 lbs. of first-class honey (no box); I am in love with the subject, and like to be among the bees. For a short time past the queens have not been laying much. I commenced feeding a little sugar syrup, and to-day find every cell filled with eggs. I find that feeding them a little is a first-rate thing to do, and pays well for the trouble.  
Flatbush, L. I., Aug. 7, 1883. A. N. CLARK.

I have got one patent hive, and I want to know where it was made. It is a sash hive. The sash are tipped with tin at the corners; and where they rest on the hive they have tin horns, so that the bees never fasten them, and they can be lifted out without the least trouble. Please inform me who makes them, and the price.  
Hobbs, Ind., July 24, 1883. JNO. BOYD.

Now, I really do not know whether this belongs in "Reports Encouraging," or not; but I guess it does. Your humble servant is the man who invented the frames with "tin horns" on them, friend Boyd.

### TOO MANY SWARMS TO HIVE.

Such a honey crop as this year I never had before, and I never was out of bees since 1860; but I came near getting sick from overwork, extracting, hiving and returning swarms, and cutting queen-cells. I increased to only 37 from 27, and sold and gave away only six. Swarms were no sale this year; farmers found and hived runaways from fences and bushes as they came to them, and they have been so numerous that a good many let them go again for want of time and a hive. GEO. L. HOLLENBACH.  
Noblesville, Ind., July 24, 1883.

### 12,000 LBS.

We are having a little too much rain, but it keeps the white clover still blooming finely; and with the bush, swamp woodbine, Indian corn, and sorghum, the bees are bringing in the nectar with a rush. I have taken off to date, 12,000 lbs., and extracting at the rate of 500 lbs. per day. This is the greatest country for honey anywhere to be found; but the fear of malaria will keep away many Northern beekeepers. None but the Southern salamander will try it, although I must say, on an average we have as healthful a country as anywhere. We shall soon be cut up with railroads, and then Northern men will come and prospect around. O. M. BLANTON.  
Greenville, Miss., July 9, 1883.

I like GLEANINGS well. I know the instruction I got from it was worth several times the price. I will recommend it to my neighbors. I expect to take it as long as I have a stand of bees. I started with three stands last year. I got 200 lbs. of honey, and part of it in 1-lb sections. I sold for 23 cts. per lb., and the rest we used. My bees cost me \$30.00, and I have 7 good stands at work now. I shall try to double this number by natural swarming this season. I like to watch and handle bees, even if they do sting me once in a while. I started my bees on maple sap as soon as it would run, and it did them good. They are now at work on clover, sumac, and buckwheat.  
Paola, Kan., June 23, 1883. W. J. PHILOW.

### A CROSS BETWEEN ITALIANS AND HOLY-LANDS; 382 LBS. FROM THE OLD STOCK, AND 241 LBS. FROM ITS SWARM.

I think I have the "boss" bees at last, which are a cross between the Italian and the Holy-Lands. After getting Italian queens from a dozen or more breeders, I at last got what I thought was a good strain of Italians, then I sent to Henry Alley for a select tested Holy-Land, and let them cross with my best Italians. Well, the result was I got one swarm from them last year the 11th of May, which made me 394½ lbs. of comb honey, after filling the hive, so I thought I would run them this year for extracted honey, but they would swarm, on the 21st of May; but from the old swarm I have extracted 382 lbs., and from the new swarm 241 lbs. comb honey up to July 12. How is that? O. E. COON.

Le Moore, Cal., June 15, 1883.

### BEEES IN MANITOBA.

The hive of bees you expressed to me July 6th came through in eight days. They flew very lively for a few minutes, and settled down all right. They carried in pollen in two hours after they were let loose. Some of my black bees went into their hive. They were soon driven out.

Whitewood is 250 miles west of Winnipeg, and 40

miles north of the line of Dakota. Didn't the little fellows get a long ride? I don't think there are any other bees in this Territory. I put an upper story on the one you sent me; they started to build comb this morning. The Italians are larger than common blacks, and I think will work better on the prairie flowers. JOHN HEMSWORTH.

Whitewood, Manitoba.

1000 COLONIES OF BEES, AND 50,000 LBS. OF HONEY.

As I am interested in bee culture, I thought I would let you know how they are doing in this State. Myself and brothers have 1000 stocks; think we shall get about 50,000 lbs. They are not doing well, as it has been so wet. Please write and let me know what the prospect is for a honey crop over the U. S. As I have never seen GLEANINGS, please send a copy; and if I like it I will subscribe. F. S. COONS.

Cold Spring, Wayne Co., Pa., July 28, 1883.

Why, friend C., it seems to me by the number of bees you mention you ought to have all the bee journals and bee books in the world; 50,000 lbs. of honey sounds pretty large, but I suppose this is not a very big yield for 1000 stocks, for almost any of us ought to be able to secure 50 lbs. of honey on an average. We shall certainly be very glad to send you a sample copy, and furnish you all the information in our power.

#### DECOY HIVES, AGAIN.

A few evenings ago, just about dark, we were surprised to discover a swarm of bees hanging on the limb of a golden willow, close to the house. We had no idea where they came from, or how long they had been there; but they evidently intended to remain over night, as it was then too dark for bees to see to fly. I had set a decoy hive, filled with fdn. a few days before, and had noticed bees going out and in every day, but more especially on the day on which the swarm was captured. None have been seen to enter the decoy hive since; perhaps it was that which brought the swarm. We hived them in the dark, and they are doing nicely.

LOUISA SIMPSON.

Lidcote, Kent, Ont., Can.

And so, friend Louisa, they did not go into the hive, but they did come and hang on the willow-tree. Well, I do not know but that was just about as well. May be this does not exactly belong in Reports Encouraging; but I should consider it quite encouraging if I should find a nice swarm in a similar place.

#### CONVENTION NOTICES.

##### WESTERN BEE-KEEPER'S ASSOCIATION.

The annual meeting will be held at Independence, Mo., on the 20th and 21st days of Sept., 1883. Special invitation to all bee-keepers. S. W. SALISBURY, Secretary.

The Kentucky Bee-keepers' Society is called to meet at the Southern Exposition Building, Louisville, on Wednesday and Thursday, August 29 and 30. The premium exhibition of bees and honey will take place August 28 to September 1st. A full attendance is requested. N. P. ALLEN, Sec. G. W. DEMAREE, Pres.

Our County Bee Association holds a bee fair at this place the first Saturday in Sept. The object is to exhibit and explain every thing connected with the apary. We would like to have something from you. Every exhibit will be given due credit and prominence. JOHN M. JONES, Sec. Greenfield, Hancock Co., Ind.

#### TO THE MEMBERS OF THE NEBRASKA STATE BEE-KEEPERS' ASSOCIATION.

I desire to call your attention to the liberal premiums offered by the Nebraska State Agricultural Society in Class Seven, entitled Bees, Honey, and Apiarian goods, and especially the premium of \$25 offered for the best colony of bees. The test of colonies will be net gain, and will be weighed and sealed August 28, and weighed again September 11. Each colony must be the progeny of the queen and colony on trial. All shipments in this department can be made to the Hon. B. E. B. Kennedy, superintendent Class Seven, and bees should be on the ground on or before August 27. All other articles may be entered up to noon of September 10.

M. L. TRESTER,  
Sec'y N. S. B. K. Association,  
Greenwood, Neb.

#### OHIO STATE BEE-KEEPERS' CONVENTION.

The Ohio State Bee-keepers' Association will hold a convention during State Fair week at the State Fair grounds, Columbus, O., commencing on Tuesday evening, Sept. 4. The following programme has been arranged:—

Tuesday evening, Sept. 4.—1. Greetings and organization; 2. Annual report of Secretary and Treasurer; 3. Election of officers; 4. Annual address of President; 5. General discussion of topics presented by members present.

Wednesday evening, Sept. 5.—1. Address by S. D. Riegel, on improvement in bee culture, as deducted from the season's operations, followed by discussion on same; 2. Question-drawer, and discussion on topics presented.

Thursday evening, Sept. 6.—1. Address, or general talk, by Vice-President Aaron Benedict, on the rearing and management of queens, followed by discussion on same; 2. Question-drawer, and discussion on topics presented.

Conference meetings of bee-keepers, and those interested, will also be held each afternoon at one o'clock, in Apiarian Hall on Fair Grounds.

The place of meeting of convention, to be decided at the time of the fair—probably in the upper room of Apiarian Hall.

Everybody who is at all interested in bees is invited to meet with the association; and all who can, bring articles for exhibition, as efforts are being made to render this department a grand success.

The State Board of Agriculture has furnished the bee-keepers a separate hall for their exhibits at the State Fair, with an upper room in which to hold meetings. Ample room will be furnished for all exhibits.

DR. H. BESSE, Pres.  
DANIEL SPEAR, Sec.

AARON BENEDICT, Superintendent Apiarian Hall.

## Honey Column.

#### CITY MARKETS.

The following market reports were too late for our last issue.

BOSTON.—Honey.—We quote you our market as quiet. We had our first arrival of new comb honey last week, and offer at 23c. We made a large sale of Florida extracted at 9c. CROCKER & BLAKE.  
Boston, Mass., July 30, 1883.

NEW YORK.—Honey.—We take pleasure in quoting honey the same as last issue. Prime yellow beeswax is more plentiful, with a limited demand. We quote 31@33. H. K. & F. B. THURBER & CO.  
New York, July 31, 1883.

I have 4000 lbs. late extracted honey in 200-lb. barrels; will take 10c per lb. on board cars here. F. MINNICH.

North Freedom, Wis., July 26, 1883.

I have one alcohol barrel filled with (A No. 1) clover honey. Who will make me an offer for it on board of cars at Muscod? F. L. SNYDER.  
Orion, Richland Co., Wis., Aug. 11, 1883.

We have 40 barrels of clover honey, first quality, for sale, in quantities to suit, at reasonable prices. Barrels average 525 lbs. We can put it up in any shape to suit customers. CHAS. DADANT & SON,  
Hamilton, Hancock Co., Ill., Aug. 8, 1883.

## "Forgettery,"

Or Department for those who don't Sign  
Their Names, etc.

**I**NCLOSED please find one dollar, for which please send me by return mail its worth in section-box foundation. If not on hand, any thing in the line will do, as I am in haste to prevent swarming.

Montville, July 24, 1883.

L. A. ROBERTSON.

You see, our friend wanted his fdn. by return mail, and he was in such a hurry that almost any thing in that line would do. But for all that, all he said about where he lived was Montville. Our clerks found, on looking at our Postal Guide, that there are Montvilles in nearly all the States, and therefore there was nothing more to do but to wait until he got impatient enough to write again, which he did after watching and waiting for the mails every day, I presume, for just 14 days, and then he wrote us the card as below:

On July 24th I wrote you a letter, inclosing one dollar, for foundation. I have heard nothing from it yet. Please inform me whether you received it or not.

Montville, Aug. 7, 1883.

L. A. ROBERTSON.

Well, now, the particular point of this letter comes in here: You will see that in his *card* he says simply "Montville," and not a word more; and had it not been for the fact that the office stamp on the back of the card was legible this time, we should still be as badly off as before. Had our friend even put on his county, which I have so often talked to you about, we should have been able to locate him. Once more, what are we going to do to make people tell who they are and where they live? The foundation was tied up, all properly stamped, and plainly directed, as far we could direct it, and there it was for two weeks, while he was waiting two weeks.

### DECOY HIVES AND OTHER MATTERS.

**T**HE honey-flow has been heavy and continuous thus far this year, and prospects still good.

People are getting very enthusiastic about bees in this section. Bees prospect for their new home before swarming.

#### DECOY HIVES.

Almost every one in this section of country puts hives up in trees to catch runaway swarms. As many as 50 have been reported as caught. I knew of six swarms to go into the hive, and in every case the bees were working in the hive from one day to a week before, as strongly as if a swarm were already in the hive.

After carrying a hive to the bee-house, in which a swarm had been caught, I took some sections, fastened a queen-cell and some old combs into them, and placed them so that the workers that were left out might go in. They hatched her, and she is now laying nicely.

I have been putting old combs into the new swarms; and in every case, eggs are laid in the new comb before any are to be seen in the old; however, in a few days the old combs commence filling with eggs, and all goes well. Can you give any reason for the queen not laying immediately in the old comb?

I send, for a name, a specimen of a mint. It blooms earlier than catnip, and lasts a long time; is a very good honey-plant; bee-men ought to encourage the growth of mints, etc., along hedges and fences.

C. STIMSON.

Tiskilwa, Bureau Co., Ill., July 24, 1883.

Friend S., we are very much obliged indeed for the facts you give us in regard to decoy hives. I have many times thought there was a field for invention here, and that the time would soon come when the apiarist would have the hives so prepared that the swarms that come out would be almost sure to go into them.—In regard to the queen not laying in old combs, it has been several times reported that she would lay quicker in a frame of fdn. than she would in old natural combs. I can not tell just why this is, but it seems to speak a little in favor of new combs occasionally.—The plant you inclose is the well-known motherwort, so frequently spoken of in A B C, and often mentioned in our journals.

### A BEGINNER'S TROUBLES.

THE BEES THAT WOULDN'T BUILD COMBS WHERE COMBS WERE WANTED.

**I**PURCHASED some bees of you about the middle of July, a half-pound, frame of brood, and queen. I think it wonderful how well they are doing raising brood and making comb, just as white as paper—the whitest I ever saw.

But, I am taking up your valuable time. There is one thing I do not understand. I put on the enameled cloth, as directed, and they would persist in starting to build comb on the cloth. They built a piece as large as my hand, in two days. I took it off and fastened it to a frame, and took the cloth away. They accepted it, and went to work and filled the frame, and now they build the combs up above the frame, and have commenced on the lid to meet it. I have put the cloth on again. I have found nothing in the A B C that gave me the desired information. If you will kindly tell me why they built up, and how to prevent, I would be much obliged. There were sheets of fdn. in the hive all the time, and they preferred to stick the comb to the cloth.

Groveland, Iowa.

Mrs. E. E. COLL.

Why, my good friend, you must surely have spaced the combs badly. The enamel sheet should always be over the frames for the express purpose of keeping the bees from getting up against the cover. Surely I told you that, did I not, in the A B C book? Now, if a sheet of fdn. had been at the exact point where the bees started their new white comb, they surely would have used it. The sheets of fdn. should be spaced about as far apart as bees ordinarily build their combs, say  $1\frac{1}{2}$  inches from center to center, or a little less than that. All comb-building on the inside of the frames is wax and time wasted.—I am very glad indeed to hear that you are prospering so well with your bees. When bees are building nice white combs, such as you describe, you can always be sure they are all right. Building up colonies in that way is to me the most enjoyable part of bee culture; and when I see them eager to build combs, I always catch their enthusiasm, and feel happy accordingly.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Off, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chiel's amang ye, takin' notes;  
An' faith, he'll prent it."

**W**ELL, little friends, you see JUVENILE has doubled its size this month, do you not? Well, there are several reasons why we decided to make JUVENILE as large as its "mother." The letters in regard to the National Convention could not well wait until the regular issue; besides, as many of the little folks read Our Homes, we thought it might be just as well to have that in your part of the journal; and thus, you know, we can have old GLEANINGS all bees, or pretty much all. You see, if I throw in the JUVENILE, and do not make any additional charge for it, nobody will feel like disputing my privilege of making it just as I have a mind to—partly old and partly young folks, and partly of something that will interest all classes alike. I presume it will settle down where it should be eventually, for I am a great believer in the doctrine of the "survival of the fittest," or the survival of the best, if you choose to put it so. That is why I have such firm faith that we shall soon do away entirely with saloon-keeping. The best people are all in favor of temperance. Now, if there were no God above, wicked men might prevail; but as there is a kind Father who watches over all, I am sure he will never let them prevail. Therefore right and truth must triumph finally.

Do you want to hear about Peter? Well, in the first place the friends and relatives all scold so much about his name, that I do not know but that we shall have to have a different one, and so I told them we would call him Peter until some one else gives him a better name. Do you know any nice little name for a little rosy-posy, chubby, dimpled boy-baby? If so, you can just mention it when you write. He is just now delighting himself in the knowledge of the fact that he has a pair of hands. He doesn't know very much about them yet, but he has progressed far enough to discover that his little pink thumbs are his property, and under his control; and I am sure you would just "giggle" if you could see him look a while cross-eyed at his thumb, preparatory to fetching it, by

several awkward movements, around until he can get it into his rosy, juicy mouth. If you want to please him, just call him "dood boy." He seems to take this as the tallest kind of a compliment; and sometimes he just crows when you tell him so. And I am glad to say that he is getting every day to deserve the name more and more. There, shall I let you talk now?

My papa has twenty stands of bees. He has taken 103 lbs. of honey in section-boxes from 3 swarms. He had one swarm that went away; it swarmed 5 times. He hived them three different times.

Sunny Side, N. J.

LILLIE SHEETS.

I thought I would write and tell you how our bees are getting along. We have had 15 new swarms; one swarm came out, and we hived them, and in about two hours we went out there and found a queen dead. I help my ma milk the cows.

Rock Spring, Mo.

KATIE GOUGH.

My brother and I have each a hive of bees. There was a man who lives about eight miles from our house who died from the effects of bee-stings. There are a good many bee-trees in this neighborhood.

Montrose, Ia., July 16, 1883.

JOHN E. ALVIS.

CAUTION ABOUT SAWING LIMBS OFF WITH SWARMS ON THEM.

My uncle has eight hives of bees, and a smoker. He takes GLEANINGS, and I like to read it. The Italian honey-bee is different from our native, or black bee, in color and size. One time my cousin was sawing off a limb of a tree that some bees had swarmed on, and the bees all came at him and stung him badly.

CHARLEY BEARDSLEY, age 13.

Titusville, Pa., June 25, 1883.

My pa has 24 stands of bees; my ma has 2, and I have one. I must tell you how I got them. The bees came over, and ma and I fought them with water, and that is the way we stopped them; they alighted in a little peach-tree, and ma and I hived them. Pa has one swarm that came out and swarmed 4 times—July 25, 26, 28, 29. Pa killed six young queens. I have a little pet lamb. I go to Sunday-school when it doesn't rain.

Elyria, O.

CHARLEY DRUSEDAHL, age 10.

THE BOY WHO CAN FIND QUEENS BEFORE HE IS THREE YEARS OLD.

Reading over No. 10 of the JUVENILE for Jan., 1883, I notice a piece over the signature of L. G. Hallup; this signature should be S. G. Holley, my mistake, no doubt, in not signing plainly. I read this piece to my little boy (his name is Cleland, but we call him Clelie), and asked him what he had to say in reply to your note at the bottom, and he says, "Tell Mr. Root I will show him a queen bee at the convention next fall." So I hope, if all goes well till then, to help him keep his promise. He is not yet 3 years old. He claims the JUVENILE as his bee-paper, and is very proud of it, and asks me to read it to him, and we have great chats about our interesting little pets.

S. G. HOLLEY.

New Hamburg, Ont., Canada.

Many thanks, friend H. I should be very glad indeed to see our little friend, and to have him hunt out the queens. So there will be another attraction to be considered at the convention, won't there, Clelie?

Pa has 30 stands of bees; he has the Italian bees, of which he thinks a great deal. All of his bees don't make 700 lbs. of honey. He has a smoker, but no extractor. We live in the South, where we have no use for chaff hives. I have a dog and pet sheep which I raised, and am very fond of. I love to read in the JUVENILE the letters of my Northern friends.

Alatoona, Ga. EMMA NICHOLS, age 9.

I live in the country, and go to school, and have good times. My school will soon be out, and then I shall have to go to work. My pa farms 200 acres of land. He has 18 hives of bees; he is making hives now for next summer. WILLIE PETROW, age 12.

Yocumtown, Pa.

That is considerable land, Willie, and I hope you will do your farm work as well as you write. Do you like farming better than school?

I am just a little over 8 years old, but I go to school. I have not got anybody to go with me now, for little brother Emory died two months ago today, and that left me alone. He was 6 years old. He could read in the First Reader. I don't know much about bees, but I like to see them work. I think they are smart little things.

L. MAY HOUSE.

Dodd's City, Tex., June 3, 1883.

I think bees are *smart* little fellows, friend May, judging from the way people rub when the bee puts in his bill for damages.

My pa had one swarm of bees last summer, and they died last winter. He took from it 85 lbs. Pa is superintendent of the Sunday-school. I go to it. In the year 1881 I watched the bees for Uncle Augustus, and got \$2.10. Last fall he lost \$5000 worth of honey and machinery. His canning house was burned down, and every thing that was in it. The fire started from a saloon. ANNE BULLIS, age 9.

Smithland, Ia., July 29, 1883.

Worse troubles than fires come from saloons at times, do they not, Anne? A brain on fire is far worse.

We have 9 swarms of Italian bees. The bees belong to ma, but pa tends them. They were my brother's, but he was afraid of them, and he sold them to ma. I go to Sunday-school. I have gone to school in a dug-out, and have seen lots of Indians; but we have got a good schoolhouse now, and the Indians have all gone away. The flowers are for Peter.

SADIE H. BOGGS, age 10.

Edincott, Jeff. Co., Neb.

So your brother sold his bees to your ma, did he, Sadie? I wonder who among our juvenile friends can tell us what a "dug-out" is, and how it is made; that is, the kind of dug-out they have in Nebraska and other Western States.

God bless you, Sadie, for remembering little Peter. He is getting now so he can laugh and crow, in a manner that would make anybody feel happy and look good-natured. It is the first bouquet of flowers that he ever received, and we all appreciate your kind remembrance.

I saw the other little girls writing, and I thought I would write too. My father has no bees; he is a farmer. We bought a good deal of honey last year, but I do not know whether he is going to buy any this year or not. We have plenty of bee pasture

nearly all the year around. My uncle, Rufus Robinson, has 126 colonies. He has had 8 swarms. All the honey they are making now is from jack-oak trees. I do not like it myself.

La Clède, Ill.

MAMIE KEEN, age 11.

It seems to me, Mamie, your pa is just the man who ought to keep bees.—The "jack-oak" you speak of is probably what we call "black oak." I fear few would like honey from such a source.

#### EMMA'S STORY ABOUT THE BEES.

I have but little to tell you. We have only one hive of bees. Ma followed them and threw water among them, and they stopped on a high limb. Pa sawed them off three times. He says he will not rob them this year.

EMMA HATCHER, age 11.

Dodd City, Fannin Co., Tex., July 17, 1883.

Why, Emma, did the hive really start to run off, or was it only the bees? And did your pa saw the same limb of three different times, or did the bees go on three different times? I think we must take you as you mean, and not as you say, shall we not?

#### FROM 2 TO 16 IN TWO YEARS.

As I am a beginner at bee-keeping, I would report how I succeeded. My grandpa started me with two swarms of bees last year, and they swarmed twice apiece that year, which made me six swarms to go into the winter with. They came through the winter in very good condition; they had plenty to eat, and more bees than they went into the winter with. I did not lose one swarm, and now have 16, and are all full of honey. My bees all swarmed twice apiece before the 11th of July, and still act like swarming.

D. M. SAULSGIVER, age 13.

South Frankfort, Mich., July 15, 1883.

Well done, my little friend. I know of a good many folks who are twice as old as you are, who do not do half as well as that. Now you are all ready for a honey crop. Do not let the bees get ahead of you.

#### TOBACCO AMONG THE JUVENILES.

Please send ma a smoker. I hired her to quit using tobacco, for 15 cents. We have three hives of bees; two are ma's, one is mine. We have to borrow a smoker when we use one.

JOHNNY CROSIER, age 8.

El Dorado, Butler Co., Kan.

Why, bless your heart, Johnny, when I started the Tobacco Column it never occurred to me that I should be so fortunate as to get the little ones to help me in the work. I am sure that it is God that is putting it in their hearts; and may he help your mother in all her efforts to give up tobacco. Tell her when she is tempted, to ask the Lord to help her; and may he be praised for the influences that seem tending toward the general overturning of this old habit of tobacco-using.

#### ABOUT THE HENS THAT ABSCONDED, ETC.

I have just been away in the country, helping my uncle to make telegraph poles. While out there I helped him to transfer three colonies of bees from old box hives to good frame ones. A great lot of his bees died since he took them out of the cellar in the spring.

My mother is a widow woman. I had four hens and a rooster; but about 10 days ago two of my hens

were like uncle's bees—they absconded. I am pretty rich, though, for all, as my ma sold my hog while I was away, for six dollars, and uncle paid me for helping him to plant potatoes, by giving me a small patch for myself, and he promises me one dollar for helping him at telegraph poles.

Shelburne, Ont., Can. W. J. MILLER, age 11.

#### A NEW HONEY-BEARING MAPLE.

Pa bought 2 swarms last winter; we transferred them out of their old box hives into Simplicity hives. They are doing well. Our bees work on vine maple when it is in bloom. The honey is as clear as can be, and I like the flavor of it first rate. The flowers are red, and very pretty when they are in bloom. We got about 50 lbs. of honey this spring. Give my love to Blue Eyes.

CLARA M. WILCOX, age 13.

Silver Creek, Lewis Co., Wash. T., July 6, 1883.

Thank you, friend Clara. When I first read your letter I could not think what you meant by *vine* maple; but our proof-reader looked in the botany, and he found there a vine maple, sure enough. Now, if it bears honey that tastes any thing like maple molasses, I should think it would be very fine indeed. Do you mean to say that you got 50 lbs. of maple honey? If so, I should dearly love to have a tin can full of it sent to us.

#### LIZZIE AND THE BEES.

Hello, Uncle Amos! Here we are again, just the same as ever. The bees are all right. We got three swarms. We have now one swarm that has no queen. Pa took a frame of bees out of another hive, and gave it to them. They made a queen-cell, and pa opened it, and there was a young bee in it, and it was dead. Pa gave them another frame of young and old bees, and they never fought a bit. I put the fdn. in frames for pa, and put starters in the sections. We had snow here May 21.

For the day of the Lord is near upon all the heathen; as thou hast done, it shall be done unto thee: thy reward shall return upon thine own head.—OBADIAH 15.

Where is the shortest verse in the Bible?

LIZZIE JOHNSTON, age 13.

Danforth, Ill., July 20, 1883.

Hello, Lizzie! I suppose that you and your pa have real good times with your bees. I am glad to hear they are all right. But is not that a pretty hard text for a little girl only 13 years old?

#### 100 CHICKENS, AND OTHER THINGS.

I see you are such a friend to children, I would like to be among them. I read the letters in JUVENILE, and mamma said I could try to write one too. I can't tell much about bees, as these are the first we ever had. Papa bought one colony this spring, and now we have three. Please tell me if you know what this is. It was running out and in the hive with the bees, and no one seems to know what it is. I went to school this summer, and didn't miss any. I go to Sunday-school too. We have 100 chickens.

MINNIE CHESTER, age 7.

Carthage, Mo., July 8, 1883.

The bug you sent, or whatever it was, Minnie, was all broken to pieces, so that I could not tell what it was, even if I had been an entomologist, like Prof. Cook. It looks a little like a big hornet, or, at least, the pieces do. Was not that what it was? I am glad you go to school, and do not "miss any."

#### A BANTY HEN THAT SAT ON PARTRIDGE EGGS, ETC.

I am glad there is a man in the world to send little girls and boys books to read. Ma set the little banty hen, and I put 3 partridge eggs under her; and the ducks—I reckon they thought they were June-bugs, and swallowed them. Papa had a swarm of bees yesterday, and he got a glass and caught the queen, and put her in a cage, and tied the cage on a frame, and they settled on it. He has 38 hives.

Now, Mr. Root, as you are a Sunday-school man, I will give you a riddle. Out of the eater came forth meat, and out of the strong came forth sweetness.

JOSIE DAVIDSON.

Pisgah, Jackson Co., Ala., July 14, 1883.

Why, Josie, you do not really mean to say that you have ducks so large that they gobbled up the young partridges, do you? It seems to me that is almost a "yarn," is it not? That is a tiptop riddle. I wonder where you found it. Is it any thing about bees or honey?

#### JUVENILE SHORTHAND.

My father had three swarms of bees in the spring; and as he has a share in a store, he can not spend much time with the bees. He said he would rather the bees would swarm themselves; but as it is, he divided them, and now he has 6. We live about ¼ of a mile from Iowa City. There is a man about a mile west of us who has all the bees he wants, and so is selling them. My father has just started with some hives to take out there to wait until his bees swarm. He pays \$2.00 for the bare swarm. I have read about the shorthand writer in your office, and about your type-writer. I have learned the wonderful art of writing shorthand. I can not write very fast, as I have not practiced long enough. I have been learning on the type-writer. Mr. Moran is my instructor in the art.

LA FOREST L. PRATT.

Iowa City, Ia., June 30, 1883.

My little friend, our shorthand writer says you are trying to write ahead of your lessons, and are writing words in a manner you will have to unlearn. Your letters are too large, and out of place. Don't write one solitary word unless you find it in your book, or a good teacher shows you how.

Let me tell you something about the bees. They are working very well now. We have taken about 450 lbs. of honey this year. Those plants we send you yield a great deal of honey. I should like to have you tell me the common name, and also the botanic one. We had a swarm of bees some time ago, and they settled on a stump. We took the milk-bucket and brushed them off, and then poured them into a hive.

Pa caught a large turtle some time ago, that weighed 19 lbs.; he says he is going to take the shell to make a wax-basket.

Let me tell you a good way to break dogs from sucking eggs. Get a box of concentrated lye, and rub the egg in it, and lay it somewhere so the dog can get it.

I have had one sting this year. That one crawled up my arm, and I mashed it. Pa told me to ask you if the honey pear is good to eat. Our chickens were dying with the cholera, and we gave them Sheridan's Cavalry Condition powders. They are for cattle, but are good for chickens. All of ours are well now.

EVIE L. STEGER.

Payne's Station, Va., July 2, 1883.

## A LETTER FROM A FIVE-YEAR-OLD.

My pa has a lot of bees, some Italians. I go to Sunday-school, get a paper, and a card with "Golden Text." This is not much of a letter. Maybe I will do better next time. I read and spell in five letters. I have a sister three years old next August. I can't write alone, so pa holds my hand.

Albion, N. Y.

ELVIRA L. BURKE, age 5.

## HEMP AS A BEE-PLANT.

My pa has 65 swarms of bees. He plants hemp in his bee-yard; they make a shade-tree, and the bees work on the ones that flower; and the kind that don't flower, bears seed. We keep birds too, and I attend to them.

SARAH A. CHRISTIAN, age 11.

Lorraine, Ont., Canada.

Thank you, Sarah. I knew that hemp at times bore large quantities of pollen, but I did not know that it bore honey. So there are two kinds of plants, are there—one that bears blossoms, and one that does not? You see, you knew something that I did not. I expect to learn a great many things from these little friends of mine, if God spares me many years to read over their little letters as they come in day by day.

## TEN NIGHTS IN A BAR-ROOM, AND THE FRUIT IT IS BEARING.

I received Ten Nights in a Bar-Room, and certainly owe you a debt of thanks for it. Papa has 53 hives; one died of suffocation. We have one licensed hotel in Dry Run, and a man is trying to get another. The temperance people are trying to stop both, and it makes a great deal of excitement. I think if everybody would read the book you sent me they would want to shut all bar-rooms.

Dry Run, Pa.

CLARA B. ALEXANDER.

I am very glad to know, Clara, that there is excitement in your town on this matter of saloons or no saloons. There is a great deal of excitement just now in our town, and, I am inclined to think, most of the towns in our country. Excitement is a good thing when a great evil is to be put down. And may God grant that peace may never come till this matter is settled "on the Lord's side."

## THE SUN-GLASS TROUBLE.

My brother, J. Harry Willson, received his sun-glasses all right, and I am ashamed to tell you that he will light his pipe with them.

MRS. ST. JULIAN T. MOORE.

Monroe, La., July 30, 1883.

My good friend, I am sorry to know that your brother is a tobacco-user; and I hope that, when he sees his name here in print, right before all these children, he will decide to use his sun-glass for some better purpose. By the way, a bright thought strikes me. If he should give up tobacco, and we should give him a smoker, he might use the glass to light his smoker with. Just open the door a little, and let the focus strike on the wood for an instant, working the bellows at the same time, and I am inclined to think the smoker would light quicker than it could be lighted with a match. Now you see the next thing to do will be to have a sun-glass attached to every smoker, so bee-keepers can light up quickly during windy days, and without any necessity for having any matches around, either.

## THE TROUBLE THEY HAD AT SALLIE'S HOUSE IN MAKING THE SWARM CLUSTER.

My brother bought a stand of bees in the winter of 1880. The next spring they swarmed twice. The first time they swarmed my mother went out and beat on a pan. All the bees stung her on the head, and she had the headache all the afternoon. The next time they swarmed, my aunt went out. The bees stung her, and she threw the pan away, and we could not find it for several days. I go to school, and study four branches. I got a prize for not whispering for a month.

Pin Oak, Ill.

SALLIE NICHOLS, age 13.

I am real glad to hear, Sallie, that you got along a whole month without whispering at school. I am aware that it is a pretty hard matter for a girl 13 years old to do; but any girl or boy can do it if he sets down resolutely that he will do it. Our tongues are to be ruled by us, and woe betide the girl or boy who lets the tongue get unruly.

## ALL ABOUT HUMMING-BIRDS AND THEIR NESTS.

Will the JUVENILE let a little Texas girl 9 years old speak her piece? My pa keeps bees; he got lots of honey last year, but little this year. His bees are nearly all Cyprians. Ma says she would rather work with the Cyprians than Italians, for she gets but few stings from the Cypys; but the Italians by some means get mad, and go to fighting.

We were playing in the orchard the other day, and brother found a little humming-bird's nest. It was about as big as a hen's egg cut in two. It had two little birds in it. The old bird sucks the honey from the flowers like a bee, and she puts her bill in the little birds' mouth and throws up the honey into it like a pigeon. Do you not think they ought to be called honey-birds? The little birds have flown off, and we have the nest in the house for a show. It is made of cotton from the cottonwood, glued together, and nice little bits of bark glued on the outside, so it looks like a mossy knot on a limb.

It has not rained here since June 12th.

Dresden, Tex., Aug. 6, 1883.

MAY CARROLL.

## CLINT CAPEN AND HIS FATHER.

My pa has 21 swarms of bees. Some are in nail-kegs, some in soap-boxes, and some in salt-barrels. When a swarm comes off, pa grabs the first thing he gets hold of, and hives them; but he thinks of sending for some of your hives next winter. John Stillwell puts up bee-boxes in the woods, and almost always gets bees into them. But the bees don't go in my pa's boxes; so he took a ladder and climbed up to Mr. Stillwell's, and smelled of them to find out what he put on them. Pa came home walking kind o' one-sided; and when ma asked him what he found out, he said he "found out" better than to climb forty feet on a rotten ladder.

Farm Ridge, Ill.

CLINT CAPEN, age 10.

Well, now, Clint, aren't you a little rough on your paternal relative? Perhaps your father has a great deal to do, and does not pay much attention to bee-keeping, even if he has got 21 swarms. Can't you get your friend John Stillwell to write us a letter and tell us about his success with decoy hives? Your pa thought he would get at the secret by smelling of the hives, did he? Well, I am sorry he did not tell us whether he smelled anything, as well as what he "found out" in regard to the matter. I trust he was not hurt much in his fall, was he, Clint?

## SEVEN-YEAR-OLD MARY, AND HER OBSERVATIONS.

Uncle Fred and aunt Emily keep bees, and I watch them put section boxes on. A little boy who lives with Uncle Fred threw dirt at some bees that were going after honey. He thought they were a swarm of bees. I shall be seven years old in a month. Will you please send me a little book? This is the first letter I ever wrote.

MARY FREEMAN.

Milan, Ill., July, 1883.

So I suppose, Mary, your bees went out to work with such a rush that your little friend thought they must be swarming. Now, you can tell him that he is not the first person who has been fooled in just that way. When our bees go off for basswood or buckwheat, people passing by often come and tell us that our bees are swarming.

## HOLY-LAND BEES AND MAMMOTH RUSSIAN SUNFLOWER.

Our Holy-Land bees are determined to swarm, no matter how much pa divides them. Last Saturday three swarms came out, one after another. Two of them alighted on our Russian sunflowers, and my oldest brother, Eli, held the stalks for fear they would break; and the day before, while pa was away from home, Eli and Mary hived a swarm alone, and Mary held the stalk, and bees ran up her sleeve, but did not sting her, which shows they are not very cross.

MAGGIE MICHENER, age 9.

Low Banks, Ont., Can., July 16, 1883.

You have given us some very good facts, Maggie. I do not quite believe that I would like to have Holy-Land bees run up my sleeve. But then, may be they would not sting if they were used right. Do your bees get any honey from your mammoth Russian sunflower?

## BRICK BEE-HIVES, ETC.

My pa extracted about 74 lbs. of honey this week. Have you got a brick bee-hive? My pa has 4, and thinks they are nice. Will you please give a honey-cake recipe in the next JUVENILE, if there is room, as I want to bake one? If I bake one I will write and tell our friends what kind of luck I have. Answer to Howard Fisher's question: What two chapters in the Bible are alike? The 19th chapter of II. Kings and chapter 37 of Isaiah are alike. Where is the least verse in the New Testament, and how many words does it contain?

JESSIE GULLEY.

North Salem, Ind., June 20, 1883.

Well, Jessie, I do not know any recipes to make any honey-cake, but I dare say some of our readers do. Who will give us some recipes for our JUVENILE? I am glad you knew there are two chapters in the Bible just alike. To tell the truth, I did not until I saw it in your letter.

## SAYING GOODS ARE NOT THERE; A COMMENT BY ONE OF THE JUVENILES.

Papa found the goods at the north depot yesterday. He had been there and at the other offices (there are four freight depots in the city) several times; and when he called yesterday they said there was nothing for him; but he told them that a tracer reported the goods as then uncalled for, and they hunted them up. They had lain there since the 2d of June.

The bees are doing well. We have taken 24 lbs. of white-clover honey off from one hive. We had but

one hive here in the spring, but they have increased to five. We have more in the country.

Fort Wayne, Ind.

BRET HOPKINS.

Thank you, Bret. If we can not do any thing else to stop this work, we will set the children to writing up such men in the papers. Over and over again we have had, this year, reports from bee-men who wanted their goods; and after the goods were traced up, it transpired they were all the while standing in the depot. What shall we do with such agents? Were their depots too small or crowded? or are the men too small who have them in charge?

## THE GUILER CHILDREN.

My papa has 22 stands of bees. Last spring one was robbed by the rest until it swarmed three times, and went to a neighbor's house, and he caught it in a box. Pa brought it home, and it is getting along all right now. He was working with the bees yesterday, and got stung just below the eye, and it is nearly swelled shut to-day. Pa's mentor set of glassware that you sent him was all broken except the butter-dish, and he forgot to tell you when he sent for the extractor. He had 18 stands of bees last fall, and wintered them all. Can you beat that?

VIOLET E. GUILER, age 10.

Friend Violet, I am sorry about that glassware. Tell your pa to mention it when he sends again, and we will send him another, free of charge; and I will give our packers a good big talking-to, if they don't put more straw around the dishes.

## MARY'S FIRST LETTER.

The baby's name is Herbert Amos. Pa wanted him called for you. I like honey; pa has taken about 20 lbs. of it. He says he wants to get lots of it when he gets the extractor.

MARY A. GUILER, age 8.

McCleary, Noble Co., O., June 25, 1883.

And so you have got my namesake at your house, have you, Mary? Please give him a kiss for me.

## HONEY FROM THE WATER-LILY.

My pa has 27 hives of bees. They are working on white clover, and a kind of plant that we call water-lily. Pa lost two swarms of bees this year. I have had but one sting this year. They sting my little brothers quite often. The bees are working prettily now. I will send you a flower, and I should like to have you tell me the name of it. I will send you a bloom of the water-lily. If there is any other name for it, let me know. They are great bee-plants. The water-lily grows on the edges of the islands and in the land. I run to help pa to put rocks on the hives, to keep the wind from blowing them over. Pa is working grandpa's islands for him. Grandpa is paralyzed. Mother named the baby Ives. My sister and brother stay with grandmother. Pa has a soap-stone-quarry, and he wants to sell it.

Payne's Sta., Va.

CORA F. STEGER.

Well, Cora, I am real glad to hear that water-lilies furnish honey. It seems to me it must be nice among the islands you speak of. I should be glad to see the water-lily. Since you tell of it, one of our boys who sets type says he has a water-lily, and that there are bees on it almost all the time. Wouldn't it be funny to have a water-lily patch on the honey-farm?

HOW TO GET GOOD SMOKER FUEL, AND HOW TO PREVENT THE GAPES IN CHICKENS.

My pa and my brother have 8 swarms now; some of them are large ones too. He cuts up corn-cobs fine, and uses them in his smoker. Last fall I gathered leaves for him to pack the bees in for winter. They all wintered well; but this spring some of them died. I have a black cat 12 years old, and I have a little black chicken that was hatched in an incubator, and chicky sometimes will follow the cat. We salt our chickens' food just as we do ours, and they never have the gapes.

HARLIE B. MORSE, age 8.

New Woodstock, N. Y., June 21, 1883.

I presume, friend Harlie, why the chicken followed the cat around was because, being hatched in an incubator, it never had any mother, and so chafed after the first object it saw that looked as if it might possibly be its mother. Were you not sorry for the poor lone chicken? I am not quite sure about your gape remedy. The used to tell me, when I was a poultry-boy, that salt would kill chickens.

MINERVA, UNCLE WILL, AND THE REST OF THEM.

I like to read baby GLEANINGS. I see in your last number you have had sickness too. My aunt Maggie has been sick for 8 months, and this summer mamma took down sick with the fever. We could not get any one to come to help do the work, so Uncle Will and I had to do it ourselves. One day, when mamma had got able to go around a little, Daisy and I were watching the bees, and we saw a swarm come off. Mamma went out to see what hive they were coming out of, and we went for Uncle Will. Mamma got stung in the forehead, and it swelled both her eyes shut. A colored woman told her if she had had a mud ball, and had rubbed the place when she was stung, it would not have swollen.

I hunt the eggs and feed the chickens. I have 60 young chickens. If you will come to see us this fall, you can have fried chicken to eat. Is the wheelbarrow still full of books? Three swarms today, and not a very good day for swarms either.

MINERVA DUNCAN.

Black Lick, Ind. Co., Pa., July 3, 1883.

Well, Minerva, there is one part of your letter that is very interesting to me; I mean that part about the fried chicken. It is now just about my supper time, and may be that has something to do with it. I should very much like to go and see you, but I am so busy that I fear I can not.

A PLACE TO KEEP HONEY OVER WINTER.

My pa has 17 stands of bees; when they swarm he sprinkles them with a watering-pot just before he puts them into the hive, so that they will not rise up and fly away. Pa says in the attic over the kitchen stove is the place to winter honey. My grandma sent me a book last Christmas — the Roby Family. I think the bees ought to do pretty well by you, as you have been such a great friend to them.

GENEVIEVE HILL, age 8.

Randolph, N. Y., July 22, 1883.

My little friend, your pa is perhaps right about the best place to keep honey over winter; but we are beginning to think, a great many of us, that it is a pretty hard matter to keep honey just as it is when recently taken from the hives. I believe that, in many of our honey markets, the honey of

last year's crop has been sold at a lower price than the new honey. It candies and sometimes sweats, and then it gets a slightly old flavor that some way seems to rob it of its delicious purity that we notice when it is first thoroughly ripened in the hives. I have been wondering if there was not some way to keep even extracted honey so the flavor would be just as clear and pure as when freshly gathered. If put in barrels, the barrels are pretty sure to give it some sort of a taint. I am not quite certain that the flavor will not change a little by being kept a year or more, even if put in glass and tin. Who can tell us more about this? If you can not answer, friend Genevieve, perhaps your father can.

A PEACH-BASKET HIVING-BOX, AND SOME OTHER MATTERS.

I live 20 rods from the mouth of Buffalo Creek, 40 rods from the mouth of the Elkhorn, and ten rods from the Spring Branch. My father is a bee-keeper; he thinks we have as nice a place for bees as any one around here. We moved here in 1879; in 1880 we commenced bee-keeping. We started with four swarms in the winter. They all died, so he was not a "Blasted Hoper" yet. Then he bought a swarm in 1881. In '82 we had 5 swarms, and one died in the spring. This spring we started with 7; now we have 20. They are all getting along nicely. Father gave me one swarm of bees. He says he calculates to keep 100 stand. He makes his own chaff hives. We use all chaff hives. We think they are the best. We put a newspaper in front of the hives when we hive them with a peach-basket. Father bent a hickory stick around it in the shape of a hoop, and left the handle from five to six feet long. We have had bees to go up into trees over 20 feet high, and father would climb up on a ladder and get them down with this hiving-basket. We think it is a very nice thing to hive bees with.

Our school is out. We have been having vacation. It let out the 12th of June, and it begins the last Monday in August. I have almost three miles to go to school; in the winter I get to ride part of the time. We have quite a large school. I like to go, and I like my teacher. Irene Wilson and I are near neighbors. I go over there to their Sunday-school, and I like to go. I think it is very kind of friend Wilson to have a Sunday-school, since we live so far from church. It is about four miles, I think.

My little sister Mattie is only six years old. She goes to Sunday-school too; she can not read, so she learns a verse for every Sunday. I had another sister who went too, and she liked to go so well she would not miss a Sunday, even if it was rainy. It was so rainy and nasty a couple of Sundays that mother would not let her go. She took sick on the 22d of June, and on the 10th of July she died. Her name was Bertheniah, and her age 11 years 10 months and 2 days. We all feel very lonesome without her.

I like to read the JUVENILE. My father, Sanford Deyo, takes GLEANINGS. ROSELLA DEYO, age 14.  
Peurose, Ill., July 24, 1883.

Thank you, Rosella. Very likely your pa's hiving-basket is as good as any. No doubt you feel sad since your little sister is gone; but remember that she is with God, and you shall see her again if you live in obedience to his commands.

## Our Homes.

He trusted in the Lord, that he would deliver him.  
Let him deliver him, seeing he delighted in him.  
—PSALM 22: 8.

**T**HE words of our little text to-day were first uttered to David, and afterward in nearly the same way to our Savior while on the cross. And throughout all ages ungodly men have had a way of laughing and jeering at those who put their trust in God, especially when the time of trial comes, and, so far as human sight can go, these trusting ones are left, as it were, alone to bear the trials and vicissitudes common to all humanity. David, it would seem, had his full share of severe trials to encounter; although he put his trust in God in a way that, perhaps, none other ever did, yet God saw fit to allow him to be persecuted and maligned and misrepresented and abused; an outcast and a wanderer, he fled from the bitter persecutions and hatred of one who should have been his best friend. Skeptics and infidels and idolaters laughed at his troubles, and jeered at what seemed to them his folly in still putting his trust in God. A few verses before the one where our text comes, it seems almost plaintive where he says,—

But I am a worm, and no man; a reproach of men, and despised of the people. All they that see me laugh me to scorn; they shoot out the lip, they shake the head.

It would almost seem, friends, as if we could see them as they get around him in his trials and troubles. That expression, "They shoot out the lip"! poor David! Do you not long to be near him and to cheer him and to encourage him, and to repeat to him some of those beautiful texts, and to say to him, fear not? It seems to be God's purpose to let his children have sore troubles, yet it is said, "Whom he loveth he chasteneth." It would almost seem at times as though he purposely left us alone to try us. But all those who have trusted him know that when he has proved us, and when he sees that our faith is unflinching, then comes that wonderful sense of his presence and his love—the rewards that only he can give, and that amply compensates for all the troubles and trials we have passed through. Humanity seems so constituted that even the most trusting at times have temptations and doubts. God has delivered them and carried them safely through all troubles and trials heretofore; but a new and unexpected one comes up, and they fall to questioning. Can he, will he, take me safely through this trial? Alas for poor humanity! Knowing that we are weak and sinful, we begin to doubt God's love. We begin to doubt ourselves too. We begin to wonder, and it is well we do so, whether our hearts are really right before him. Are we honest with ourselves? Are we saying truthfully, by word and action,—

Create in me a clean heart, O God; and renew a right spirit within me?

Such has been my experience, friends. I have told you year after year, ever since these Home Papers commenced, of my tri-

als and my triumphs. A little over a year ago I was praying, and, I am sorry to say, worrying, about the issue of that trouble where I feared I should have a large amount of money to pay, up into the thousands, perhaps, for one who advertised in GLEANINGS. You know how deliverance came, and that the friends who had lost, the greater part of them, refused to accept payment for me.

Some months ago, in answer to an inquiry, I said that Mr. Forncrook had not commenced any suit against me, but only threatened. To be consistent, perhaps I should tell you now that he has commenced, and lays his damages up into the thousands. It is not a personal matter either; for, if I have made no mistake, he claims the right to monopolize the manufacture of all honey-boxes made from one piece of wood. That there may be no mistake about the matter, I copy from his circular and advertisements, as follows:

The patent covers any section made of one piece of wood, of whatever description; therefore, we hope manufacturers and dealers will govern themselves accordingly.

Now, the great point with me is to be sure that my cause is a right and a just one—to be sure that I have a right to ask God to help us resist this, as it seems to me, an attempt to blackmail the bee-keepers of our land. A patent has been granted to Mr. Forncrook for a one-piece section, as has been heretofore explained; but he broadly claims, as you see, all honey-boxes made of one piece of wood. I have pointed out to you before the description of a one-piece honey-box, given in GLEANINGS away back in 1876. I give a reprint of the letter below:

### SECTION FRAMES AND HONEY BOXES.

*Ed. Gleanings:*

I see by GLEANINGS for March, that J. I. Johnson, Palmyra, N. Y., asks a preventive of bees running the combs together in section boxes. I will tell you what I did last summer, and it worked to a charm. I had 8 stands of bees in double hives, my own make, Quinby suspended frame, 20 frames in hive. I made 100 lbs. box, 150 in sections, and 50 extracted honey. I live on a public road, and people constantly passing wanted a few pounds of honey; of course, they had nothing to hold it. Well, I thought about a section box; I could get nothing to make them of easily, so I got some peach-box covers and some strawberry-box stuff, and ripped them up in one-inch strips (I suppose you know how a strawberry-box is, cut half through at each corner, and nailed at one side; but the veneer must be wet over night before bending; it then works nicely). I then put a piece of comb in the top, 1 inch square (would prefer drone comb if white); in some I stuck little bits of wax along the under side of top. When filled they weighed from one to two lbs. each. Only two sections out of the 150 lbs. were connected. I sold all my honey at the house, for cash, comb honey 25 c., extracted 20 c. I had more demand for the little sections than any other. I put the sections in the frames both in the front and back of the hive. I think the comb foundation for the sections a grand hit. One hive made 90 lbs. comb honey. B-sides the 300 lbs. honey, I had 6 swarms from the 8 hives, making 24 all in good order to start with this spring.

ALEX. FIDDES.

P. S.—I may say that I put sections on top, but frost came about the middle of Sept., and there was no more honey.

Centralia, Ill., March 8, 1876.

Besides this, descriptions of sections made of one piece of wood are found all along through these years past. In April No. of the *American Bee Journal* for 1879, we find the following:

Mr. E. H. Wynkoop, Catskill, N. Y., has sent us a section for surplus which he calls the Gilbert Section. He says it is patented by a Mr. Gilbert of that town. It is similar to the one made by Lewis & Parks, though not nearly as nicely made, and is but a trifle thicker than the ordinary berry-box material. The corners are gouged out and then it is bent to place. Dr. Southard, of Kalamazoo, Mich., has used such for sections for years. Mr. Wynkoop has made arrangements to make and sell these sections. They can be produced cheaply, but we prefer something having a little more strength for comb honey.

—*American Bee Journal for April, 1879.*

And on writing to friend Wynkoop, we find that these sectional honey-boxes were made as long ago as 1873. The section is virtually the same kind of a honey-box as that made by Mr. Fomerook, only that it contains no slot for holding the strip of fdn., and this we have never used on the one-piece section, and do not want to. A patent was given the parties alluded to, years ago, for this plan of making boxes of one piece of wood. Friend Fiddes, whose letter I have given above, made these sections as long ago as 1875, and sold considerable crops of honey in them. They were made of thick strong wood, and had entrances cut for the bees, exactly like those made nowadays. Besides using them himself, he made them and sold them to his neighbors, and one of his neighbors also manufactured them, and sold honey in them. Without taking time to enumerate all these cases that have come to light, I give the letter below, showing that so prominent a man as our friend Quinby used such sections some time before he died. A picture of the way in which they are used is given in the *American Agriculturist* for February, 1875, page 52.

*Friend Root:*

I saw all-in-one-piece sections in Oil City as early as 1869, at one Mr. Stevenson's apiary. They were used by Mr. Quinby previous to that. I think Mr. Stevenson got his idea from him. The sections were made of very thin basket stuff. I sent my brother at Pioneer, Venango Co., Pa., a lot of bass-wood plank to cut into one-piece sections as early as 1874; he cut the V-shaped grooves with a barrel-marker.

J. MCGONNELL.

Waterford, Erie Co., Pa., May, 1883.

And now, my dear friends, does it not seem to you that my cause is a just and a right one? Is it possible that I have a wrong and selfish purpose in thus resisting Mr. Fomerook's efforts to monopolize this industry? In other words, have we a right, for it is a common cause, to pray that God may aid us in the cause of right? Will he desert us here? In the language of the opening text, "He trusted in the Lord, that he would deliver him." And will God deliver us?

You may say it is a plain and simple case; there is no need of being troubled or alarmed; but, dear friends, we are told that this is a case before the United States court, and we must go to law. Plain and simple though it is, I am told that an expensive lawyer must be employed to conduct the case. I do not know whether Mr. Fomerook is a Christian or not. I know that I claim to be, and stand before the world as such. Have you ever read the 6th chapter of I. Corinthians? Let us look at it a little.

Dare any of you, having a matter against another, go to law before the unjust, and not before the saints?

Paul seems to take it for granted, as you will observe, that most of the lawyers to be had in those times were not in the church, and he seems to intimate, too, that some one in the church, pastor or some good deacon, ought to be able to settle quarrels, as well as lawyers. I have always done this, friends, and about the first thing I did was to take the case to my pastor. He frankly told me that, in a matter that was to come before the United States court, he felt unable to advise. We agreed that we wanted a Christian lawyer. Now, I really hope that my brethren of the bar will not feel hurt by any thing that I may say in my ignorance or awkwardness. I do not know lawyers very well; but I do know that some of our kindest and best friends among our customers have "Attorney at Law" printed at the top of their letter-heads; not only kindest, but wisest. I am always glad to get a letter from a lawyer, because he always seems so clear and bright — he always seems to have such a command of language, and reasons so intelligently. I love and admire intelligent, intellectual, and educated people. I love my friends of the law, as far as I know them. As I read their letters over day after day, I fall to wondering, can this man be a bad man? is he not a Christian? Why, it seems to me he must be. I wonder if he charges \$10 a day for helping people who need help in his line; and when he is sent off to some distant city, does he always put up at the hotels where they charge \$3 a day or more? and do common people like you and I have to work a week to get money enough to pay him for just one day's time in settling a quarrel we may have got into? If he does, I think I shall try awful hard not to get into any more quarrels. In fact, I wouldn't quarrel now; I would give Mr. Fomerook almost anything he wanted, rather than have a great big lawsuit, providing I could feel quite sure that we should not be paying a premium to dishonesty and fraud, and also if I were the only party concerned. It may be better to give a couple of thousand dollars to lawyers than it would be to give it to your neighbor who is over-reaching and grasping. But I am not quite satisfied on the point. How I have longed for some good, wise, able adviser in these days past! Oh how I should love to present the whole matter to dear, kind, good old Paul, and ask him what I should do! If I could find an able lawyer who is full of the spirit of the Master, and was seeking every day to do his will, how gladly would I put it into his hands, and tell him to manage it for me! But, dear friends, now please excuse me if I am uncharitable or ignorant; I have not yet been able to find such a lawyer. There are those who are professing Christians, but they do not seem to be the proper ones to cope with a problem like this. There are others who, it would seem, have the ability, or, at least, pretty near the ability, needed for the occasion; but, alas! — Paul says, —

I speak to your shame. Is it so, that there is not a wise man among you? no, not one that shall be able to judge between his brethren?

And again, —

But brother goeth to law with brother, and that before the unbelievers.

You see, friends, Paul tells us what we should *not* do, but did he tell us exactly what we *should* do? What is to be done, and who will advise me? James tells us, —

If any of you lack wisdom, let him ask of God, that giveth to all men liberally, and upbraideth not; and it shall be given him.

Well, friends, that is just what I have done. I have felt the need of wisdom and of able advisers, and I have prayed over and over again about them; and in doing so this little text at the head of our chapter has come to my mind.

He trusted in the Lord, that he would deliver him.

Well, what is the result? Will God take my poor weak wisdom and use it? Will he enable me to stand before the courts of law, and before the judge on his bench, in a way that will help the truth to come out? Is there justice to be had at the courts of law? or are the stories true that we have heard, about bribes and chicanery, and trickery and injustice? Is there honor among our fellow-men when we get out of the province of bee culture and come into the courts of law? I believe there is, dear friends; I have faith in my fellow-men; I have faith in those sharp, witty, able ones among us who write us these good letters I have been telling you about; and I have faith in education and intelligence; I have faith in our republican government; I have faith in our land of liberty. Above all, I have faith in God; and I do also believe that little text that says, "Him that cometh unto me, I will in no wise cast out."

I have all my life enjoyed looking into the different trades and industries. I am passionately fond of following the details of any profession or trade. At one time I took so much interest in medicine that our family physician used to point out to me strange cases; and I was once with him when a human body was dissected to find out what was the matter of the heart of the deceased. We found that the valves had ossified so they would not shut closely. A knowledge of the human system, obtained while anatomy was a hobby, has been of great benefit many times in life. I have worked at many branches, as you know; and in our manufactory, in order to carry on successfully all the trades we do here, I have been obliged to learn personally a great many of the different trades. When GLEANINGS was first printed in our own office, I set type, and also learned to run a press. All these different experiences have been of value in giving me a general knowledge of all that is to be done in this world. Well, through it all I have never had occasion to touch on law. Perhaps it is on this account that I am not only ignorant, but that I am uncharitable; and it is on this account that I know so little of politics, and the affairs of government and state. Now, may it not be that God in his mercy and kindness is leading me where I ought to be led? and is it wise or well to complain, even though I should be torn away from my plans and work here, and pushed out a little more in the world?

He leadeth me! oh blessed thought!  
Oh words with heavenly comfort fraught!  
Whate'er I do, whate'er I be,  
Still 'tis God's hand that leadeth me.

And now to close with, I want to give you some words from David that I gave you about a year ago.

But let all those that put their trust in thee, rejoice: let them ever shout for joy, because thou defendest them: let them also that love thy name be joyful in thee. For thou, Lord, wilt bless the righteous; with favor wilt thou compass him as with a shield.—Ps. 5: 11, 12.

## Tobacco Column.

I HAVE been trying to get along without GLEANINGS, but I must have it, if I should do without butter and tobacco, and I am a dear lover of both of them. The bees in our county are doing well this summer. Every colony gave forth a swarm, and many of them swarmed twice. Our county is covered with white clover; new honey is now retailing at 12 c. in the country stores. I think there will be a large amount of honey this fall. I have worked up an interest in bee culture in this county, and now everybody is getting bees, but nearly all common dark bees — a few Italians. My neighbor, Frank Scott, has 36 stands of bees for sale; they are all common bees, and one Italian; he asks \$5.00 per colony, and I can buy around the county for from \$3 to \$5. I find in GLEANINGS that you are no friend to tobacco. Well, now, if I were your superintendent, or your clerk, and you saw me use tobacco, would you discharge me on that account? I base my excuse on Romans 14:11. In closing, I will add that I have been a member of the M. E. Church for 23 years; in politics I am a Republican; by profession, a stucco plasterer.

JOHN CLINE.

Watson, Ill., July, 1883.

[The "uncleanness" referred to here by Paul is the ceremonial uncleanness of certain articles of food, condemned by the law, and not the *positive* uncleanness of tobacco, which defiles the body, the temple of the Holy Ghost. My reason for *not* using tobacco is in the verse just before and just after the one you quote. Now to come right down the point, do you think Paul would approve the use of tobacco if he were now here? Think of the apostles lighting a cigar after a sermon! your use of Scripture would justify nearly all the sins ever committed, provided one thinks they are "pure." Do you know that the use of tobacco shuts a man out from entering the ministry of your church?]

Friend C., the above was written by our proof-reader. And now let me tell you a little story of yesterday. One of our boys who has lately united with the church also gave up tobacco. The craving for it became pretty hard, and in an unwary moment Satan persuaded him that there was no particular harm in it—that he could be just as good a Christian and use tobacco, and so he took a "chew." But the chew did not give him the comfort he expected. In fact, he felt worse after than he did before. So he confessed his fault, and decided to try again. Now, the point is here: I would not dare tell him he could not be a good Christian and still use tobacco; but I pointed out to him all the small boys here in the factory. Said I, "My friend, if you decide that tobacco does not harm you, we must decide also that it would not harm them. Look at their bright young faces. I

appeal to you. Will it be a good thing for them to commence using tobacco, now or at any other time?" The above may not have been the exact words, but that is the substance of them. He looked at me smilingly, and answered promptly, "No, Mr. Root, it would not be a good thing for them to commence using tobacco."

To him that esteemeth any thing to be unclean, to him it is unclean.

Now, our young friend decided unhesitatingly that tobacco would be unclean, especially for those boys; and therefore it was for him, considering his influence, also unclean; and he, as he stood there before God, whom he had promised to love and obey, thought he ought not to use tobacco. How about the small boys in your vicinity and neighborhood? Just one more point, friend C. If you were my superintendent, and had been using tobacco before our regulations commenced, I would not discharge you; in fact, I have never discharged anybody for using tobacco, that I know of. But I have declined to employ, in the first place, quite a number because they used tobacco and did not choose to give it up. To discharge a man is a hard thing to do, and should never be done without very good and grave reasons, in my opinion; but to decline to employ one in the first place is a right that no one would think of disputing.

Last summer a negro, good old crippled Christian Peter Henderson, near here, got me to start him with bees, to try if he could raise part of his living that way. He wanted a smoker, and chewed and smoked tobacco. He learned from GLEANINGS I lent him that he could get a smoker if he quit; and if I would vouch for him he said he would try. I told him to hold out till this spring, and I'd do it. I had given up smoking the weed myself, after a siege of 25 years at it, inveterately, but was using it, in a small way, in my mouth. I told him we would double teams on you, so I quit chewing, and he was to have the benefit of both cases. Now he triumphantly claims it on a nine-months' trial, or "probation," and says he is safe. You may send one of those old cheap ones I see in "baby" GLEANINGS this month; that will do. He is a good old creature, and poor as poverty, but makes his living, lame as he is, and his old wife's too. If he gets it, there will be joy in his black neighborhood. He is one among the few old slaves I ever saw that would try to keep bees.

A. W. BRYAN.

Hot Springs, Arkansas.

Most gladly we send our old friend a smoker, friend B.; and we send him a brand-new one too. May God bless him and his neighborhood; and may he help us to elevate all of that class, and draw them out of their depths of ignorance, intemperance, and sin. Give my respects to your old friend, and tell him I will pray for him.

## KIND WORDS FROM OUR CUSTOMERS.

Now, brother-readers, let us nudge our editor a little in regard to that fine boy of his. Some of the rest of us have fine boys, but have not the press at our disposal as he has. Now, I will suggest that A mos just imagine how his baby's name would sound pronounced backward, thus — Root Peter.

NIGER.

### THAT HUNTER SISTER.

Well, to make a long story short, I don't know how people keep house without it. J. NOBLE.  
Eureka, Wis.

Please send me half a dozen cold-blast smokers. We are using them to throw the fumes of sulphur on the cabbage and watermelon lice. They cook them, "you bet." J. L. MULKEY.  
Sherman, Texas, July 12, 1883.

Though I have never written to you, I have known you through GLEANINGS since 1880. My sister, Mrs. St. J. F. MOORE, and myself, a silent partner, have now 91 stands of bees. This has been a very favorable year. Cotton is in bloom now, and the bees are going for the nectar. J. H. WILSON.  
Monroe, La., July 13, 1883.

The CALENDAR CLOCK arrived all in good order. I would have acknowledged receipt sooner, but wanted to try it a short time first. To say that I am pleased with it fails to convey the proper idea. I would not be without it now since I have seen it and tried it, for double the cost. The weather is dry yet. Bees are doing nothing; have doubled back to 70 colonies. Luling, Texas, July 27, 1883. J. S. TADLOCK.

You have proved yourself more than prompt, as I sent for two queens and you sent me five. All right; I had thought I would not buy any more than the two; but as the five came, I destroyed 3 black queens, and made room for the five. I have now concluded to send for three more. W. S. PECK.  
Syracuse, N. Y., July 28, 1883.

Friend Peck, you give me more credit than I deserve. You see, it happened this way: We were overstocked with queens, and in order to get them out of the way we risked sending a few more than were ordered, where the letters seemed to indicate that the parties could use them. In your case we hit the nail right on the head, as you see; but we do not always do it where we take such liberties. Thank you for your kind words.

The supplies that you sent me came all right, and in good order, and I would say they were the most satisfactory lot, and best, that I ever got from any one. The sections are better than I expected, and they all give the best satisfaction that could be asked. I don't know how to praise them as much as I would like to, after using other men's make — thick and hard to put together, and then not fit in frames; and when you make frames to hold them, not fit in boxes, you may have some idea how I like the ones I got from you. You have my best thanks and good wishes. THOS. HOBY.  
Salineville, Ohio, June 20, 1883.

Well, I declare, friend H., your kind epistle is refreshing. It seems to me we have had more complaints of sections than any summer before. This is very likely owing to the fact that we have been less able to give them our personal supervision than we have done in former years. I am very glad indeed that they pleased you.

There are several persons taking GLEANINGS in this vicinity, and they all claim it to be a great help to them in the management of their bees. I visited one of the parties a few days ago — Daniel P. Hubbard. He has a small town of A. I. Root's chaff hives. It is the nicest sight I have seen for some time. He told me he had 20 this spring, and had increased to 45 by natural swarming. I might say here, that he prefers a natural swarm to an artificial one. He has already taken over 20 gallons of extracted honey, besides over 500 lbs. in the comb. He is prepared to furnish Italian queens to any person wishing to purchase. I find, by his conversation, that he is well posted in bee culture. I have some of the chaff hives, and I am of the opinion there can not be too much said in praise of them. I think, by giving bees the attention that a farmer has to give his stock, they will prove much more profitable, to say nothing of the difference in the capital invested in the two occupations. The reason bees have not proven a success to some persons is because they give them no attention.

Graysville, Ohio, July 25, 1883. W. H. BOOTH.

All who see my smoker say it is the best one they ever saw, and are bound to have one; so I will send an order for five of Clark's cold-blast smokers.

JOHN E. BARNER.

Viroqua, Jones Co., Ia., July 7, 1883.

#### OUR FDN. MILLS.

The mills are beauties. I have named the 14-inch one "Jumbo." The saw-mandrel is a wonder for the money. Freight \$6.60; very reasonable for 175 lbs.

W. W. BLISS.

Duarte, Cal., July 17, 1883.

The Clark fdn. fastener works to a charm. I have had some trouble with new swarms leaving their hives after being half full of nice new comb; but I think it was on account of extreme heat and no shade. I had no trouble after placing them in the shade.

J. S. DASKAM.

Kendallville, Iowa, July 12, 1883.

Fdn. arrived, and I can truthfully say it is nice, light-colored wax. And now, friend Root, I return many thanks. I can well say so, for you do every thing up so nicely, and send every thing so promptly, I believe that every one who deals with you will say so.

FILMORE DECKER.

New Florence, Pa., July 8, 1883.

I really wish I deserved all your kind words, friend Decker.

Goods came last Friday, all satisfactory, and especially the extractor, which I am well pleased with. I now have 82 hives of bees; they did well on white clover, but it is now over, so we shall have to wait for Spanish-needle and big smartweed, which will be plentiful in two or three weeks, as we have had much rain.

WOOTEN HARRIS.

Hillsboro, Ill., July 24, 1883.

Every thing came all right but those sponges. Husband looked at them and says they are small. I replied, "They will be all right when they are washed out." I put them in water, and, presto! they were as big as my head. Husband said, "We will cut them in two and make four; they are too large. Bees are working well on clover; fireweed is beginning to bloom."

MRS. NELSON KELEY.

Ferndale, Wash. Ter., June 28, 1883.

#### ALSIKE, ETC.

I am well pleased with all you have sent me yet, and I am elated over the alsike clover I got by your recommendation of it in the A B C book. I got 6 lbs. of seed, and sowed 1¼ acres, and I think I shall never sow any other. It is from 3 to 5 feet long in the stock, and alive with bees, and all my neighbors want seed of it.

GEO. H. STOCKDILL.

Brattonville, Pa.

Instead of Bear Grove, Iowa, we are in Kansas, settled and started again with one swarm of bees. I am introducing GLEANINGS among all our bee-keepers, and expect you will get some subscribers from here. But that is not the point that I started out on. No, it is that wonderful, wonderful baby-boy. Now let us hear from him again in about six months, and then let the mother tell us who is "boss," Peter or Uncle Amos.

W. STANARD.

Louisburg, Kans., July 23, 1883.

Please send me as many of the Pilgrim's Progress books as you can for the money inclosed. The one I got in that little bill of goods has proven to be very interesting to my girl, 9 years old. I want this lot for my Sunday-school.

WM. FULLER.

Woodville, Wis., Jan. 28, 1883.

The book should be in the hands of every Sunday-school scholar, friend C., and you show great wisdom in your selection.

That queen you sent me proves to be a wonderful layer. You could not buy her back for \$5.00.

JAMES W. MCCORD.

McCordsville, Ind., June 26, 1883.

Friend M., that we may not sail under false colors, I will say that the queen that you speak of was bought of W. J. Ellison, Statesburg, Sumter Co., S. C. Now, I will not say whether friend E. sends out queens like that every time, or whether that one happened to be extra. May be he will tell us.

#### THE TWIN SISTERS.

The A B C book came to hand all right. It was quite a surprise. We think it is a very useful book for bee-keepers. Its teaching are so plain that any child could understand it. Accept our thanks. I have twin sisters 5 years old; they have blue eyes and golden hair, and they look so near alike that we can not always tell them apart. Perhaps I will send you a picture of them some time this summer.

N. Ridgeville, O.

LOUISA A. RINDSPACH.

I shall be very glad to see their pictures, friend Louisa.

Goods received in good order June 16, 14 days on the road; charges only 98 cents; am well suited with them; never had any thing from your establishment yet but what was O. K. I should have notified you of arrival of goods sooner, but the bees would not let me off. Please accept thanks.

E. J. SCHOFIELD.

Hanover, Rock Co., Wis., June 22, 1883.

But I tell you, friend S., it is not every one who can say that every thing they have received from our establishment is O. K. It is with sadness I say it.

#### TRANSFERRING BY DIRECTIONS IN A B C.

We transferred one swarm of mostly Italians into the Simplicity hive very successfully in 2 hours, having one to assist me; did not get stung, barefaced and bareheaded. The hive is well named, and deserves the highest commendation. By the aid of your A B C book we are able to manage our own bees without hiring experts. We can make our own hives like yours, but it will be best for us to buy the comb-frames and sections of you; but we would rather have just the prepared material sent — wooden strips, and tin corners, etc., ready to put together, as expressage will be less. It was \$1.95 on one hive — too high, I thought.

L. D. BROWN.

Montmorenci, Ind., July 18, 1883.

Every thing you send out is such good value for the price you sell them at, that any person who would fail to send any overplus due you would be very mean indeed.

WM. CAROTHERS.

Guyville, Ill.

I am very much obliged for your good opinion, friend C.; but I am sorry to say there are a good many who do not agree with you. It is true, that I have tried to sell goods to you at a small profit, and I try to economise the machinery for doing business at as little cost as possible. It is not often that we find any one who refuses to pay the little balances that may accrue; but there are a few.

#### HOPE AND CONFIDENCE FOR CAPITAL.

Now for just a little chat. I am a bee-keeper, just got built up to 102 swarms, spring count. I need lots of the goods you describe, but have got to go slow to support a family and build up an apiary at the same time, and that, too, with no capital except a pair of good hands, a big bump of hope, and almost unlimited confidence in bees in my range. I have been a long time building up. I had lots of experience, and am now quite a customer of yours, though you don't know it. Your extractor, A B C, smoker, etc., are getting plenty of "biz" this year at my hands. I find 100 strong colonies in this range can furnish lots of shuffling for one bee-keeper; but I have been boss of them this year, and they will repay me well.

C. WATERHOUSE.

Bayou Chene, La., July 25, 1883.

#### QUEENS IN WINTER, ETC.

If I buy an imported queen from you, will you take queens raised from her in the months of Jan., Feb., March, and April? For the last two years I have raised them in my apiary, and queens raised in Jan. and Feb. are as prolific as any raised under the swarming impulse. I know it is rather early to ask the above questions; but you know I live a long way off; and to raise queens in large lots, I shall have to order many things that can not be got here.

The labels came to hand before I expected. You must work day and night, to fill orders so promptly.

Key West, Fla., July 6, 1883.

G. A. DE LONO.

Friend L., we can not use many queens in January, February, or March; and, in fact, we seldom

have many calls for them in April; but I have given your letter here because there may be friends among our readers who will be very glad to have some queens from you. In regard to selling imported queens and taking others for pay, we have found by past experience that by far the best way is to buy for cash and sell for cash, and it really amounts to the same thing as swapping. I shall be very glad indeed to contract with you for May queens in the latter part of April or during May; for we have never yet been able to supply the demand during these months.

Let me say, the things we get of you are generally so satisfactory that I do not feel like paying any attention to it, if some small thing fails to be equal to what we expected. Please accept our thanks for what you have been the instrument, in the hands of the Lord, to help us in.

#### THE "JOYFUL" POSTOFFICE.

We have just started a new postoffice at our house called Joyful, and we hope we shall all so live in obedience to divine laws that we shall never have any more sickness; but right here in this notorious-ly ague country, demonstrate the glory of God by being joyous all the time. We hold that a person has but little if any more right to be sick than drunk. We have 5 lodges of I. O. G. T. in the county, and established a Band of Hope, which we hope will do good work.

ISAAC B. RUMFORD.

Joyful, Kern Co., Cal., July 12, 1883.

Friend R., I should think that would be a very good kind of postoffice to have. But are you not just a little bit funny when you say that a man has not any more right to be sick than he has to be drunk? I should think that would be a very good doctrine for one who is quite well. But if I should happen to come some day when you had the toothache, what would you say then? I sincerely *hope* you are right about it.

#### MY BOY'S "TICKET."

I am glad you are to have an opportunity to vote on the prohibition question in your State. You know we thought we had settled that question by a majority of nearly 30,000, which our Supreme Court has set aside on small technicalities. Perhaps we may not question the honesty of the judges; but temperance people have their own ideas all the same. We avoided one of the difficulties which trouble friend Hasty, by having the election entirely separate from all election of officers, thus making it purely non-partisan; and I think the result proved the wisdom of the course.

But I sat down to relate an incident which occurred in an adjoining county at that election. An old toper came up to the polls, and, with unsteady hands, selected two tickets—one of each kind. Holding up a whisky ticket in one hand he said, "That's my ticket;" then holding up a prohibition ticket he added, "That's my boy's ticket. I'm going to vote my boy's ticket to-day." And he did.

Politicians generally watch eagerly for the election returns from Ohio. You may be sure temperance people will do so this fall. The W. C. T. U. canvassed this State in the same manner your sister speaks of.

Since the decision of the courts, the Republican party have taken it up, and the Democrats have declared for free whisky, so it is driven into politics in this State.

BURDETTE HASSETT.

Howard Center, Iowa, July 14, 1883.

#### KIND WORDS FROM TEXAS.

This is to inform you that my goods came, which were ordered a long time ago. They came safe and sound, and just as I ordered them. They came too late to do me much good this season; but I am satisfied. I can use the goods next year. If I had known that you were so far behind on orders, I would not have ordered at all; but when I read in GLEANINGS about your troubles, and complaints against you, it made me feel as if I wanted to help you; therefore I can not complain about my order.

It has been said that Texas beats the world for honey; but I hardly believe this is true every year. This year has been the poorest honey season that I

have seen here for 18 years. I have commenced to keep bees with the late improvements, and people make light of my business, and say that I will never accomplish any thing. Well, I may not accomplish any thing; but I pay no attention to their talk, and work quietly and easily.

G. W. BEARD.

Milano, Milam Co., Texas, July 18, 1883.

Friend B., you are kinder than we deserve. I am very much obliged to you indeed for your consideration in overlooking the delays and damages we have caused you. In your closing sentence you have struck the right spirit exactly. Quiet, steady work is an argument that can never be answered. If you took the advice of those who find fault, and croak, if that is the proper word, you certainly would never amount to any thing; but if you stick to the bees, as you propose, you will surely receive your reward. If your friends are interested in the matter, lend them a number of GLEANINGS, and ask them to read Reports Encouraging. If they never bring them back, just let us know, and we will replace those that are lost. We are always glad to give away sample copies of GLEANINGS; and if our friends give them away themselves, we shall be much obliged for the kindness. Whenever we find we have not enough for your purpose, we will just tell "Barney" to print a few more next time.

I want to return you thanks for your kind instruction in bee culture. I used my extractor last week for the first time; it works finely. I extracted 27 lbs. of honey. I tell you, it is nice. I sold some of it for 15 cts. per lb. My bees are doing well. I have 35 swarms. I shall extract more honey this week. I clipped my queen's wing, and divided the bees to keep them from swarming.

#### HOW TO MAKE AN ARTIFICIAL SWARM.

The way I do is to take 2 or 3 frames out of one hive that is full of brood, and brush all of the bees off and put it in a new hive, and fill up the hive with comb fdn., and then I take a hive that is full of bees, and move it away 3 or 4 rods, and set the new one in its place. I do it in the morning, say from 9 to 11 o'clock; and by 4 I have a good swarm of bees in the new hive.

#### STARVATION DURING THE HONEY SEASON.

Will bees turn all their brood out of the comb when they are starving? I had one this spring that tore all of their young bees out. I was looking through the bees, and all the rest were getting honey, and had lots to live on; and when I came to this one it was a sight to see. The bees had no life in them; they had killed all of their young bees, and had torn about half of them out of the comb, and then they had not life enough to do any more. They had no honey in the hive, and I fed them a week before they would show any signs of work. What do you think was the cause?

#### MILKWEED FOR HONEY.

We have a milkweed here that must be very good for honey. The bees work on it all day; it commenced blooming two weeks ago; it is very thick around here. It looks as if it would last for a month longer.

MALINDA A. WILKINS.

Seneca, Kan., July 15, 1883.

My friend, it was starvation and nothing else that was the matter with your bees, although it is a little hard to see how they came so near to a starving condition in July. I would suggest that they had been raising brood largely, and had taken about all the food that had been gathered, when several stormy days occurred, and they ran out of honey, and became so weak they could not go after more; therefore you would see some starving when the rest were storing honey. When at the last stage of starvation, they always turn upon the brood and suck the juices, and this is what you saw.—Your plan of making artificial swarms is a very good one, especially if you have a laying queen or a mated queen-cell to give them.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

\$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or of any thing of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \*, use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

SAVE YOUR FOWLS. SAVE TIME and MONEY.

FANCY POULTRY, POULTRY POWDER, ITALIAN BEES, BEE-HIVES, & C. 6ftng For circulars, address J. R. LANDES, Ashblou, Ashland Co., Ohio.

## Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

### CITY MARKETS.

**MILWAUKEE.**—*Honey.*—This market is not very lively on honey, and the demand is not large. But I expect, as cool weather comes on, it will be wanted, and shipments can be disposed of to good advantage. Choice white comb in 1-lb. sections, quotable at 18c per lb.; white comb in mixed or larger packages, 15@16c. Extracted white, in small packages, 11c; in large, 10c. *Beeswax* in some demand. Choice quality would bring 30@35c. A. V. BISHOP.  
81 & 83 Detroit St., Milwaukee, Wis., Aug. 13, 1883.

**CLEVELAND.**—*Honey.*—New 1-lb. section honey of first quality is in good demand, selling at 18 to 19 cts., as fast as it arrives, no stock accumulating. Second quality not so salable, and stock does not move off so readily at 16@17c. Extracted not inquired for; no new stock in market. *Beeswax*, none offering. Cleveland, O., Aug. 21, 1883. A. C. KENDEL.

**CINCINNATI.**—*Honey.*—The demand for extracted honey is exceedingly dull; for comb honey, only fair. Arrivals are plentiful. Stocks are large in the hands of commission merchants and others. Our own supply is larger than ever; and for the present, we can not compete with commission merchants. We may have to offer lower figures. Our price so far was 7@9c for extracted honey, and 14@16c for comb honey on arrival. *Beeswax*, arrivals are good at 25@28c. Demand is fair. CHAS. F. MUTH.  
Cincinnati, O., Aug. 21, 1883.

**ST. LOUIS.**—*Honey.*—Large offerings of California comb honey caused great depression of values here at opening of season. Prices are, however, rapidly recovering, enabling us to place choice comb honey, in neat clean packages, from reputable apiaries, at 17@20c per lb. Extracted still moves slowly at 7½@8c per lb. in barrels; 9@10c per lb. in 1 and 2 gallon cans. Extremely warm weather still causes consumers to limit their purchases to their most immediate wants. With cooler weather we look for largely increased demand and values for all classes of honey. *Beeswax*, quotable at 27c per lb. W. T. ANDERSON & CO.  
104 N. Third St, St. Louis, Mo., Aug. 22, 1883.

**NEW YORK.**—*Honey.*—We quote: White clover, 1-lb. sections, 20c; 1½-lb. sections, 19c. Buckwheat, 2-lb. sections, 13c; 1-lb. sections, 14c. No changes in extracted honey, and no arrivals of new comb honey yet. *Beeswax* is plentiful, and holds steady at 29@30c. H. K. & F. B. THURBER & CO.  
New York, Aug. 22, 1883.

**BOSTON.**—*Honey.*—One-half-pound sections, 25c; 1-lb. sections, 20c; 2-lb. sections, 18c. Extracted, 8@10c. All of best quality. CROCKER & BLAKE.  
57 Chatham St., Boston, Mass., Aug. 22, 1883.

**DETROIT.**—*Honey.*—New honey is beginning to come in freely, though the demand has improved but little if any. A good article is offered at 16@18c; but little has been sold yet. *Beeswax*, firm at 28@30c. Detroit, Mich., Aug. 25, 1883. A. B. WEED.

**CHICAGO.**—*Honey.*—The trading in honey is fair for the season. Values are without change from last week. There are no orders for pound lots of comb or extracted on the market; hence, prices vary. Choice white-comb, 1-lb. sections, 18c; 1½ to 2-lb. sections, 15 to 17c. Dark, no sales being made; extracted, 8@10c per lb. as to quality and amount taken. *Beeswax*, quiet at 28@35c. Receipts moderate. R. A. BURNETT.  
161 South Water St., Chicago, Ill., Aug. 24, 1883.

### OUR MARKET REPORTS.

What is the reason your city honey-market reports are so slim? We fellows in the West would like to see you give the markets of St. Louis and Chicago, as these are our main points to ship to. Please give us the markets of these two places, if it is not asking too much. J. E. WALCHER.  
Millersville, Ill., July 20, 1883.

*Ed Gleanings.*—Permit me to inform you of my withdrawal from the house of H. K. & F. B. Thurber & Co. There is no doubt that there is needed a strictly *honey and beeswax* house, whereby products can always be obtained, and consignments made by producers to best advantage. My long experience as manager of this department for the house of H. K. & F. B. Thurber & Co., familiarity with the honey trade, and my connections with all principal beekeepers throughout the country, enable me to understandingly establish a honey emporium where all the bee products can be handled to best advantage; and I desire to thank friends for their confidence and patronage in the past, and to direct them to the excellent advantages and facilities I now offer in establishing a business where goods in this special line will receive undivided care, management, and attention. Any goods intrusted to our care on commission will be disposed of at the highest market prices, and prompt returns made. Soliciting your patronage, and hoping for favors from old friends, I remain yours truly, JOS. M. MCCAUL.  
80 Hudson St., New York, Aug. 27, 1883.

Wanted, a few crates of honey; also 2 or 3 kegs of nice extracted honey. Send sample and price, to be delivered at depot here. JAMES S. CASE.  
Colchester, Conn.

Who can deliver me 400 or 500 lbs. of choice white-clover comb honey in one-pound boxes? I will pay 15 cts. per lb., delivered here. S. WHAN.  
Raymlton, Venango Co., Pa.

I should like to buy 200 lbs. of extracted clover honey, for which I will pay 9c per lb. C. L. PAYNE.  
Eagleville, Ashtabula Co., O.

I have about 1000 lbs. of nice comb honey, white clover, which I should like to dispose of very soon. Do you want it? Please let me know soon, stating price. FAYETTE KEITH.  
Dundee, Ill.

I have on hand about 75 gallons fine extracted honey. Please let me know where I can find market for it, and what it will bring. My honey is in small barrels. J. F. WILLIAMS.  
Warsaw, N. C.

How is the price of honey in your neighborhood? I am almost discouraged. We can not get over 12½ cts. for the very best one-pound boxes. Can not the Bee-Keepers' Association make and keep a standard price for honey? How do you dispose of your stock? E. E. DEYLER.  
Black Ash, Henry Co., Ohio.

Wanted, 1000 or 2000 lbs. white-clover or linn honey, extracted, delivered at Des Moines; also about 1000 lbs. 1-lb. sections of same grade. State price delivered at Des Moines in good order. MLO-SMITH.  
Greenwood, Polk Co., Iowa.

## Black and Hybrid Queens For Sale.

I shall have about 20 hybrid queens. If they are of any value to you, let me know. E. BAER.  
Sterling, Ill.

I have a few hybrid queens which are almost pure; would sell them at 25c. Is there somebody who wants them? WM. K. DEISHER.  
Kutztown, Berks Co., Pa.

I have 10 black queens which I wish to sell. Afton, N. Y. O. J. RUSSELL.

## THE VERY BEST

*Italian and Holy-Land Queens; also Apianian Supplies* at prices to suit the times. Circular free.

Established in 1873.

PUBLISHED MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

NOTES FROM THE BANNER APIARY.

No. 46.

POOR HONEY SEASON.

**T**HIS has been about the poorest honey season we have had since I have been in the business. The spring was late and cold, the summer was cold and rainy, and the fall promises to be cold and perhaps dry. Well, we have the satisfaction of knowing that not a stone has been left unturned, and not an ounce of honey has been lost from neglect, or from lack of hives, sections, fdn., or fixtures of any kind. When the season is over, I will tell you what we have done.

THE FOUNTAIN PUMP

is an instrument I should not think of doing without, especially where natural swarming is allowed. We have saved at least two swarms with ours this season, besides "controlling" several more. We keep two large tin pails of water standing near the shop door, and the pump hanging near by, and thus are *always* ready for business.

CLOTHES-BASKETS FOR HIVING SWARMS.

We have two of the 25-cent splint clothes-baskets, lined with cotton cloth, and furnished with a burlap cover sewed fast at one side, and I would ask for nothing better in which to shake off clustering swarms. The hive is placed upon the stand that it is to occupy, the bees shaken into the basket, the cover "flopped" over, the basket carried to the hive, the bees shaken to the end of the basket by "chucking" it upon the ground, the cover turned back, the bees shaken down in front of the hives, and the job is done.

NATURAL SWARMING PREFERRED.

After having seen the ease with which bees can be managed when allowed to swarm naturally, the energy with which they work, and the excellent results that are obtained, I shall never, no, *never*, go back to artificial swarming; but I don't want any

QUEENS WITH CLIPPED WINGS,

as the few that we had of that kind gave us more trouble than all the others. In the first place, we have the queens to find and catch; but this, however, is the smallest of the bother; the bees roam around a long time, and sometimes finally cluster; and if another swarm comes out they are sure to join it. When the bees do come back they often go "piling" into the wrong hive, or perhaps *hives*; and if they do "catch on" to the proper hive, instead of going in they often cluster all over the outside of it. Sometimes, after the queen has been allowed to run in she comes out again, thinking perhaps that *she* hasn't "swarmed" yet. In my experience, a swarm having a queen unclipped will cluster, and can be hived, and be at work in that "whooping," "zipping," go-ahead style, in just about the same time that it takes a swarm with a clipped queen to make up its mind, sullenly and doggedly, to go back home. I presume that a swarm with a clipped queen feels very much the same as would a picnic party whose lunch-basket had been stolen, and, as a consequence, they had to come back and not have any picnic. The following is from friend Doolittle:

INTRODUCING VIRGIN QUEENS.

I have just read your article on Alley's book, friend H., in Aug. GLEANINGS, and note what you say about introducing virgin queens. Now, won't you tell us, in Sept. GLEANINGS, very *minutely*, just how you introduce those virgin queens as soon as

you remove a fertile queen? By the Alley plan (waiting three days) I can get a part accepted, but I have lost more than 100 trying to get them in as soon as the laying queen was taken out, and never succeeded even *once*. G. M. DOOLITTLE.

Borodino, N. Y., Aug. 4, 1883.

Friend D., there is no trick or secret about it. As soon as the laying queen is caged I take the virgin queen by the wings and place her among the bees, at about the center of one of the combs. Usually, the bees pay no attention to her; if they *do* attempt to sting her, I smoke them, and then watch her and continue to smoke them until they let her alone, and I never yet had to watch one *more* than ten minutes, and seldom more than two minutes. I am well aware that nuclei that have been queenless two or three days accept a queen much more readily than do those from which a queen has just been taken; but in *my* experience, the percentage killed by introducing them without waiting is so small that it does not pay to wait. I have 130 nuclei this season, and I do not think that I have inserted half a dozen cells; all the queens have hatched out in the lamp nursery, and then been introduced. As a *general* thing, the laying queens have been caged in the afternoon, and the virgin queens introduced the next morning.

#### METAL-CORNERED FRAMES.

Friend Root, in your comments on my article in July GLEANINGS, you say: "Had you provided yours with some of the spacing-boards we describe and illustrate in our price list, you would have found it a very simple matter indeed." And in reply please allow me to say, had not the frames been metal-cornered, spacing-boards would not have been needed. Do you know what I did when I got those metal-cornered frames home? No, I suppose you don't; but you can easily guess. I just took the hammer and "smashed 'em" right around the ends of the top-bars, and then nailed another top-bar right on top of the old one. The frames were a trifle smaller than mine, otherwise I could not have done this, and should, I suppose, have been compelled to use the metal corners. Cyula Linswik and her sister do not like metal-cornered frames, and bought them, I *presume*, just as thousands of others have done, because *you* used and advised the use of them. Candidly, friend Root, do *you* like frames with metal corners? do you know of any good purpose that they serve that is not more than counterbalanced by objections? A nailed frame made from  $\frac{3}{8}$  stuff is strong enough, and then the top-bar doesn't sag, and diagonal wires and center-posts of tin are done away with. The tins cut the fingers. I know we can take hold of the frames nearer the center; but the frame back from the ends is more liable to be covered with bees, and it is not so convenient as to take hold at the projections at the ends. With metal corners we are not so liable to kill bees when putting back the frames. True; and this, I believe, is the only point in their favor. Now, I dislike to kill bees; but I am in the bee business to make money; or, if you will, to get my bread and butter; and when it pays to kill bees, I shall do it; but the number of bees that will be killed, even with ordinary care, in handling all-wood frames, is a very trifling matter indeed. When metal corners are *new* they can be picked up more readily than all-wood frames; but after the bees have their brace-combs completed, a frame has to be pried loose before it can be removed, whether there are metal corners or no metal corners, and it takes just about

as long in one case as the other. In working for extracted honey it is well to have the *upper* stories made with metal rabbets; but in working for comb honey, even metal rabbets are not needed, nor advisable.

#### THE HEDDON, OR MANUM, SECTION.

Friend Root, you have probably learned, ere this, that I believe in "hewing to the line, let the chips fall where they may;" and for this reason I wish to enter my protest against the *intimation* that the sections sent out by Mr. Heddon are not thoroughly seasoned, and will shrink and easily tumble to pieces. Last winter friend H. sent me a sample. I gave it to the twins to play with, and after they had taken it to pieces and put it together again a few times it wouldn't stand alone, let alone being knocked off the window. The reason was, it had become so worn. Friend Walker put that section together and took it apart at least once, then you put it together, and *perhaps* it was taken apart several times; if so, it was not a fair test to knock such a section off the window. Now, let me tell what I did. I took one of friend Heddon's sections that had been put together nearly three months, and threw it up *ten feet*; and when it struck the floor it was thrown only slightly out of the square. I continued to throw it up, and the third time it came to pieces. You think Mr. Manum might make some one-piece sections of the same material. I fear not. I think the wood is too hard and brittle; but, of course, I may be mistaken. This hardness is a valuable quality, as it prevents the honey from soaking into and discoloring the wood. No, friend Root, and all the other friends, the section that friend Heddon sells *is* seasoned, and thoroughly seasoned too, and it never mildews as did some of the basswood sections that you told about last spring.

W. Z. HUTCHINSON.

Rogersville, Gen. Co., Mich., Aug., 1883.

Friend H., are you not getting a little vehement, too? We make metal-cornered frames and all-wood frames, and like our customers to have which they prefer. In our own apiary we have tried, over and over again, to get along with all-wood frames, which we get every season in buying bees. But I never yet had a hand in my employ but that begged to be allowed to transfer all the combs in all-wood frames into the metal-cornered ones. Do you remember, that in the price list I advise trying one frame with metal corners before getting more? Difference in locality may have something to do with it. When I visited Cyula Linswik and her sister I found their hives so crammed with honey that metal corners and every thing else were built up solid. Furthermore, the combs were so heavy that the metal corners would hardly bear the weight of them. Now, we do not have this state of things in Ohio; or at least we do not allow bees to get so crowded for room that they fill up every thing in that way. Are not your remarks a little intolerant of the opinions of other people? Should I allow the protests that will come, from what you have said, a place in GLEANINGS, there would hardly be room for any thing else. We have great numbers of customers who are ordering metal-cornered frames year after year; and the present season the demand has been greater than ever before. As an illustration of how opinions differ, I would cite you this matter of introducing virgin queens, which

you have just mentioned. Doolittle says he never succeeded even once: you say that your failures are so few that the loss of time in waiting three days is a much greater loss. Now, I agree with you; but what shall we think of friend Doolittle? As a great many agree with him, should we not conclude it lies mostly in the different ways we manage, and also in the different notions we have, and the different ways we have got used to?

I agree with you, that friend Heddon's section is a splendid one, and I have just been thinking about trying to buy 100,000 or more for next season's use. Still, I think the one-piece section will hang together under some circumstances when Heddon's would not; and Heddon's is a great deal more work to put together. I know our basswood sections mildewed because the lumber was not seasoned enough; but we are making preparations now to have sections enough for next season, put up months before they are wanted. As the bee-world has got to be a pretty large world, I am not sure we shall be able to do it; but we are going to try hard. It might be a good idea for many of the bee-keepers to have their sections made and in store, even this fall, for next season's use. I presume 100 manufacturers of sections would be glad to take orders now for sections at a low rate for next season's use. There ought to be manufacturers of sections, not only in every State, but in different parts of every State, to save expensive shipping rates, and also to prevent those who have, during the past season, been trying to fill orders, from being so overcrowded as we all have been. And you think you never want any more artificial swarming, friend H.? May I caution you again about being too positive? I rather expect to see you change your mind in a good many respects, and on a good many points, during the next ten years, if you will excuse so much from an old friend.

### THE SOLAR WAX-EXTRACTOR.

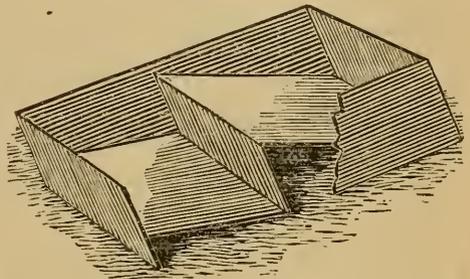

A VALUABLE PAPER FROM FRIEND POPPLETON.

SOME seven or eight years ago I experimented with the idea of giving bees a flight in the winter by means of the sun's rays passing through glass. The story of these experiments might make interesting reading, but would probably be of no practical value to bee-keepers. These experiments, however, taught me the use of two of the most important fixtures in my apiary; viz., the chaff hive and the solar wax-extractor, both of which have been largely used by me since first learning their utility.

The solar wax-extractor seems to be a new idea to a great many bee-keepers, so I will give a description of the one I use, and some suggestions as to how to use it, etc. Mine is only a rough affair; one can be made by any person who can use a saw and hammer (except the tins from the tinsmith); but mine has answered my purpose very well. I am in hopes, however, that some ingenious mechanic who has the proper facilities will improve the shape or position of the glass so as to give greater heat, and make the implement more effective.

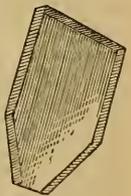

Mine is made of ½-inch lumber, planed and paint-

ed red (I think black would be better), but inch lumber would do just as well. It is simply a square box 40½ inches long, 25 wide, and 12½ deep, with an irregular bottom. The following is a side view of the implement, one of the sides being removed, showing the zigzag bottom.

SOLAR WAX-EXTRACTOR.

The highest part of the bottom is for holding the tin containing the combs to be rendered, the lower part holds the vessel that catches the drippings. The tin comb-holder is simply a sheet of any kind of tin, 20x28, cut in this shape: That is, two of the corners are cut beveling, and the entire outer edge of the tin, except the point, is turned up about ½ or ¾ of an inch, and the corners soldered, leaving an open place at the lower end of the tin, about two inches wide, for the melted wax and honey to flow off into the dish placed to catch it. This dish may be a common 10-qt. milk pan, or a flaring-top WAX-PAN. tin pail, the latter being preferable.

WAX-PAN.

I make a frame of the right size for holding a 24x40-inch glass, out of inch lumber; rabbet the inside edges of the frame, so the glass will fit in the rabbets and allow thin strips of the same width as are the pieces of the frame to be nailed over frame and edges of glass to hold the glass securely in its place. This is an easier and safer plan than to use putty. I use two thicknesses of glass, one on each side of the frame, which leaves them about ½ inch apart. I do not think this is absolutely essential, but it furnishes more heat than does a single thickness of glass. If glass 24x40 can not be obtained, use two frames 20x24, letting the edges of the glass come together in the center of the frame or sash. I set the implement on any firm support that keeps the lower end one or two feet above the ground, and inclined to the south enough so the rays of the sun will strike the glass at as nearly right angles as possible. The tin comb-holder wants to be inclined so the melted wax and honey will run off freely, but not so much as to allow the bulk of the refuse matter to run off also. Mine has an incline of 1 inch in 5½, which is about right. When I open the implement for any purpose whatever, I raise the lower end of the sash, slide it back until it overbalances, and let the back end rest on a post driven in the ground at a proper distance.

For dipping the melted wax into molds, I use a small tin cup, ½ pint, made with one straight side, and the handle nearly on top when the cup is laid on the straight side. Leave the straight side of the cup smooth, without either wiring or turning over. This all sounds like the description of a complicated

implement, but it is really a very simple, erude affair. The expense of the material to make it should not be over \$3.00, depending on the price of glass, and whether one or two thicknesses are used.

As simple as it is, the one I now use is the third one I made before being satisfied. The first was only for experiment, and satisfied me of its utility. The second was made of 3 sheets of 20x28 tin, soldered together, put into a box similar to the one I now use, only larger, and covered by some old windows that I happened to have on hand. This was too large to be handled easily, and the shadows of the pieces of sash that were over the wax were an injury. I found that it took so long to render a charge of wax that it would partly bleach, harming both color and quality. I then adopted the smaller size I now use, which has nothing that can cast a shadow on the wax while melting.

Now, what practical use is this implement to us? What are its advantages, and what its disadvantages? I do not think it will ever be largely used if at all, by those who have large quantities of old combs to render up; but I think it will be found invaluable to small bee-keepers, and to every one who produces extracted honey. Its chief advantages are the little time and attention its use requires, and the large amount of honey it saves from cappings.

In the morning, before commencing regular work in the apiary, I usually empty the vessel containing the honey and thin cake of wax left from the previous day's running; fill up the extractor, and pay no more attention to it until 3 or 4 o'clock in the afternoon, when I dip off the melted wax into moulds, and the last thing before quitting work at night, I take out the large tin, and clean off the refuse while it is yet warm.

Very few are aware how much honey is wasted by the ordinary method of rendering up the cappings. I first drain my cappings very thoroughly—more so than can be done in draining-cans, such as those described by Dadant in his pamphlet, and then get nearly or quite 2 lbs. of honey to one of wax. I save at least 200 lbs. of honey each year, that, by any other process, would be wasted. This honey is very thick, and would be of extra fine flavor but for the small amount of pollen that gets mixed with it while melting. I always put this honey into a separate barrel, notify the consignee that it is a different grade of honey from the rest, and to pay me what it is worth, and I have always been allowed the same as for other dark or mixed honey.

The one great drawback in the use of this implement is, that it can be used only on clear warm days, and this is a very serious inconvenience in this far northern climate. I think the further south one is located, the less this would trouble; and if I were located in any of the Southern States, I think I should use no other form of wax-extractor. When I first commenced its use several years ago I used to leave it open to the light several days at a time until the combs in it were all rendered out; but I soon found out that wouldn't do, on account of its bleaching and hardening the wax, and I now have a cover of thin boards that I keep over the extractor at all times, except when running, and never put any more comb in it at a time than I think will be rendered out that day. If at any time during the day the sky becomes cloudy, I cover up the extractor and finish that run the next clear day.

What may be an objectionable feature to some, is

the fact that wax rendered by it is harder than that rendered by other methods. I can not see but the bees work foundation made from it just as quickly as from any, but it will require experiments by others who use fdn. made on roller or press machines to determine the facts.

When wax is kept for several hours at a time in a liquid condition, as is the case when using this implement, every impurity it may contain rises to the top, when it may be skimmed off, or it settles to the bottom, leaving the wax absolutely free from any foreign matter; and wax that has been properly handled in the solar extractor is as beautiful in color, and as free from all impurities, as it is possible for wax to be.

O. O. POPPLETON.

Williamstown, Iowa, August 21, 1883.

Many thanks, friend P., for your very plain and complete description of this scientific instrument, for it truly deserves the name. I, too, learned some to me very strange things when experimenting with bees under glass; and one of the strangest was the great amount of heat that will be developed under a double glass such as you describe. I have often thought it might be utilized for warming buildings, in place of burning so much wood and coal. Why has it not been done? We all know of the curative properties in the direct rays of the sun. Now, why not have a sort of playroom for the children done off on the south side of the house, to be warmed only by the sun's rays? Of course, we should not expect the children to frolic around in it in summer time; but even in the freezing days of winter such a room would be comfortable without a stove or fireplace. I feel a strong temptation to make these solar wax-extractors for sale; but when I think of the number of things we already offer for bee culture, I am almost afraid to start out on another thing. With your very plain description, perhaps our friends can easily make them themselves. And I believe it will be found a very useful thing for converting all sorts of refuse into nice bright wax.

#### THE STANDARD LANGSTROTH HIVE AND FRAME.

SOMETHING FROM FRIEND LANGSTROTH HIMSELF IN REGARD TO THE DIMENSIONS OF THE ABOVE.

**B**EFORE inventing my movable frames I used bars, in a hive with movable top and bottom, by which the bars could be worked to much better advantage than by side-opening doors. My latest style of bar hives were  $1\frac{1}{2}$  by  $1\frac{1}{2}$  by 6 inches deep, all in the clear. At that time (1851), honey, to bring the best price, had to be in combs built in neat glassed boxes, and this shape of the hive gave an unusually large surface for such supers. The walls of these hives were double glass, to give the dead-air space, which protected the bees against extremes of heat or cold, and sudden changes of temperature. That fractional  $\frac{1}{2}$ , which has puzzled so many, gave room for two strips of wood, each one inch wide by 1-16th thick, against which the double glass could be fastened with glazier's points. One pane of glass, 18 by 12, a common commercial size, could be easily cut so as to answer for one side. My movable-frame hives were first made in the spring of 1852, in the city of Philadelphia—some six months before the

patent, which was applied for in January, was issued. These hives were  $14\frac{1}{2}$  inches from front to rear, and  $18\frac{3}{8}$  from side to side. Early in 1853 my hives were made in Greenfield, Mass., and the first edition of my book on the "Hive and Honey-Bee" was published in May of that year. The present size of hives,  $18\frac{3}{8}$  from front to rear,  $14\frac{1}{2}$  from side to side, and 10 inches deep, was then adopted. The dimensions,  $18\frac{3}{8}$  from front to rear, and 10 inches deep, have never been changed; but that from side to side may vary according to the number of frames, some preferring 8, some 10, and some even more. I am correctly quoted as having said, in the *American Bee Journal*, in reply to an inquiry, "Considering the accuracy which may be obtained in making the frames stiff and perfectly square, I prefer the Root and Newman measurements." What I meant was, that frames could be made so stiff and square as to allow of their being  $\frac{1}{4}$  of an inch longer than the old standard size, and that the  $\frac{1}{4}$  inch (instead of  $\frac{3}{8}$ ) still left between the uprights of the frames and the front and rear walls of the hive, gave all the room needed for their proper manipulation. It never occurred to me that any one could possibly suppose that I meant that my frames could be improved in squareness or stiffness by making them only  $\frac{1}{4}$ th of an inch longer! I then thought that it was quite a desirable point to gain this  $\frac{1}{4}$ th inch, as in ten frames it gave an increase of comb surface enough for rearing over 1100 bees.

As such large operators as Heddon, Root, and Baldrige, insist that  $\frac{3}{8}$  of an inch space between uprights of frames and hive is the least that can be safely allowed; and as hives are not unfrequently made, even by good workmen, which vary a little from the true dimensions, and further, as some kinds of lumber are badly affected by variations in the weather, I am now of opinion that  $\frac{3}{8}$  is better than  $\frac{1}{4}$ th.

Considering the frequency and severity of my attacks of head troubles, which not only prevent me from taking any interest in bee matters, but which render any thought upon such subjects both painful and dangerous, it will not seem surprising that it is only within a few weeks that I have learned that the change in the size of the standard L. frame was made to carry with it a change in the size of the standard L. hive! I have no recollection of ever having read the article to which Mr. Baldrige thinks I ought to have responded, until I saw his reference to it in the *A. B. J.* of August 8th, or I should before this not only have corrected his misunderstanding of the reason I gave for preferring that extra  $\frac{1}{4}$  inch, but should have expressed my deep regret that the size of the standard L. hive had been changed; not that slight changes in frame and hive are of any special importance, except as they interfere to any extent with the cardinal principle, that any L. frame ought to fit in every L. hive. Even after I ceased to use the double glass walls, the fractional  $\frac{1}{8}$  was retained to prevent confusion by departing even to so small an extent from the size then so widely disseminated. It is, however, very easy to exaggerate the inconveniences which have resulted from these slight variations. One will contend that the standard L. frame can not be used in the Root and Newman L. hive, and many will actually prefer that size of hive for them, as giving more room for the safe and rapid handling of frames. If both hives and frames are *very carefully* made, I find no trouble in using the R. and N. frame

in the standard L. hive. The great length of the top-bar of the L. frame enables me, after removing one frame from the hive, to take out the others with great ease, thus: When frame (1) is lifted out, the end (C) of frame (2) is drawn toward the operator, without any lifting, until the angle is large enough to remove it without danger of hitting the sides of the hive; so in replacing it the end (2) is first put on the rabbet, and (C) can then be moved readily to its place. The long leverage of the L. frames greatly favors such manipulations. I would say here, that a variation of only  $\frac{1}{8}$  from front to rear, if it is on the side of making the hive *smaller* (say only 18 inches), is, for divers reasons, a much more serious matter than the extra  $\frac{1}{4}$  inch; for in such hives it is well nigh impossible to have any free manipulation of the longer frames. I am using in my own apiary the Root size of frame in the standard L. hive, and find no trouble at all in doing so. I would even prefer, with hives and frames made as accurately as they should be,  $\frac{1}{4}$  inch space, manipulating in the manner above described, to  $\frac{1}{2}$  inch, if the frames had to be squarely lifted out.

The conclusion of the whole matter seems to me to be this: The standard L. hive is  $18\frac{3}{8}$  inches from front to rear, and ten inches deep, all in the clear, and the standard L. frame is  $17\frac{3}{8}$ , and not  $17\frac{1}{2}$ ; and I advise all who make new hives, if they can do so without too much loss, not to vary at all from these measurements. I certainly have no right to demand that the parties who are using the extra  $\frac{1}{4}$  inch, both for hive and frame, should return to the old standard; but I hope that, instead of calling their hives the standard L. hives, they will call them the Root L. hives, as Mr. Root first used the extra  $\frac{1}{4}$  inch. I presume that Messrs. Root and Newman, and other hive-makers, if not willing to return to the standard L., will have no objections to filling orders for Simplicity, chaff, or other styles of hives of the L. standard size.

Intending in another article to give in detail my reasons for adopting my standard size of frame, I will close by saying that I no more claim perfection for it now than I did in 1853, when in the full gush of enthusiasm over an invention which I hoped would revolutionize practical bee-keeping.

L. L. LANGSTROTH.

Oxford, Ohio, August, 1883.

Many thanks, friend L., for the valuable facts you give us in the above. I suppose our friends will, of course, give us credit for having good sense enough in this matter to avoid being tenacious of any peculiar views and opinions we may have in regard to the size of hives and frames. So far as I am concerned, I would just as soon the frame should be  $17\frac{3}{8}$  as  $17\frac{1}{2}$  with the exception of this matter of having the standard frame contain 8 one-pound boxes. Aside from that, I know of no objections to a change, except the number of hives and frames already in use, made to pretty exact measurements. In 1873 it seemed to me too bad that we should have such a sea of differences in sizes of frames and hives, with no two alike. And in order to try to start a system of regular sizes, I made the five illustrations which you all doubtless remember have been in our price list all these years. Before deciding on the size of a Langstroth frame, I sent to

you, friend L., for a sample frame while you were in Washington. It came by express, and I used it as my standard—or at least I supposed I did. I do not know why I did not consult your book at this time; in fact, I did not think how much depended upon it. But we fixed our machinery then, and went to work. We have worked this one size ever since, and have also made Simplicity hives that would pile up and fit one another. We have also, during these years, sent out about 40 editions of our price list, averaging, at a very low calculation, 20,000 copies to each edition, making about 800,000, and these have gone to every part of the world where civilization extends. These Simplicity hives and frames are made and used in the Sandwich Islands, New Zealand, Australia, Europe, Asia, and Africa, and to some extent in South America. One more fact: During all this time we have been making these hives and frames, we have also made odd sizes to order; yet I can not now call to mind a single order for L. frames made 17 $\frac{3}{8}$  inches long, outside dimensions. Yet we have had orders for the L. frames for a great variety of different dimensions. Perhaps I am a little vehement in this matter, but I am sure I seek only the public good; and if there is any great good reason why we should commence making frames and hives differently, I should think better of the idea of so doing. Our hives are generally termed Simplicity hives, and the frames which are generally used, of course in both Simplicity and chaff hives, are usually termed Simplicity frames. I do not know of any reason why we should not adopt the term Simplicity instead of Langstroth.

One more point occurs to me. I first suggested and put in practice the idea of having rigid iron frames to gauge the hives, that all manufacturers might work to one gauge. These iron frames have been sold for several years past, and shipped to manufacturers all over the world. These manufacturers are making hives to these gauges. I do not know how many we have sent out, but probably more than a thousand. Now, my good friend L., in view of all this, is it wise to advise even beginners to take up something different? I should be very glad indeed to know how many hives there are in use with a dimension from front to rear of 18 $\frac{1}{4}$  inches. Can some of the friends tell us something about it?

#### HOW FAR WILL A SWARM OF BEES FLY?

A SURE CASE OF A STRETCH OF 80 MILES.

**I** FIND the following items regarding the distance a swarm of bees will travel in search of a home, recorded in my diary of 1880, made at the time. The 19th of July I encamped under some pinon-trees at the base of the Spanish Peaks, 85 miles southwest from Denver City, Colorado. Twenty-five minutes past 12 o'clock I discovered a swarm of Italians clustering on the trunk of one of the trees near the ground, coming from the direction of Denver. They were flying slowly, evidently fatigued; securing the exact direction from whence they came, I mounted my pony, cantered over the plain in search

of the ranch from whence they had escaped, expecting to find the parent stock in a couple of hours' ride at most. I kept up a steady march, with neither trees nor ranch in sight until 4 o'clock and 10 minutes, when I discovered some bees hovering around some giant cacti, from which 2 pieces of new comb depended, about as large as my hand. I readily perceived my colony had spent the previous night there. This was fully 30 miles from my starting-point. Going into camp there until the next morning I decided to keep on the same course until I found their starting-point. No more bees nor signs were reached until I came to J. C. Sines' ranch, within five miles of Denver. Mr. Sines told me that, the day before I discovered the runaways, at about 2 o'clock one of his colonies swarmed out, starting directly across the plain; after following them on horseback some 10 or 15 miles he had returned, never expecting to hear more from them. I am sure they could not have surveyed the country before starting on their long trip; and how much further they may have gone, I have no means of knowing. Hoping this may lead observers to approximate the distance an absconding colony may fly, I am yours respectfully,—

H. RANDALL.

Prairie du Sac, Wis., Aug. 25, 1883.

It seems a little wonderful, friend R., that you succeeded so well in striking the direct line in which the bees came; but I believe it is a fact, that bees do sometimes get a sort of migratory mania, when they will fly a piece and cluster, build a little comb, as you describe, then "light out" and try it again, and so on until they may be the means of peopling very remote districts with bees.

## Bee Entomology,

### Or Enemies of Bees Among Insect Tribes

HONEY-DEW FROM SUGAR-CANE.

**I** CONCLUDED this morning to send you a piece of cane-top that has the insects on it, but don't know that they will live sufficiently for you to tell any thing about them. The tops infested with them are full of honey-dew. J. D. FOOSHE.

Coronaca, S. C., Aug. 1, 1883.

We mailed the specimen to Prof. Cook, who replied as follows:

The insects sent are a species of plant-louse, of the genus *Aphis*, as shown by the nectaries on the posterior end of the abdomen. (See Fig. 123, 8th Ed. of Manual). From these tubes come the exuding sweet. Our tulip-trees at the college are now all gummed up by the exudations of the tulip-tree plant-louse, which is green in color. The one on the cane is black. Insects of all kinds that crave sweets swarm about such plants, though bees do not keep them company till the fountains of the basswood nectar are dried up. A. J. COOK.

Lansing, Mich., Aug. 10, 1883.

My friends, here is another funny idea. We all know there is sugar in sugar-cane and corn. The problem has been to get it where the bees could use it. The aphides come in and offer to do the job "free gratis." The question now is, as to whether their reputation is such that we would want to let the job out to them at any price. I am a little doubtful in the matter.

## SUCCESS WITH BEES.

A GOOD REPORT FROM THE AUTHOR OF "BLESSÉD BEES."

THE following, from the *Iowa City Republican*, is interesting to us, from the fact that it shows that the author of "Blessed Bees" has done something with bees besides write fiction. Since reading the book I have many a time felt anxious to know how far friend Clute had succeeded in making the pleasant fiction a reality.

Our townsman, Rev. O. Clute, has for several years made bee-keeping a recreation. Many gentlemen get relaxation and amusement with the horse, the gun, or the fishing-rod. Mr. Clute gets it among his bees. And in his case the pleasure brings profit also, for he makes bee-keeping a financial success.

A year ago he began the season with 110 stands of bees — 80 in his apiary, and 30 in charge of Mr. Ed. Younkin, on College Hill. The spring and early summer last year were most unfavorable for bees. The weather was cold, and the rain was excessive. But by daily feeding he kept his hives rearing large quantities of brood so that they were very strong in bees. After the middle of June the weather became favorable, and the white clover bloomed in great profusion. The constant rains of spring and early summer had saturated the ground so that the clover remained in bloom a long time. It yielded honey well, and the linn, or basswood, also yielded well. From these two sources an excellent harvest was secured.

In favorable seasons there is a good flow of honey here from fall flowers, including asters, goldenrod, figwort, boneset, sunflowers, Spanish-needle, heart's-ease, and some others. In this locality, heart's-ease is found in large quantities. Last fall it seemed especially abundant. The frost held off until late, so that the season was long. The clover, the linn, and the fall flowers combined gave a splendid honey yield. When the season was over, the crop from the 110 stands was found to be a little over 17,000 lbs., an average of 154 lbs. per stand, spring count. In addition to this yield of honey, the stock of bees was nearly doubled.

A part of this excellent success was due to the good management given by Mr. Ed. Younkin to the thirty stands in his care. From these he obtained more than 6000 lbs. of honey — a little more than 200 lbs. per stand. He also doubled the stock of bees. Mr. Younkin had for his share one-half of the honey and one-half of the increase of bees, which gave him a very good return for his summer's work.

The winter and spring brought some losses in stock; still, Mr. Clute brought his bees through in fair shape. He bred his queens last year from an imported queen, obtained directly from Italy, and from a beautiful queen given him by his friend Dr. J. P. Wilson, of Burlington, one of the professors in the Dental School in our University. Being bred from such superior queens, his stock was very excellent, and this spring has been in large demand. He has sold to different parties in Iowa and other States, 138 colonies, which have brought him in cash, \$1132.

In sending out this large number, not a single accident has happened. The bees have been so well put up that every swarm has gone safely to its destination, with no complaints from express companies on account of inferior packing.

Mr. Clute begins the season with about 70 stands in good condition, which will be managed for surplus honey, and about 30 stands in not so good condition, which will be used for growing queens and increasing stock. The season thus far this spring has been about as unfavorable for bee-keepers as was last year. Cold weather and rains have kept every thing back. But the white clover now promises a most abundant bloom; and should the weather for the next two months be good, the harvest from this and from linn will probably be large.

Mr. Clute manages his apiary mainly for extracted honey, which he thinks is more profitable in this locality than comb honey. Not nearly so many pounds of comb honey can be obtained per hive, and it is more difficult to store it after taken from the hives, to prepare it for market, and to send it to market in good condition. The extracted honey is simply thrown out of the combs, run from the extractor di-

rectly into nice kegs or barrels, bunged up, rolled into the store-room, and gives no further trouble. When time for marketing comes it can be weighed, loaded on a dray, sent to the railroad station, and go thence around the world with no loss from broken combs and mussed honey.

Within a few years the production of extracted honey, and the demand for it, have assumed large proportions. It can never supersede comb honey, for the latter has excellence and beauty which will always be in demand. But the demand for extracted honey will in a few years be immensely greater than it is now. People are learning that it is a delicious, healthful, and cheap article of food, and are beginning to use in place of the inferior and unhealthful syrups with which the market has of late years been flooded.

It will be well for more of our intelligent men and women to turn their attention to bee-keeping as a regular business. It is healthful, independent work, and on an average gives fair profits. It requires intelligence to learn it, and skill and delicacy in manipulation. Our young friend Ed. Younkin spent three months with Mr. Clute in the summer of '81. Last summer he took care of 30 stands of bees with the success we have mentioned above. This spring he has gone to Davenport, on recommendation of Mr. Clute, to manage 100 stands for Mr. George B. Engle, Jr., who gives him his board for the summer, and one-half the honey and one-half the increase of bees. If the season is favorable he will have a profitable year — more profitable than most clerks and young professional men.

Mr. Clute has been solicited to open a school of bee-keeping at his apiary, and give to a class of students a thorough course of instruction in the theory and practice of this fascinating pursuit. At one time he thought of having such a school this summer; but his health has been so impaired by several years' close application to his professional duties that he finds it best not to attempt at present this delightful work.

A few years ago, under the pseudonym of "John Allen," through the house of G. P. Putnam's Sons, New York, Mr. Clute published a romance of bee-keeping, entitled, "The Blessed Bees." It has had a most cordial reception from the literary and bee-keeping public, and is having a steady sale from year to year.

The friends who have read "Blessed Bees" will remember that the strongest point in the little romance, perhaps, was that our hero had every thing so well arranged that failure was almost impossible. In the above report, where he speaks of shipping bees without accident, I was reminded of this especial point. Were we to visit friend Clute's apiary, I presume we should find that he is a remarkable workman and a nice manipulator. I feel, after reading the above, as if I should like to go and get "Blessed Bees" and read it over again.

### MRS. COTTON, AND THE GOODS SHE OFFERS FOR SALE.

CAN WE RECOMMEND HER AMONG THE REST OF OUR SUPPLY DEALERS?

PLEASE inform me if you have ever seen or heard of the party, Lizzie E. Cotton, W. Gosham, Me., and also what you think of her hive. I do not like the spirit she manifests.

Boston, Mass., Aug. 17, 1883. W. A. RICHARDS.

Yes, friend R., we have heard a very great deal in regard to Mrs. Cotton. If you will look over our back volumes you will be very well satisfied of the fact. I do not know how to answer you much better than to give the following, which came only a short time before your letter:

*Friend Root—*

Last spring I sent to Mrs. Cotton for a hive of her Italian bees. They arrived in deplorable condition,

most of them dead, and no queen to be found. She lately sent me a new queen — the smallest specimen I have ever seen, and that she considers making things satisfactory. I consider her a humbug and a fraud.

J. EDWIN KEENE.

Newark, N. J., Aug. 6, 1883.

The above letter is a fair specimen of the reports we get from her customers. I believe there are some, however, who are pleased with her goods, or at least she claims there are. If you will compare her circular with the circulars of other dealers, you will find her prices enormously high. That does not quite express it either, for she charges *four dollars* for a very small bee-book, and drawings and illustrations for making the Controllable hive. This bee-book embodies nothing not already well known; furthermore, it entirely ignores a great many of the modern improvements in bee culture. If I am correct, she gives the honey-extractor not even a passing notice! The Controllable hive, so highly recommended, contains no principle not already well known to all intelligent apiarists. Now if you still conclude to patronize her, we have nothing at all to say. So many inquiries keep coming up in regard to the many circulars she is sending out, that I do not know but that I shall have to keep a standing reply, embracing the substance of the above. The prices she charges for the things she has for sale would of itself forbid her being classed with the regular supply dealers who are now to be found in almost every locality.

### QUEEN-REARING; SOME NEW FEATURES.

#### QUEEN-REARING AND DRONE-REARING.

**I** BELIEVE it is said that Mr. Alley, in his book on queen-rearing, claims that, if there are no black bees within half a mile of our queen nursery, our queens will be almost sure to become purely mated. Although this is altogether contrary to the general theory upon the subject, yet two years ago, in raising queens, there were black bees within one mile of me at two different places, and at the same time I found my queens were all purely mated, though I raised only about a dozen that year, and of course could not consider this a thorough test. Since that time I have been requeening the black bees near me. But the new features above alluded to are, first,

HAVE YOUR DRONES  $\frac{1}{4}$  MILE FROM YOUR QUEEN NURSERY,

and, what is better, at two or three different points; and to accomplish this is an easy matter, which brings us to our second new feature; viz., to CLIP SOME VIRGIN QUEENS' WINGS, AND MAKE DRONE-LAYERS OF THEM,

and in this way we can easily have any kind of drones we choose. It would be well to have at least four colonies with this kind of queen, the colonies to be stationed at four different points  $\frac{1}{4}$  mile distant from our nursery. Of course, we shall have to keep these stocks replenished with workers by giving them worker brood. One who has never tried this would be surprised to find the number of drones that could be kept in one hive. CHAS. KINGSLEY.

Greeneville, Tenn., Aug. 15, 1883.

Very good, friend K.; but have you ever

done this? I should suppose from your remarks that you have, although you do not say so directly. The next thing is, are these drones as large and vigorous as drones reared in the natural way? The idea has been many times suggested; but there is a little controversy in regard to these drones. Your suggestion in regard to having drone-rearing colonies a quarter a mile from the apiary in four different directions is, I think, a good one.

### DOOLITTLE'S LETTER.

UNSEALED BROOD TO KEEP FIRST SWARMS FROM LEAVING.

**W**ITHOUT desiring any controversy, and with no spirit of contention, I wish to say a few words more regarding giving first, or prime swarms, unsealed brood to keep them from decamping, as it may be of benefit to all. Friend Root and others recommend doing so, while all of my experience goes to prove that it is bad policy. Friend E. T. Flanagan writes me under date of Aug. 3, "I have read yours in last GLEANINGS, in regard to putting a frame of brood in hives to make swarms stay, and I am satisfied that you are mistaken. I have had some experience in this thing in the last few years; and in nine cases out of ten, if no brood was given, away would go the swarm; while with a frame of unsealed brood (*not hatching brood, or capped brood*), they would stay 49 times out of 50. I doubt seriously if you ever tried it sufficiently to prove its efficacy. It's all bosh about their being tired of brood, and wanting to get away from it. Then why do they go right to raising more again? I should like to know. I hate to see two such good teachers in apiculture give the novices such contrary advice. It bothers them, and shakes their confidence in the reliability of their teachers."

On page 451, friend Root tells us how he purchases bees of the farmers, and divides them up into from 1 to 10 lb. lots; and when given unsealed brood they generally stay; otherwise they often leave; but he will readily see that this is not trying the efficacy of it as Maggie tried it, or as I would do in my own yard. In his case I should most assuredly give brood; while in Maggie's case I should *most assuredly* not do so.

Right here I wish to ask all who favor the plan of giving brood to prime swarms, to tell the reason, if they can, why Maggie's swarms both stayed and commenced to build comb before the brood was given, and why they both went out and left after the brood was given, if it was not that brood which changed their motives. It will be observed, by turning to page 596, that all went well with Maggie's bees till the brood was given.

Now, as regards confidence in teachers: What shall I say of the assertion friend Flanagan makes, that 9 swarms out of 10 will leave where no brood is given, when I have not had a swarm offer to leave, out of over 200 hived, for the past four years, under precisely the same conditions? Well, I had to laugh outright when I read it. Friend F. says it is all "bosh" about the bees wanting to get rid of the brood, as I quoted from friend Betsinger. Well, let us see: I think I tried 16 swarms with the brood, (was that a sufficient number?) and out of the 16, eleven tried to leave, and the first succeeded, making 12 out of the 16. In all these cases I found

queen-cups built on this frame of *unsealed* brood, and eggs laid therein, just as is often done when the bees swarm from the parent hive in a hurry, which proves Mr. Betsinger's idea correct, that the bees considered themselves placed in the same condition they were before they swarmed, and so swarmed to get away from the brood. In all the cases, from a teacupful to a pint of bees stayed to care for these queen-cells and brood, which again proves that the swarm left under the same conditions in which they leave the parent hive. In answer to the question, Why do they go right to rearing brood again? I will say, that after the queen has had a little rest she goes to laying as new comb is built, and it is at least six days before the swarm gets brood in the state of that which is given them; and by this time the desire to swarm has been changed to a desire to keep their numbers good, and thus continue their existence as one colony; while up to this time brood only increased their desire to "multiply and replenish the earth." Localities differ much, and bees act differently in accordance therewith, hence no rule will apply to bees in all portions of the world. I but speak what I know to be true in this locality, and accord to all the same privilege.

Now I will stop right here, by requesting all who read this to try next season 10 first swarms, giving 5 a frame of unsealed brood upon being hived, and hiving 5 without brood, and see which is the more inclined to stay. By so doing we shall arrive, not at my conclusion, and not at friend Root's conclusion; but at a conclusion which will be beneficial alike to all.

G. M. DOOLITTLE.

Borodino, N. Y., Aug. 13, 1883.

Here is another friend who has something to say on the other side of the matter.

On page 376 is an article from Mr. Doolittle, in which he gives his experience with sheets of brood used in swarming-time. I am not going to dispute friend Doolittle's sincerity, for I think he speaks according to his experience; but it is not at all like mine. In an experience of seven years handling bees, I have had but one swarm leave me. That occurred in 1878; they came out, and they did not alight, but left for parts unknown. I was a little greener in the business than I am now, and knew nothing about putting a sheet of brood in, and I think I am indebted to GLEANINGS for that information in 1879; but I will not speak positively about that. Well, since I saw the article I have practiced it, and, as I think, with the most favorable results, for I have yet to have the first swarm leave a sheet of eggs and larvæ.

#### CLIPPING QUEENS.

Now, I do not clip queens' wings, for I think I have been rather unfortunate with three valuable queens, all of which I clipped (one we got from friend D. this spring), and the bees have invariably superseded them in a few weeks; but perhaps it was not owing to the clipping. Friend D.'s plan of managing (if he has his queens' wings clipped), will work all right with two or more swarms when they come out and go together; that is, if he is right at the entrance, and can pick the queen up and cage her. But we will suppose friend D. is up in the top of a tree trying to capture a swarm that has just alighted; is there not danger of one or more of the queens that have their wings clipped crawling away in the grass, or under some hive, and get lost? I should think the loss in this way would be fully as

great as it would where the queens are allowed to fly with the swarm. I have this summer had as high as 8 swarms in the air at one time, and all went together; 5 of the queens I found, and three of them I did not find; but all were divided as nearly as I could, and given separate hives; but, mind you, there was the sheet of eggs and larvæ in every hive, and in 4 days I was able to tell which had a queen and which not. Now, for me I would almost as soon think of not hiving a swarm at all, as to think of hiving them without the sheet of brood.

I am not prepared to believe Mr. Betsinger's theory (though it be indorsed by friend D.); i. e., that putting in the sheet of brood is the cause of their absconding. No, no, friend D., don't let's believe all that, but take another view of the matter. "Bees swarm to get away from their brood." What, when we have so many evidences that they are so fondly attached to their brood that you may take a young sheet of larvæ with the adhering bees from the parent hive, and put it where you choose, and enough young bees will stay with it to care for and nurse their young sisters? Now, this is not an evidence, in my mind, that they want to get away from it. I think it is clear, to my understanding of the matter, that when bees swarm, the principal reason is, that their hive is too small to hold the rapidly increasing numbers, and the queen is either compelled to stop laying, or hunt new and more commodious quarters. How is it when you divide a colony? You take the old queen and one-half the brood to a new stand; it is not usual, I think, for the bees to desert the brood, queen, and all, and go off. Any one who has doubts about the quieting and consoling influence of a sheet of young brood upon a colony, let him hive a second swarm with a young queen on a hive full of foundation, and, as you will many times see them do, run out and in the hive, over the front, and show great signs of dissatisfaction; give them a sheet of young larvæ, and note the instantaneous change. They are contented and quiet at once. When I see a swarm coming out, I no more think they are going to the woods than I think the sun will not go down behind the western horizon that evening; and after they are hived I have no more thoughts of their leaving the hive than I had of their going off.

I have had, this summer, several cases where the queen was lost in swarming, and the bees, after they were hived, would, a portion of them, go back to the old hive; but in no case did they desert the brood so but that there would be a good strong nucleus left, and those nuclei now are good strong colonies.

A. W. OSBURN.

Water Valley, N. Y.

And here is still another letter in regard to the same matter, and this time it is from a lady; and she gives us some very valuable suggestions besides:

#### A CHAPTER ON ABSCONDING SWARMS.

Having had quite a large experience with new swarms absconding, or endeavoring to do so, I will give you a few items in regard to it, which I think will be of interest to many bee-keepers who are losers in this way. For two or three years after we began to keep bees we had no trouble from this cause, and wondered why so many of our neighbors' bees left and went to the woods. We thought it must be some mismanagement of theirs; but in the summer of 1881 we began to have some experience of our

own. We always allow natural swarming, and do not clip the queens' wings, because so many would get lost in our grassy apiary; and besides, we don't quite like the plan. Up to this time we had not placed unsealed brood in the new hives. But one morning a large first swarm issued. We hived them as usual by shaking them down in front of the hive and letting them run in; then we carried them into the apiary, placed a board shade over them, shoved the hive out beyond the bottom-board, to give plenty of ventilation, and supposed they would stay, as all other swarms hived in the same way had done. The day was very warm; the thermometer rose to 100° in the shade. About one o'clock we saw them leaving their hive; and with a mirror and a pail of water we endeavored to make them cluster; but our efforts had no effect upon them, and they were lost. Then we resolved that henceforth brood should be placed in all the new swarms. For the next few days several swarms were hived, which made no attempt to leave, and we began to think that brood was a sure cure. But another very warm day came, and with it another large swarm, which was given brood. They stayed quietly three or four hours, and then were seen coming out. We pelted them as much as possible with dry dirt and water, but they kept steadily on their way, and we had to say good-by. Soon after, another swarm departed in the same way. We were now fully convinced that brood did *not always* keep bees. These three were lost out of the 30 new swarms of the season.

In 1882 we lost three in the same way—two with and one without brood. Four others attempted to leave, but I succeeded in confusing them enough so they clustered, and were rehived. They were stopped in the following manner: Having become somewhat provoked at losing so many bees, I said I would drown the next swarm before I would let them go off. So the next swarm I saw coming out, with a pail of water and a whisk-broom I ran to the hive, sat down before the entrance, and deluged them with water as fast as they came out. This bothered them so much that they clustered (but I did not drown any of them, for a bee can live through a great deal of drenching); all the other swarms had started straight for the woods. After this I treated all absconding swarms to a cool bath as they were leaving the hive. I always succeeded in making them cluster but once, and they swarmed out the second time, and were more than half out before we saw them. So four were lost out of the 50 hived, and four others would have been, had nothing been done to stop them.

During the past season, all the swarms (30 in number) hived before the 26th of June, made no attempts at leaving. They were hived without brood, in empty hives, for we had tested the plan pretty thoroughly, and could not see that the swarms were any more inclined to stay when we gave them unsealed brood than when they were without it. But at this time the weather became very warm, being over 90° in the shade, and continued so for three days, in which time we had 13 swarms, and 8 of these were determined to leave; but only one succeeded in doing so, and that was because they had a clipped queen that we found, too late, could fly. Most of these swarms came out three and four times. Each time they were hived they would stay quietly for four or five hours, and then come out again. When they were hived quite late in the afternoon they would remain over night, and come out about nine

o'clock the next morning. I have not a doubt but that each one of these swarms would have gone directly to the woods had nothing been done to prevent it.

In the February number of GLEANINGS, page 90 N. N. Shepard states that when he sees new swarms deserting their hives he at once closes the hive, letting it remain so for about a minute, then opens it, allows about a quart of bees to escape, and again closes it, continuing in this way until the bees are all out. This confuses them so much that they will always cluster. We had always been afraid to close the hive for fear the bees would smother; but when we saw that it had been tried with success, we resolved to try the plan at the first opportunity; and having had plenty of opportunities during one week we have tested the plan quite thoroughly, and consider it a sure preventive of the bees going to the woods without clustering. Our bees would not come back to the hive, but some would try to unite with some new swarm near by, and others would cluster. If we could secure their queen, her wing was clipped (although that would not prevent their swarming out again) and we knew they couldn't leave. We usually sprinkle the bees with water as they come out of the hive, in order to check the rush a little, so that we may catch the queen when she comes out, which will be when the swarm has about half issued. These eight swarms we hived and rehived about twenty times, so you may know that business was lively for that week. Since then we have hived a good many swarms, but have had no trouble with them.

Now, all these swarms were well ventilated, the hive shaded with trees, or else with wide board shades; at no time of the day was the sun allowed to shine on them. The hives were large; had been made and painted in the winter, and we could see no reason for the bees disliking them. We always hive our swarms as soon as possible after they are clustered, and then move them away quite a distance. We have tried hiving with brood, and without it, about equally, and are of the opinion that it makes no difference with this kind of absconding. But we think that it is the *intense heat* that causes their dissatisfaction, for we have never had a swarm try to leave when it was not above 90° in the shade. If any one else has, we should like to have him report. All of the 18 cases mentioned above were large first swarms, four of them double. We do not allow second swarming. If all these swarms had succeeded in going to the woods, our losses in this way would have been greater than in all other ways combined. We are rather inclined to think that these swarms look up a location after they are hived, but we have no way of proving it. Do bee-keepers in the North have less trouble from this cause than those in the warmer climate of the South? Can any thing be done to lower the temperature of the hives during these warm days? Any information in regard to this matter will be read by us with interest.

Brookfield, Mo.

ANNA STANCLIFF.

I think, after reading the above, we shall have to conclude that friend Doolittle knows pretty well what he is about, after all. And one point seems to come out quite clearly; viz., that strong first swarms, especially during severe hot weather, are rather an exception to the rule, if there be one, that bees are loth to desert unsealed brood. Now, my plan of fixing these heavy colonies so they

can not get away would be to break them up so small that they would not feel the effects of the extreme heat, and that they might get over this feverish spell that seems to accompany this swarming mania. I tell you, friends, they would not get away from us, and we would hold them with brood too. But we would break them all up in little pieces, you see, and then make them pay for their board and lodging by furnishing us with queens. I know this would not be very practicable for all of you, but it is the best I have to offer. I do not like queens with clipped wings either, any better than our friend who has just written. In regard to sprinkling them with water, the great obstacle, as I see it, would be in being right on hand while they were just pouring out of the hive. And, in fact, this is a great obstacle in the way of making any of the plans practicable. How about decoy hives, of which we have heard so much lately? Can we not fix some sort of a decoy hive so tempting that, when they run off, they will run somewhere on our own premises?

## MORE ABOUT FLORIDA.

### BEEES AND ORANGES.

**Y**OUR agreeable and instructive GLEANINGS is reaching me regularly down here in my Florida home. It is hard to tell how much I enjoy it, and what a pleasure it is to become acquainted through their writings, with your "big" bee-men, and especially with yourself, although you will now and then make an "unkind" remark about our adopted State. I don't mind that, though, for I think you are a Methodist; and a State that is dotted about with pretty lakes that comprise about one-fourth of its surface is not the place for you, for you would soon be a Baptist. You are afraid we will get lazy; but I can assure you that we have no time to get lazy, and there are less lazy people and loafers here than any place I ever saw. We work right out in the sun, summer and winter, without any injury, and do more hours' work in a year than you all do. Our bees do not get lazy either, when their master is not lazy, for they will get honey when there is any to be had, and store it bountifully.

I commenced with six hives in the spring, and increased to 13 by natural and artificial swarming, after losing some swarms that took to the woods. One swarm came out on Sunday, while I was away, and I found them the next morning, and hived them. In two hours they all rushed out and made for the swamp. Thereafter, as soon as I got a swarm in a hive, I moved it to its permanent place before any runners could return from the woods. Since then I notice some of your writers recommend the same thing.

I introduced my first Italian queens last week. One was a complete success; the other as complete a failure. They balled around the queen, and I caged her a few hours longer. I then let her walk out. She seemed afraid of the bees, and passed down the frame; and when they tried to make her acquaintance she cried "zeep, zeep," two or three times, and ran around the end of the frame, and I never found her afterward, and I examined them every few minutes for two hours.

Our bees commence to store honey in Jan. and Feb. from the orange and yellow jessamine, etc. They work rapidly then for about two months, when there is a cessation for two months, during which they gather enough for themselves. In June and July they store a good quantity of honey again. Sometimes it lasts till September. There is hardly any time in the year, close to these swamps, that they are compelled to use up their supplies.

We are troubled some in the spring with mosquito-hawks catching the bees late in the evening. As their damage is done near sunset, I do not think that they catch any queens. The watchword is, "Kill them." The more hives the less damage. They last about six weeks.

The moth does not trouble in the L. hives where they are attended to. I am making the plain L. hive, and using frames of my own make. I wish your factory were closer. However, it pays me better to send to you for frames and sections than to make them myself. I hired a Barnes foot-power saw last week, with the intention of buying it if I liked it. I put it in good working shape, and commenced. I soon found that I could make frames 4 times as fast by plowing for my neighbors at \$3.00 a day, and sending to you for them. I could not afford to run it on our Florida pine, if it had been given to me. A bee-man in the next county drives his bees into a new hive when he wants honey, and makes them begin over again, and says by that way he keeps them free from the moth. He needs a bee journal.

### SOUR HONEY.

I had a small lot of sour honey. It was taken from an L. glass-end box. I noticed that the bees were a long time capping it over, and I could see them standing around, running it out on their tongues, and fanning. I took it off before they capped it all, and the whole of it soured.

### HYBRIDS.

One of my young queens left in the old hive after the swarm issued, met an Italian drone, and now all the busy workers are yellow-banded, and indefatigable workers. I have noticed a few yellow bees in some of the other hives. I hope to have them all Italianized in a year or two. My black bees are very gentle, seldom offering to molest me.

If I get three acres of orange-trees bearing, and 100 stands of bees to look after, do you think I shall have time to get "lazy" down here? At any rate, give me the orange-trees and bees.

Altamont, Fla., Aug. 4, 1883. S. P. SHEPHERD.

Friend S., you are quite mistaken if you think Florida would not be pleasant for me on account of your pretty lakes. I love lakes dearly; and furthermore, I love both Methodists and Baptists, and all other Christian people who are trying to serve God according to the dictates of their own conscience.—I am very glad indeed to know that I was mistaken, and that you Florida folks are not in the habit of getting lazy; and I am glad, too, that those mosquito-hawks come only at certain seasons of the year. Some of us were a little afraid that they were chasing the bees up all the time. If you can get \$3.00 a day for plowing, and plowing is a business you understand (for I am well aware that a man may be expert in handling a team or a plow, as well as in handling a Barnes foot-power saw), no doubt you would do better to follow the plow, and

let some one else make the hives. But I think that some one who knows just how to handle a Barnes saw would make it go nicely, even in your Florida pine.—In regard to the sour honey, if there are enough bees, and you give them time enough, they will sweeten it all out, if left in the hives. I see you have accepted friend Hasty's explanation as to the way in which bees ripen their honey.—No, I am sure you ought not to get lazy with 100 bee-hives and three acres of orange-trees.

### THAT 90 MILES AN HOUR.

**I**NASMUCH as friend Root has said that he now believes that bees do sometimes fly 90 miles per hour, it is my intention to re-claim what he has conceded, by showing that all the facts presented thus far tend to show that in no instance has it been shown that bees fly even 40 miles per hour.

#### FRIEND PHIN

takes me to task for arguing about things in which my knowledge may be incomplete, and proceeds in a very logical way to show that bees fly 90 miles per hour; while if he had compared the wing power of his pigeon with that of the hawk or eagle, — birds possessing great wing power, and adapted to carrying heavy burdens, but slow in flight, — it is easily seen that his deductions would have been against him. This being true, his argument possesses no special merit in this case.

#### FRIEND DOOLITTLE'S ARTICLE

appears to be mostly guesswork. So he will excuse me if I guess that, in observing that train, he would be like the person mentioned in the Scriptures, who, beholding himself in a glass, turning away, forgetting, etc.

I have hunted and found bees in Ohio, Iowa, Missouri, Kansas, and Illinois. I have followed them over hills and hollows, through timber, across fields and open prairie; and if friend Doolittle has any way of determining that bees actually fly faster when half a mile from the apiary than they do within 10 or 15 rods of it, I should be glad indeed to have him explain. I am aware that not a few bees about an apiary fly very slowly; but these are the old veterans in the cause, which have their wings ragged and worn from the many miles they have flown in their toil for the precious sweets, and their flight is just as slow in the fields as it is about the apiary. Those able-bodied fellows whose flight in the clear bright sunlight is like a flash, are just as difficult to get sight of at a distance of 100 yards from their hives as they are 100 rods away; and if friend D. doubts the correctness of this statement, I suggest that, for the sake of science, he try hunting bees a few days in some community where he is not familiar with all the surroundings.

#### VELOCITY OF WIND.

The best I can do at present concerning the velocity of wind is to give the following table, taken from a work on natural philosophy:

6 miles per hour,	- - - - -	Pleasant wind.
10 " " "	- - - - -	Brisk wind.
15 " " "	- - - - -	Very brisk wind.
20 " " "	- - - - -	High wind.
30 " " "	- - - - -	Very high wind.
40 " " "	- - - - -	A storm.
50 " " "	- - - - -	A hard storm.
60 " " "	- - - - -	A great storm.
80 " " "	- - - - -	A hurricane.
100 " " "	- - - - -	A violent hurricane.

I may be mistaken about a 90-mile wind taking friend D.'s hives out of his yard; but it does not fol-

low that, because an 82-mile wind did not move his hives, a wind increased one-tenth that velocity would not carry them away. At least, I should not care to have the matter tested in my apiary.

#### OUR RAILROAD FRIEND.

The only data given so far, from which any definite conclusions can be arrived at, is that from our railroad friend. But I am sorry that he should have given us the details of his experiments, and at the same time summed up his conclusions just the reverse of what his experiments teach.

Our friend evidently liberated his first bee inside the car, or he would have had no occasion to darken the car windows. The car being closed, the bee would fly from rear to front of the car just as easily as it would if the car were standing still, because the atmosphere, which is the medium of flight, is carried with the car. He says the bees reached the window in "10 or 15 seconds," a distance of about 25 feet, I suppose, the car being some 28 or 30 feet in length. As those bees circled about in the car, just as any other bees would do in a strange place, it is no more than fair to say that they traveled about 100 feet before they reached the car window; 100 feet in 10 seconds is 10 feet per second, or a little less than 7 miles per hour; while a velocity of 90 miles per hour is 132 feet per second — a velocity so great that I am prone think that an object so small as a bee could not be seen.

Now let us look at the bees liberated outside of the car. Every one who knows what a train of cars is, knows that a passing train disturbs the air about it just in proportion to its speed; and although it is easily observed that the air is disturbed much less above than at the sides of the train, I think that no one will deny the fact that it is disturbed several feet above it. This disturbance must of necessity result in carrying the air in the direction of the passing train, so that at 6 or 8 feet above the train the air is moving in the same direction at least  $\frac{1}{4}$  or 1-10 the speed of the train; so it is evident that a bee, by keeping inside of this circle of disturbed atmosphere, can keep up with a train without flying as fast as the train is running.

Who is it, of apalarists, that does not know that a bee, when liberated in a strange place, moves about very slowly, and circles around very closely to the spot where it first takes wing? These two facts of themselves are conclusive evidence that my position concerning the motion of the atmosphere about a moving train is correct. This being true, it is easily seen that a bee liberated from a train running 45 miles per hour could, by keeping close to the train, keep up with it by flying only  $\frac{2}{3}$  or  $\frac{3}{4}$  as fast as the train was running, because the atmosphere carries it along at the rate of  $\frac{1}{4}$  or  $\frac{1}{5}$  the velocity of the train.

It is evident, that bees can not fly fast when flying in small circles; yet it seems our friends have all overlooked this point in their argument.

I mentioned before, that bees can not face a very strong wind. If a bee can not make any headway against a wind blowing 20 or 25 miles per hour, how can it be argued that a bee can fly 90 miles per hour, when at a velocity of 20 or 25 miles it would meet with the same atmospheric resistance in a still atmosphere?

Some of the friends may think to gain a point here by saying that, if the bee would go with the wind it would make 50 miles per hour. I admit that it would

travel at the rate of 50 miles per hour; but I wish to ask, Does the bee fly that fast, or does the wind do a part of the work? There, have I not redeemed my promise, friend Root?

S. A. SHUCK.

Bryant, Ill., Aug., 1883.

Friend S., I suppose I shall have to own up that I read that account of the railroad experiment at first, and took it for granted that the bees were flying outside of the car when they went from the front to the rear. I did not see my mistake until friend Doolittle's article was in print, and I have been a little ashamed of it ever since. I think I won't decide any more whether bees can fly 90 miles an hour or not, until I see how many facts are going to be brought out. At any rate, I feel like thanking you for the able manner in which you have handled the subject in this present article.

### BEE-NOTES BY FRIEND WILLIAMS.

#### GETTING BEES TO FIX UP BROKEN COMB HONEY. BEE-KEEPING IN CENTRAL ILLINOIS.

**T**HERE are fifteen or twenty large bee-keepers in this county. I mean men who make it a business. Some thrifty farmers are into it, and say their bees make them more money than their farms. I keep only a few colonies, and have for my object fun and not profit.

#### CHAFF HIVES.

I am making chaff hives for future use — using chaff only around and under brood-chamber. In fact, they are about the hive Langstroth describes in GLEANINGS, except that the frames in super hang crosswise. I used for outside walls, wagon-box boards (\$4.00 per 1000), and 3-in. wainscoting,  $\frac{3}{4}$  in. thick (\$24.00 per 1000), inside walls. It works with no waste at all. I use the Langstroth frame exclusively, below, above, summer, winter, yesterday, to-day, and to-morrow.

#### CYPRIANS.

Well, I should think they are prolific. If one wants a "start," they have only to get a queen and two or three bees, and set them up, and then run for life. Can not friend Gray invent special machinery for making steel coats, or armor, to be used when we open a colony of these Cyprians? Several of our best apiarists here prefer them to Italians. If I have been up and lost sleep, and feel sluggish and drowsy, I go out and open the Cyprians, and I am wide awake in three seconds.

#### SMOKERS.

What would you think of a "large and influential" bee-man who never had nor wants a smoker? I am trying to get him to chew tobacco, and then get him to quit, so you can give him a smoker.

#### INDUCING BEES TO FINISH UNSEALED COMBS AFTER BASSWOOD AND CLOVER.

I had a dozen or more frames, about half of which were filled half way down, but uncapped. These I took and cut the empty comb off, sawed off the lower half of the end-bars of the frames, tacked on bottom-bars, which gave half the depth of L. frames, and full of comb, unsealed. I filled a half-story full of them and put it over a strong colony. They could build no comb then for want of room. I hoped to see them seal this white honey. Failure. I took the other frames that were full of comb and honey, and only partially capped, and put them all

in one super, and placed it over a strong colony. Failure. I then took them from the bees a week, left their super frameless and empty, talked discouragingly under their eaves of nights, and sung doleful songs about famine and idleness, then gave them the combs back. Failure. I next, with considerable trouble, hung the frames bottom side up, bringing the unsealed margins above. Failure. I am in fine spirits yet, but the frames have been carried around until they are about all worn out, and the honey too. They both look now as if they had come through the Revolutionary War, and my wife says she would not eat it, if I was to get it sealed in this century. Bees are at work now on Simpson plant and corn-tassels; can't you give us a picture of goldenrod in GLEANINGS, so we can see if we all mean the same plant. A. C. WILLIAMS, M. D.

Hugo, Ill., Aug. 16, 1883.

Friend W., if you manage to make your bees pay, and have fun with them too, you certainly ought to be satisfied. It is not every one in this world who can make this happy combination in his daily avocation. — In regard to that tobacco matter, if you go to trying to get people to chew, we will have you advertised in the papers — see if we don't. — No wonder you had a failure in trying to get them to finish up comb honey. I once cut out little squares, and then put them into the hives to induce the bees to clean up the drip and seal it all over, so as to have 10-cent cakes of honey in the comb. My experience was about like yours. By feeding until you had the brood-nest crammed and bulged, you would have succeeded, I think. — Goldenrod is already pictured in the A B C book; but there are so many varieties you would hardly know it with a great many pictures, unless you went into botany a little. A dozen different goldenrods may often be found by a single roadside; and, if I am correct, there are some forty or fifty varieties from which the bees get honey.

### THE BEE-KEEPER'S SABBATH.

BY REV. W. D. RALSTON.

**N**OTICING something on this subject in GLEANINGS, I will give my experience. As I am the pastor of a church, of course I could not remain at home, and I would not wish any of my family to absent themselves from church and Sabbath-school to look after my bees. This summer I had a man, hired for two months in the busy season, to help in the apiary. It was his custom to go home on Saturday evening and return Monday morning; and although he offered to remain in swarming-time, and watch my bees while I went to church, I declined his offer, feeling that my conscience would not permit me to hire a man to stay away from church to watch my bees. If any swarms came off before I went to church I hived them; if any were hanging on the trees when I returned, I hived them also; but if any came off while I was away, which was from 10 A.M. until 1.30 P.M., and got tired of hanging in the cluster, they were at liberty to go to the woods. I can also say, that the thought of a few swarms leaving for the woods has never troubled me in the least. Along the edge of the timber, and here and there through it, are poor men

living. Some of them are quite expert as bee-hunters. As the timber is not very extensive, few colonies go there but are hunted up by these persons before winter, and the honey thus obtained is an addition to their bill of fare much relished by their children. If a few of my bees have thus stolen away on Sabbath while I and my family were at church, and helped to increase their fall supply of honey, I am satisfied; and more so when I read such a passage as Lev. 19: 9, 10: "And when ye reap the harvest of your land, thou shalt not wholly reap the corners of thy field, neither shalt thou gather the gleanings of thy harvest. And thou shalt not glean thy vineyard; thou shalt leave them for the poor, and the stranger; I am the Lord thy God."

Six years ago I purchased 19 colonies of bees. I now have 80; I raise both box and extracted honey, and depend for increase on natural swarming. By giving plenty of room and ventilation, and by carefully shading my hives from the sun, I have labored to keep down swarming. All these years I have gone to church and left my bees, and I never heard of a swarm leaving while I was away, and I never had any grounds to think that any did leave.

Scotch Grove, Ia., Aug. 22, 1883.

Thank you, friend R., for your wise counsel. I am pleased to note how nearly you decide just as I had done before your article was received, on page 538.

## RAILROAD FARES TO THE CONVENTION, ETC.

SOMETHING FROM D. A. JONES.

**A**NNOUNCE return tickets at single fares on all railroads in Canada from the 17th to the 23d of Sept.;  $1\frac{1}{4}$  fares for excursion tickets from the 10th to the 23d of Sept. I am arranging hotel accommodations. Urge every one who possibly can get here, to come. There will be special excursions from many points in the U. S. very cheap, to the Falls and Toronto. I hear of one from Kentucky, Cincinnati, Pennsylvania, New York, Chicago, etc., but can not get particulars yet. They are to be advertised thoroughly by the excursion agents of each road. Parties communicating with them can get full particulars. We will do all we can.

And, friend Root, you say the can business is lively now with you, and that you receive many orders every day. Why, after your people visit our exhibit in Toronto, your trade will doubtless double for some time. We have been receiving orders for from 500 to 3000 daily; but last Wednesday, orders arrived for nearly *ten thousand!* We expect to have the first hundred thousand completed next week, and yet are behind on orders.

I should have sent you samples of our new tins sooner, but was improving on them, so now we consider them perfect. When you start making them you can turn your whole shop into an immense tin-factory. I will have you some honey-can labels ready to take back from our convention; and if I do not surprise you all with their beauty and value, I shall be disappointed.

Excuse haste and scribbling, as you know how it is to be nearly driven to death with work. Looking forward to the time when I shall have the pleasure of again talking to you personally, I am, dear sir,

Yours in haste, —

D. A. JONES.

Toronto, Can., Aug., 1883.

Thank you, friend Jones, for your suggestions. We shall be very glad indeed to see the new honey-pails, labels, and all the other things you are continually inventing and devising to make the bee-men happy. Long may you "wave"! By the way, we do not find Cleveland in your enumeration. Are there not friends enough going from Cleveland so as to get tickets at a reduced price? Who is there among us who can agitate the matter, and get us a rate that can be reported in our SEPT. JUVENILE? We will try to have it out a little earlier next time.

By the way, friend Jones, if you don't already know it, I have another piece of good news for all who go to the convention. Mr. Langstroth is to be present, and has promised to go with me; and I hereby invite friend Muth to go to his home and get him, and bring him to our place, and then we can all make the trip to Toronto together. If any other bee-friends want to be among the number, let them come along.

## WINTER PREPARATION.

BY J. E. POND, JR.

**O**NE of the reasons for severe losses in winter, I firmly believe, is that we wait too long before we commence winter preparation. In our anxiety to obtain the largest possible yield of surplus, we draw from the brood-chamber with the extractor, up to the very last moment, or leave the sections on till it is almost too late to feed up for winter with safety. By these means we either exhaust the brood-chamber entirely of stores, or allow the bees to put both honey and pollen where they choose, which, as a rule, is in such parts of the frames as will be nearly inaccessible to them in late winter or early spring, at just the time when they are most in need of them. I once thought the form of frame was the chief cause of loss in winter; but I am now convinced that such is not altogether the case; and while I favor the standard L. form, believing it to approach the nearest of any to the shape indicated by an observance of natural laws, I am still of the opinion that deeper frames would winter more successfully, if care were taken in their preparation for the approaching cold season, at an earlier period than is usually done.

What, in my own view, is needed to enable a stock to winter safely, is a frame that contains a sufficient amount of stores, so placed that they are at all times accessible, no matter how cold the season, or in what condition it is placed. I am speaking now of wintering on summer stands; having had no experience in any other form of wintering, I am unable to give any but a theoretical view upon aught else. An experience, however, of sixteen years wintering on summer stands, using the standard L. frame without loss, may warrant me, perhaps, in thinking my ideas are nearly correct upon the matter, and may, perhaps, be considered tolerably safe for others to follow.

My apiary is protected on the north and west sides by a high close hedge. The hives face the south, and have no other protection. I have used double-walled and chaff hives, and also single-walled Simplicity hives, made of  $\frac{3}{4}$ -in. pine stock, and with the alike good results given above. I have lost colonies in winter during the above-mentioned period, but

never one in the L. hive. I commence preparations early in the season — as soon as the first of August, sure, when the yield from white clover has ceased. I consider seven standard L. frames sufficient to winter any colony upon, and use chaff or dead-air division-boards, made of very thin material, in each side of the hive. I want each of these seven frames (or a smaller number for a smaller stock) filled and capped throughout the whole upper two-thirds (or  $\frac{1}{2}$  at least) with pure honey, or such other stores as I design to use. This object can easily be accomplished by using the extractor; and if I could use it for no other purpose, I should consider it paid me well to own one.

I stimulate brood-rearing by feeding diluted honey or sugar syrup, up to the latest moment I can induce the queen to lay. By this means my stocks enter the cold season with a full force of young, strong, active, and vigorous workers that have stamina enough to withstand any changes, even of a climate as variable as Eastern Massachusetts. About the first of November I open my hives and force the clusters, by changing the position of the frames if necessary, to occupy one or the other side of the brood-chamber. I tip the hive at the back, by placing a piece of deal, two inches thick, under the rear end. After having placed the cluster where I wish it, I put on the frames a "Hill's device," or some substitute for it; but I consider that the simplest and cheapest device that can be used. I then cover the bees closely into the brood-chamber with a mat made of burlap, or light cotton duck (any porous cloth may be used), and then fill an upper story with forest-leaves over the mat. A chaff cushion, or a cushion filled with leaves, may equally well be used; but ordinarily a cushion filled with any material is too compact to suit my views. I do not desire to have any upward ventilation to a hive, as most seem to understand the term; that is, I do not want a current of air to pass through the hive from the entrance to and out of the top; but I do want the covering over the frames to be sufficiently porous to allow egress to all foul air and excess of moisture. I give an entrance for air large enough, in my judgment, to furnish a sufficient supply; six or eight inches in length is sufficient for the largest stock.

With colonies prepared in the above manner, all the heat generated by them is economized just where it is needed. The "device" will allow the bees to cluster on top of the frames, or pass over them from one side or end of the hive to the other. Excessive moisture is conducted through the mats over the frames, and that with no perceptible loss of heat. The cover of the hives I should say should have a  $\frac{1}{2}$ -inch hole bored in each end of the gable, with guards placed over them to prevent rain and snow from driving in. With the preparation I have described I feel full confidence that my bees will winter safely, and have no hesitation in advising others to adopt the same in their own apiaries.

Foxboro, Mass., Aug., 1883.

J. E. POND, JR.

I believe, friend P., I entirely agree with you in regard to winter preparations. That chaff cushions are too dense, I have felt satisfied. A covering of burlap and then forest-leaves, it seems to me, will be about the thing. And it will be, too, in accordance with many facts that have pointed strongly to the need of more ventilation during severe cold weather.

### ANOTHER VALUABLE FACT, SHOWING HOW BEES GO BEFOREHAND TO HUNT UP A LOCATION.

A COLONY OF BEES GOING INTO A HIVE INFESTED WITH MOTHS.

I WISH to send you a few words, so as to report how bees are doing this year in New Orleans. Willow began to bloom in January; bees gathered a good yield from it — enough to last them one month, to rear brood. We have had a good season from that time till about June 15. The swarming season began as early as the 28th of March, until about April 20. So you can see for yourself that we had a good spring for the bees.

I have no bees at present for myself, but I am in charge of those of my stepfather, which I manage for him. He began the season with three swarms; increased to six by natural swarming; one hive gave him two swarms; the other two gave him but one each, and one he bought of a friend for \$1.50, which made 7 hives of bees. That was about April 12.

Now I should like to ask you a question regarding a swarm of bees which went to a hive which was in "charge" of millers. I saw, on the 30th of March, some bees flying in and out of said hive. When I went to see what the "ups" was with those bees, I found them to be a pure strain of Italians working very busily. I put my ear to the hive to hear if they were humming, and they were. That was in the evening. Next day I went to look again; then I found only a few dozen flying about the hive. Some would go in, then some come out and fly away. I watched them till about 9 o'clock, when, to my surprise, I heard some humming come from the southwestern direction. The wind was blowing just a little then from the direction whence I heard that humming come. All at once I looked at the hive, when I saw those bees pile into that hive where those millers had made their home. No sooner were those bees in with those millers than the latter got the "grand bounce." They brought millers out that were fully  $1\frac{1}{2}$  inches long. It took the bees a day and a half to clean out that hive. I have the bees in that hive yet, and in a very good condition up to date. Do you think that those bees which were so busily at work the day before were some bees from that swarm that went into the hive, or not?

GEORGE A. SCHAFER.

New Orleans, La., Aug. 22, 1883.

To be sure, the bees you saw were from the same swarm you saw going into the hive a few days before. They had evidently gone and looked the premises over, and decided that, with a proper force, such as they could muster, they could easily clean out the moth worms, webs, and all; and after having thus decided, they just "went and did it." I think if I were you, friend S., I should be a little proud of that colony of Italians. We thank you for the important link it furnishes in this queer matter of looking up a location before the colony swarms. For years I have had this matter in mind, and now I am more than ever convinced that if those bees would go into a hive full of webs and worms (the most disagreeable things to a bee the world contains), we could certainly arrange hives so tempting to them that our new swarms will, when they get in the way of it, come in and occupy them "of their own sweet will."

### AN OBSERVATORY-HIVE WITH THREE FRAMES.

AND SOME INTERESTING FACTS IN REGARD TO ITS MANAGEMENT.

It has been well said by Prof. Cook, that every bee-keeper should have an observatory-hive — not only for his own instruction and amusement, but also for his family and friends. Prof. Cook has one which he has placed on the window-sill; and when wanting to examine it, he raises the lower window-sash in order to do so. My own is placed just inside on the window-ledge, and an entrance is made in the lower part of the sash. To make a profitable use of it, the hive must accommodate the same frame that is used in the rest of the apiary, although of course, a less number (three, I find) will work to the best advantage. If you are using a narrow frame in your apiary it will be better for your observatory-hive, as it can then rest on the window-ledge, with the entrance at the end of the frames, so that, by having both sides made of glass, more of the economy of the hive can be seen. I use the Jones frame, so that the hive, when in position, projects about seven inches behind the ledge, the latter being about that width. This might be considered a serious objection; but on trial it will scarcely be found such, as it will soon become part of the furniture of the room. To stock the hive, take two frames of bees and hatching brood, and one empty comb, and give them a laying queen. If you wish to make sure that they will have plenty of bees, and the two frames of bees and brood are not well covered, then give the third frame of hatching bees instead of the empty comb. It will not do to have them much crowded for room, so that, in a few days, if necessary, take away one frame and adhering bees, and give them a sheet of fdn. instead. By proceeding as above you will have your observatory-hive in good working order.

Now, to make a practical use of it and at the same time have the pleasure of seeing all the various workings of the same, you will find it advantageous to have one outside frame permanent in the hive, from which to supply itself with bees. Even this one frame will probably overstock it; but you can very easily reduce the number of bees by taking some away if necessary. By using three frames, as directed above, you will have two frames left to work with. Now, if you want to make the best use of your queen, take away the other outside frame (free from bees) every four or five days, at the same time removing the center frame in its place, and put a frame filled with fdn. in the center. By repeating this operation every four or five days during a moderate flow of honey you will find that the center frame of fdn. will be drawn out, some honey in several of the top cells, and nearly all the remaining ones filled with eggs, the remainder of which the queen will complete while the new sheets of fdn. in the center is being drawn out. In this way the frame you take away (if you take one every five days) has been in the hive ten days, and will therefore contain honey, some larvæ about ready to be capped, and the rest of eggs nearly hatching. In this way the frame you take scarcely ever has the queen, as she will probably be busy on the center frame. This does not make any material difference, as you are to brush all the bees off before taking the frame.

To facilitate this, make a box about six inches high, and without top or bottom, the latter being just the size of the top of your hive, and make the sides so as to slope outward. This will more readily catch any falling bees. We will suppose that you have the top of your hive covered with glass, which either lifts off or slides out; now, before opening the hive, close the blinds of any other windows in the room, lift up the window-sash where your hive is; and if you can open also from the top, so much the better. In this way you will never be troubled with bees in the room, as they very quickly make their exit.

Now for the frame of eggs and larvæ you have taken away. You will no doubt find lots of use for it, either to strengthen some weak colony, perhaps one that may be queenless, or give it to some strong colony that you may wish to rear queens from, or to stimulate them to early swarming. All this is much sooner done than described.

You will find that this hive will fully repay you for any labor bestowed upon it. It is very useful as a honey-indicator, as the flow of honey can easily be recognized by the progress made. One lesson of self-sacrifice I have been taught by its use: When the nights were cool, and we might suppose each bee would be looking after his own comfort, they would invariably be found congregated on the corners of the frames nearest the entrance, and so protect the larvæ by their own discomfort.

G. A. DEADMAN.

Brussels, Ont., Can., Aug. 12, 1883.

### MAKING RAISINS, AND SOME OTHER MATTERS.

I HAVE just been taking a first look at August GLEANINGS, and have noticed friend Harris' inquiry for the method of making raisins. As I have two brothers in Southern California engaged in that business, I believe I can give a hasty outline of the method there practiced.

When the grapes are ready to pick they distribute flat boxes, or trays, through the vineyard, into which the grapes are picked, and left right there until they are about half dry; then a man starts in at the end of the row with one extra box, turns it over the first one containing grapes partly dried, then overturns them, leaving the grapes in the new box, with the other side of the branches up, then carries this released box to the next, and overturns it in a similar manner, and so on through the vineyard, and the grapes are left right there until nearly dry, when they are taken to an airy storeroom, where the process of drying is completed, and packing done.

But all this will be of no service to our Georgia friend, because, first, the climate will not permit of this treatment, as rains are liable to come frequently, which is not the case in California. Second, if he could succeed in drying his grapes successfully, they would be only *dried grapes*, not raisins.

No process of drying will make raisins of any grape grown in this country except those grown on the Pacific coast, where the climate is such as to produce the European varieties successfully. It is not the process of drying or curing that makes raisins; but raisins *grow*, and are simply dried.

IS IT FOUL BROOD?

Not long since I was invited to go out in the coun-

try about six miles and see a colony of bees said to contain foul brood. I opened the hive, took out every frame, and looked it through carefully, and found on one or two frames plenty of larvæ that had died and decayed before being capped over, but no capped cells that showed the usual signs of foul brood. The owner told me that the colony had been dwindling all summer, and finally he had run a second swarm into the old hive, which seemed to give new life for a time.

#### MRS. COTTON'S HIVE.

While I was at this place I was shown one of Mrs. Cotton's Controllable bee-hives, with a colony of bees already in it. He paid \$8.00 for the hive, and something over \$3.00 for getting it here by express, making between eleven and twelve dollars for a hive that I should think could be manufactured for \$2.50.

#### IS THE GOLDEN AGE DAWNING UPON US?

If not, the Golden bee-hive certainly is. I am informed that there has been a man in Hudson, in the western part of this county, selling the Golden bee-hive and farm-rights this spring and summer—one hive and one farm-right for \$10.00. Cheap enough, if a tenth part of the claims made for it are true, and I don't know but they are, for I haven't seen it yet.

D. G. EDMISTON.

Adrian, Lenawee Co., Mich., Aug., 1883.

## BEES AT PUBLIC PARKS AND MUSEUMS.

### AN INTERESTING LETTER FROM OLD ENGLAND.

I AM surprised that our Parks Committee do not keep these interesting creatures in our parks and museums, to instruct and interest the thousands of our men of toil, many of whom do not know what a honey-bee is. The expense to the Parks Committee would be very trifling, as I proved by the swarm of bees I took to our Red-Park Museum on the 3d of July, 1862. The bees were in one of my improved observatory bar-frame hives; the four sides and the top were composed of glass. The hive was placed near one of the windows over the principal entrance to the Museum, a hole being cut in the bottom of the window-frame, for the bees to go out and in. The energetic curator, Mr. Piant, took charge of them, and he will confirm my statement, that during the 293 days the bees were in the Museum they were a source of endless amusement and attraction to thousands who visited the place.

The bees did very well in their new home, and I brought them back to Newton Heath to swarm, Apr. 22, 1863. The consumption of food was more than the usual average, amounting to 1 19-100 oz. per day; rather less than 1 1-5 oz. per day for the 293 days they were at the Museum. This I account for by the bees being in a warm room all winter, which made them active, and caused them to consume more food.

When the Royal Agricultural Society of England visited Manchester in 1869, I exhibited some bees at work; and one stock gained in weight 9 lbs. 9 oz., whilst at the show at Old Trafford. Bees will go four miles to collect honey; so they must have worked in the gardens around Old Trafford, much to the benefit of the owners of these gardens, as bees are the principal agents in the production of nearly all kinds of fruit and vegetables; so that it is not only honey we get from the bees, but nearly every thing we grow.

The great Mr. Darwin tried a number of experiments proving the fertilization of plants by bees. He covered over a quantity of beans with a very light net that prevented the bees getting to them; and where the bees worked on them they produced on an average four times the quantity of beans. Again he covered over a quantity of white clover (*Trifolium repens*), and where the bees got to it, it produced on an average ten times the quantity of seed. About ten years since I was going through the grounds of the President of the British Bee-keepers' Association, the Baroness Burdett-Coutts, at Highgate. In going into the peach-house her head-gardener said, "See what a quantity of peaches I have got set." I turned around and said, "You have, indeed; how do you account for it?" He said, "I have always kept bees to produce my fruit; but last autumn I got a stock of Ligurian bees, and they, being hardier than the common black English bees, got into the house when the peach-trees came into bloom, and I have more than double the number of peaches set I ever had before."

A large Lincolnshire farmer went to the Lincolnshire Bee-keepers' Association show at Boston, 1880, and he heard them say that bees were profitable, if properly managed, in bar-frame hives. So he thought he would try them, and got some in 1881. In Sept., 1882, he exhibited at the Association's bee show at Lincoln, 894 lbs. of honey that he had taken from his bees that year. He had also sold several hundreds of pounds. He got several sovereigns in prizes, and I awarded him the silver cup of the Association. He had also several acres of fruit-trees, and he was the only one in the district who had a large crop of fruit last year.

Bee-keeping is rapidly becoming a national industry in England. We have now thirty-four different County Bee-keepers' Associations, and four of the Queen's children are presidents of four different county associations. We have a Lancashire and Cheshire Bee-keepers' Association, with the Earl of Latham as president; and as patrons, the Duke of Devonshire, the Duke of Westminster, the Earl of Derby, the Earl of Beetive, Lord Egerton, the Bishop of Manchester, and the Bishop of Liverpool. Why should we send thousands of pounds annually out of the country for honey and wax, when we have it running away for the want of collectors at our own doors, doing nobody any good? WILLIAM CARR.

Newton-Heath Apiary,

Near Manchester, England, August 10, 1883.

Many thanks, friend C., for your very kind letter, and the many valuable facts you give us. I most heartily agree with you, and it seems to me nothing can add to the beauty of any garden or residence as do a few hives of gentle Italians, managed in such a way that visitors can easily inspect the workings of the interior of the hives.—May I take the liberty of saying, "Long live the Queen, and all her royal household"? and may God be praised that they set such an example in the way of encouraging rural industry by taking right hold of the subject of bee culture in the way you have mentioned. I am glad, too, of the fact you mention, of the agency that the bees have in this matter of fruit-raising. I hope the time will never come again when superstition shall induce people to declare that bees are antagonistic to fruit-growing.

## *Heads of Grain,* From Different Fields.

FRIEND MUTH, AND HIS CHANGE OF BASIS.

**F**RRIEND ROOT:— Allow me to apprise you of a change in my business. You are aware of the death of my eldest son, which occurred in May last. He had been quite a help to me. After his health was impaired he went to the country, and I had become accustomed to missing his assistance in my business; but he had taken upon himself the care of the farm. When I found there was no remedy for his unfortunate disease, my mind was made up to reduce my business.

My grocery and seed trade was unusually heavy the past spring and summer, while my honey trade kept growing steadily; and when the rush for supplies was added to the rest, I was crowded more than was pleasant to myself and business friends. I could take no time to write a postal card, unless it was absolutely necessary.

On Monday last I rented my store, etc., to a couple of good young business men, and sold them my stock of groceries. I will be found, hereafter, in my honey-store, on the corner lot, opposite the old store, which you perhaps remember.

"Pure Honey and Bee-keepers' Supplies,"

"Seeds and Pure Baking Powders."

is my motto from now on.

Please give the above notice in September number of GLEANINGS, if possible, and much oblige,—  
Cincinnati, O., Aug. 22, 1883. CHAS. F. MUTH.

Well, old friend, you have just done a good and wise thing. When I saw you last fall there in your store, I made up my mind that you must do one of two things—get a small army of boys and girls to run your increasing business for you, or let a part of it go. Well do I remember that corner where so many of the barrels were stored away; and when you get fixed for the supply business of the South, I shall be delighted to make you another visit.

BEES ABOUT TO BE BRIMSTONED; CAN THEY BE  
UTILIZED?

I am a beginner in bee culture under the new system; and as you have always been kind enough to answer my inquiries, I should like to trouble you again. I am situated in a location where bees are kept in some quantities in box hives, and numerous colonies "brimstoned" in the fall for their honey. Now, I can get any quantity of these bees; but how am I to winter them? I have no extracted honey; no combs, except perhaps about 25 or 30 partly filled when I prepare my bees for winter. Can I put them on fdn., and feed them sugar to such an extent that they will build it out and store syrup enough for winter, so late in the fall? Now, what I want is to know just what you would do to save those bees under those circumstances. W. G. FISH.

Ithaca, N. Y., Aug. 12, 1883.

Yes, my friend, you can fix them so as to winter nicely. You will have to give them four or five combs of fdn., the number depending on the size of the swarm, of course, and then you will have to feed them daily (providing no stores are to be had in the field, and this is usually the case. I presume, where bees are to be brimstoned) until they

are in proper trim for winter. Keep them up at high pressure in brood-rearing, and lengthening out the cells and sealing up stores. It can be done almost without failure, if properly managed and finished up before the weather gets to be too cold. I should advise all who are new in the work, to try a few first. When you can make a few work and winter nicely, then try more until you can utilize all the bees to be brimstoned in your region. If you put in an Italian queen when you commence, by the time you begin for winter you will have a fine Italian colony that will well repay you for the time and sugar.

HONEY-DEW IN THE FIELD.

I notice the agitation of the honey-dew question is going on yet. The question is now settled with me and my neighbors. When I began to argue that the honey-dew was brought about by insects called aphides, my neighbors howled at the idea, and said it came from heaven. To prove the fact, one morning last week I went to an idle field where they were innumerable on weeds called by the old folks here, "farewell summer," and which comes into bloom about the middle of August, at which time the face of the earth becomes yellow in the place of green, when it is not covered with bees. Well, I broke off the top of a weed that had a lot of aphides on it, and carried it home with me to show some of the folks that were there the insects, as they said they had never noticed any of them. The thought of experimenting struck me while we were examining the aphides, so I just carefully fastened the weed with the insects upon it in the top of a small cherry-tree standing in the yard. The next morning about sunrise I stepped out to the tree, and the first thing I saw was a bee after the so-called honey-dew that had exuded from the aphides during the night, and the leaves of the tree directly under the weed upon which the insects were was "sploched" with honey, so that it could be tasted by myself and wife. Now, these are facts that can be proven. I am a poor writer; it may be that some one would like to question me; if so, I will take pleasure in trying to answer him.

HENRY W. CARMAN.

Custer, Ky., July 25, 1883.

NECTAR IN CANADA.

Look out for a big honey report from Canada this year. Bees are storing honey by bucketfuls, and the average in this section will go a good deal over 100 lbs. to the colony. One Stratford man the other day took 112 lbs. of sections off one colony, and there is plenty of time for them to do a great deal yet, as the bulk of the crop was made in Aug. and Sept. last year. I notice in the *Beacon* of this week that Mr. Chas. Mitchell, of Molesworth, has taken 364 lbs. from one colony already, and 57 from a young swarm, which they gathered in two days. Perhaps we may come up to friend Carroll's figures, if the fine weather holds out.

WIDE FRAMES.

This is a little secret for bee-keepers. Any of the fraternity who intend splitting up their wide frames for kindling, as they are sure to want to sooner or later, had better "stop a leedle." If they wire them and put in full sheets of fdn., they will have the nicest kind of frames for extracting. Too bad, Uncle Amos, for you to invent them for sections. They make bee-keepers sing too much. Of course,

they never swear, as I said before, and there are other objections too numerous to mention.

#### SMALL BUSINESS.

Last year a bee-keeper out in the country sold a lot of honey to Stratford store-keepers at 12½ cents, when the local men were getting 15 c. easily. Of course, he had a right to do as he pleased with his product; but when he sells the same class of honey in other towns a few miles away at 15 to 18 c., it looks as if he were bound to break down the smaller men here. I hear he has been offering to sell here at 10 c. this year, while local men are getting 12½ and 13 c. in quantities. It's kind of small business.

C. W. YOUNG.

Stratford, Ont., Can., Aug. 16, 1888.

We are very glad to hear of the bright prospects in Canada, friend Y.—I am sure that I have not heard that wide frames were to be rejected "sooner or later."—In regard to the difference in prices at which honey is sold, I know it is bad; but I think we are rapidly getting things in shape where this can not happen. Of course, nice honey will bring nice prices, just as nice butter brings nice prices; but a butter-raiser would not be very likely to sell his butter for 12½ cents in one place, and 15 at another, on the same lot.

#### AN INQUIRY IN REGARD TO SOURWOOD.

I will be obliged if some of your Southern correspondents will inform me, through GLEANINGS, how the sourwood (*Oxydendrum arboreum*) can be propagated with greatest facility. I have become interested in it by the notice of it in A B C by the representations of a neighbor, and by finding small bushes of it in full bloom. The seeds are so exceedingly small that I doubt if they will germinate. It would be difficult, too, to save them, for the five-lobed pod which produces them is pendant, and they doubtless drop out promptly at maturity. I wish some Southern correspondent of GLEANINGS would tell me, also, if it can be propagated from cuttings or twigs (as is now done, I believe, with most trees), and the right method of doing this.

J. A. G.

Tuscaloosa, Ala., Aug. 14, 1888.

Please answer the following: Can honey be extracted from frames that are not wired, without its breaking or coming out? I have ten stands of bees, all in Simplicity hives, and have wintered successfully for the last four winters on their summer stands, having them packed in chaff. I must say, to the credit of the Waterbury watch, that I have been carrying one for about thirteen months, and it gives perfect satisfaction.

D. CONGLETON.

Heslop, Ohio.

Why, friend C., extractors were used years before any such thing as a wired comb was known. In fact, it is only about three years since wired combs came into vogue; and, come to think of it, it is wonderful to see how rapidly they have come into general use. Your question illustrates it well.—I am glad to hear so good a report from your Waterbury.

#### ITALIANS, AND THEIR ABILITY TO REPEL DISEASES.

At the time I wrote the article published on page 256, current volume of GLEANINGS, I had but little practical knowledge of the Italian bee, and all that is said in it relates exclusively to the common black variety; but in the latter part of April I received thirty 4-frame Italian nuclei from Mr. Viallon, and I

have been experimenting with them in regard to the brood-plague mentioned. I find that they do not seem to be affected by it; and when introduced into a diseased colony they soon overcame it. Early in June I removed the queen from the only hive of blacks I had left; and after waiting some eight days, and destroying cells so that they were hopelessly queenless, I introduced a frame of Italian brood, with the bees that adhered to it, from which they raised a queen; and although the colony was badly diseased, there does not seem to be a vestige of the trouble left. I have also furnished brood to several neighbors for the same purpose, with equally satisfactory results. Of course, I am highly pleased with Mr. V.'s stock of Italians, as they have also done very well in other respects. Are the Italians affected by foul brood the same as the black variety?

MILTON HEWITT.

Perryopolis, Pa., Aug. 13, 1888.

Friend H., it would seem in your case that the extra vigor of the Italians drove out the disease as they drive out the moth worm. Yet I am inclined to think the disease you have described was in some way inherited, and hence a healthy queen of any race would eradicate it. I think this is never the case with foul brood; and, so far as I know, the Italians are affected with this equally with the blacks.

#### MAKING NUCLEI; HOW TO MAKE THE BEES STAY.

That Doolittle has been and gone and stolen my discovery! Well, I guess he discovered it first. I am only a beginner in the bee business, and make my artificial swarms by making nuclei and building them up. Last year I merely took several frames of brood and bees, and let them raise a queen when I hadn't a queen-cell for them; but sometimes it was slow work. This last summer I moved a queen with two or three frames of brood and bees, and they built up splendidly, leaving the old colony to rear cells. I did so again, giving cells to old colonies. I was pleased with the result, and thought I had made a discovery. Now here comes a sample copy of the *Bee-Keeper's Guide*, August number, with a Doolittle article, copied from the *A. B. J.*, in which he states that the old plan is not very good, because so many bees go back to the old stand. He then explains how he discovered that by taking the queen along, in making nuclei for queen-rearing, the bees became fixed in their new habitation, and then the queen can be returned in a few days, and be ready for business. He says such nuclei can be depended upon every time. Truly, "great minds run in similar channels." Doolittle and I — —!

"WHITE CAPS."

Your rule for telling when a colony has a laying queen by the "white caps" at the upper edge of the frames must have some exceptions. Honey has been coming in rather slowly until within a few days, and now almost the only one of my ten hives that shows any "white caps" is the only one that has not a laying queen.

BURDETT HASSETT.

Howard Centre, Iowa, Aug. 11, 1888.

#### WATERING-PLACES FOR BEES.

I will tell you how I water my bees. I have a trough made of two 6-inch fence boards, which I place under the drip, or lead trough that carries off the waste water from the pump. I take a well-washed piece of cotton-cloth (old is the best, I think), wet it well, and then place one end in the trough

down into the water, and let the other end hang over the edge of your trough; let the longest part of the cloth hang outside, and it will act on the same principle of a siphon, but will keep wet all over all the time, and the bees will soon take to alighting on it for water. Dark-colored cloth is the best, I think, because it looks most like a piece of wet wood.

#### WHY ARE BEES AND IMMATURE LARVÆ THROWN OUT BEFORE THE ENTRANCE?

What makes the old bees throw out of the hive the young brood? Sometimes the young bees look as if they were almost ready to come out of the cells, and some look as if they would come out in a week, and sometimes the worm, or larvæ, is thrown out. Don't say it is for the want of room to store, because I looked after that, and they have plenty of room to work.

#### VENTILATION.

How shall I ventilate my gums best when I am working the honey-sections? W. L. HIGH.

McLean, Ill., Aug. 19, 1883.

I do not think it is because they lack room, friend H., but because the larvæ, or young bees, thrown out are imperfect in some way. The ravages of worms in the combs often injure a large amount of brood; and where this is the case you will find they are thrown out of the entrance very early in the morning. Unless you look quite early you may not find them, for small birds have a habit of going around among the hives, and gathering up all this stuff brought out during the night.—See the recent articles by Langstroth and George Grimm in this matter of ventilation for comb honey, friend H.

#### SMOKER FUEL.

I have used the dry "toad-stools" from old fallen timber this summer, with satisfactory results. It holds fire longer than any thing I ever used. I see in your comments on page 509 of GLEANINGS, 1882, that you thought it would be impossible to secure enough of it. I think I could furnish several cords of them to friends who would be willing to pay, say 25¢. per bushel here. I do not find any trouble in breaking them when dry. Take a hatchet in one hand, toad-stool in the other; lay it on a hard-wood block near the side of your wood-shed, and let the pieces, as they fly, strike it. You will soon have a nice pile of the very best fuel. I keep the tin oven full of the stools all the time, at the risk of being scolded by the women folks. A. R. CROSIER, 12.

Fair Haven, Cay. Co., N. Y.

#### FIREWEED.

The July No. of GLEANINGS is at hand, and I am much pleased with it. Bees are doing well. This is my first year with them, and I think I shall have to send in my report when the season is over.

I inclose a stem of flower and a few leaves of a honey-plant, which is called elkweed, or fireweed here. I should like to know if you have it, or what you know about it. If you would like some seed, I think I can send you some this fall. There is probably 2000 acres of it within reach of my bees, and it blooms from the middle of June till frost.

FRANK S. HARDING.

Willamina, Yamhill Co., Oregon.

Thank you, friend H. The plant you send is probably *Epilobium angustifolium*, or Great Western Fireweed. Concerning it, the botany says: "One of the plants that grow up

abundantly everywhere northward, where forests have been newly cleared and the ground burned over. Simple-stemmed, smooth, with lanceolate leaves, and a long succession of pink-purple leaves." With 2000 acres of it, there is certainly no need of planting honey-bearing plants. I should be glad indeed to see a sample of the honey. We mail you to-day a little block, inside of which is a small vial. I wish you would fill it and mail me a sample. I presume this is the great honey-plant that has been spoken of in Maine, that yields more honey than the bees can possibly gather.

#### WHAT BECAME OF THE EGGS?

In looking over my bees to-day, I found one that I had given eggs to raise cells, two days ago. Well, I found no eggs, and I thought here is a case of transferring eggs; but on looking very carefully over every frame in the hive I still can find no eggs. Now, what do you think the bees have done with those eggs?

#### CARING FOR SWARMS ON SUNDAY.

"Six days shalt thou labor, and do all thy work." This is the law, friend Root; and where you find the exception, mentioned on page 467, Aug. GLEANINGS, I do not know. Will you please inform the A B C class the chapter and verse? D. M'KENZIE.

New Orleans, La., Aug. 11, 1883.

I have noticed eggs being gone when they were given to certain colonies for queen-cells; but I have never been able to explain it. Can any one help us here?

Friend M., the text I had in mind was as follows: "What man shall there be among you, that shall have one sheep, and if it fall into a pit on the Sabbath day, will he not lay hold on it, and lift it out?" You will find it in the 12th of Matthew. I presume if the fence should be blown down, so the sheep was in danger, the spirit of the text would prompt that we go after him, even though we should go several miles, and then put up the fence. In this case some labor would be necessary on this day, in order to save valuable property. Of course, we should strive to avoid the necessity of doing any labor of this kind on the Sabbath, as far as possible to do so. If there is any way to prevent swarms coming out on the Sabbath-day, such as Jones's entrance-guards, etc., of course any Christian bee-keeper should try to avail himself of such means. However, if swarms do come out on this day, as I understand the spirit of Christ's teachings it would be right and proper to take care of them. If they are found hanging on a tree, I should say it was a Christian duty to have them properly. If I started for church, and on my way saw a swarm of bees hanging on a tree near my apiary, I think I should have them before going further, even at the risk of being late to church. At the same time, I think I should try very hard to avoid the necessity of having any one in my employ kept from going to church on account of bees swarming. Am I not right about it, friends?

#### INTRODUCING.

The queen you sent me came to hand in good condition. I had quite an experience introducing her,

for an A B C. I had a very cross colony of hybrids. It took a week before they would receive her; once when I was smoking them off from her she flew away, but soon came back. A. TRUEBLOOD.

Fountain City, Ind., June 23, 1883.

#### FRAMES OF OLD AND SOURED HONEY.

I have some honey in frames, which has soured. Is it of any use? The bees died. WM. M. YOUNG.

Nevada, O., July 14, 1883.

Yes, sir, lots of use. Just give those combs, one at a time, to colonies raising brood rapidly, and they will manufacture that old honey into young bees, and have it out of the way, besides fixing the combs all up in nice trim.

#### WHERE DID THE QUEEN COME FROM?—HONEY FROM CORN.

In the swarming season I divided a strong colony of Italians, putting the old queen on a new stand; two days after, the queenless colony cast a swarm. I hived them, giving a frame of unsealed larvae. In two more days I examined them and found eggs in all, or nearly all, empty cells. I looked farther, and found a dark-colored queen, while the mother-queen was light. Where did the dark one come from? Up to that time I had not lost any laying queens. I hived an after-swarm, and gave them a frame of unsealed brood; but in about an hour they came out again and clustered in the same place they did the first time. I found the queen on a sunflower leaf; killed her (she being a hybrid), and united the swarm with a nucleus. Why did they leave the hive when they had brood in all stages? They had plenty of room, and were removed to their stand in the shade immediately after hiving the first time. So you see that unsealed brood will not hold them every time. I practice giving each after-swarm a frame of brood when hived, and this is the only instance of their leaving it. My bees have been gathering honey from corn for the past week—not from the tassel, neither from the silk; but where the blade comes out from the stalk. I have seen and watched them while gathering the honey. J. H. EBY.

North Robinson, Ohio, Aug. 5, 1883.

Friend E., I can not tell where the dark-colored queen came from. If you were not sure it was the old queen, I should have said she had left the hive and gone home again.—It is now pretty well proven that the stalk of the corn does sometimes furnish honey, or a sweet substance.

#### WIRED FRAMES, ETC.

The season for honey has not been very good. We have had lots and lots of white clover, fields and roadsides white with blossoms, but not much honey—only enough to keep up breeding, and develop the swarming mania. Bees have therefore swarmed a great deal, and the demand for hives and fdn. has been good—more than I was able to supply. When a man has once hived a swarm on wired frames of fdn, and sees the nice straight combs built out, almost as if by magic, he thinks he is not using his swarms fairly to require them to *build* their combs, and is very willing to pay for the fdn. I tell them it is money well invested; for if the bees die, the combs will be worth more than the fdn. cost. We have had a great deal of rain this season, which is probably the cause of the poor yield of honey from clover. Basswood did quite well, and bees got to

work in sections quite freely; but the weather was not good—cold and wet and windy—only several nice days. The past week we have had rain every day. All kinds of bloom are, however, prospering; and with good weather we may get more honey yet. Two years ago we got the bulk of our honey in August. E. C. LONG.

Williamsville, N. Y., Aug. 3, 1883.

#### WHO SHALL BE THE LOSER?

I sent a man a dollar queen last fall. She had a good appearance, and was laying well before being shipped. This summer, about a month ago, she was returned to me, the man stating that she was entirely worthless, not laying enough to keep the colony up. Please let me know the reason, whether the cause lay with me or with the treatment she received after she had been received. If the fault was mine, I must send him another; if his, he has paid only for his experience.

#### QUEENS RETURNING TO THE HIVE WHERE THEY WERE HATCHED.

I had a strong colony into which I wished to introduce a queen; so I took one from a neighboring nucleus, and introduced her safely. Upon examining the stock two days afterward I found eggs, but no queen. Happening to look next day into the nucleus from which the queen was taken, I was surprised to find the very same old queen back into her old quarters, as contented as you please, and the one which had just hatched, balled by the bees. I know that it was the same queen, from her appearance—being a very choice one. Is it a very usual thing for queens to act so? I never saw it before.

J. O. FACEY.

New Hamburg, Ont., Can., Aug. 15, 1883.

Friend F., if your queen never laid at all after your customer received her, or if the eggs she laid were all drone eggs, I should say it was your duty to give him another queen, because the one he received from you was never of any value; but if, on the other hand, the queen commenced laying all right, and afterward turned drone-layer, or ceased laying, I do not think you should be held responsible; for queens, like all else of animated nature, are liable to die at any time. If you sold your neighbor a horse or a cow, and it should die within six months, would you expect to give him another? If, out of the kindness of your heart, you thought proper to sell him another at a low price, or bear part of the loss on account of his misfortune, it might be a kind thing to do; but I should no means say you are *obliged* so to do.—It is not unusual for a queen to go back in the way you state. I have mentioned the same thing in the A B C book, and many other cases have been reported. I do not know, however, that I have heard of one where the queen stayed long enough to get to laying. On this account it is a little unsafe to take a queen from one hive where she has been reared, and introduce her to another hive in the same apiary. I have sometimes thought the bees perhaps drove them out of the hive, and on taking wing they would of course remember the location they noted when they took their wedding flight. From the facts gathered it would seem, too, that a queen will remember the location she fixed on her wedding flight, even as long as a year or two afterward.

Old works on bees have been for some time past much sought for. Here is something printed from a paper nearly a hundred years old.

BEES 96 YEARS AGO.

*Friend Root:*—I have taken the liberty to send you by this mail a copy of *The Pennsylvania Packet*, an old newspaper printed in Phila., Pa., in 1787. It contains a short article on Bee-keeping. If you consider it of sufficient interest to copy in GLEANINGS, please to do so, and afterward return the paper on the wooden roller to me again, and I will thank you. The paper is a relic of value that I wish to preserve.

J. G. BINGHAM.

McGrawville, Cortland Co., N. Y., Aug. 7, 1883.

ON BEE-KEEPING.

Many and great are the advantages to be gained by the inhabitants of these United States, if bees were propagated, supported, and preserved. Our soil and climate are inferior to none for this purpose. Not Egypt, Greece, Italy, Germany, France, England, or any part whatever of the whole globe, would exceed us in the quantity, quality, or flavor of the honey. Canaan, of old, could not with more propriety be called a land flowing with milk and honey, than America would be did we but improve all the means to produce these so valuable and so important articles, which we might do very easily; which would assist each other, when we annually extend such pastures as would increase both.

Beeswax for manufacturers, candles, and exportation will be a great motive to exertion, and perhaps emulation in this system; especially were a bounty given upon it by government. Wax candles would then be sold as cheap as tallow, and the quantity of wax, in American exports, would be very great indeed.

A writer observes, that were bees propagated, and supported as extensively as a country would bear, innumerable insects would be destroyed; which feed upon the honey in the bloom of trees, shrubs, and herbs. And that this would tend to expel those hosts of insects, which we observe floating in the air, playing in the rays of the sun, near the time of its setting; many of which we are in danger of receiving into our bodies by respiration, because of their smallness; much to the injury of our health.

If these observations are just, will not the increasing of bees assist in expelling the caterpillar and canker worm, which have so often destroyed the fruit of the apple-tree; whose young, often feeding upon that part of the bloom from which the bees collect the yellow down, which they carry into their hives on their legs?

This point would easily be decided by those persons who have trees near their bee houses, or in those parts of the country where bees are most frequent. Should the knowledge of any one prove this to be fact, that such trees are less frequently, or never attacked by these ravages, the world ought to be favored with the information.

Insects often feed upon that moisture which many trees, especially the chestnut, afford in very sultry days in summer; when the bees feed upon with great activity. This is sometimes called honey-dew, and is the sweet sap of the tree sweating through the leaf, and becomes honey; which, if more generally collected by the bees, would thereby serve to expel those troublesome and noxious insects.

A FARMER.

—[New Hampshire Spy.]

WHY DO THEY CLUSTER OUT?

My bees keep out on the alighting-board and side of the hive much of the time. Does it not indicate they are too warm? and should not the sack of chaff be removed from over the foundation-racks?

Lewiston, Me., Aug. 17, 1883.

J. C. MERRILL.

Friend M., I do not think there is very much danger of their being too warm away up in Maine where you are. I think the reason must be, because there is not any honey to be found. I should overhaul them and hunt up the trouble. I do not think a chaff cushion would do any harm at this season of the year. You can start them out if you get to work at it right. There is never any need of bees clustering out when there is honey to be found in the fields.

RAISING QUEENS IN A HIVE HAVING A LAYING QUEEN.

I have been experimenting on raising queens in the same hive that has a laying queen. The first three hives I tried very early in the spring, failed; but on investigating I discovered what was lacking; and since, I have had no trouble, and raise them right along. I want those zinc strips to place in my division-board, and try to have my queens fertilized in the same hive, which I am satisfied I can do. I

never could get them to raise more than from one to three cells at a time; but I think by combining some of the principles given in Mr. Alley's book, I can raise more. I am now raising them on Mr. Alley's plan, and am well pleased with my success so far.

HYBRIDS VS. FULL-BLOODS FOR HONEY.

I have just got three queens from Mr. Heddon. I am satisfied he is on the right track for the coming bee. My experience with the Italians for over 22 years convinces me that a cross is preferable. I never had more than one full-blood to come up to the hybrid, and that was two years ago. She just equaled a hybrid. This year my best full-blood, a long dark leather-colored queen, has given me 324 lbs. extracted, while my best hybrid, perhaps three-fourths Italian, has made 583 lbs., including 26 lbs. comb honey.

GOOD NEWS FROM CALIFORNIA.

I commenced extracting May 21, and the honey-flow has changed but very little, and this evening they are just roaring, as they have done nearly every day since spring.

HONEY FROM ALFALFA.

Our main and principal honey-resource is the alfalfa, which will continue to bloom yet for the next two months.

J. F. FLORY.

Lemore, Cal., July 31, 1883.

Thank you, friend F., for your valuable facts. I know queens can be reared in a hive with a laying queen; but the matter seems to need investigation and experiment.

—In regard to hybrids gathering the most honey, I am very much inclined to agree with you—at least to the extent that a small dash of black blood makes Italians better honey-gatherers. — I am very glad indeed to know that California promises so well this season; and particularly am I rejoiced to know that alfalfa is really a valuable honey-plant. Now, then, friends, if we can raise a forage plant that will pay, besides the honey it yields, we are on a safe road to start a honey-farm.

HONEY FROM WHEAT-STUBBLE, ETC.

Bees are doing well here this summer. Basswood lasted about two weeks. I see reports of bees working on wheat-stubble; but I saw them working on barley very strongly here.

R. DUNFORD.

Young's Point, Ont., Can., Aug. 18, 1883.

Friend D., do you mean to say that bees work on the heads of the barley or on the stubbles, the same as on wheat? We presume the latter, although you do not quite say so.

DO BEES STING WITHOUT PROVOCATION?

I think, friend Root, that Andrea Norton has rather "got" you with regard to bees stinging without reason (page 405, July No.). My bees are not uncommonly bad, and I am not very often stung, and yet one of them came three or four rods from the hive and stung my face without giving any warning, and I wasn't thinking about bees either.

QUAKING ASPEN.

On page 390, Green R. Shirer seems to almost doubt whether the quaking aspen is properly popular or not, because it is not *liriodendron*. Gray's Botany speaks of the aspen as a true poplar (genus *populus*); while the tulip-tree, *liriodendron*, is said to grow "140 ft. high, and 8 to 9 ft. in diameter, in the Western States, where it is wrongly called poplar."

BURDETT HASSETT.

Howard Center, Iowa, July 23, 1883.

I believe you seek to make up statistics for the benefit of bee-keepers. My own showing is about thus: I had to start with this year — spring count, 21 colonies; lost six swarms; sold two; have now 35. I have sold 737 lbs. comb honey; 1550 lbs. extracted; in all, 2287, besides what we have consumed and given away. Sales have amounted to \$295; expenses, \$65; profit, \$230. The season is over here, unless we should have some surplus fall honey, which would be chiefly from smartweed, the main fall supply in this section.

CHAS. W. BUCK.

Midway, Ky., July 27, 1883.

### CRYSTALLIZED HONEY-DEW.

THE REAL GENUINE ARTICLE, AND NO MISTAKE ABOUT IT THIS TIME.

**FRIEND ROOT:**— As Oregon seems to be poorly represented in the bee industry by its bee-men, I will venture a few items; and if any part is of interest to you, good; if not, why, it will be but little loss, any way.

To begin with, I will send you a little package containing cuttings from the fir-tree, which is coated over with honey-dew (so called here); it evidently oozes out, and thickens from the stem and leaf, and finally candies, as you see it now. Being white, it can be seen quite a distance. It is not on all of the branches, but in spots, or it appears in different places on the trees; nor do all the trees secrete it, for the majority of them show no traces of it. I could not detect any apis at any time upon it. Honey-dew has been plentiful this season, but candies on nothing but the fir. The flowers, too, have been full of honey, and I am inclined to think that honey-dew, and the nectar from flowers, is one and the same thing. May it not be, at least partly so, that the sweet passes off through the pores of the plant-leaf and flowers into the air and is condensed by the night air, or comes in contact with the dampness, arising from the earth, and settles in the form of dew? for it appears on dry leaves sometimes, as well as green.

The bee business has not received much attention in this State, for it has been considered a poor country for bees and honey; but now with the improved hives and other appliances used in modern bee-keeping before us, it dawns upon our minds that bees and honey may be produced here too.

#### THE HIVE I PREFER.

I prefer the Simplicity hive to all others tried thus far, for bees winter well in them for me, and I get from one-third to one-half more honey from them; besides, they are easily handled. I have some colonies tiered up four stories high, and nearly all three deep, with bees enough to fill them. I use starters full size in both one and two pound sections.

#### THE WAY I PUT IT IN.

I cut a block just the inside size of the section, out of  $\frac{3}{8}$  stuff, square; then nail this to another larger one, of convenient size to handle easily. Then drop the section down over the small block, which comes up about half way of the section, and press the starter down on the block, and, with melted wax, fasten it in about three places, and you have it square, with starter in center of the section, and straight. I suppose you will say, "Too slow." But it is good and sure. I laid aside the Parker fastener. I am satisfied that it pays to use full-size starters, for the reason that the sections are filled much

quicker and more regularly. I use no separators; the bulged ones I cut down to size, and extract. The foundation used was made on the rubber plates, shipped to me from your house.

#### A WAY TO USE THE RUBBER PLATES.

I did not succeed well in running melted wax over the plates, and have made dipping-plates, and dip sheets of wax, and press while warm, or I warm them afterward in the sun, or over hot water; in this way it is a success. We have supplied fdn. for 100 colonies this summer — all that was needed. I made fdn. about once a week. If a sheet is torn or broken, it is easily mended by lapping the broken edges and pressing it in the plates. The bees drew out this foundation very readily. Our principal honey-plant at this place is the fireweed (*Epilobium Angustifolium*), and the honey is considered No. 1.

E. S. BROOKS.

Silverton, Oregon, August 12, 1883.

Sure enough, friends, we have it now. The branches and twigs sent by friend Brooks are coated so thickly with a beautiful white candy that the leaf can be slipped out, leaving an oblong ball or roll, not unlike what we sometimes find at the confectioner's. The taste is slightly aromatic, from the fir-tree; but otherwise it is much like fine cream candy. I should think the quality of the honey would be excellent. This is most wonderful. The branches look as if they had been dipped in hot syrup, and repeatedly coated until the covering is something like the tallow which covers the wick in the old way of making tallow candles. The substance has a sort of cooling taste to the tongue, something like the sugar in raisins, from which I presume it is a sort of grape sugar; but as honey is principally grape sugar, this would be nothing strange. When this accumulation is wetted by the dews of night, it seems to me it would give an unlimited number of bees work enough to keep them busy. If such secretions are common, it would seem that 1000 colonies, or even more, might do well in a single spot. I declare, if I could afford it, and Oregon were not so far off, I would at once go up there and investigate. Friend B., how many trees have you that thus exude honey? and over how large a tract of land are they scattered? Why do you not locate bees enough right near these trees, to utilize every bit of this wonderful sweetness? As it is candied so white and dry, I presume very likely it would candy in cells. But even if it did, it seems to me it would be beautiful confectionery even then. Do you see this state of affairs every season, or is it only occasional? and is it confined to special months in the season? is it on only one kind of a tree? Excuse my inquisitiveness; but it seems to me this is a matter of great moment. I would give one hundred dollars for such a tree on our grounds, without hesitation. I will carry your box of samples to the Toronto Convention; and if you can answer my inquiries in time to have the paper present there, we shall be very glad of it indeed.

I believe, friend B., your suggestion, that the honey from the plant might float in the atmosphere, is not considered tenable. Water evaporates; but sugar, never, unless it is burnt, and then it is sugar no longer, but caramel.

## 1000 LBS. OF HONEY EVERY 10 DAYS FROM 37 HIVES.

A GOOD PLACE TO RAISE HONEY.

PERHAPS it would be interesting to a few of you to hear from me again, although it has been a long time since I have written for a journal. I would say, that I have located at last in Fresno County, Cal., which I find to be as good a place as I could find for a honey-producing locality. One apiary of 37 hives, all of which were transferred and Italianized this season, since they began gathering honey has turned off 1000 lbs. every 10 days, and they are full again. This is an irrigated section, and, to the careful bee-keeper, there will never be a dearth of honey. To the new comer it is the barest-looking place a honey-man would be likely to settle in. Every place that is not irrigated is as dry and dusty as a desert. Alfalfa and Egyptian corn are the honey-plants of our section. The country is becoming better every year for bees, and will, ere long, rival any part of the world for honey-producing, and the quality is excellent. The Holy-Land bees are the best for this section. They are hardy, long-lived, strong-winged, and great layers; all the points combined make them the bees for us.

Selma, Cal., Aug., 1883.

O. S. DAVIS.

Friend D., I am very glad to have you bring out the fact that honey can be produced in abundance by artificial pasturage and irrigation. When we get down to this we have got pretty nearly a sure thing on a big crop of honey every year. The alfalfa we are familiar with, but the Egyptian corn we do not quite understand. Who will tell us a little more about it?

## HOW TO GET GOOD QUEENS.

FRIEND HAYHURST'S VIEWS ON THE SUBJECT.

FRIEND HUTCHINSON, in reading your criticisms of friend Alley's book I am led to infer that you have overlooked a suggestion by me on page 33, 1881, for I am quite certain that, if you had tried the method there mentioned, you would hardly advise cutting holes in combs to give the bees a chance to build cells. I used the method during the summer of 1880, and have used it ever since, preferring it to any that has been described. Perhaps I had better tell the story over again.

Get some nice stiff basswood, and cut it into strips  $\frac{1}{2} \times \frac{1}{2}$  in., and as long as the bottom-bar of your frame; these are to be dipped in melted beeswax, and then nailed to the end-bars of empty brood-frames, one piece just below the top-bar, a second one about two inches below the top, and a third one four inches below the top.

Have your breeding queens deposit eggs in new foundation combs; and when they are just beginning to hatch, cut out strips about eight inches long, and containing one row of cells each. These strips are to be fastened to the pieces of wood that are nailed to the empty brood-frames, and on the inside of the frame. They are easily attached by "pinching" them on. They should be so placed that the septum will be below the lower edge of the strip to which they are fastened.

Your brood is now ready for the cell-building colony, and the place in the comb from which it was taken can easily be filled with *fdn.*

When the queen-cells are well started, it is a good plan to reduce the number by picking out the larvae from alternate ones; the bees can then transfer the feed to other cells, and thus give the "babies" plenty to eat. I rarely have queens hatch from cells that contain no surplus feed. When the cells are about ready to hatch, I transfer them to the lamp nursery, each cell in a cage by itself. These cages are made in cases by boring  $1\frac{1}{2}$ -in. holes in a  $\frac{3}{8}$ -inch board, about the size of a Langstroth frame. Each case contains four rows of nine holes each; one side of the board is covered with wire cloth. On the other side I have narrow strips of tin folded V-shape, and nailed just below each row of holes. These are to support pieces of coarsely perforated tin, cut as long as the case, and wide enough to cover one row of holes. They are kept in place by buttons made of bent pins. The queen-cells are fastened in the cages by "pinching" them to the wood in about the position they occupied in the hive. A moment's inspection shows if any queens are hatched, and it is not necessary to visit the nursery more than four times daily.

The idea of the case of cages was suggested to me by friend J. D. Meador, of Independence, Mo. I have used them with success three years.

E. M. HAYHURST.

Kansas City, Mo., Aug. 8, 1883.

## SOME SUGGESTIONS FROM C. P. DADANT.

THE DADANT HONEY-PAILS; VENTILATION FOR COMB HONEY.

DEAR MR. ROOT:—In regard to what you say in JUVENILE for August about the tin pails we use for extracted honey, allow me to say that there is one advantage with them which you do not consider. It is, that the 10, 5, and  $2\frac{1}{2}$  lb. pails can be used by the purchaser after the honey has been taken out, and this is quite an item in the sale of honey in pails. They are not very convenient for liquid honey, indeed; but as honey is handled mainly in winter, after it is granulated, they are then as safe as any thing else, and much handier. We have shipped honey in them as far as Montana, and had no trouble, whenever the honey was granulated.

I should also like to put in a hint in regard to the matter spoken of by Mr. Langstroth; i. e., ventilation in summer. There are two risks to run in summer—too much ventilation, and too little. In June and July we have had numerous cases of comb melting by want of air, and extreme of heat. For the last 3 years we have been in the habit of raising the hive 2 inches from the bottom-board, and of leaving a space of an inch at the junction of the upper and lower stories, by setting the upper story 1 inch back. This leaves a chance for air to circulate in extremely hot weather.

We consider that, whenever bees lie out of the hive in clusters, they are too warm inside, and they need air. So this for us is a rule; and if any colony clusters outside we give them more ventilation, and keep increasing the ventilation until they manage to find room for all inside. Of course, the other extreme is as bad. If you have too much space, and the bees lose their heat, it will be injurious. But I would rather see them with plenty of ventilation than have them cluster outside, because the hive is too hot for them to remain, and I often pity the poor bees that belong to some of the old fogies. They

are willing enough to work; but what can they do, 50,000 of them, in a hive 12 inches each way, with an entrance one inch wide, and no other ventilation? No wonder they swarm to exhaustion; I would do the same in their place. If your readers will try this rule, *ventilation enough to keep all the bees inside*, I will warrant they will find it good.

C. P. DADANT.

Hamilton, Hancock Co., Ill., Aug. 25, 1883.

You are right, friend D. The sized pails you mention are perhaps a little more like an ordinary pail, having the cover to cover the whole top and slip over the outside, than the Jones pails, although the latter can be used as a pail also; but, having the cover smaller than the top of the pail, it is a little troublesome to get the goods out of them. Friend Jones suggests, however, that he was something more in the way of pails when we get up to Toronto. Thanks for your suggestions in regard to ventilation.

## Notes and Queries.

### SYRIO-ITALIANS.

**Y**OU ought to see some workers of large yellow Italians in my yard mated to Syrian drones. 'Twould do your old eyes good to look. And Syrian queens mated to Italian drones make a worker just beautiful; yes, and they are workers too. I don't expect to ever have to feed again with such stock. I had 2 natural swarms this forenoon of the above mixture.

W. P. HENDERSON.

Murfreesboro, Tenn., Aug. 18, 1883.

[Friend H., we have quite a lot of those half Italians and half Syrians (or Holy-Lands); and although they are very nice bees, they are not storing honey now—at least, not enough so but that they would have to be fed if they hadn't old stores enough to take them through the winter. I have occasionally found colonies of this cross that get honey where the full-blood Italians did not seem to get any.]

### DRONE FDN. FOR COMB WORKER.

Drone fdn. is not nearly as good as worker fdn. for sections. My experience in drone fdn. is about like friend Green's on page 446, Aug. GLEANINGS, 1883.

Hill Church, Pa. H. M. MOYER.

The 11th line in my communication, page 485, Aug. JUVENILE, should read: The whirlpool is one mile below the railroad Suspension Bridge, and the railroad Suspension Bridge is two miles below the Falls. St. Davids, Ont., Can., Aug. 22, 1883. WILL ELLIS.

I extracted 40 lbs. of honey from one hive 11 days ago, and to-day I extracted 80 lbs. more from the same hive. That is not very bad. My bees are all working like tigers. Basswood is in full blast just now.

J. G. PARTRIDGE.

Newmarket, Ont., Can., Aug. 8, 1883.

### BEEES SOMETIMES LEAVE WITHOUT CLUSTERING.

I see some doubts in GLEANINGS in regard to bees leaving without clustering first. I will add my mite, by saying that one swarm did, anyhow; one of mine came out and left in less than three minutes; and, what hurt me, it was an imported queen that went with them.

S. H. MILLIGAN.

Portland, Ind., July 25, 1883.

You think that bees working on lilacs is uncommon. Our bees worked lively on them this year.

ELMER SCHRIFTERKNECHT.

New London, Ohio.

### PARSNIPS.

I had about a half-acre lot next to my garden that got set in parsnip seed, I suppose from the garden. It was thick. The other day I started to cut them all down, and, to my surprise, found thousands of bees busy gathering honey and pollen, so I left them. They come up every year, but I don't know what kind of honey they make.

JOS. PERKINS.

Mechum's River, Alb. Co., Va., Aug. 16, 1883.

[Thank you, friend P. I do not think we have ever had a report before of honey from parsnips. Our market gardeners who raise parsnips for seed can probably tell us something about this.]

### EXPRESS AGENTS WHO SAY GOODS ARE NOT THERE.

I delayed sending to you to trace up our basket of things, because we sometimes find them stored away in the depot. We believed ours was there, and sent twice for it, and finally, after writing to you to have a tracer sent after it, it was found stored away in the express office. I am very sorry to make you the least unnecessary trouble. Bees are O. K.

SARAH J. W. AXTELL.

Roseville, Ill., July 14, 1883.

[It seems to me, friends, it is time some sort of a vehement protest were made against this state of affairs. If some penalty were decided on by the express companies that their employes would have to stand when they throw one out of the use of his goods that he has paid for, perhaps such cases would be less frequent.]

### CAUTION ABOUT INTRODUCING WHEN THE BEES ARE DISPOSED TO ROB.

I think I have lost two more queens. I looked tonight; the bees were out of the cage. I found some queen-cells started, but it was too dark to look for the queen. It is not safe to open a hive in the day time. They got to robbing the other day when I was looking for a queen. I think that is the reason I have had such bad luck. When I find how many I have lost I will try my luck again.

WM. FOWLER.

Geneseo, N. Y., Aug. 20, 1883.

[Friend F., I presume a great many queens are lost in just that way. It is very bad to have the bees get to going like that. When they do, you want a bee-tent, or else you want to work by moonlight, as I have directed in the A B C.]

### HONEY FROM COTTON.

I am sorry that I did not tell you to put a little of the cotton honey I sent you in some water, but suppose it is too late now. When put in water it makes a very delicious drink, as it has a very peculiar acid—more like citric acid. The flavor is caught better in water.

J. D. FOOSHE.

Coronaca, S. C., Aug. 20, 1883.

[Many thanks to you, friend F., for the sample of cotton honey. But to tell the truth, it was not admired very much at our table. The color is rather dark, and the flavor rather rank; and I remember now there was considerable acid taste—nearly enough, no doubt, to make fair lemonade. If you will send some more I will try it in a glass of water. By the way, does cotton yield honey ever year, or is it only occasionally? There has been quite a little discussion in regard to the matter.

My bees up to date have increased from 6 to 23, and over 350 lbs. extracted honey.

WM. HUMPHREY.

Rodney, Ont., Can., July 30, 1883.

#### CABBAGE-PALMETTO.

Bees are not doing much now with us, but will be as busy as can be in about two weeks more, when cabbage-palmetto will commence to open its blooms.

La Grange, Fla., July 17, 1883. I. MENDEL.

#### HONEY FROM THE BLACK-OAK.

My bees are working vigorously on the black-oak. I send you a sample of bud and blossom which I find on this tree, and which the bees are working on.

Calhoun, Ill., July 31, 1883. M. J. HARRIS.

I started in spring of 1882 with 4 stands; increased to 18, and took 400 lbs. of comb honey. Lost three in wintering; started spring of 1883 with 15; have increased to 37, but no honey to amount to any thing; has been dry here.

A. W. SPRACKLEN.

Cowden, Ill., Aug. 25, 1883.

What do you think of the new system of bee management, by Mrs. Lizzie E. Cotton, called the Controllable bee-hive?

AMOS IVES.

Ionia, Mich., Aug. 10, 1883.

[Friend Ives, we refer you to page 525 for our opinion of Mrs. Cotton and her system.]

#### BEEES IN KANSAS CITY, MO.

Bees are still doing well in this locality. I have taken 4800 lbs. extracted and 430 lbs. comb from 91 colonies, spring count. They swarmed inordinately—107 colonies having issued; but by putting back and uniting I increased my stock only 23. The honey is all white-clover and linden.

Aug. 13, 1883. S. W. SALISBURY.

#### A QUERY ABOUT HONEY-ROOMS.

Will J. W. Porter, who wrote about a "honey-room," on page 86, please to describe more particularly how the roofing-felt is applied, and how long it has kept him free from insects? can it be put on the honey-house already built? I am troubled by large black ants.

M. FRANK TABER.

Salem, O., July 26, 1883.

We got about down to the bottom of the ladder this spring, taking out only 10 per cent of live bees in one cellar; but they have come on wonderfully this summer, and we have over 5000 lbs. of honey, with the promise of as much more.

#### RAPID EXTRACTING.

We took out 500 lbs. in 4 hours, two men, and put the honey in firkins. Is that not good time for two men?

M. A. WILLIAMS & CO.

Berkshire, N. Y., Aug. 7, 1883.

#### SOUR HONEY FOR WINTERING.

I had a good swarm last week, and have hived them. I gave them brood, etc. I have about 20 lbs. of old honey in frames, *soured* some. Will it answer to feed it to them on top of the frames after fall bloom, to fill up for winter?

WM. M. YOUNG.

Nevada, O., Aug. 27, 1883.

[I would save the sour honey till spring, friend Y. So far as I have experimented in the matter, for feed in the fall it is sure to kill, every time.]

Bees are working well, but season is so wet that honey is thin, and capped very slowly. But the demand I have for section honey is wonderful. I can hardly drive through town but some of the grocers

hail me to say their case of honey is all gone, and they *must* have some more this very day. I keep every thing sold out close.

WALTER B. HOUSE.

Saugatuck, Mich., July 23, 1883.

#### THE WEED THAT POISONS FLIES.

As no one has made any reply to our friend near Wilmington, N. C., in regard to fly poison, I will say that I have killed thousands of them with a weed that very much resembles the ground-cherry, although it grows much larger—sometimes four or five feet. It looks quite watery, and is full of ridges, and grows on rich soil around the barnyard. The leaves from the wild coffee-bean tree will answer the same purpose.

DAVID ENGLAND.

Red Oak, Ellis Co., Tex., Aug. 12, 1883.

#### "A" SUGAR VS. NATURAL STORES.

This has been an extra good year for honey so far, and bees are still bringing it in. I always rob my bees very close, and then feed them up with the best A sugar that I can get. I let it boil 15 to 30 minutes; let it cool, and then pour it in the feeder, a tin box 5x6x2 inches, with a floating rack in it made of wood. I think that the more good sense that we make use of in the handling of our bees, the better.

I. A. HEICHERT.

Newcastle, Henry Co., Ind., Aug. 16, 1883.

#### A BEE-MAN IN TROUBLE.

I have 40 colonies of bees I wish to sell. I got badly hurt about two weeks ago—horses ran off with me, broke my collar-bone, dislocated shoulder, broke two ribs, and punctured the lungs. I was in poor health before; vitality low; doctor says it will make it harder for me to get along, if I *live*. If you or any of your readers can come and take them from my yard, I would sell very cheap for cash, as I don't expect to be able to handle them soon.

SAMUEL G. MCQUISTON.

Clarence, Ford Co., Ill., Aug. 27, 1883.

#### FRIEND BOLIN'S IDEA OF WHAT GOOD QUEENS OUGHT TO BE.

I see in the JUVENILE for Aug. that those imported queens have arrived, and also that the best will not go around. Well, in case they are not *all* sold when this reaches you, send me a fair or dark one, it makes no difference about the color, just so she "makes the gravel fly" in the way of laying. Whatever kind you send, send the rest of the \$6.00 in \$1.00 queens with the imported one. If the imported queens are all gone, send \$1.00 queens for the entire amount, as I have more calls for queens than I can fill.

JAMES BOLIN.

West Lodi, Seneca Co., Ohio, Aug. 22, 1883.

#### HOW I INTRODUCE QUEENS.

First move the old swarm 3 or 4 rods, then set the new hive (with comb in it) in the place of the old one; in 5 or 10 minutes put your cage, with queen and bees in it, bottom up, on top of the frames; withdraw the wire gauze so they can go into the hive; cover the top of hive and cage tight. The queen will go to laying the next day; the bees that are abroad will return to the new hive. This is dividing a swarm. In 3 or 4 days, if you wish you can take what is left of the old swarm, and transfer to the new. I never lost a queen in this way.

V. MCBRIDE.

Chardon, Geauga Co., Ohio.

[Your plan does very well sometimes, friend M., and then, again, sometimes it does not.]

## THOSE CRAZY BEES.

If friend J. M. Harris' bees are mad, there is method in their madness; for while they are pretending to rake hay they are also raking up the fibers of wood, or lint, to use in brood-capings, eh?

A. A. FRADENBURG.

Port Washington, O., Aug. 11, 1883.

[I can't quite agree with you, friend F., although your explanation is ingenious. If, after they had raked and scraped a while, they could be seen raking portions of the fuzzy wood, I would accept your explanation; but I have watched, and have never been able to see that they scraped up any thing.]

## PUTTING BEES ON FDN. DURING SEPTEMBER.

I write you for a little information. 1. Can 2 or 3 pounds of bees make enough this fall on comb foundation to keep them through the winter? 2. Since my old swarm turned out the last new swarm, they have apparently done but little good. One or two days after they swarmed last, I saw a queen in front of the old hive. What became of her, I don't know. Since then they don't appear to be doing any thing. I examined brood comb, and can not see any young bees. Do you think the queen is lost? It's very seldom you see a bee leave hive or return. The hive-box is almost full of honey. I placed a box on top, but they do not go into it.

J. W. STEVENSON.

Zanesville, Ohio, Aug. 14, 1883.

[Friend S., you can build up good colonies in the way you suggest, with three or four pounds of bees, if you get them right into business, and make them "climb." But unless you give them very careful attention, and make the queen raise brood largely, there is much danger of a failure.—The only way you can do any thing with the old colony that has swarmed, is to transfer them, for you must be able to see their combs, and know what they are doing, before you can decide what to do. They may be all right; for a colony, after it has swarmed, is usually pretty quiet for a week or two. The young queen would not be laying under ten days or two weeks, perhaps. See remarks in regard to building up in the fall, on page 536.]

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE OF READING MATTER.

MEDINA, SEPT. 1, 1883.

The Spirit itself beareth witness with our spirit, that we are the children of God.—Rom. 8:16.

We have to-day, Aug. 31, 6190 subscribers. The highest number GLEANINGS has ever reached.

HALF-POUND honey-pails we are obliged to advance to \$4.25 per 100, instead of \$4.00, as formerly given. We have them packed 100 in a box, all ready to ship; the extra 25 cts. is to pay for the box and packing. There has been a great demand for the three sizes of glass honey-pails; but we hope soon to be able to send any of the three sizes promptly; namely, ½, 1, and 1½ lb. sizes.

## SUPPLIES FOR ANOTHER SEASON.

As we have now a good force of hands to make work, or to put up orders, and comparatively little to do, we will, until Jan. 1, 1884, allow a discount of 5 per cent on all orders for fdn. mills; and on orders for bee-hive material, and implements for bee culture, a discount of three per cent, in addition to the discounts already mentioned in our price list. On goods from the counter store, we can make no further discounts than those already mentioned in the price list.

## DECLINE IN FOUNDATION AND WIRE NAILS.

In accordance with the drop in wax, we have reduced the price of fdn. as follows:

1 to 25 lbs., per pound	42c
25 to 50 " " "	41c
50 to 100 " " "	40c

By mail, the regular size will be 65c; 3 lbs., \$1.80. By freight or express,

3 lbs., regular sizes, will be	\$1.20
5 " " " "	2 00
10 " " " "	4 00
25 " " " "	9 75

We have the fdn. ready to ship by first train, any size or any quantity. Very thin, for starters, 10c per lb. more than above prices. We can now make very thin in full L. sheets where wanted. Above prices are good until further notice.

We have also been able to make quite a reduction in the price of wire nails, and more too, they are now to be made of Bessemer steel instead of iron. For particulars, see new price list.

## THE ONE-PIECE SECTIONS.

CONSIDERABLE discussion has come up in regard to the one-piece section, and some do not seem to see clearly what we intend to do about it. Well, there is nothing to do about it, that I know of, except to fight it out; in fact, there is nothing else to do. If Mr. Forncrook has no legal or moral right to the one-piece section, to give way to him would be like giving way to a thief because it is a difficult matter to arrest him. I have had counsel from an able attorney, whom I am to pay \$25 a day, if I need him; and he says Mr. Forncrook can by no means make our sections an infringement, after what I have shown you of what Fiddes has made and used since 1873; and it seems to me any reasonable man must admit as much. With this before us, it is only a question of resisting an attempt at blackmail. But on the other hand, just as soon as it can be made to appear that friend Forncrook has a right to the sections, I will stop making them at once, and do all in my power to induce all bee-keepers to stop making or using any not of Mr. F.'s make. If Mr. Forncrook can give any satisfactory reason why he has a right to monopolize sections made of one piece of wood, our columns are always open to him; but until he can make some such explanation, it seems to me a Christian duty to resist him with all our combined strength, even if it takes the best lawyers in the land, and costs ten thousand dollars to do it. Most of you know how earnestly GLEANINGS has fought against humbugs and swindles in all these years that are past, and some of you know that I have been a great many times threatened. I want to be sure that I am right; and I am always glad of suggestions and advice. But while I am in the right, I hope I shall not be easily frightened out of what I ought to do, even if it takes large sums of money to maintain right.

SHORTLY after the notice in our last number, of our reduction in the price of maple sugar, we closed out the whole lot, so we shall have no more maple sugar until another season, except the little cakes on our 3-cent counter. Where these are wanted by the pound, they will be 18 cents.

#### THE IRON-JACKET HONEY-CANS.

A GREAT trade has sprung up in these. We are able to make a discount from our table prices as follows: On orders of 10 or more, a discount of 5 per cent; on 100 or more, 10 per cent. These can be shipped anywhere full of honey, or empty, without any crating.

FROM our notice in the last JUVENILE, many of the friends got the impression that we wanted to purchase black and hybrid queens. I am sorry we did not make it clearer. We do not want to buy them at all. We simply publish the names for the accommodation of those who want them. Our imported queens are all gone, even to the most indifferent one. We are waiting anxiously for the next fifty.

#### A NEW USE FOR THE QUEEN NURSERY.

WE have recently made the discovery, that the queen nursery is just the thing for putting fdn. into wired frames. Heat it up as for hatching queen-cells, having the temperature pretty high; slip the sheet of fdn. between the diagonal wires and the uprights, then hang them in the nursery until the wax is quite soft. Now imbed it with your roller and Easterday fdn. fastener, and you will find you can do it with great ease, and it will stay, even for a long shipment.

### CONVENTION NOTICES.

#### WESTERN BEE-KEEPERS' ASSOCIATION.

The annual meeting will be held at Independence, Mo., on the 20th and 21st days of Sept., 1883. Special invitation to all bee-keepers. S. W. SALISBURY, Secretary.

#### OHIO STATE BEE-KEEPERS' CONVENTION.

The Ohio State Bee-Keepers' Association will hold a convention during State Fair week at the State Fair grounds, Columbus, O., commencing on Tuesday evening, Sept. 4. DANIEL SPEAR, Sec.

A meeting of the bee-keepers of Maryland and vicinity, and all interested, is called, by several prominent bee-keepers of this State, to assemble at the Bee Tent on Thursday, Sept. 6, at 11 A.M., for the purpose of forming a bee-keepers' association. Baltimore, Md., Aug. 12, 1883. C. H. LAKE.

#### TO BEE-KEEPERS OF NORTH AMERICA.

As one of the oldest of your number, I desire respectfully to remind you that the Toronto Convention will afford us all an opportunity of paying a well-earned tribute to the memory of our honored dead—Samuel Wagner, Moses Quinby, Adam Grimm, Richard Colvin and others, who did so much to elevate American apiculture to its present high position. L. L. LANGSTROTH. Oxford, Ohio, Aug. 23, 1883.

#### BEE CONVENTION AT TOLEDO, OHIO.

The next annual meeting of the Tri-State Bee-Keepers' Association will be held on the 12th, 13th, and 14th of next September, during the week of the Tri-State Fair at Toledo, Ohio. It is customary to say that Messrs. So and So, "and other prominent bee-men will be present," etc., etc. Well, we have quite a number of "prominent bee-men" (prominent at home) in this region, and they know how to raise the bees, get the honey, cure foul brood, and winter the bees too; but if Mr. Heddon is well enough to be at the meeting and the fair, we will pump him on wintering, and Mr. Muth on foul brood, and Novice, if here, on general principles, and the editor of the *Bee Journal* to fill in where the rest lack. We do not expect to have any long essays or speeches. It being the week of the fair, we ex-

pect the great attraction for bee-keepers will be the Bee and Honey Show, and such bee-keepers and their friends as desire to stay several days can bring their "eatables" and blankets with them, and camp on the fair grounds. One or more tents will be provided for such as make application to me a few days before the fair, at a cost that will pay for the use of the tents, but we hope to be able to borrow tents and so save expense.

A premium is offered for the foundation-machine making the best foundation for the brood-chamber on the grounds, and two mills have already arrived for that purpose, and the makers of three other machines have promised to be here if possible.

A premium list with extra blanks, rules and regulations, railroad fares, freight rates, etc., will be sent free to all applicants. DR. A. B. MASON. Wagon Works, Ohio.

From the *American Bee Journal*, of Aug. 22, 1883.

#### SOMETHING MORE IN REGARD TO EXCURSION RATES.

Mr. A. I. Root:—I have received a letter, of which the inclosure is a copy, from Mr. Hiel, manager of the Toronto Industrial Exhibition, which is the outcome of an application which I made to him to secure reduced rates for bee-keepers in the State of Michigan. As it would receive publicity through your journal, perhaps you will be kind enough to give it insertion. There are single-fare rates for the whole week of our convention. I inclose you, also, a clipping sent me by the Rev. L. L. Langstroth, agent cheap excursion rates from Cincinnati to Niagara Falls. As these Falls are only a short distance from Toronto, and the fares very low, many of our friends may, and no doubt will, avail themselves of this opportunity, whereby they will behold the grandeur of Niagara Falls, and also be present with us at the convention. The prospects are brighter than ever. D. A. JONES. B-e-ton, Can., Aug. 25, 1883.

H. J. Hiel, Esq.:—Replying to yours of the—Inst., would say that we do not wish to advertise any reduction from regular rates; but if there are any on our line who apply to you, and you will refer the application to me, I will furnish them certificates, on which they can obtain tickets to Port Huron or Detroit, and return, at excursion rates. D. EDWARDS.

#### SUMMER EXCURSIONS BY THE BEE LINE.

Cincinnati to Put-In-Bay and return, \$8.35; Cincinnati to Lake Side and return, \$7.65; Cincinnati to Lake Chautauqua and return, \$11.25; Cincinnati to Buffalo and return, \$14.25; Cincinnati to Niagara Falls and return, \$14.75. All the places named above can be reached in twelve hours by the Bee Line. Tickets good to return until October 28, 1883.

BEE-LINE TICKET OFFICE, 108 WEST FOURTH ST., Between Race and Vine streets. AND GRAND CENTRAL DEPOT.

#### FURTHER.

When you report rates of fare to Toronto, you can mention that tickets from Odgensburgh to Toronto, and return, for \$8.00. If I learn of other rates I will inform you. GEO. W. HOUSE. Fayetteville, N. Y., Aug. 28, 1883.

## DEALERS IN APIARIAN SUPPLIES!

We invite correspondence with dealers in supplies, and large consumers, as to furnishing their supplies for next season. We shall give such discounts and protection as will give them good profits, and still be an advantage for small consumers purchasing of them, avoiding the annoyances of delays, miscarriage, and shortage, and a great saving in freights, and cost of boxing and crating in small lots. We are now building a new shop which will have three or four times the capacity of our present one, and shall be able to fill orders to any extent. We have commenced the manufacture of a new hive, which meets the wants of experienced bee-keepers and beginners better than any thing we have seen. Send for circular of this hive. G. B. LEWIS, Sept. 1, 1883. WATERLOO, WIS.

**PATENT FDN. MILLS.** 6-inch, \$10.00.  
10-inch, \$15.00.  
2ftd WM. C. PELHAM, Maysville, Ky.

# PURE QUEENS AND STRONG COLONIES

of Italian or Holy-Land bees, in ten-frame Simplicity Hives, queens reared this season. hives full of pure bees, and combs full of brood and honey. One colony untested (warranted queen) \$7.00; less than five, \$6.50 each; five or more, \$6.00 each. If sent in old hive or shipping box, \$1.00 less; with tested queen, \$1.00 more by express. Safe arrival guaranteed. Queens on hand as usual.

**W. B. COCCESHALL, Supt.,**  
Hill Side Apiary, Summit, N. J.

## FINE IMPORTED QUEENS

JUST FROM BOLOGNA, ITALY, ONLY \$5.00.

Select tested queens, young and prolific, - - \$3 00  
Tested queens, young and prolific, - - - - 2 50  
No more "dollar" on hand this year.

J. S. TADLOCK, Luling, Caldwell Co., Texas.

## CANADA ONLY.

DOLLAR QUEENS BY RETURN MAIL.

H. SMITH, BOX 102, NEW HAMBURG, ONT., CAN.

# CHOICE QUEENS

I am now up with my orders, and cull my queens down to the very best. Can send by return mail.

J. T. WILSON, Mortonsville, Woodford Co., Ky.

## 100 Pure Italian Queens.

Price reduced to 75c each for untested queens, for this month only. Discount on large orders. All queens bred from a select imported mother.

**D. G. EDMISTON,**

ADRIAN, - - LENA WEE CO., - - MICHIGAN.

### BARNES'

Patent Foot and Steam Power Machinery. Complete outfits for Actual work-shop business. Lathes for Wood or Metal. Circular Saws, Scroll Saws, Formers, Mortisers, Tenoners, etc., etc. Machines on trial if desired. Descriptive Catalogue and Price List Free.

**W. F. & JOHN BARNES,**  
Rockford, Wis. Co., Illinois.  
No. 2009 Main St. 11ftd

Oldest Bee Paper in America—Established in 1861.

## AMERICAN BEE JOURNAL,

WEEKLY, at \$2.00 a year.

MONTHLY EDITION, 32 pages, \$1.00 a year.

THOMAS G. NEWMAN, Editor and Proprietor,  
925 West Madison Street, Chicago, Ill.

## SWEET CLOVER,

Fresh seed, 25c per lb., or will send 2 1/2 lbs. post-paid, for \$1.00. Can sow fall or spring.

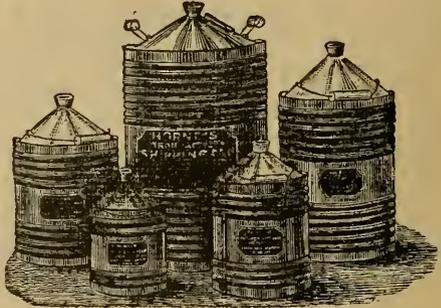

J. G. LEHDE, Gardenville, Erie Co., N. Y.

## FOR SALE!

One 4 h. p. engine and boiler; also one 6 h. p. portable engine and boiler for sale cheap. Description, prices, and cuts, furnished on application.

O. H. TOWNSEND, Kalamazoo, Mich.

# SHIPPING-CANS For HONEY.

### "Iron-Jacket" Honey-Cans.

I presume the friends are aware that ordinary tin cans are not very safe for shipping full of honey, unless boxed or crated. The cans above are ready to be shipped anywhere.

#### PRICES.

1 Gallon,	- - - - -	\$0 25 each.
2 "	- - - - -	.38 "
3 "	- - - - -	.47 "
5 "	- - - - -	.68 "
10 "	- - - - -	1.10 "

By figuring 11 lbs. of honey to the gallon, you can easily see how many pounds each can holds. They are made from tin plates. A sheet-iron casing, with wood bottom, protects them from bruising. The iron jacket is stronger than wood, and far more serviceable. They neither shrink nor swell, and do not split nor fall apart. Every can is tested by steam, and guaranteed to be tight.

**A. I. ROOT, Medina, O.**

## HOLY-LAND BEES.

Twenty four-frame (Langstroth) nuclei colonies, with dollar queens, brood and bees sufficient to make good colonies for wintering, \$5.00 per colony. Where two or more are taken, will ship in Simplicity hives. Express and money-order offices, Des Moines.

Address **MILO SMITH,**  
GREENWOOD, POLK CO., 10 WA.

## THE British Bee Journal.

The British Bee Journal is now mailed to our address in packages, semi-monthly. In order to dispose of them, we offer them at present at \$1.00 per year, postage paid, beginning Jan., 1883. Will guarantee safe arrival of every number.

**A. I. ROOT, Medina, Ohio.**

### FOR SALE!

82 STRONG SWARMS OF ITALIAN BEES FOR SALE, with 40 or 50 lbs. of basswood honey apteece. Gallup and crosswise Langstroth frame, 420 wide frames in the upper story. I will take \$450.

JULIUS FROSCHE, Elmore, Ottawa Co., O.

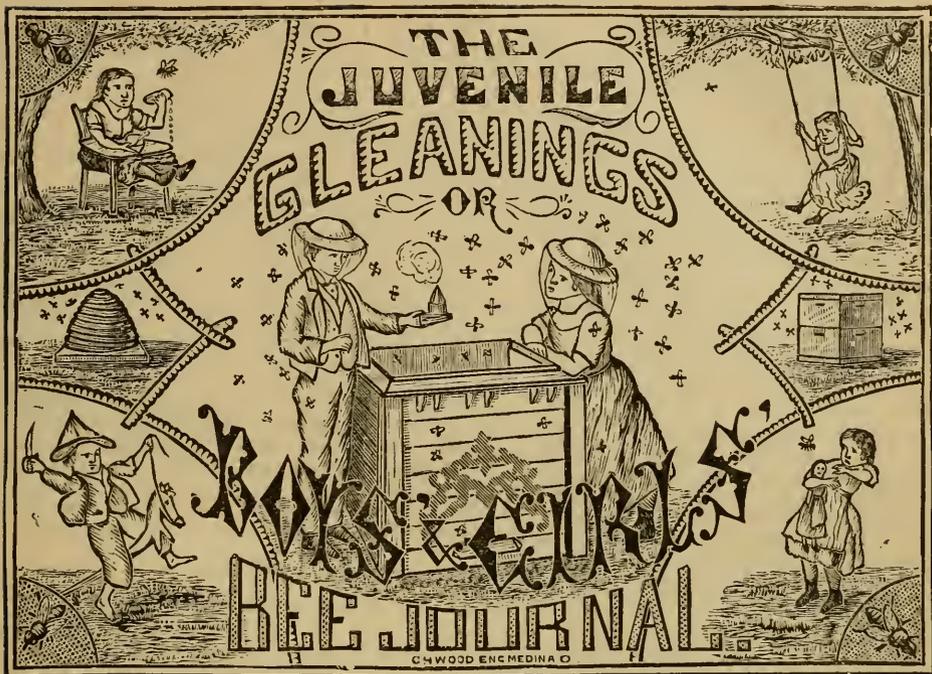

### HEADQUARTERS FOR TIN POINTS.

Price, 20 cts. for 1000, by express; by mail, 30 cts. 5ftd **W. C. GILLETTE,** Le Roy, Genesee Co., N. Y.

## CHOICE WARRANTED ITALIAN QUEENS AT \$1.00 EACH.

SATISFACTION GUARANTEED.

CHAS. D. DUVAL, - - SPENCERVILLE, - - MONT. CO., MD.

He that is faithful in that which is least, is faithful also in much.—LUKE 16: 10.

PUBLISHED BY A. I. ROOT, MEDINA, OHIO.

Vol. XI.

SEPT., 1883.

No. 9.

### MYSELF AND MY NEIGHBORS.

WHO IS MY NEIGHBOR?—LUKE 10: 29.

**M**Y little friends, within just half a mile from our factory is the county jail. I do not know how it comes, but in some way or other the unfortunate friends who get into that jail have seemed to be especially my neighbors for the past few years, and I confess I have felt very happy in being allowed to go in there and talk with them and get acquainted. After they have been there a while they get very lonely, and almost hunger for human companionship, or somebody to talk with, and so of course they are always glad to see me. Almost all I meet there are grown-up people; but now and then I find boys and young men, and just now a bright young fellow only sixteen years of age is the occupant of the room with its stone floors and grated windows. He was put in for horse-stealing—at least, so the papers said. Does it not seem a little strange that a boy of sixteen should think of stealing horses? When I first went in and took him by the hand I was surprised, and told him so. Said I, "Why, my young friend, is it possible you are the horse-thief we have been reading about?"

"Yes, Mr. Root," said he, "I am the horse-thief."

He smiled as he said it, but it was a rather sad smile. I sat down beside him and had a

long talk with him, and he told me freely all about it. Just one year ago Ellsworth Sinclair (for that is his name) was a pretty good, honest, hard-working boy, and had never tasted any thing that would intoxicate. His father died many years ago from intemperance, and his mother married a man whom he did not get along with pleasantly. So he decided to go away from home and find a job elsewhere. He got work on a farm near Easton, Wayne Co., Ohio. Of course, he soon became acquainted with the boys of the neighborhood, and through them found out that the principal place for amusement was at the saloon in Easton, where they had a pool-table. At this saloon he learned to drink and smoke and play; and on the day before the Fourth of July a number of the boys were at the saloon as usual. Perhaps they felt a little patriotic, as boys of sixteen usually do the day before the Fourth, and so they treated and drank and played a little more than usual. Some time in the night our young friend lost all his money, and, crazed with drink, he declared to his comrades that he would have more money, and have it by the next morning. He had a horse and buggy of his own that he worked and paid for. He started out with this in the darkness of the night, and, when far enough away, took a farmer's horse out of the lot and drove until daylight, and then tried to sell it. No one would buy it, and, getting alarmed, he left it to be sold, saying

he would call for the proceeds. Then he went back home and resumed his work, and heard nothing about the horse for several weeks. Do you think he was happy with this guilty conscience following him, and fearing every moment that some one might be approaching to arrest him? He was getting hardened in sin, however, and kept on drinking and going with his old companions; and finally one day he drove down where he left the horse, and, as any one of maturer years would have known, was arrested.

He tells me there are about ten or fifteen boys of about his age who are patronizing that saloon, and who are likely on the way to a fate similar to his own. The boy has done wrong, and should be punished, and it is right and proper that he should be inside of prison walls. But is he the only one to blame? I talked to him about his duty to his country and his fellow-men in having the saloon-keeper arrested; but with a boyish frankness he replied, "Why, Mr. Root, it would break him up. He has just paid about \$200 tax, and has also paid about that much for a new pool-table. He told us he wanted to sell all he could to get square." Is it the boys alone who should be in prison, and punished?

In the town of Mt. Vernon, in our own State, a few years ago a boy of about the age of this one shot a comrade while under the influence of drink, and died on the gallows. This boy's father was also an intemperate man. When his poor wife laid him away in his grave she resolved that her whole life should be devoted to the task of keeping her baby-boy from intemperance when he grew up. No doubt she looked upon him as we look upon our own baby as he prattles and crows in his childish innocence. Did she succeed? He was a model boy until he was about ten or twelve years old. Then the saloon-keeper who sent his father to ruin called a crowd of boys into the saloon to have some beer. It didn't cost them any thing, you know. This boy, remembering his mother's teachings, refused to take any. "Oh! well," said the saloon-keeper, "you needn't take any beer, if you don't want it, but you can have some lemonade." It seems he thought it hard to refuse so kind an offer, so he took the lemonade. My dear friends, that glass of lemonade had whisky in it; and the boy's inherited appetite was aroused, and he became an inebriate, and died on the gallows. This same saloon-keeper was the principal witness who appeared against him. Before he was hanged he threw his arms around his poor mother's neck, and in his paroxysm of grief said, "O mother! is it really true, that I am the worst boy in the world?" Then they took him to the gallows, and hanged him; but, the rope broke; and while the blood gushed from his mouth and nose, they carried his limp form on the platform again, and fixed the rope and hanged him until he was dead. At the time of his hanging, the saloon-keeper sold more beer than he ever sold in one day before!

My dear friends, a few years ago they used to drown people and put them to death for witchcraft. What an awful blunder it was! what a horrible mistake did our people

make! Are you sure we are not making a horrible mistake now when we hang our boys, sixteen or eighteen years old, because they murdered somebody while intoxicated? Does it necessarily follow, that these boys are the worst boys in the world? Is it not possible, that we are making a mistake yet, and hanging the wrong ones?

Shortly after this number reaches you, our people here in Ohio will have the opportunity to decide whether these saloons are to be kept scattered all over our land or not. Very soon all of you will have an opportunity of voting in a similar way all over the United States, for aught I know. Are we ready? The boy we have in our jail might have committed murder just about as easily as he did stealing, under the frenzy of liquor he had taken: with only a boy's wisdom and judgment he was likely to commit any crime that presented itself. Is it not possible, my dear friends, that your sons and brothers might, under similar temptations, be led away as he has been? Whose business is it to *right* this awful wrong? Who is my neighbor?

#### VIRGIL'S TREATISE ON BEES.

##### TAKING HONEY — VIRGIL'S COLD SMOKER.

AND if at length the honey you will take,  
And in upon the noble mansion break,  
Robbing the treasury, thy cheeks first fill  
With draught of water to spray forth at will;  
In hand before thee careful hold a smoke, (1)  
Following the sprinkling as their door is broke. (2)

##### THE TWO HARVESTS.

Twice in the year the well-filled combs they take,  
Two seasons of the harvest time they make; (3)  
One when, 'mid Pleiades in starry space,  
Taygete shows to earth her honest face, (4)  
And from the ocean, at the dawn of day,  
With eager foot thrusts the spurned waves away;  
And one ere winter, gloomy and severe,  
Descends from heaven upon the waters drear, (5)  
While on from Pisces, charged with stores of rain,  
The same Taygete swiftly flies amain.

##### GETTING STUNG.

—The bees—their wrath beyond all bounds exceeds;  
Bereaved and plundered, as their foe recedes, [(6)  
They thrust in poison with their pungent stings. (7)  
Fixed to his chosen spot each warrior clings; (8)  
Hid in the veins relinquished darts he drives, (9)  
And in the wound with zeal they lay their lives. (10)

##### LEAVING SUFFICIENT FOOD.

But, if you fear a winter stern and rude,  
You'll surely spare enough for future food;  
You should have pity on their wrecked affairs,  
And minds all torn with fresh-inflicted cares. (11)

##### THE EVILS OF TOO MUCH EMPTY COMB.

The force of mercy's claims why need you doubt?  
Smoke them with thyme, and empty comb cut out; (12)  
For oft unseen a lizard, sly and small,  
Gnaws in the combs a place to snugly crawl; (13)  
And bed-chambers are made that do invite  
The cockroaches that scamper from the light;  
The idle drone, lurking round empty comb,  
On others' food doth make himself at home; (14)  
Or cruel hornet, nesting there with ease,  
In arms unequal wars upon the bees;  
There the dire moth, which one hath cause to fear,

Finds rest and space a family to rear; (15)  
 Or spider, of Minerva hated sore, (16)  
 Hangs her loose webs in every cranny door.  
 BEES STIMULATED BY TAKING AWAY THEIR HONEY.  
 The more their honied stores are snatched away,  
 So much the more with sharp vehemence they  
 Devote themselves the ruins to restore,  
 Of their impoverished clan, and yet once more  
 They'll fill the chasms, from flowers enrich their  
 homes,  
 And cap again the rough and jawning combs.

(1) I read somewhere in a recent journal of the *first discovery* of smoke for quieting bees. A poor Irishman (or was it a Scotchman?) for a trifling reward revealed the secret to somebody's grandfather; and thus the world became possessed of a very valuable piece of knowledge. Is there no limit to this sort of thing? Why, we must expect to hear soon that it was a Dakota girl who first discovered how to chew gum! Virgil makes no claim to discovering the use of smoke. That was very likely known centuries before him.

(2) This is very ingenious, and may be said to be the best method of dealing with bees known up to the time when modern smokers were invented. With a little practice a big mouthful of water can be ejected as fine spray. The "patent" feature of Virgil's arrangement is holding a smoke before the face and driving the spray through it. The bees are both sprinkled and smoked at the same instant, as the spray and breath carry the smoke along with them. More than this, the fine particles of water dissolve some of the smoke, and retain it so it does not immediately drift away as smoke alone would.

(3) It is the same with us. First comes the harvest of white honey, which our teachers advise us to take off before borders of darker honey are put around it, and later the fall harvest of various colors.

(4) Taygete rises with the sun May 18th. This would be too early for the main harvest of white honey in our latitude; but we must remember that Italy is further south, with seasons much more forward than ours.

(5) The poet's language here is florid and a little difficult, and critics are puzzled to know whether the date is the rising of the sun with Pisces, or with Scorpio, or with the Dolphin — or what not? I don't believe he intends any precise date, only to be sure to have it done before winter.

(6) Theory and practice do not always correspond, and it was the same in ancient times, it seems. In theory the bees ought to behave like little angels while the keeper is going through them; but in practice they would sometimes go for a fellow. 'Spects that the laurel-crowned poet danced and shook his robes, and lost the aforesaid crown off in the woods, just as an ordinary mortal might do; but when the muss was over he sat down and figured the whole thing out very accurately.

(7) He knew, it seems, that there was a receptacle of poison attached to the sting.

(8) Doesn't he, though? And more than that, what astonishing wisdom he shows in choosing the spot! Three times as many will sting a thin spot on a glove, where there is some chance of doing execution, as will leave their stings on a thick place of equal size on the same glove.

(9) Even at the present day only well-posted persons know this. The dart of the sting is not single, but triple, and the two smaller shafts often separate

and remain in the wound, when the victim thinks he has pulled the sting out.

(10) The opinion that the bee dies after stinging still prevails, and very likely is correct; but somehow the positive proof of it seems to linger strangely behind. This summer, after hiving a very cross swarm that wasted dozens of stings on me, I saw, some hours after, quite a lot of dead bees on their alighting-board. Had I not been hurried and heedless I might have examined to see if each one was minus a sting. In that case I should have had tolerable evidence that stinging results in death. Perhaps the children will say, shut up a bee after he has been stinging, and see if he dies. The trouble is, that *any bee* will soon die if made a prisoner.

(11) The curiosity of it is, that Virgil from first to last does not say a word about destroying a colony outright and appropriating their stores. He pleads earnestly that sufficient food be spared them, but not for their lives. I think it must be that, in warm climates, bee-keepers hardly ever destroy a colony. Instead of slaughter they just cut out all of the honey that is worth taking, and then leave them to live or die, according as the winter may prove open and flowery, or severe and barren.

(12) Here we have conjured up before us the keeper standing before a hive that is light in stores. Gentle Mercy says, "Spare them;" but he scratches his head, and draws up the corner of his mouth, as Greed whispers in his off ear, "Take the honey, and be sure of it; and may be they'll live through, any way." At this point the poet breaks in with his blunt question and command. The fumigation with thyme, I suppose, is to correct any bad smells that may be getting started. The number and magnitude of the evils that are counted up as resulting from leaving too much empty comb is almost startling.

(13) As lizards eat bees, this is rather "cheeky."

(14) A rather novel idea, and perhaps there may be something in it — that bees do not kill off drones so promptly and thoroughly when there is too large an expanse of empty comb for them to dodge away in. But queenless stocks are pretty sure to have unoccupied comb, and lots of drones also; and more likely that's the way the idea got afloat.

(15) I see no reason to doubt that this is the familiar bee-moth, well known to modern bee-keepers. And I suspect that the reason Italian bees fight moth-worms so well is that they have been steadily bred to it from ancient times; while to northern regions, where black bees live, the moth has spread in much more recent days.

(16) Minerva was a great weaver; and, on the principle that "two of a trade can never agree," she and the spider were enemies. There is also a tale told that an ancient lady once engaged Minerva in a matched trial of skill in weaving. Minerva got mad, and changed her rival to a spider. After this arbitrary act of wrong she will, of course, always feel mean and hateful whenever she sees a spider — just as we shall, children, if we wrong others, and neglect to set the wrong right again.

Richards, O., Sept. 8, 1883.

E. E. HASTY.

Well, I declare, friend Hasty, if you haven't gone and fished up the idea of cold-blast smokers away back in Virgil's time! and he not only used cold air, but cold water also. Why not sweeten the water, and so both coax and drive the bees all at once in the same time? No doubt Virgil would ex-

press to you his most earnest thanks, friend H., if he could, for the able and scholarly way in which you have taken up his defense, and interpreted his words and bright thoughts to the bee-men of the present day.

## BREAKING DOWN THE HONEY MARKETS.

### AN EXPLANATION.

I DO not know whether I am the "bee-keeper out in the country" referred to by Mr. C. W. Young, on page 537, Sept. GLEANINGS, or not; but as I sold honey in Stratford last year at 12½ cents, and afterward sold it in other places at 15 c., wholesale, I should like to give some explanations.

Last year the honey-crop of Canada was very light; and, not knowing what price to set on mine, I wrote to Mr. D. A. Jones for advice. He advised me not to sell for less than 15 cents. When I offered my honey at that price in Stratford and St. Mary's, I was told all around that bee-keepers from a distance were offering it at 12½ c., and one store-keeper in St. Mary's showed me a letter from Mr. Jones himself, offering it at that price. I then began to think, that if I did not lower my price I should have to keep a lot over winter; so I sold about half my crop at 12½ c., to my sorrow, as, in a few weeks afterward, I might have got 15 c. for any amount. I thus lost about \$50.00 by being in too great a hurry to sell. I afterward learned that the honey Mr. Jones was selling so low was old, and of inferior quality. Of course, the store-keeper would not tell me this.

In regard to offering it at 10 c. the present season, I had not made an offer in Stratford at all until a few days since, when the lowest offer I made was 13½ to 14, in quantity; but I found the town pretty well supplied by the "local men" at 12½, so I did not make any sales. I hope this will satisfy Mr. Young that I, at least, did not wish to do any "small business," or "break down the smaller men."

My loss last winter was 4 out of 77 colonies. The greater part of those that survived were very weak in the spring; sold 8 of the strongest, and three or four weak colonies, before the honey season commenced. Have taken, up to the present, over 9000 lbs. of extracted honey. There is probably 2000 more yet in the hives. I probably lost 3000 or 4000 lbs. by not being able to extract fast enough to give them room during the height of the honey-flow.

That a queen will sometimes sting, I had proof a short time since, having received a sting on the finger from a virgin queen that I caught as she was rising from the hive to join a swarm that had just issued.

A. G. WILLOWS.

Carlingford, Ont., Can., Sept. 5, 1883.

Thank you, friend W., for the very courteous way in which you reply to those who have censured you. It were always well to bear in mind that there may be a reason we do not know of, when we are tempted to criticise the conduct of another. It is well, however, to have attention directed to this matter, and bee-keepers should be informed of the consequences of even a little carelessness in regard to the price at which they sell their honey.—I am very glad indeed to know that we have such good reports from Canada this season.

## HONEY-LABELS FOR COMB HONEY.

SOMETHING VALUABLE ON THIS SUBJECT PROMISED  
BY D. A. JONES.

FULL well, brother Root, I knew I scribbled my last badly, but I did not think I said *honey-can* labels. I intended to say comb-honey labels. Now, section-honey labels will form one of the new and grand features of the exhibition, and those were the labels I said I would have ready for you to take home with you; and when parties see them they will not growl about mildewed sections, or sections made out of dark or common wood, so long as they are strong, and the labels entirely cover all the wood, strengthen the sections, and hide the usual defects in comb honey.

Now, I don't pretend to be a comb-honey man, but I let them practice, so they will be able to produce it if they wish; but if you should see some new features in connection with its production, at the convention, you must not be surprised; and if you can sell your customers labels that are so attractive that their comb honey brings in several cents more per pound, and sells twice as fast, you will be assisting them considerably. I will tell all who come to our convention how to introduce fifty queens into fifty queenless colonies (even if they are all fertile workers), in fifty minutes, and not lose a single queen; at least, so my experiments this season prove.

Becton, Can., Sept., 1883.

D. A. JONES.

Friend Jones, we certainly ought to be able to appreciate an invention that will make mildewed sections handsome; for during our great rush the past season, we have had some "sore troubles" when sections were long on the way, or a trifle too green. If you have managed to make a success of covering the wood of sections of honey, we owe you still another vote of thanks.

I have many times thought of this matter, and have tried putting labels around wooden sections; but it seemed to be quite a job to cover all the wood perfectly, and I did not make it work very well. I shall take great pleasure in noting your success in the matter.

## THE BEES AND THE BABY.

THE STATE OF AFFAIRS AT FRIEND SECOR'S HOUSE.

IT would seem there is another household besides ours that is blessed with a new baby. Just see what friend Secor has to say about it. I wonder if any one besides bee-keepers could appreciate such a blessing as he seems to.

We have a new baby at our house. A baby is not such a novelty in itself, as we have had seven before. But they were all boys. This one is a girl. The first girl-baby creates as much interest at our house as the first swarm of bees. We are probably nearly as enthusiastic over its arrival as Adam was when the first woman appeared at his lodge. My time is now divided between the bees and the baby. My wife says it is hard to tell which has the stronger attraction to me. She maintains that this girl-baby is "sweeter than honey and the honey-comb." I have learned not to dispute her judgment in such matters. In fact, I more than half agree with her. It is not strange, then, if I leave the honey in the hive unex-

tracted, while I extract joy and comfort from that baby. What with attending to the bees outside, and *tending* the baby inside, I am having a sweet time of it.

I can enjoy one during the day, and the other at night. Between the two sweet employments, you may imagine that I am kept busy. Sometimes the singing during the night is so interesting that I have to get up to enjoy it. The hum of the busy bee is nothing to the music of that baby. The former come home laden with all the autumn richness of the asters and the goldenrod, singing their "harvest home" melodies in a way that only an enthusiastic bee-keeper can fully appreciate; but that first girl-baby creates an enthusiasm in the neighborhood among the old maids and the young maidens, the married women and little children, equal to a bee-keepers' convention.

On one particular night this particular baby was more frisky than usual. Mrs. S. says it was a flea, and she knows it. The wicked flea, when no man pursueth, biteth the baby. Solomon knew what he was about when he wrote that; but perhaps he had to stop writing to rock the baby to sleep, and forgot to finish the sentence. It's a burning shame that the festive flea has been biting the babies from Solomon's time down to the present, and no one has invented a flea-trap.

"The bees are swarming!" Well, well! will they never stop swarming? They began in May, and, from present indications, I do believe they will keep it up till October. Every fresh spurt of honey they act as if it were always to last, and leave their unfinished sections to "multiply and replenish the earth." Talk about the wisdom of the bees! They don't know any more than that baby, who is now as wide awake as a fish, when she ought to be growing in baby dream-land. The bees show just as little wisdom and foresight in a great many other things as swarming so late in the season. Why do they toil all summer gathering propolis to stop imaginary cracks? Why do they rear ten thousand drones when only one is necessary? Why do they sting the hand that feeds them, just as quickly as one that robs them? Why do they refuse to accept a queen, if a fertile worker is in the hive?

There! the baby has the stomach-ache, and I must go and rock it. EUGENE SECOR.

Forest City, Ia., Aug., 1883.

Friend S., are you not afraid that was a wicked pun of yours when you perverted Solomon's wise saying in regard to the conscience of wicked men following them in some respects like a flesh-and-blood foe? May God bless that first girl-baby!

### MRS. LUCINDA HARRISON.

WHAT SHE SAW IN CENTRAL PARK, ETC.

I AM in New York City, children, and I went to see Central Park the other day, and the first thing I did on entering it was to scamper off after a flower that I never saw before. It was blue, and belonged to the Ray family, and a lady informed me that it was chicory, and its roots are ground up to adulterate coffee with. Who can tell us some more about it, and whether it is a honey-plant? Now, don't speak all at once. I can see a good many hands raised.

The company I was with didn't care a fig about a simple wild flower, and hurried me into the muse-

um, saying, "There, Aunt Lucinda, is Powers' Greek Slave." Sure enough, here was a white marble figure, with such perfectly formed limbs, with dimples and finger and toe nails so natural; the countenance had such a sweet, sad look, and the hands were chained. There was a great deal more sculpture, that I haven't space to tell you about. It is strange that marble can be cut to express love, despair, hatred, etc. I saw lamps, tombs, or sarcophagi, and ugly shaped figures cut out of stone thousands of years ago, and dug up in the island of Cyprus. There is where the Cyprian bees come from. Which will benefit the country most, the bees or the old stones?

There are many pictures in the museum, but I'll tell of only one which has world-wide reputation,—Raphael's Madonna. It was sold in 1878 for twenty thousand pounds (\$100,000), and belongs to an Englishman, who loaned it to the museum. I can't describe this picture, children, for my pen is not equal to it; and as I sat and looked at it I did not know which to admire the more—the picture or its generous owner. If its owner were selfish, he would have kept it at home shut up in a picture-gallery, instead of risking it on an ocean voyage, to be brought here to be viewed by the American people.

When I left the museum I heard, "Aunt Lucinda, don't you want to see the Obelisk? We'll go under that bridge, and up on that mound so we can view it better." And here was Cleopatra's Needle! What queer fingers she must have had, to use such a needle! and I could not see a speck of an eye. Only think! Moses saw the obelisk, and it has changed but little since his day; the hieroglyphics are slightly worn on a part of it, by the drifting sands of the desert.

The Park has many things to amuse and entertain children. There is a playground with swings, and merry-go-rounds, and a dairy near, where healthful food can be purchased. In another part, burros and ponies can be hired for a ride, and on the Mall are miniature barouches, with a span of goats to draw them. These goats have harness like horses, only they have no bits in their mouths. These little carriages had two seats, and four could ride at one time. Oh how the little boys wanted to drive themselves, instead of having a boy in livery to do it!

In one part of the Park is a flock of sheep, attended by a shepherd dog. There is a pond with row-boats upon it, which can be hired; also a base-ball ground. There is a menagerie where many wild animals are kept; and many other interesting things which I can not at present tell you about.

New York, Sept. 8, 1883. MRS. L. HARRISON.

Now, Mrs. H., you may be right in your statement, that Moses saw Cleopatra's Needle, but I should very much like to know how you know it. While reading your article, my mind ran back to all I ever knew of Moses, which perhaps isn't very much, and also to all I knew of contemporary history, which is surely very little, but I could not in any way make the connection. Probably you are right, and I should view the obelisk with even greater wonder and reverence; if it is really so.—Children, we can see flocks of sheep, and shepherd dogs, without going to Central Park, can't we? and bees and bee-hives too? Mrs. H., do they not have any bees there? You told us about flowers, but you did not say you saw any bees around them.

**HOW DID IT HAPPEN?**

SOME QUESTIONS FROM A BEGINNER.

I HAD a swarm issue out of a hive that had already swarmed three times. It getting late in the season, and weakening the colony, I put them back and clipped one wing of the queen. In a day or so, out they came again. On examination we found two queens in the swarm — one black and one Italian. The stand they came from being a hybrid, we killed the black one; and in catching the other we caused a bee to sting and kill her. We put them back, and in a few days out they came again, but did not more than half cluster till they all went back, and seemed satisfied.

Now, what became of the clipped queen? and why did two queens — a black and an Italian, come out together? and why two different kinds of queens in one hive?

My bees have not done much this season, it being wet and cool part of the time, and part too dry, and we had a frost in the latter part of May which killed all the bloom mostly. There is an abundance of wild and tame flowers now, and my bees are booming on them and buckwheat. How will it answer, should they store any more than will keep them after the flow of honey is over, to extract over what I think will winter them? My bees have never noticed the Russian sunflower, and have only commenced to work on spider plant the last few days, notwithstanding there were great drops of honey in it. I send you a sample of plant that grows from 6 to 7 feet tall that is just bending with bees from morning till night. It has been in bloom for nearly two months. I want to know if you have a name for it. My Simpson honey-plant did no good.

**HONEY FROM THE OAK.**

I will say, that bees are swarming on black-oak timber, working on a kind of gum, I think, that oozes out of the leaves.

**SWARMING WITHOUT CLUSTERING, AND THE SWARMING MANIA.**

I had a large swarm come out and cluster. I hived them, and next day, about 9 o'clock, they came out, and we settled them; hived them and put them in another place. In an hour, out they came, and we watered them; but, go they seemed determined to. We fired off a gun among them, and finally succeeded in settling them. We put them back, and my wife gave them some syrup; but they still seemed uneasy, so I put in a good-sized piece of comb I had just taken out of a hive with some honey and unsealed brood, but that did not seem to satisfy them; and the next day, out they came again. We rallied them round and round for half an hour or more, and finally back they came, and went into the hive, and seemed to be contented, and went to work. I think the queen, perhaps, was on the comb I had put in with a few remaining bees; and when they found she had not come out, they returned, and were willing to stay. In about four weeks they sent out a large swarm, and we hived them. After dinner my wife went to see a sick woman, and I was busy in the yard, and the children failed to watch them closely, so the first we knew they were out, and gone to parts unknown. Now, was it not the same queen, and a portion of the bees of the swarm that we had so much trouble to keep? My impression is that it was, and they had not forgotten their first determination to leave. My experience is, that bees sometimes pick out a tree to go to, and,

under such circumstances, it is almost impossible to keep them.

CHAS. L. GOUGH.

Rock Spring, Mo., Sept. 6, 1883.

Friend G., the queen you clipped was a virgin, as are all queens from after-swarms; and when you clipped her wing you spoiled her just about as effectually as if you had clipped her head off. She got lost in the grass, probably, and then the bees waited until the other two hatched, which you speak of. I think both were Italian queens, but one was accidentally black. We often find dark queens and light from the same lot of cells. This matter is so much discussed that we keep a black queen in our apiary all the while, producing nice yellow bees. —By all means, extract what your bees store more than they need, but be sure you do not starve them. —This matter of honey from the oak is now reported from almost all localities, and I should like very much to meet with a case of the kind. One of our office boys says he saw bees literally swarming on an oak-tree a year ago, within only two or three miles of where I am writing. —I think bees that have had the swarming mania would be quite likely to have it again, and I think you are right in saying it was the uneasy and discontented bees that started up the swarming mania again in that hive. —I do not quite understand you, friend G., about your Simpson honey-plant. The plant you send us, which you say is bending with bees, is the Simpson honey-plant, and nothing else.

**“Remindery,”**

Or Department for duties to be attended to this month.

NOW is the time to prepare the bees for winter, with most of us. The directions have been so fully gone over year after year that it is hardly worth while to repeat them. Quite a number of friends have been raising queens for sale, as well as for honey, and it is well known that our queen-rearing hives, or nuclei, are more difficult to winter. Neighbor Rice was just in, and I asked him what he should do with his. He said he should raise queens as long as he could, and then double up and winter the bees “as long as he could.” The trouble seems to be, we have too many old bees to go into winter quarters. If we double them so as to make powerful colonies, there are so many of an age that they will die off nearly at the same time, and then the colony dwindles. Having some brood in all the nuclei before they are united, and then having a good queen to fill combs well when they are united, would probably be at least a partial remedy. Then feed with sugar stores until all the combs are filled well around the brood-nest, and the young bees will probably winter well, if the winter is a mild one. If it is very cold, you will likely have losses. Mr. Rice winters in the cellar, and the cellar would probably be an advantage for such, in the majority of winters, if one has a good one.

## Reports Encouraging.

**M**Y bees have done well this season. I have taken 2600 lbs. of honey — 1600 lbs. in 1-lb. sections, and 1000 extracted. I have taken 114 sections from several of my best colonies, besides extracting from 6 to 9 gallons from the same colonies. Is that not good enough? I have opened the eyes of some of my old-fogy neighbors this season, who still use the old box hives, and think they have done wonders when they get a box of honey that will weigh 25 or 30 lbs., from one hive. I have taken over 200 lbs. this season from several of my good colonies. When I talk of getting 200 lbs. from a colony, they hardly believe it; but I can show the honey.

W. H. CULP.

West Jefferson, O., Aug. 13, 1883.

I have a swarm of bees that was hived on the 22d day of last May, and since then they have put in boxes 210 lbs., besides filling brood-frames, making nearly 300 lbs. of honey, stored by this young swarm the present season. When you can make a better record out West, I should be pleased to hear from you.

FRANKLIN TREAT.

Centreville, R. I., Aug. 20, 1883.

OUR FRIEND DR. J. E. LAY; THE SEASON IN TEXAS, AND CYPRIANS BY THIS TIME.

This has been the driest year in 25. But little surplus honey; a great many bees died of starvation in this vicinity; ours are in splendid condition. All we ask is rain, and we shall have honey yet. We have watched the different races closely. We have Italians, hybrids, and Cyprians. The Cyprians are ahead of all, and we consider this a test year. Bees are now gathering from live-oak balls.

J. E. LAY.

Hallettsville, Lavaca Co., Texas, Aug. 16, 1883.

### CHAFF HIVES.

I purchased a chaff hive of Mr. Samuel Calland, from which I have taken 115 lbs. of good choice comb honey, and I think they have 20 lbs. more in the upper story, and I may get 30 lbs. They are rich in the brood-chamber. I think the comb fdn. the best thing ever invented to encourage the bees, and to realize the greatest profit out of them. I shall not hereafter be without it, as I realize a great advantage in using it.

S. S. LEACH.

Quincy, O., Aug. 13, 1883.

I am a poor man, and bought one stand of bees the first of May. I now have 3 stands doing well, and 2 swarms ran off.

JOS. MCFARLAND.

Goldsmith, Ind., Aug. 16, 1883.

Friend M., I do not know but this is out of place in Reports Encouraging, but I guess it isn't, for the bees did their part if you did yours. If you continue letting two swarms out of four go off every year, I am afraid you will always be a poor man. If we understand you, you had four swarms from the one you started with in the spring; from which, I should think, your locality must be a good one, and we must expect next year you won't let any go away at all.

R. E. FROM QUEBEC.

About the 15th of April, while there was yet much snow on the ground, I managed to get to the hives, and, to my joy, I heard a joyful buzz. On examining I found one stock dead, the remaining 3 alive

and strong. As the sun disappeared, the bees came out stronger. I unpacked them and put all in order, and on the — of July I had my first natural swarm. I increased to 7; sold the stock that wintered in cellar in box hive, drummed out the Quinby, and settled down to the Langstroth hive. I have taken nearly 100 lbs. of section and 230 lbs. extracted honey. Had I had an extractor at the commencement, and bees all in Langstroth hives, I should probably have exceeded 500 lbs.

W. TRICKER.

St. Foy's Road, Quebec, Can., Sept. 5, 1883.

## Notes and Queries.

TAKING AWAY HONEY, AND GIVING THEM GRANULATED SUGAR FOR WINTER STORES.

**I** WANT to ask you a question. I thought of taking the larger part of the honey from the brood-department and feeding granulated sugar for winter stores, for I can get nearly one-half more for extracted honey than I would have to pay for sugar. Will they winter as well, or not?

Millersburg, O.

C. F. UHL.

[As a rule, friend U., I think there is no question but that stores of granulated sugar are even safer than natural stores. Of course, we would not recommend taking out parts sealed late in the fall, and giving them syrup that they would not have time to seal over. If you do it at once, I think you are safe in taking away the honey, and feeding sugar.]

What should a two-year-old empty comb be worth in a Langstroth frame, without tin corners?

[In the price list we have rated empty combs at 25 cents each. Those on wire combs, 30 cents each. This is for metal-corner frames. I should rate all-wood frames at least 5 cents less. Of course, these combs are built out on foundation. Frames of natural comb are rated from 10 to 15 cents each.]

How old should combs be, to be discarded?

[I think I should use combs ten or fifteen years at least, before thinking of melting them up and using new ones.]

About what time should bees be laid away for winter?

[If you mean by the term "laid away," the time bees should be put into the cellar, it depends on the locality and the opinion of the bee-keeper. We used to put our bees into the cellar or bee-house about the middle of November.]

If you should make a hive 12 ft. long, and fill it with bees, with wire-cloth partition, would it not produce more of an equilibrium through the hives than if each swarm were in a separate hive, and retain the same in colder weather?

[The plan of a long hive is an old idea, and would seem reasonable; but it has so many times been tried and discarded, I am inclined to think it is not very satisfactory, as a general thing.]

Do you recommend empty fdn. to put in hive in winter, in the place of old combs, for bees to lounge on, if comb is not to be found?

Do you consider it necessary to use empty combs, for wintering purposes? If so, what number to a middling size swarm?

[To be sure, we want combs for wintering; but I believe it is generally thought better to have *filled* ones than empty. In regard to the number, it depends upon the size of the colony. Three combs

might do, and then, again, a strong colony might need the whole ten.]

What is your rule for making such candy as you put in your queen-cages?

Would not that candy run in a wired frame be preferable to syrup to feed for winter and spring, and less liable to attract robbers, and less apt to sour? I made some candy last spring, and ran it in a frame. It was so hard that bees were loth to touch it. That which you send in your queen-cages is much more pliable. I should be pleased to know its proportion.

[The recipe for the candy in queen-cages is given in our price list. It is simply the best common pulverized sugar, powdered, and kneaded up into a dough with honey. The candy we use in queen-cages would not be apt to stand in a wired frame. Little balls, say the size of a biscuit, placed upon the top of the frames, I should say, would be the better way.]

Would it not be a good plan to let one of Jones's queen-traps remain at the entrance for one or two weeks, after introducing a queen?

[Your plan might prevent the queen from escaping, but I do not believe they very often go out of the hive after being introduced.]

How many combs of honey, 10x14, would you recommend to winter a fair-sized swarm?

[I would recommend about 8 combs, 10x14, for a fair-sized swarm.]

If there should not be more than one pound of bees in a hive, would you recommend uniting for winter?

[I would not attempt to winter a single pound of bees.]

What would be the least weight of bees you would recommend to lay away for winter?

[Better have at least three or four pounds.]

Syracuse, N. Y. A B C SCHOLAR.

#### THE GOLDEN BEE-HIVE.

Is there such a hive as the "Golden," and is there a patent on it? There is a man selling such a hive here. His name is Pickerel.

Litchfield, Mich. J. D. KENNELSBROOK.

[Friend K., we have published complaints of the Golden bee-hive men a good many times in our back volumes. If the hive is not a swindle, it is pretty near it, and you and everybody else will do better to let it alone. We can only reiterate, that the successful honey-raisers to-day do not use any patent hive of any kind. If any man talks patent to you, set him down as either bad or ignorant; and in either case do not have any thing to do with him.]

#### EXTRACTING FROM THE BROOD-NEST.

I am old in years, but young in bees. I bought 2 colonies last spring; increased to four; have taken out 170 lbs. of honey, and season just fairly opened. I have put one-pound boxes on the top of one hive; should I extract below? There does not appear to be room enough for the queen, as all the cells are full of honey. Should I extract before combs are capped over?

Pella, Colo., Aug. 13, 1883.

JAMES ACKEMAN.

[There are different opinions in regard to this matter, friend A.; and as localities also differ very widely, perhaps it is difficult to give a general answer. In our locality, I should by all means say, do not extract. If you get the bees to working all in the sections, they will take the honey out of the way of the queen as fast as she needs it; and hybrids

will sometimes take so much of their honey from them that they will not have enough remaining for winter stores.]

## GOLDENROD.

### THE GREAT FALL HONEY-PLANT.

**A**S this is the season for goldenrod, I thought it might be well to direct attention to it. It is now in the height of full bloom with us; but I am sorry to say, that I have never seen goldenrod honey in our locality. Further north, by the lake-shore, where the soil is sandy, the bees get so much honey from it that they fill their hives, and the honey looks almost as yellow and golden as the flowers themselves. I have often wondered why it is that no one has ever thought of cultivating the goldenrod as an ornamental plant for our yards and flower-gardens. Again and again have I stopped in wonder and astonishment when I passed by clumps of these beautiful masses of gold, dotted here and there with beautifully marked Italians. I wonder if any one admires them as much as I do. Below we give you a picture of three of the common varieties.

GOLDENROD.

One thing that adds to the beauty of these flowers is, the different varieties are always found side by side. You examine the delicate pencil-work and coloring of the flowers of one stalk, and then look at the next, which is just enough different to give added charms, and so on with the other ones; and may be, if you examine closely, you will find that there are many different ones in the same patch. Several years ago I found one quite late in October, away back in the fields, and it was, so literally covered with bees that I had a root of it put in our flower-garden; but it never did well. Although we gave it the best ground and most careful attention, it seemed to prefer its tangled fence-corner, where I first found it. It is No. 1 in the cut above. Our artist has tried to show you one of the little flowrets.

**THE WHITESIDE APIARY,**

BELONGING TO W. H. SHIRLEY, GLENWOOD, MICH.  
ALSO A VIEW OF A DISCARDED HOUSE APIARY IN  
THE DISTANCE.

**F**RIEND ROOT:—Often, when looking over your ABC, I wondered how my own apiary would look in a picture. Well, an opportunity came June 19, 1883; and by this mail I send you one. The picture shows about 4-5 of the number of hives. The

The person shown in the foreground is your humble servant.

Bees are doing nicely here on white clover. Our prospects are good for a fair yield of honey.

Excuse my intruding upon you in this busy time with pictures,\*etc.

W. H. SHIRLEY.

Glenwood, Mich., June 26, 1883.

Friend S., we are the more glad to see the picture of your house apiary, because it shows us also the old house apiary that

APIARY OF W. H. SHIRLEY, GLENWOOD, MICH.

little building in the center of apiary is where we take hives in to manipulate them in times of robbing, etc.; we also use it to get bees out of surplus honey, in the fall.

The longer building is the house apiary which Mr. Heddon built for bees five years ago. We kept bees in it two years, and gave it up as a bad job. I use it for a supply and work shop, extracting honey, etc.

friend Heddon wrote us about some years ago. Unless I am mistaken, house apiaries are pretty much discarded, the land over. Although great numbers of them were built, for some reason perhaps not easy to explain, no one seems to like them. It looks a little funny to see a big rock on top of your hive-covers, to keep them from blowing off. I

suppose those broad covers are for shade. It seems to me I would much rather have the grapevines that we use. I should get tired of moving those stones every time I wished to open the hives. You may think, however, it is less trouble to move the stones than to trim the vines. But our grapevines usually pay for the training. We are glad to get a view of your pleasant place of work, and we hope you may enjoy it and make it profitable.

---

### PAUL PRICE.

ANOTHER VERSION OF VIRGIL, ETC.

**M**ANY thanks for the cards. Paul has distributed them among the children of the neighborhood, and I hope they will do much good. I am sorry to say we have no Sunday-school, nor do we live near a church; but mamma teaches the boys at home, out of the Bible and other good books.

We were delighted to hear of that wonderful baby, and pray that he may grow up to be as good and useful a man as his father. Peter is *not* a very pretty name, but a very solid one. Paul sends in the great apostle's name, and his own. We like it very much.

It was rather wonderful to him to see his name in print, and your kind words were very cheering to him. He is glad to have you for his friend, and hopes at some future time to meet you face to face among the bees. He promises to write the next letter, perhaps after wintering, and tell you all about his bees. They have not made as much honey as we hoped they would at our last writing; but the goldenrod and buckwheat are now in bloom, and the promise is fine for a splendid fall crop. The colonies are strong, and full to overflowing; have commenced swarming, to prevent which, Paul looked them over, clipped the queens' wings, and removed queen-cells, and thinks he will have to divide them. He has a nucleus, and has sold two dollar queens. He is very hopeful of the coming year's work, and is complete master of his apiary, thanks to A B C, which he never could have gotten along without.

We have watched for and read with great pleasure the "inimitable" *Hasty's* unfolding of Virgil. It is a beautiful thought — culling bees from leaves and sweet herbs! Paul's father was professor of the languages and English literature for many years in our State University, after which he lost his sight entirely, then became a minister of the Christian Church, and labored in the service of the Lord some years before his death, twelve years ago. A puer man, and more devoted Christian, would be hard to find. He had a fine library of choice books; and although Paul has never read a great deal himself, he has considerable knowledge of classical lore, gathered from these, through mamma's reading. I read to him some time since the whole of Virgil's treatise on bees, which interested him greatly, although he is too practical to indorse the entire theory of generating bees from the blood of bulls. But then, he wonders where the bees came from that Samson found in the carcass. Virgil writes:

"But if the whole stock should suddenly fail any one, and he should have no means to recover a new breed, it is time both to unfold the memorable invention of the Arcadian master, and how the tainted gore of bullocks slain has often produced bees. I will disclose the whole tradition, tracing it from its source. For where the happy nation of Pelkean

Canopus inhabit the banks of Nile, floating (the plains) with his overflowing river, and sail around their fields in painted gondolas; and where the river, that rolls down as far as from the swarthy Indians, presses on the borders of quivered Persia, and fertiles verdant Egypt with black silt, and pouring along divides itself into seven mouths, all the country *grounds* infallible relief on this art. First, a space of ground of small dimensions, and contracted for this purpose, is chosen. This they strengthen with the tiling of a narrow roof and confined walls; and add four windows of slanting light in the direction of the four winds. Then a bullock, just binding the horns in his forehead, two years old, is sought out: while he struggles exceedingly they close up his nostrils, and the breath of his mouth; and when they have beaten him to death, his battered entrails are crushed within the hide that remains entire. When dead, they leave him pent up, and lay under his sides fragments of boughs, — thyme, and fresh cassia. This is done when first the zephyrs stir the waves, before the meadows blush with new colors, before the chattering swallow suspends her nest upon the rafters. Meanwhile the juices, warmed in the tender veins, ferment; and animals, wonderful to behold, first short of their feet, and in a little while buzzing with wings, swarm together, and more and more take the thin air, till they burst away like a shower poured down from summer clouds; or like an arrow from the whizzing strings, when the swift Parthians first begin to fight."

Paul has found that the black bees are *not* the best workers, although mamma thought they were. The honey made by them, however, was the finest. It might have been accidental, but it certainly was the most delicately flavored.

After having thus fully introduced Paul and his bees, I bid you good-by, with many thanks for kind attention.

L. B. ROOTE.

Coffman, Mo., Aug. 25, 1883.

### A POOR ORPHAN-BOY.

A WHOLESOME LESSON FOR THE JUVENILES.

**D**EAR CHILDREN:—Do you know a poor little orphan boy or girl? Did you ever think how sad are the thoughts of a poor little boy or girl being left without papa, or without mamma?

Well, I will tell you of a little boy I knew many years ago. I can recollect when he was three years old, a bright-eyed little fellow. His hair was as black as a raven; his father was *gone*; but he was left, thank God, in the care of a good Christian mother, though almost penniless; no home that she could call her own, no one to provide for a living for her and her little boy. And I will tell you what I have seen. I have seen that good mother following the plow in the field, plowing corn day after day, trying to make bread to keep herself and little boy from starving. I have also seen her using the great sledge-hammer in the blacksmith shop, many a day, all day long, striking the red-hot iron, and making the sparks fly. And how much money do you think she would get at night for her day's work? Why, only twenty-five cents! Don't you think that was very little for striking all day in a blacksmith shop? But time rolled on, and the little orphan-boy grew up to be large enough to take his poor mother's place at the forge in the shop, which he did cheer-

fully. He has taken, as any good boy would, the hardships off his mother's shoulders, and borne them himself; and, by the help of the great Father, they managed to keep food and raiment, and also acquired a good name that gave them the respect of the best of society. He has often told how his dear mamma would read the Bible to him, and tell him the story of the cross, and taught him to keep holy the Sabbath-day, and how ugly it is to use bad language, and what a degrading habit it is to use tobacco, and how little most people think of a boy who plays cards, or is caught visiting saloons, or in bad company of any kind.

Children, does your mamma teach you the same lessons? Oh! I know she does. This is not all. When Sunday morning came, after a hard week's work, by nine o'clock he was off to Sunday-school with his Bible in his hand, with a lot of questions to propound to his teacher. He finally became teacher of the Bible-class, and after awhile superintendent of the school. This, you see, is the outgrowth of a good mother's teachings. That orphan-boy is now a grown-up man, and you ought to hear him express his love for his good mother (and she is still living too), and ask God to abundantly bless her in her old days.

And that is not all. That poor orphan-boy has married, and has three juveniles at his house, and the two oldest are both going to Sunday-school every Sunday. And what do you think he is doing now? Well, I will tell you. He is keeping bees, though his bees did not do much this season; he got only about 20 lbs. of honey to the colony, spring count. He now has 35 colonies, and says that he is going to make a speciality of queen-rearing next year. The name he has given his apiary is the "Queen Apiary."

Hoping, dear juveniles, that none of you are orphans, and that you will "obey your parents in the Lord, for this is right," I bid you good-by, by saying that the author of this article is the poor orphan-boy,—

T. J. HEAD, age 31

Sherman, Texas, Aug. 24, 1883.

## WORKING, AND MAKING MONEY.

ONE OF THE JUVENILES TAKES ME TO TASK.

**I** THINK from what you said in reply to my letter in July JUVENILE, that you don't want to hear about any thing but working, and making money; so I am going to try to please you in this letter. Ever since I can remember, we have had to pick up hickory-nuts to sell. Two years ago, when I was 9 years old, I gathered 4 bushels, all myself. I sold them for \$1.00 a bushel. I got very tired at it, and my back ached awfully; and when mamma used to sell strawberries I had to help pick them until I would be nearly tired out. Last year, when we sold blackberries, I had to pick three gallons every other day, for three weeks. It was in August, and the sun was very hot, and the briars stuck me, and the gnats flew in my eyes and nose, and the sweat dripped off my nose and chin. Now I shell the beans for dinner, peel the potatoes, wash the supper-dishes, and set the table ready for breakfast. I fill the milk-trough, and I have to pump 300 licks to fill it.

I help churn, and I can wash the butter, and salt it all myself; and mamma says my butter tastes better than any other. Last week, when Mamie Marshall was here, we did three churnings, and mamma

paid us 5 cts. apiece for each churning. I gather the cucumber pickles. The first time I gathered them I "scalped" them; but I know how to do it now. Just the stem must be cut, and nothing else. I help wash and iron, and I tend Harry a great deal. I guess if you lived with my ma you would get so tired of work that you would never want to hear of it again. It is work, work, work, early and late. My sister Minnie keeps the house clean, all but the kitchen and cellar. Aunt Sarah keeps the kitchen clean, and mamma attends to the cellar. We all have our work to do; and if any of us get sick, or go away visiting, it throws the whole machinery out of joint. Give my love to Blue Eyes. I have blue eyes too.

Won't you please send me some of those little envelopes on your 5-cent paper, for this letter, instead of sending me a book?

I forgot to tell you about the tag-locks. When we sheared sheep, Irving and I picked up the tag-locks and washed them, and we sold them for 25 cents a pound. Mine came to 37 cents.

If I were you I would name my baby Glenn, for Glenn can not be nicknamed. I think Peter sounds as if you were making fun of him. I know a little boy named Glenn Hughes; he is a good little boy, and is good-looking.

JESSIE CHADDOCK.

Verment, Ill., Sept. 1, 1883.

Well, now, Jessie, that is a real good letter. If you were trying to please me, I think you have succeeded pretty well. A good many years ago there used to be a machine, or a toy, rather, called planchette. It was about the size of a flatiron, and it had three legs to it. Two of the legs had wheels on them, and the other had just a pencil. About that time there was quite an excitement about this wonderful machine, which they said would read thoughts if some one would just put his fingers on top of it. Of course, I bought one and carried it into a room with a lot of young people. They placed their fingers on it, placed it on a piece of paper, and, of course, it began to write, and we began to ask questions. It was when I was getting the bee-fever; and as everybody knew that, I asked the machine to please write what subject was constantly uppermost in my mind, and also what I was principally devoted to. I supposed the machine would, of course, tell us, and truthfully spell out b-e-e-s. Well, do you think it did? Not a bit of it. The contrary and mischievous little institution just went to work and wrote out—what do you suppose it was?—why, it wrote "g-i-r-l-s." I need hardly tell you that it was a mischievous, bright-eyed, rosy-cheeked girl who had her fingers on the machine. We accused her of cheating; but she declared the machine did it itself. Well, my little friends, here I am, almost an old man, bald-headed and gray-headed; and here I stand before you, accused of being devoted to—what?—"Working, and making money." But do you not think it is a little too bad, now, Jessie?—Even if you do fell about some of your trials and hardships, I begin to think you live in a well-regulated household; and I believe, too, you have a most excellent mother to preside over it. Yes, I send you the envelopes gladly; and if any of the little girls would rather have envelopes than books, they can have them postpaid for every good little letter they write.

## AN A B C SCHOLAR'S STORY.

AND SOME KIND WORDS THROWN IN ALONG THEREWITH.

**A**FTER respects to yourself, Blue Eyes, and those thousands of little workers of yours, I ask you to accept my thanks for GLEANINGS; the foundation all came to hand nicely. In Feb., 1882, I concluded I should love to handle bees; and, being ignorant of the manipulations, I sent to you for the A B C book. It came, and I read and re-read. In 30 days I concluded I was fully "fledged," and offered ten dollars for a good colony. I could not get one; bees are not plentiful here. Eventually I found a man with two starved colonies. I took them on halves. I fed sugar and unbolted flour. Soon brood began increasing. In May I made one "divide," and had one swarm; June, 2 swarms; July, made another divide; in Aug., had another swarm, 7 colonies to begin winter. I got stung every day. Wife, reasoning the case about those pesky bees, said, "I thought if A. I. Root or any other man said he divided, extracted, etc., without veil, coat, and gloves on, went"—well, you may guess what.

Spring came, and five colonies only left; but, having launched my bark on the river that "flows with milk and honey," I must extract some of the sweets of life as I float down its placid current. I ordered an extractor, 100 frames, 500 one-pound boxes, and 50 wide frames. I made 16 hives, Simplicity principally. Have extracted 336 lbs., and taken off 85 lbs. comb honey to date. I shall take off 100 lbs. more. I have increased to 17, and lost 3 that left for parts unknown; and—

"If anybody will them bind,  
And bring safely to the 'Squire's,  
Twenty dollars they shall find,  
And more if they require."

I quit extracting in time for bees to fill frames with clover honey for winter use. Clover season closed 15 days ago; not much buckwheat, and but little else for bees here this fall. Bees did well till clover closed. Hundreds of colonies in this county now, and for a while the market was glutted; but now it is better. Market price, 15c for extracted; 15 to 25 for comb. I put my extracted in ½-lb. tumbler, and quart glass, and sell at 17 to 20c; my comb in 1-lb. boxes at 25c, and calls for more than I can supply. Please tell our brothers that neatness of the package we put on the market wins the day. As I am a beginner, and this my first letter to you, I must close, or you will think "talk is too cheap."

Selden, O., Aug. 14, 1883.

L. B. PARK.

## AN ENTHUSIASTIC A B C SCHOLAR.

LET US CATCH SOME OF HIS ENTHUSIASM.

**N**OW, Mr. Root, I will give you just a little description of how I have succeeded with my new undertaking. I feel that I owe you a debt of gratitude which it will be very hard for me to pay. Your A B C book is certainly a perfect guide for the beginner; and if a person of any judgment whatever studies it carefully, he certainly will make a success of his undertaking; and, with a little of the practical part of bee-keeping, will soon be taught to love the dear little fellows. I at once began to manufacture chaff hives for myself after I received your A B C book; and after a long search, and a number of tiresome walks, I succeeded in

finding a man who was willing to sell me a colony of black bees, for which I paid \$5.00; and by another diligent search I found two persons who were willing to trade me a swarm for a hive. So I set myself at work; and by the first of July I had three good colonies, and I then bought an Italian nucleus, and that is the extent of my undertaking thus far. As soon as I arrived home with my old box hive and its inhabitants, I set myself at work and followed your instructions in relation to transferring, and I made a grand success from the first; and I find, by following your teachings, it is a very easy task to perform; but as soon as I undertook to transfer my second colony I was beset by robbers. But I made short work of them by keeping every bit of honey out of the way under cover, and then there was no trouble. I have now stuff on hand, all sawed, for 25 chaff hives, and I am busily engaged in working it up, and getting ready for fall, as I expect to take from my neighbors enough bees to fill them, as they generally kill their bees in the fall and take out the honey; and, as you know it will be their best colonies that they will take up. I can get a good start; and if I make a success of wintering, I will come out in the spring ready for business.

I must say, for one of my friends, that he is a man of large experience in bee-keeping, and he has promised to come and put my bees up for winter quarters, and teach me the great secret of wintering without loss. He has kept his bees in chaff hives for two years, and I just wish you could see the inside of his hives at present, and see the bees and honey. He has 35 colonies, and by the first of August he had 2000 lbs. of surplus honey. He says he will put up my bees, and would not be afraid to insure them for the small sum of 10 cents. Last winter he did not have any loss; and there were so many bees in his hives by the first of May that there was scarcely any room for more, and you know that that is just what we would all like when spring comes, to have good strong thrifty colonies. He lives about 10 miles from me, and I go up occasionally to see him. It does me good to see his bees and honey.

My bees will give me a small surplus this season; but as it was very late when I commenced, I can not expect much honey. But I tell you, I have built them up strong, and have learned the art of hatching young bees, and how to keep the queen laying; and that is what we want—young bees crawling out of the combs every day. It is a pleasant sight to see them come out of the hive the first time, and crawl around.

I may be taking up too much valuable space in your journal; but one word more, and I will close. I must tell you about where I live. I live in the Rondout Valley, as it is called, and it is a splendid location for bees. Every month, from May until frost comes, blossoms abound abundantly; and I think, by skillful management and close attention to 25 colonies, that I shall have next fall a good report to make to you.

ED. HARNDEN.

Kyserike, Ulster Co., N. Y., Aug., 1883.

Friend H., I felt a little troubled when I read that you were going to try to winter 25 colonies, and that the 25 are to be principally made up of bees that were to be brimstoned; but when you told me you had an experienced friend who would come over and help you, I felt a little better about it. You say, he says he will almost warrant them for

10 cents a colony. Tell him I will give him 50 cents a colony if he will warrant ours, and he may have all the granulated sugar to feed them he wishes, and he may also double them up as strong as he pleases. Now, then, may be there is a chance for him to make us a visit and make some money besides. If he does not take the offer up, it is open to any other bee-friend. If I could give the apiary my personal supervision, as I used to do, I should not be so much troubled about loss; but with our great business it is now impossible; and our boys who have been trained for the work are all going off to school. I am glad they are going off, for I would rather lose the bees than to have the boys lose an opportunity for getting an education. I feel very much pleased, friend H., to get such kind words as yours from my pupils; and when reading your letter I made up my mind that there would be no trouble at all about your succeeding, if your enthusiasm held out, and you followed the A B C book as you have been doing, and did every thing up well and thoroughly. Text-books are excellent helps, but they can never make up for want of energy and thoroughness. Perhaps I should mention to your bee-friend that we now have between 300 and 400 colonies; but I presume he would double them up to one-half that amount, or still smaller.

### SOME PRACTICAL MATTERS FROM FRIEND POND.

#### HIVING BEES ON THE SABBATH.

I AM an advocate of a strict observance of the Sabbath; not in the letter only, but in the spirit. I hold it to be sinful to do aught that will cause offense to any one—that is, legitimate offense; still, I believe we must take care of those things that a wise and merciful God has given us, and not allow loss or injury to any property that he has allowed us to come in possession of. In regard to hiving bees on the Sabbath, had God intended we should not do so, he certainly would not have given them the swarming fever on that day. We, however, must make these matters questions of individual conscience. I feel it my duty to stay at home from church, and hive any swarms that issue on the Sabbath. Did I not do so, I should feel that I was not taking proper care of the possessions an all-wise Creator had bestowed upon me. I think the best creed to be observed in the matter is the one shown up by the slave down South, whose master on Saturday cut down a large quantity of grass, and on Sunday desired the slave to go out and take care of it. The slave remonstrated, on the ground that he was pious, and considered it wrong to work on the Sabbath. The master then said to him, "Doesn't the Bible teach you that, if an ox or an ass fall into a pit on the Sabbath, it is right to help it out?"

"Yes," the slave, "but it doesn't say nuffin' about diggin' a hole Saturday arternoon for the ox to tumble into."

If we take this view, and do all we can on Saturday by dividing, or something of the kind to prevent swarming on Sunday, or if we do the best we can any way, and a swarm does issue on the Sabbath, I think we should be blamed by our heavenly Father

if we did not take such steps as were necessary to save it.

#### PREVENTING THE FASTENING OF FRAMES IN UPPER TO THOSE IN LOWER STORY.

As an experiment in a two-story hive, working both stories with regular brood-frames, I took a piece of enamel cloth, twice as large as the top of hive, folded it so as to leave the enamel on the outside of both sides, and placed it over the frames, leaving a space about  $1\frac{1}{2}$  inches wide the whole length of the hive, for the bees to crawl through. I then put on the upper story filled with brood-frames of fdn. The bees immediately occupied the upper story, and worked in it as readily as they did in other hives where they had no obstruction whatever between the frames. They filled the frames with honey at once; the queen did not go into the upper story at all, and I got a fine yield of extracted honey without any sticking of frames together at all. This was a single trial, but it worked so satisfactorily that I shall try it next season on a larger scale.

#### PREPARING BEES FOR SHIPMENT.

I have met with good success in moving bees in the hottest weather, when prepared as follows: I first securely fasten the frames so they can not move in any direction, and then nail a sheet of wire cloth over the bottom of the hive. For the top, I make a rim  $1\frac{1}{2}$  in. wide, similar to the rim of a Simplicity cover. Fasten it on top of the hive, and cover it with wire cloth. The bottom-board and cover, I fasten above and below the hive, with 8 strips of  $\frac{1}{2}$ -inch stuff about 4 inches longer than the hive is deep, by nailing one of these strips to each corner of the hive, and nailing bottom and cover to the ends. By this means I give ample ventilation from below, and plenty of breathing-space above; at the same time, I secure the wire cloth from any possible chance of injury; and as but one package is made, a considerable saving in express charges is made also. While I do not consider the plan given by friend Carroll, on page 410, to be safe, owing to the lack of breathing-space above, I am satisfied that the plan I give is as safe as any that can be devised, when we wish to send the whole hive economically with the bees. I have shipped a large colony on ten frames, each containing three or more pounds of honey, 200 miles in July, in a Simplicity hive, with the loss of hardly a bee.

#### CLOSE-TOPPED SECTIONS.

I have become convinced that close-topped sections, or close tops to broad frames for sections, are a positive detriment, unless some convenient plan when they are used can be adopted for giving ventilation. My bees have no shade, except such as I can give them by some artificial means, and I find that the colonies storing comb honey would loaf outside the hive, while those that were storing in brood-frames in upper story kept busily about their work. Thinking lack of ventilation, and fear of melting down combs, was the cause of the loafing, I removed a brood-frame and spread the others out so they spaced evenly. In a few moments a decided change took place, and I then reduced the width of tops of brood-frames, and after that I had very little trouble of the kind. "One swallow does not make a summer," I know; but the hint was just as good as a kick to me; and hereafter I shall go in for open tops to frames and sections.

#### DO BEES REMOVE EGGS FROM ONE HIVE TO ANOTHER?

Since the arrival of Aug. GLEANINGS I put a frame

of comb containing some brood and honey, and a few eggs, into the upper story of a strange hive. I cut a small hole through the covering mat, about 2 inches long and one inch wide; laid the frame on its side over this hole; propped it up about two inches high, and there let it remain two or three days. The bees clustered on both sides the comb, as if desirous of keeping the sealed brood warm. They removed but a small portion of the honey, but did remove every egg in the under side of the comb, leaving these in the upper unopened. As both colonies are Italian, I shall not be able to decide whether these eggs were deposited in cells below or not, but have good reasons to think they were. This experiment does not prove that bees will rob a strange hive of eggs, but does certainly show that their wonderful instinct teaches them to preserve all the worker force they can, and that they reassembled the fact that they could better do so by taking the egg from the cold upper story into the warm brood chamber.

#### HUTCHINSON ON ALLEY'S NEW BOOK.

I read friend Hutchinson's *critique* on friend Alley's new book, and was amused at his statement (in substance) made after saying he had not given the method described a trial, that the manipulations detailed were so complicated, and caused so much labor and trouble that he would give up queen-rearing sooner than use them. Now, if friend H. had not given them a trial, how could he know any thing about them? Friend H., would it not have been more sensible for you to have given them a trial before setting the seal of condemnation on them? What say you? and, frankly, do you think that you, with your four or five years' experience only, are fully competent, without trying them, of passing in judgment upon the plans of one who, for twenty-five years, has made queen-rearing a matter of study and experiment? It is easy to condemn, but hardly fair to do so without evidence. Give any method, friend H., a fair trial; and if you don't view it favorably, give your reasons for an unfavorable criticism, and no one will find any fault; but to condemn a matter of manual manipulation without trying, is like condemning an accused without knowing the evidence against him. J. E. POND, JR.

North Attleboro, Mass., Sept. 1883.

When preparing our bees for shipment we do so in just the way you mention; and the Simplicity hive favors this by its construction. When making the pieces to go around the cover we sort out the poor strips and save them for frames for holding the wire cloth to put over the bees. You see, these strips bring the wire cloth about two inches above the tops of the frames; and where there is wire cloth over the bottom of the hive also, the bees can never suffer for lack of ventilation.—Bees do remove the eggs from the combs sometimes, but I have never been able to prove that they put them somewhere else in other combs. Some way I just got the idea that they ate them up only to get them out of the way.—I believe I agree with you, friend P., in all your points. I do not think that, as a rule, one should condemn any process who has not tried it; or, at least, he should not condemn it very vehemently. Our friend Hutchinson may have erred in the way you mention; but has not friend Alley erred in condemning lamp nurseries, while he says in almost the same sentence he never used one? I am asked to try a

great many things before deciding against them; but it is often impossible. Notwithstanding I am compelled to decline even giving the hive or process a trial, I think I am justified in deciding against it. Your remarks in regard to open ventilation and open-top sections seem to show that there is to be so wide a difference in this matter of ventilation that it will remain, like many other points, for a long time unsettled.

#### NOTES OF TRAVEL AMONG THE BEE-FRIENDS OF MICHIGAN.

BY OUR PROSPECTIVE ASSISTANT EDITOR.

I HAVE just completed a part of my trip among bee-friends in Michigan. Starting from home on Monday night I arrived at Cleveland on the same evening, and from thence took the steamer for Detroit. Here, according to previous agreement, I met friend M. H. Hunt, a man full of enthusiasm, and one, too, who makes bees pay. Anxious to see all that could be seen, we at once took a car for Otto Kleinow's, at the other end of the city. Reaching there my eyes were first greeted with a large and elegant flower-garden—one of the finest I have ever seen. After viewing this a short time we went, in company with Mr. Kleinow, to his apiary, which appeared to be well cared for. One thing in particular attracted my attention, and that was some very large Simpson plants. They had attained a height far exceeding any thing I ever saw before, and I have seen some pretty large ones too. Well, after having had a pleasant talk, Mr. Hunt and myself went back through the city again. At various places he pointed to me where his honey was kept at retail. Finally I inquired how many of these places he kept supplied with his honey. He replied, that there were about *sixty*, and that he had already put upon the market about two tons of honey. He has about as much more to come off the hives, and at this rate will probably have to buy more to keep pace with the demand.

But, to return. After seeing the city we started for Mr. H.'s two apiaries. Stopping shortly at the first we went on to the second, at his home. Both apiaries are kept in splendid order, and the bees were housed in very pretty chaff hives of Mr. Hunt's own design and make. At the rear of the barn was the horse-power, a modification of which was given in *GLEANINGS* a short time ago. Up to this time Mr. Hunt has made all his hives with this, and he says it works well too.

Next morning I took the train for Lansing, and from thence started on foot for the Agricultural College Grounds, about  $3\frac{1}{2}$  miles from the city. Unfortunately, however, I learned too late that this was during vacation; but on making some further inquiries I soon found Mr. Hershiser, a student of Prof. Cook in apiculture. In company with Mr. H. I visited the College Apiary, where, under Prof. Cook, the boys are taught bee culture at its present stage of advancement, together with the use and management of apian implements. From here we went to the museum, then to a large spacious hot-house. The grounds and every thing in general were kept in splendid order, and I must say that it is one of the finest places I have ever visited.

Not having much time to spare I returned back to

Lansing, where I took the next train for Flint. On arriving here I was duly informed that Rogersville, Mr. Hutchinson's postoffice, was from 12 to 15 miles out, and that the train would not start till 4 P.M. I also had the satisfaction of knowing that there was no stage line to this point, and that a livery could be had for \$3 00, when it cost only half that from Lansing to Flint. To wait all day in Flint when time was precious did not strike me favorably. Finding that a train would take me 4 miles of the distance, I took advantage of this, and walked the remainder. In due time I arrived at the "Banner Apiary," and found W. Z. Hutchinson at work in his shop. It did not take long to make his acquaintance, and we were soon engaged in matters pertaining to bee culture. The first thing that met my eye was that foot-power buzz-saw which he described in GLEANINGS a short time ago. Of course, Yankee like, I had to try it the first thing, and to my surprise it worked splendidly. With this he has made most of his hives and frames; and from the working of it I should judge it would do ordinary hive-work without much difficulty. In an adjoining room was his honey, which was put up in crates ready for sale. He, as well as Mr. Hunt, has a very fine lot of honey, and I understand they are to exhibit at the Detroit State Fair. They have both made great preparations; and from what has been seen already, I am of the opinion that it will be the finest display in this line that Detroit has ever had. Next Mr. Hutchinson showed me his lamp nursery, where he had a nice lot of cells. During the whole time I was there the nursery varied only one degree; and in that time, toward evening he had taken the lamp out about an hour to show me some things he wished me to see. After having had a very pleasant bee-talk with Mr. H. I took the morning train for the town of the Linswik sisters. Arriving there toward evening I soon made my way to "Our Clearing," situated in the midst of the forest. Located here was a very pretty frame house, at a place, too, where one would hardly expect any thing but a log-house. Although my arrival was entirely unexpected, I soon made myself known. Next morning we took a look through the apiary. Here were about 60 colonies of as fine and gentle Italian bees as I have seen. Although the season was somewhat backward in this locality, they had gathered quite a little honey. In this lot I saw some prize sections, which I think were the best I have seen while on my trip through Michigan. It seemed to me a little curious that these ladies could manage 60 full colonies; and yet they told me that no one else helped them, except to put the bees into winter quarters. This, then, demonstrates that women can handle bees, and make it pay too, though it is not all of them who are thus successful.

Manistec, Mich., Sept., 1883.

E. R. ROOT.

You see, friends, Ernest and I talked the matter over, and we concluded that, with over 6000 subscribers, GLEANINGS ought to have a traveling correspondent, or a traveling editor, if you choose, and so I suggested that he start out and send in notes of travel, and I think he has done pretty well; don't you? Well, along with his notes of travel he sent in some kind words that he did not intend for print; but as the JUVENILE is privileged; in the way of kind words, I think I will give it, after all. When we get our project started, we shall perhaps give notice where we expect to go, that we may be able

to call on the friends who would be especially glad to see us. But for the present, Ernest must go back to school, and I shall have to shoulder the editorial and factory work until the boys complete their education. I say *boys*, for there are several of them who are going through college with an especial view of fitting themselves to assist in the management of the "Home of the Honey-bees." Here are the kind words. You see, they did not all come from Ernest himself.

*Dear Father:*—I have had a most splendid visit among the bee-friends. Everywhere I received the most cordial welcome, and that, too, from friends whom I have never seen. I never realized before what it was for you to have so many friends. Just as soon as I mentioned your name they knew me right away. Everywhere I stopped I have felt perfectly at home. The ideas that I have gathered since being away have been of great value to me. Inclosed you will find an account of my travels. I have not sent my notes along as soon as I had expected; but the fact is, I have been just as busy as a bee, and it has not been till I arrived at Aunt Sarah's that I have had time to write them up.

Your son,— ERNEST.

---

#### DEPARTMENT FOR THOSE WHO SAY GOODS WERE NOT THERE.

---

I RECEIVED your shipping-bill of goods on yesterday, and went for the goods to-day. The bill was all right as I ordered, but I could not find the circular saw, which I sent for. Every thing else is all right, so far as I can see. I suppose it was a mistake in packing the goods. I hope you will send it, and the cheapest way. CHAS. MATTHEWS.

Fredericksburg, Ohio, Aug. 18, 1883.

On receipt of the above we had the proper clerks hunt up the whole matter; and when they found it was the foreman of the packing-room who put up the goods, they wrote as follows:—

*Friend M.:*—Your goods were put up by our most careful clerk—one who rarely makes mistakes. He states that he put the saw in the last thing himself. We can not but think, friend M., that the saw must be in the pkg. We think, if you will again look carefully, you will find it.

After a few days we got the following:—

I have found the saw. I did not unpack the boards at the time I got the package. I found the rabbits, queen-cages, and cards all together, and I supposed the saw was forgotten.

Fredericksburg, O. CHAS. MATTHEWS.

Now, friends, this is a small matter, it is true; but we have to keep constantly two pretty good clerks hunting up correspondence, adjusting just such complaints as this. And a great many times it happens as above, just because the one who unpacked the goods was heedless. I admit, we have some carelessness here; but when the one who sent the goods, and the one who gets them are both careless, you see it makes a heavy bill of expense. Another thing: how can I very well ask a clerk to pay for his mistakes, with these cases in view? Perhaps if I keep this department constantly before you, it may help all to do better.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Off, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chief's amang ye, takin' notes;  
An' faith, he'll prent it."

DO you want to know about that baby again, my little friends? Well, he is big enough now so he can sit up in a clothes-basket, and Caddy and Connie have just been carrying him around the house by taking hold of the handles of the basket. Well, he enjoyed the fun amazingly, as long as they carried him about; but when they put him down he would grunt and scold, as I have told you. Well, Caddy came to her mother one day, and, said she, "Why, mother, just see what an ungrateful little fellow he is. We have carried him around until our hands ached until we could hardly stand it. And when we set him down he just grunted and scolded!"

What do you think about it, little friends; is his ingratitude so very unusual? No doubt your mothers or your older brothers and sisters have carried *you* about until their wrists ached, and backs too, perhaps. But instead of being thankful, you looked cross, and grumbled and complained. I wonder if you are looking happy and pleasant, and feel thankful for what has been done for you. How is it, my little friends, are you looking pleasant *now*? Suppose you take a look in the looking-glass, and then write me how that face looks that you see in there. And that reminds me, we have a great deal of fun in holding baby up before the looking-glass. I carried him up to the glass the other day; and when he saw me in the glass he laughed and began to "coo." That set me to laughing, and Maude came up. When he saw her he laughed and crowed more. Then came mamma, and he gave her a greeting, and the same with Blue Eyes. Then *his* great blue eyes opened wide in astonishment. He looked at the crowd in the glass, and then he looked at us, and his crowing and merriment all at once changed to astonishment and then to fright. How *could* it be, that there were *two* whole families? Even though his little life spans only a few brief weeks, he has learned some things by experience. He had found out what a loving little circle God had dropped

him into, and he had learned to know his brother and sisters, and father and mother. But he had not yet had experience in looking-glasses, and he finally rolled his eyes in such a fright that we were obliged to take him away and pacify him.

Poor little Peter! With his baby sense he doubtless thought he had learned pretty much all there is in this world; and when he ran against this big problem of looking-glasses, he was frightened, because he could not solve it. Now, little friends, our baby's memory goes back perhaps not to exceed eight or ten weeks. You who can remember eight or ten years feel old and wise in comparison; and some of us who can look back and remember forty years, or even more than that, think we are *very* old and wise; but is it not likely that our span of life and experience is but as an infant's, compared with the great eternity yet before us?

Except ye be converted, and become as little children, ye shall not enter into the kingdom of heaven.—MATT. 18: 3.

#### HOW JOSEPH GOT A SWARM OF BEES.

My pa has 23 swarms, and I have one. Last summer, one noon when pa ate dinner I watched the bees. He told me if a swarm came out they should be mine. Out came one! They alighted on a peach-tree right by a hive, so I got a swarm of bees.

Homer, Mich.

JOSEPH BENHAM.

My pa has got 5 colonies of bees; he had 7, but two colonies died. Pa has an extractor of your make. He got it of Mr. Scovell. He is very much pleased with it, although he has not extracted very much with it yet. I go to Sunday-school every Sabbath at Sparta.

NELLIE GORDEN.

St. Joseph, Mo., June 15, 1883.

#### HOW JAMES SPENT HIS FOURTH OF JULY.

My pa has 151 colonies. I help him very much; I have sat three or four hours at a time, wishing that a swarm would come out, for I do love to hive them. I stayed home almost all day the Fourth of July helping my pa. JAMES T. LEFFINGWELL, age 13.

Nonewac, Wis.

Pa had a swarm of bees to-day. The bees that were in the cave wintered the best. Our school is out now. We have taken off 3000 lbs. of honey. We have 124 swarms of bees. EVA L. FARRINGTON.

Strawberry Point, Ia., Aug. 1, 1883.

Can't you tell us a little more about that cave, Eva?

#### HONEY FROM COTTON.

I have three colonies of Italian bees in the Langstroth hive. I have been reading the JUVENILE and GLEANINGS for some time to give me knowledge about bees. My bees are in good order, and working on cotton-blooms, and I think on sunflower too. My brother has three colonies, and my sister has two colonies of bees. Pa helps us attend to them.

HOWARD GRANBERRY, age 13.

Austin, Texas, Aug. 4, 1883.

#### HARRY AND HIS FATHER.

Papa has 6 swarms of bees in chaff hives, and two in box hives. I should like to see your mill where you make bee-hives. I suppose you have a great many swarms of bees. Papa got five bee-hives from you. He and my brother have been making chaff hives. Papa has a little mill, and he turns it with

horse-power. He says he likes to work with bees, and when he looks at them I like to be with him, so that I can see the bees and the honey.

New Town Mills, Pa. HARRY B. DATTERER.

#### HONEY FROM THE WAX-PLANT, AGAIN.

Pa has 40 colonies, and has taken, this season, 1800 lbs. of comb honey in one-pound boxes, and 800 lbs. extracted. He makes his own hives, and my brothers, Milton and Willet, and I help put the frames and sections together. One of our neighbors has a large wax-plant, and nice white honey comes from the blossoms, and drops on the floor. I have heard that the Italians were not as cross as the blacks; but ours are very much worse. VERNON W. TRAVIS.

Lyons, Wal. Co., Wis.

Please don't tell any more such stories as the one about the bees taking *all* the cider away, because— I think you had better call that rosy-posy, dimple-darling baby-boy "Peleg." It is almost like "Peter." I think you had better put his picture in the JUVENILE. BERTHA HALLETT.

Galena, Ill., Aug. 22, 1883.

Why, Bertha, I should be glad to put the baby's picture in the JUVENILE, but I can not find any engravers who can make good pictures of babies and little folks. If any engraver should see this paragraph, I wish he would send me a specimen of his work.

#### MAKING A CAPON DO DUTY FOR RAISING CHICKENS, SEE PAGE 419.

You are right about the purpose. It is so that the hen can go right to laying. The object of pulling off the feathers, and washing him with salt and water, is to make him smart, so that, when the little chickens are put under him, they soothe and stop the smarting, and make him cluck and like the chicks. If he doesn't cluck, he won't take the chickens. As soon as you hear him cluck you may be sure he has taken the chicks. In the morning, give them a little feed; and if he is a good capon he will call them just like a hen. J. P. ISRAEL, JR.

Point Loma Light-House, Cal., Aug. 18, 1883.

#### WHITE POLLEN FROM PLANTAIN; PROPOLIS FOR SEALING FRUIT-CANS.

This is to let you know that I like the book you sent me. It is the Giant-Killer. I didn't expect such a nice book. Mother says it is the best one of the kind she ever read. I thank you for it. Our bees gathered white pollen from plantain. Mother sealed up the cans of currants with propolis that we scraped off the sections. When our bees swarmed, mother was sick, and I helped father hive them. I like to work with the bees. Our two old colonies threw out seven swarms. We put the two last ones together, and one went in with another. That made five out of seven, so we have seven in all.

INA HUNTER, age 10

Kendallville, Ia., Aug., 1883.

#### HOW GAIL BUILT UP A LITTLE COLONY FROM A SWARM AS BIG AS YOUR EYST.

Since I wrote to you, God has given me another darling little brother to love. He is eight months old, and his name is Clyde Ellwood. He is pretty, and cunning as he can be. I think that Glee, Artie, Otto, are nice names for little boys. Perhaps you would like Jesse Dell, or Ray. Pa has 154 colonies of bees, and they are doing well for the season. I like to watch the busy bees as they gather their

stores of honey. I found a cluster of bees about as big as my fist, on an apple-tree, on the first of July, and they are now on six frames.

GAIL B. CROWFOOT.

Bloomington, Mich., Aug. 23, 1883.

#### SOME POETRY ABOUT THE HONEY-BEE, BY A JUVENILE 13 YEARS OLD.

I am at present with D. E. Best, and read the JUVENILE. I saw nice letters and poetry, so I thought I would compose a few verses. We used to have bees, but sold them to Mr. Best, who has 105 boxes, all in nice trim.

#### THE LITTLE FAIRIES.

I was in the apiary  
Picking up a new section,  
When something like a fairy  
Strang, strang just to perfection.  
Down I grabbed, but just too late;  
Down I threw the little box;  
I no longer now could wait;  
Home I ran, just like a fox.  
I scratched and scratched all the night,  
But it swelled; it swelled the more,  
And my leg it was a sight,  
Greater, greater than before.  
Children, can you tell the name  
Of all these little fairies  
(And they are not always tame)  
Who live in the apiaries?

FRANK KINSEY, age 13.

Bests, Pr., Aug. 20, 1883.

#### BEEES ON LILACS, ETC.

A swarm of bees came off the 30th of June. They circled around a few minutes, and went in with another swarm that father had hived the day before. They didn't cluster at all, and we thought perhaps they had that hive already picked out to go into, as it had been standing about 20 feet from the hive they issued from, for some time.

I saw our bees working on the lilacs. They are black bees.

We wintered 4 colonies in the cellar. Three of them came out heavy with bees and honey. The other was a small late swarm. We fed it part of the winter. The bees looked bright and nice when they came out of the cellar; but we had a good deal of cold wet weather in the spring, and they kept dwindling away till they were all gone. One of the others became queenless. When we noticed it, mother put a frame of brood in with them, but they didn't raise a queen. Father put the first new swarm in with what was left of them.

Horsemint is in bloom; the bees are not working on it yet. There is no basswood nearer than three miles. A "cosset" lamb means a pet lamb.

Kendallville, Ia. LOVINA HUNTER, age 12.

#### BEEES THAT CARRY FLOWERS.

On page 457, August GLEANINGS, friend Corbett speaks of wood-bees carrying leaves, which, of course, is nothing new. But, to the subject. As I was taking my usual round in the apiary to-day, I noticed one of my Syrian colonies carrying something in their mouths that looked rather strange. On going closer I caught some of them and took an observation of their loads and found them to be blossoms from the teasel, and they were not inclined to drop their freight either, as I had to wrest it from them by force. This can be proven, as one of my neighbors was with me at the time, and noticed the same. Now, Mr. Root; the query is, What was their object in carrying those flowers into their hives? A. S. LINDLEY.

Jordau, Ind., Aug. 7, 1883.

Why, friend Lindley, it must be that your

bees have got some nice little vase set up somewhere on some brackets inside the hive, and they are carrying in the posies on purpose to have a bouquet to make their home kind o' cheerful like. How is it, children? Do you suppose that bees like to see flowers standing around in their hives, especially on rainy days, when they can not go out to gather honey? Who can tell us more about this matter?

FROM 10 TO 32, AND 600 LBS. OF HONEY.

My pa had 10 stands of bees in the spring, which have increased by natural swarming to 22. He had a great deal of trouble with them, it being the first year he ever kept bees. But he has subscribed for the bee journal, and thinks he can do better with them next year. Pa took out about 600 lbs. of honey, and sold some of it. I help pa swarm the bees in the summer time. This is my first letter to you.

Wyoming, Ill. CORA JARMAN, age 12.

Pa has 200 colonies of bees. He is a bee-keeper and honey-producer, and raises tons of honey. He winters his bees in the cellar, except a few which he has on their summer stands, unprotected, to experiment with. He has kept bees for about 30 years; but on the improved plan, for about 12 years. My brother helps pa with his bees, and takes GLEANINGS; and as the JUVENILE comes with it, I like to read it.

MARY M. BULL, age 12.

Valparaiso, Ind.

#### WHAT AILED THE QUEENS?

My papa has 49 swarms of bees, and we have had lots of honey this summer. Quite often I smoke them for him when he takes honey off. As all the others seem to tell about their homes, perhaps I might as well too. We have a nice large orchard a little way from the house; my sister and I have just returned from picking apples. We have plums, grapes, choke-cherries, and long blackberries in our orchard. Papa had one swarm which was queenless, and upon examining it he found the young queens had dried up in their cells, and would like very much to know the cause.

FLORENCE WESTOVER, age 14.

Frelighsburg, Canada.

I am sure I can not tell, Florence, why the queens dried up in the cells, unless it was because the colony was too weak to raise a good live one.

#### CATCHING BEES ON THE WINDOW, WITHOUT GETTING STUNG.

I saw in Mrs. Harrison's letter that she wants to know how many could take a bee off the window and not get stung. I can, and I think almost any one could.

NANCY E. CHAPMAN, age 13.

Smoky Valley, Ky.

Well, now, Nancy, I am afraid you are not quite right about this matter. I have seen a great many people try to pick the bees off the window, and not get stung, and I do not now remember of seeing anybody do it, although I do it very often. I take hold of both their wings, and then I can carry them to the door without any trouble. I do not hurt them, and they do not hurt me. I should like to have you little folks learn how to do it, because it saves the life of a bee, besides keeping the room tidy. Who wants to see dead bees lying around on the window-sills? I am sure I do not.

#### DO THEY CHOOSE A LOCATION BEFORE SWARMING?

Pa's opinion is, that some do and some do not. Neighbors here have known bees to stay on the shore of Lake Erie, hanging on a bush for a week, apparently starved. Another neighbor's children followed a swarm that was flying over to the bush, and saw them enter a hollow elm-tree which they afterward cut down and brought home with the bees in it. Pa had a hive of bees stolen this year.

Merlin, Ont., Can. FANNY GRAY, age 13.

I think your pa has got it about right, Fanny. Perhaps their natural instincts prompt them to select a locality when all things are favorable. But they doubtless oftentimes swarm when they have not made previous arrangements.

#### THE SUPERINTENDENT WHO USES TOBACCO.

Here I come again, after another book from your wheelbarrow. Gail and I go to Sabbath-school. Our superintendent uses tobacco. I think that tobacco song is just the thing. Kiss cousin Peter for us. Gail forgot to tell his age, which is ten years. I am eight.

ROY R. CROWFOOT.

Bloomington, Mich., Aug. 31, 1883.

My little friend, it has been said, that "murder will out;" and here we have it right it print, that the superintendent of your Sunday-school uses tobacco. Now, I hope if he ever sees this he will conclude that it ought not to be, and will set a better example before the little boys of his school, and also cease it because the girls feel sorry to think that their superintendent is a tobacco-user.

#### BLACKS AND ITALIANS.

We have 14 colonies—4 in Langstroth hives, and 10 in American. Pa is a carpenter by trade, and is away all summer; and when the bees would swarm, ma and I would have to hive them. We have kept bees about two years; we had a hive of blacks last spring, and bought five colonies. We are wintering our bees in the cellar. Pa had a new cellar dug for the bees last fall. Two swarms left us—one black and one Italian. The black bees wouldn't stay. Ma and I tried to hive them, but they would not go into the hive; but we didn't care so much if they did go off, because we don't like them as well as the Italians. The blacks swarmed twice. The bees we bought were the Italians. Pa clipped the queens' wings so they would not go away. When the bees swarmed, and I found it out first, I would call to ma, and say to her, "The bees are swarming! come, we must hive them." And she would say, "Let's hurry and get ready, and get our veils and gloves on;" and when she or I would see the queen she would say, "There she is! catch her quick, before she gets away," and she would hold the cage, and I would put the queen into it. I thought that was the best part of the hiving—to catch the queen. I think she is the best bee there is, because she doesn't sting. When the blacks swarmed, one came and stung me on my lip, and it hurt so that I didn't like the black bees; but I like the Italians. We have sold 175 lbs. of comb honey, and 125 lbs. of extracted.

SUSIE BERNSCHEIN.

James'own, Wis., Jan. 20, 1884.

#### AN ESSAY ON THE POPLAR-TREE.

I will tell you something about the poplar-trees in this county. They grow very large—some of them five feet in diameter, and 75 feet to the first limbs.

Papa told me that he counted the growth of one in Fayette County, Ind., that was 240 years old, and 6 feet in diameter. They bloom from the first to the 15th of May, and last usually from one to three weeks. The honey is very rich and thick, but rather dark. The bloom comes before our bees get strong enough to store much surplus, and I think it would be better for bee-keepers to feed their bees six weeks before the poplar blooms, where it grows.

Galena, Ill.

FREDDIE L. CRAYCRAFT.

Well done, old friend Freddie. I thought before I got through with your letter it must be written by some one who is an old friend, if I may be pardoned the expression. Now, if our young friends will take to writing up honey-bearing trees in the way Freddie has described the poplar, it will be a fund of quite general interest and importance.

## ANOTHER REMEDY FOR THE CHICKEN CHOLERA.

Here we are again. The bees are all right. I got 3 stings one day on my head. I have some white chickens. Bleeding under the wing is good for chickens and turkeys when they have the cholera. My brother has a nice watermelon patch. Don't you think it nice? My mother is staying with my grandmother, so I have all to do. If you like, you may name Peter, Lovin Robert, or Willie Wintry. Shadwell, Va.

JULIA A. GRIFFIN.

Friend Julia, did you not know that it used to be a fashion to bleed people for almost every thing that happened to them? Well, this plan of bleeding has passed away, or at least pretty nearly so, and I do not believe bleeding chickens will do them much more good than to bleed human beings. When chickens have the cholera they generally need all the blood they have got.—Thank you for the picture you sent to Peter. I do not see but that he will have to be called Peter still, even though a great array of names has been sent in for him.

## HONEY FROM BASSWOOD ON THE 15TH OF AUGUST.

My uncle's bees are getting along well. He has 14 swarms now. We had 3 swarms all on one day, and I thought I would get tired of them. The bees are busy gathering honey off the basswood-trees. They are just out in bloom. We had some swarms go back to their old box after they swarmed, and come out again the next day and swarm, and be all right.

BELLA FRASER.

Campbellville, Ont., Can., Aug. 15, 1883.

Friend Bella, you have given us quite an important fact, although I suppose you did not know it, and that is, that we may get basswood honey in Canada as late as the middle of August; and I firmly believe the time will come when bees will be moved from Florida to Canada, just to keep pace with the basswood and clover bloom. We have got now the latest period that basswood blooms in the North, and we should be very glad to have some of the friends in the South, tell us *how early* they get basswood honey. Who will tell us?

## 20½ LBS. IN A DAY FROM A SINGLE COLONY, REPORTED BY A JUVENILE.

We had one swarm on a pair of scales that gained 20½ lbs. one day in basswood time, and they gained over 10 lbs. a day for three weeks, and lay still some of the time for want of storage room. They were

Italians. Pa has 80 swarms and I have have three — one in a chaff hive; and from that one we have extracted twenty dollars' worth of honey. Pa will get about 3000 lbs.—2000 lbs. extracted, and 1000 in sections; the most of it from basswood. He would have got more, if he had not burned his eye. He has extracted from 14 hives. We had 40 hives with bees in them at the beginning of the swarming season, so you see we have doubled our number, and they have filled up well. The honey season is over.

Pa never had a cigar nor a chew of tobacco in his mouth, and he is 46 years old; and he never drank a drop of liquor. I am never going to smoke nor drink.

WILLIE H. DARLING, age 14.

Lincklaen, N. Y.

Why, my little friend, your report is a rousing good one. I am glad to know that you are going to follow your father's example in regard to cigars and tobacco; and, by the way, I think there is a pretty good sermon right here. If fathers want their boys to be clean and temperate, let them set them a good example.

## HATCHING QUEENS IN AN INCUBATOR.

I read the account, of how Mattie's father hatched queens, in the Jan. number of GLEANINGS of this year. Two years ago papa had a lot of queen-cells nearly ready to hatch. It was early in the spring, and the weather wouldn't remain clear long enough for papa to make his nucleus. He didn't want to lose his queens, as they were from fine Italian bees; so he got a piece of soft pine board, about 2½ inches wide, and bored holes nearly through it, edgewise, at an equal distance apart, so as to saw between and separate them. He then bored at right angles across the previous borings, through the block, and nailed wire cloth on both sides, and put a cork in the opening. He then cut the queen-cells out, and put them in the cages, so they could gnaw themselves out easily. He then placed them in an "Eclipse" incubator, with three hundred eggs, and the most of them were saved. A few corks got out of the cages, and papa found some of the queens crawling among the eggs. He had to make some of his nucleus swarms, and introduce queens, between showers. The showers come and go quickly in the spring, and bees fly here directly after a shower, and the weather is nice while it lasts. EUNICE A. ENAS, age 13.

Napa, Cal.

Yours is a tiptop letter, friend Eunice. You demonstrate that an incubator will answer nicely in place of a lamp nursery. How much will the incubator cost? You have given us some very important facts, and have told them very nicely.

## A STORY ABOUT A QUEEN.

We have four colonies of bees; they are working very hard. We have extracted 150 lbs. of honey from three colonies. I carry the frames to and from the hives. The queen, we got of you; we introduced her according to directions, and two hours after we let her out, the bees balled her. Mrs. Gillam took the ball on a sick near the house, where it is sandy. As soon as she got the queen loose from them she flew away, and she had only the empty cage left, and looked as though she had lost a dear friend. In a minute or more she heard a peculiar buzzing, and, on looking up, saw the queen circling around her hat. She caught her in her apron, took her into a closed room, and the queen flew against

the window. She re-caged her, and put her in the hive again, and in 24 hours they gnawed her out. We are proud of her; she keeps the hive full of bees. I am learning a few things about their wonderful ways.

ZELLA CUTTING, age 14.

Courtland, Ont., Can., Aug. 25, 1883.

IDA'S LITTLE BEE-HIVE THAT HER UNCLE HENRY MADE.

My uncle Henry called to see us, and made a box, or nailed 4 boards together, and called it a bee-hive. He made a bottom to it, and just set it on a board, and made light frames for it. He and my pa broke one of the bee-boxes open, took the honey-comb, and tied it in the frames with wire, and put it in the box he made for the bees. All went in and fastened the comb to the frames. Uncle gave us children a heap of things. The bees did not sting any but my brother Frank, for he was afraid of them. He says you give little girls and boys a pretty book. I live away off from any big town, and can not write very good letters; but I like pretty books as well as any little girl in town.

IDA D. WOODSIDE.

Garman's Mills, Pa.

BEEES IN OREGON.

I live in Oregon with my papa, mamma, and three sisters. We moved to this place two years ago. When we came here we didn't have any bees. About three months ago pa found a swarm in the field. It was about noon when he found it, so he took a sheet and threw over them till evening, when he took a hive and smeared it with syrup, as we had no honey. He then put it close to the swarm. Early next morning he took some mud and blocked the entrance, and carried the hive up into the yard, and put it in a warm corner. I have been watching them anxiously, and see they have filled the lower story and half of the upper. Papa thinks that buck-wheat makes the best honey. The honey that is made of the honey-suckle is a little sour, and has a touch of bitterness.

LENA LORENTZEN.

Denmark, Oregon.

A VISIT TO FRIEND DOOLITTLE; A HINT ON AUTOMATIC SWARMING.

Last spring pa had 56 colonies of bees; now 125, and many of them are in Simplicity and chaff hives. Some of the bees in box hives are making more honey than those in frame hives. Pa went a short time ago over 100 miles to see Mr. Doolittle and his bees, and came back pleased with his visit. A man near here had two hives of bees sitting quite close together on a plank; one of them was a small swarm, and the other very strong, and a large portion of the bees left the strong colony and went in with the smaller one. The strange part of it was, they did not fly, but just walked on the plank from one hive to the other.

NINA ROTHWELL, age 11.

Austinville, Pa.

Thank you, Miss Nina, for the important facts you give. I know bees will sometimes occupy a hive sitting close to the parent hive; and I have been told they went in on foot, as you describe. Now, who can invent a way to get them to do this every time, without swarming out in the air?

SOME FACTS AND SOME QUESTIONS FROM A 9-YEAR-OLD BEE-MAN.

I am all the baby papa and mamma have got. I bought a colt of papa last summer. I value him very highly. He is a sorrel, with a white stripe in

his face. His name is Tinker. I go to Sabbath-school. We have been having Advent meetings. Which do you think is the right day to keep? I don't want you to think I am an Adventist because I ask this question. My uncles, Bright Bros., keep a good many bees. Their apiary and bee establishment is about  $\frac{1}{4}$  of a mile from where we live. They make lots of little boxes, which make nice playthings for us little folks. They cage their bees up like canary birds, and send them off to sting folks. I guess I like the honey better than the sting of the bee. Please tell me how it is with you.

Mazeppa, Minn.

CECIL BAUGHTON.

And so, friend Cecil, you think our friends Bright Brothers send off the bees in those boxes that look like bird-cages for the purpose of stinging folks, do you?—In regard to which day is the proper one for Sunday, it seems to me if none of our people were guilty of any worse sins than making a mistake in regard to which day should be kept sacred and holy, I think we should be pretty near millennium. I should by all means advise keeping that day as the Sabbath that is generally kept by the people in whatever country I was in. "The letter killeth, but the spirit maketh alive."

FROM 5 TO 1, AND THEN FROM 1 TO 5 AGAIN.

Our bees did not winter very well. All of them were alive when we took them out of the cellar, but not very strong. Some way or other they all died but one, and they went through the rest of the spring all right. We have now 5 good stands from that one. Isn't that pretty good? One swarm came out early Monday morning and settled low on a quince-bush. The swarm was about two feet long and about six inches through. We could just set the hive under them. We had five stands last fall, and now we have five this fall. I do not know whether we shall prosper very well or not. We wanted to move a hive the other day with the top box off, and pa picked up the lower part to where he wanted it, without veil, and he said that you could not have got him to do that last summer for five dollars. He said if he had a veil over his face he was not afraid of them. I go out among them, and never get stung. I never had a veil over my face about the bees. I do not do much with them, though, but I expect to be a bee-man some day. Do you think bees that swarm the last of August will make enough honey to keep them through winter, if they have no queen? We have not looked in the old hive for a queen yet. Our bees seem to be bringing in lots of honey and pollen. They seem to be working on smartweed now. Pa thinks it is too late to transfer the combs to Simplicity hives. Pretty nearly every one around here keeps bees. Two of our hives have glass in the back, so we can look in. I went out to one of the hives to-day, and took away the board we had over the glass, and the bees did not come about me any; but I went to the other hive, and they did not like it very well. They came around the hive and told me to get out of there, and I did; but they did not sting me, though. What makes the bees go off and leave no queen? ours did.

WALTER G. COMIN.

College Springs, Ia., Aug. 23, 1883.

Friend Walter, I do not believe the bees do go off and leave the queen. The queen oftener goes off and leaves the bees. But if

your hives are properly looked after and cared for, there will never be any queenless stocks. Your little story is a pretty fair type of the way bee-keepers often manage.

ERNEST'S STORY ABOUT THE EDUCATED CAT.

I thought I would write you a letter about bees. I am sorry to say that the honey crop was not large this year. The hot dry winds we had in June cooked the blossoms.

My father has about 120 stands of bees. He had 7 stands melt down this season. He got only 3600 lbs. of honey.

My mother has a cat that will drink milk with his paw. When we put milk in a little cup he will drink with his nose until he gets it drank down so low that he can not reach it with his nose, then he will put his paw in and get it covered with milk, and then he licks it off from his paw. ERNEST HILTON, age 10.

Los Alamos, Cal., Aug. 22, 1883.

Thank you, Ernest. I would go several miles to see that cat lift up milk with his paw. Your story is well worth a book. I like to know of these queer tricks of domestic animals, on several accounts. One is, that it seems to give us a better understanding and comprehension of them. We know them better, you see. As civilization progresses, we steadily gain in our knowledge, not only in regard to bees and their habits, but also of all animated nature round about. There is now in our land an organized society "for the prevention of cruelty to animals." They have such a society in San Diego, Cal., and my brother is president of it; and every few days he writes to me something about what they are doing for the sake of the poor dumb brutes, and especially about the efforts they are making to render their lives happy. And is it not a grand and glorious work, to study the ways and means of adding to the comforts and happiness of these poor mute friends of ours? When I think of it, it makes me like cats and dogs and horses and cattle and chickens and bees. Yes, and while I think of it, it makes me like little babies too. Do you not believe that? And the great and final end of it is, that it gives me a greater and wider and grander love for God, who, in his infinite mercy and goodness, *made us all*.

BIBLE VERSES, ETC.

As you are such a friend to children, I should like to be among them. Father keeps bees, and has two bee-yards — one at Pendleton, and one at home. One yard has about 170 hives, and the other has 80. In answer to Jesse Gully's question, "What is the least verse in the New Testament, and how many words does it contain?" I answer, "Jesus wept," John 11: 35. I also ask, "How many times does *and* occur in the Bible?" MARTHA MOFFATT, age 13.

Riceville, Ont., Can., Aug. 27, 1883.

Friend Martha, it is an excellent idea to become conversant with the Bible. But I do not believe I would take very much time in trying to find which is the least verse in the Bible, or to see how many "ands" three are. The Bible was written for us, to guard us against evil and sin, and to tell us of God, and to let us know what he would have us do. Some time ago I found a friend in jail, and I earnestly recommended him to study

the Bible. One day I was very much encouraged to hear him say he had read the Bible more since he had been in jail than in all his life before; but on questioning him a little further he said he read in some paper of a prize to any one who would find some little thing in the Bible, I have now forgotten what, and he had been reading this book day after day for nearly two weeks, hoping to get this prize. So far as I could learn, his Bible-reading had not made him a bit better; in fact, it made him seem to slide over every passage that ought to have sunk deep into his heart, and shown him what a sinner he was in the sight of God. Now, reading the Bible, of itself, does not necessarily make anybody better. I am not sure but that it may make them worse, under some circumstances. It is the *searching* of the Scriptures with an earnest desire to make our hearts clean in the sight of God, that we want to do. Will our little friends try to remember this when they search the Scriptures?

LETTING BEES CRAWL INTO THE EAR — A CAUTION.

My papa brought 15 colonies of bees from Maryland to this place about the first of May. They came to Blairsville, about a mile from here, and they had been handled so roughly on the cars that bees were flying from nearly every hive. Papa took them outside of the depot, and tore off the wire cloth from the entrances, and gave them a good fly, as it was the only way to save them. A great many people were stung in passing the hives. The next morning, papa nailed up the hives again and brought them over here. So many bees flew away that they were nearly all very weak, and did not do well this year. We shall have only about 200 lbs. of comb honey. We increased to 25 colonies. Our bees did not swarm until the basswood bloomed, and then just as they got to work nicely in the sections they swarmed, and then all work ceased in the boxes.

I must tell you a strange story about my little brother, 5 years old. He was standing near the bees, when one stung him on the cheek, near his ear, and the bee, in twisting around to get the sting out, saw the hole in the ear, and crawled in. Papa pulled it out. Now, there was nothing strange about that; but what follows is what we think so curious. In less than a week he was playing near them again, when another bee stung him near the same place, and then popped into the same ear. My brother is so much afraid of bees now that he will not go near them; and if he hears a bee buzzing, he claps both hands on his ears and runs away.

CORA MAJOR, age 10.

Cokeville, Pa., Aug. 25, 1883.

Friend Cora, I know what it is to have a bee crawl into my ear. I wrote about it to the bee-folks a few years ago; and I told you that, when a bee comes buzzing about my ear very close nowadays, I am a good deal like your little brother five years old. I think bees are more apt to crawl into cavities in one's clothing, or get into one's ear, when the weather is rather cool. When a bee is partially chilled, he seems to be apt to crawl into places that seem to be quite warm; and the human ear is in some respects like the cell in a honey-comb, only it is much warmer. When a bee gets into your ear, you had better poke him out about as lively as you can.

## FROM 3 TO 8, AND 300 LBS. OF HONEY.

My father has 8 stands of bees. He had 3 last summer, and they made 300 pounds of honey and swarmed 5 times. Father made them a house to live in. This is my first letter. ELMER OTTOWAY, age 11. Flushing, Mich.

## MOLASSES MADE OF WHITE SUGAR.

I go to school. I like my teacher very well. My pa has 6 hives of bees. He keeps them in the cellar in the winter. Our bees like molasses made of white sugar. Pa takes GLEANINGS, and he likes it very well. Do I deserve a little book for this? Atwater, O. ALLAN MYERS.

## THE BABY THAT CREEPS BACKWARD.

When I wrote to you before, my little sister was 7 weeks old, and now she is 7 months old. She creeps backward (but her eyes are not black), and can almost stand by a chair alone, and push it along.

MINTA F. MISER.

Minta, I should really like to see a baby that creeps backward.

## THE MOON CHILDREN; 40 LBS. OF HONEY IN 3 WEEKS.

I have been watching the bees. One of the new swarms made 40 lbs. in boxes in 3 weeks. We had 12 swarms of bees; we have got 27 now. I have two swarms. BENJAMIN J. MOON.

My brother Bennie has 2 swarms of bees. He had 3 swarms; but one died in the winter. We sell honey at 25 cents a pound. There were 3 swarms came out yesterday. INA MOON, age 11.

Youngstown, N. Y., July 20, 1883.

## A NOVEL PLAN OF HIVING BEES; BY A 9-YEAR-OLD BEE-KEEPER.

I THOUGHT I WOULD TELL YOU HOW PAPA HIVES HIS BEES. HE SETS THE NEW HIVE BESIDE THE OLD HIVE, AND WHEN THE BEES COME BACK HE THROWS A BLANKET OVER THE OLD HIVE. LEORA M. FAYLOR, AGE 9.

SUFFIELD, OHIO.

Very well done indeed, Leora. You see, we have given your letter just as you wrote it, right out. The plan you mention may be of value to a great many bee-keepers.

## A BEE'S COMPOSITION ON BEES.

The bee is a very independent creature. It asks no quarters, nor gives any. It sets up a kingdom of its own by electing its own king and queen. They then become rulers and governors of their own kingdom, by making such laws as to unite them together in one band of unity. After being organized, they put their sentries, or guards, out on duty to watch in case of danger for the enemy's approach. Being satisfied that peace reigns within and without, the king and queen consult together about the manner of building their house. Having formed their plans for the same work, they call their family together and send them out by twos in search of such material as will complete the structure of said buildings. FERDIE LANGSTAFF.

Indianapolis, Ind.

Pretty good, Ferdie; but I am afraid there is more poetry than truth in some parts of your composition. I should not wonder if some day you would make a Fourth-of-July orator. But if you will excuse the liberty I take, I would suggest that you study up the subject a little more carefully.

## THE HONEY WAS NOT OLD ENOUGH.

Our bees are getting lots of honey now. I have one swarm. We have extracted some honey, but it doesn't taste well. I guess it is not old enough yet. Linn, Ia. WILLIE GRANT WRIGHT, age 14.

Friend Willie, I am inclined to think you did not leave your honey in the hive long enough, so it would ripen thoroughly. Better have it mostly capped over before you throw it out.

## 23 STANDS OF BEES AND 600 LBS. OF HONEY.

My grandpa has 23 stands of bees. He has taken 600 lbs. of honey this year. He has taken GLEANINGS five years. I like honey. I am a little crippled boy, 12 years old. I walk on one crutch. Pa has to take me to school. I can walk to Sabbath-school every Sunday. It is a quarter of a mile. I have only one brother, 7 years old. I live in the country. This is my first letter to the JUVENILE. El Dorado, O. CHARLES H. COBLENTZ.

## THE ASTER AS A HONEY-PLANT.

Grandpa has two hives. Pa is a preacher, and sells Bibles. A school miss has just been here and bought 22 five-cent Testaments for her scholars. Grandpa did not get any honey this year. He had no extractor. We have a great deal of the aster weed, from which bees make a great deal of honey. It blooms in the fall. They make more honey from this weed than from any other plant in this country.

ZELLA C. METHENY.

Charleston, W. Va., Jan., 1883.

## FROM 19 TO 41, AND 360 LBS. OF HONEY.

We started last spring with 19; they came through the winter in good condition, and increased to 41, and took out 360 lbs. of honey. In the fall we fed one barrel of sugar, and united them down to 26. They have done very poorly this year. I saved up all my money to get a hive, and got one a year ago last spring, and now I have four; so you see I am a bee-keeper myself. I have been going to Sunday-school all along, but it has stopped for the winter, as we have two miles to go.

Aberdour, Can. ROBERT W. MURKAR, age 12.

## THE DUCKS AND THE PARTRIDGES, AND SOMETHING ABOUT THAT RIDDLE.

Mr. Root, I was not yarning about the ducks eating the little partridges. I saw one run under the floor with one in its mouth, and the other two were gone, and I guess they got them too. My riddle is composed of bees and honey; and you will find it in the Bible. If you can't find it for the next JUVENILE, I will then tell you. We have 40 stands of bees. JOSIE DAVIDSON.

Pisgah, Ala., Aug. 30, 1883.

I guess, Josie, the 14th chapter of Judges will tell what your riddle is.

## A LETTER FROM GEORGIA.

I have not seen any letters from Georgia, so I thought I would write. My pa keeps bees. Last spring he had 6 colonies. Now he has 16. He had 21; but 5 of them died on account of robbers. He bought 3 colonies, and Mr. Wm. Oliver gave him one Italian queen and 12 bees. He went to his other bees, and took four or five pieces of comb full of young bees. When they hatched out there was a nice hive of them. They raised a young queen, and the old one went off with the most of them, and the others died. JAS. W. CALDWELL, age 14.

White Sulphur Springs, Ga.

MR. DOUGHERTY'S BEES AND HONEY, AND THE \$27.00 PREMIUM.

I thought I would write and tell you about Mr. Dougherty's bees. He has a great many bee-hives. I often stop and look at a bee, and see how busily they work laying up their food for the winter. He went in partnership with a man whose name is Mc-Kee; and when they took their honey out to the fair this year they got the premium, which amounted to \$27.00.

EDDIE ALLEN.

Indianapolis, Ind.

FRANK AND HIS MOTHER AND THE BEES.

Pa had 6 swarms this spring, and he has 19 now. Mother and I extracted 66 lbs. of honey from six stands. The two first swarms went off. The first swarm went off without clustering. The next swarm we hived, and the next day it went off. Can you tell why the first swarm went off? We put in one comb of brood from another hive, and they stay now. I made a little hive with five racks in it, and I want them to put bees in it.

FRANK WEAVER.

Ligonier, Ind.

A SWARM GOING THROUGH A SWARM.

Father takes GLEANINGS. I claim the JUVENILE as mine. As they were talking about bees going off without clustering, I thought I would tell you about a swarm we had, as we never had one act so before. One swarm came out and was just alighting when another came out and went right over and through the others, and went to the woods without alighting. The boys followed them about a quarter of a mile, and then lost them. When the season commenced we had 40 swarms in working order, and 20 weak ones. We think it is a good season for honey in our location. Father makes bee-hives to sell. I nail the sections and racks.

ETHEL ANDERSON, age 12.

Cambridgboro, Pa.

A POUND OF BEES JUNE 16, SENDS OUT A SWARM JULY 23.

My uncle has 32 stands of bees; 8 of them are Italian. He takes the JUVENILE. I like to read it very much. Two swarms of his Italians came out to-day; one swarm went back. He sent to Illinois the 16th of June and got 6 one-pound boxes of Italian bees; each box contained one Italian queen. These two swarms that came out to-day were from the ones he bought. I am stopping at his house a few days. I like to make section boxes. I have two sisters; one is 6 years old and the other 2 years old. I never wrote for the JUVENILE before. I have a bird and a kitten. My uncle calls his Italian bees his pets.

Corinna, Me.

BERTHA M. CORMICK.

HOW THEY GOT THE BEES OUT OF THE HEMLOCK-TREE, AND WHAT BECAME OF THEM.

My pa has about 110 swarms of bees, and I have 10 swarms. In summer I watch the bees, and hive them when pa is away. We winter our bees on summer stands. I like to work among them, putting on and taking off boxes. Pa had a swarm go to the woods. I followed it, and it went into a hemlock-tree, and pa cut it down and took an upper story and put the bees into it, and left them by the tree one day; and when he went there the bees were all gone.

W. E. COLEMAN.

Port Allegany, Pa., Feb. 7, 1883.

I think, my little friend, I would not have risked them off there, even for one day. Would they not cluster in the hive so you could carry them home?

THE LETTERS THAT WERE TIPPED OVER.

As my sister is writing a letter, I thought I would try to write one too. I am seven years old. I go to school. I saw a letter in the JUVENILE that was written by a six-year-old girl who had part of her letters laid down to rest. But I will try to keep mine up. If this is not good enough to put in print, put it in the waste-basket.

CARRIE A. MISER.

Mantua, Ohio.

Very good, Carrie. It is true, your letters are not laid down quite as badly as in the letter you tell about; but if you will excuse me, I think there is some chance for some of yours to be straightened up a little better.

THE YOUNG TELEGRAPH OPERATORS.

My papa says you are a great friend of children, and want them to write you some letters. I will try to give you an introduction to myself. I am a little boy nine years old, and am a telegraph operator, and so is my brother Frank. He is 16 years old. We have a telegraph line from the depot to our house, where we do our practicing. We can read off the main line. My papa runs the steam-pump for the railroad, and keeps bees. He has 54 swarms, all in Langstroth hives, nearly all Italians. I have two swarms. I must watch the bees during swarming time. I go to Sunday-school, so does my brother Frank, and my sisters Alice, Jessie, and Gertie. Papa says you like children who go to Sunday-school. Ours is held in the chapel of the North-Western College.

L. EDMUND STOVER.

Naperville, Ill.

HONEY, STRAWBERRIES, AND THE BABY.

I promised in my last letter to let you know how my mamma and I get along with our bees. We started with 29 colonies, and now we have 72. The spring and summer were very wet, so they can't work half the time. White clover is plentiful yet. We took off 115 lbs. of honey last week in one and two pound sections, and will take off more in a day or two. We have two observatory-hives. We like to see the bees through the glass. My sister Mina says she wrote you some nice verses. She thinks it was in May, and you did not publish them. She says she thinks you forgot them, on account of that new baby at your house. She wants to write and tell you about the bees, but is afraid you would not publish it. Can't you name your baby after me — Freddie? If so, I will send him my picture, or treat him to the strawberries, if you will bring him here next year. We sold over 4000 quarts this year, and I don't know how many raspberries. We have been very busy. I like to work with bees; they don't often sting me, though I work with them bare-footed. Mina says they won't sting homely boys. My father died 4 years ago. He liked GLEANINGS very much. We had 165 colonies when he died. He loved bees.

Keithsburg, Ill. FRED WIRT, age 14.

That is a very good letter, Freddie. I should think you might afford to treat to the strawberries, if you had 4000 quarts. I think that is more than I ever saw in all my life, and I think it would be a nice place to go to, would it not, Freddie? I am very sorry if I overlooked any of the little letters, but I do not believe it was baby's fault. When we have so many we are obliged to select those we think are most valuable; that is, which give the most valuable information.

583 LBS. FROM A COLONY, REPORTED BY A JUVENILE.

My papa has 100 stands of bees. My brother and I help to extract. We have 3 tons of extracted honey, and about one ton of comb honey. We have a handy tank that holds a ton and a quarter. A few days ago my papa got 3 queens from Mr. Heddon; but if they are any better than one of ours they will have to "git up and git," for one of ours has made 583 lbs. already, and the season is not nearly over.

ANDREW FLORY, age 9.

Lemoore, Cal., July 3, 1883.

FOR VALUE RECEIVED.

My pa keeps bees. He has got 38 stands. Pa sold 333 dollars' worth of bees and honey last year. He had 30 stands last spring. I have got a note like the one in your book, only it has a "Post" instead of a "Root" on it. It is worth 13 dollars.

FRED GILLET, age 7.

Brighton, Ohio, Feb. 13, 1883.

Now, friend Fred, that is a pretty big joke for a boy only 7 years old, where you talk about Posts and Roots. If anybody should ask which were more substantial, I do not know but that I should have claimed that the Root would be best on the end of a note. Roots are generally the hardest to get out, are they not? But did you ever think, Fred, that Roots and Posts, and every thing else, and everybody else, for that matter, must pass away? There is only one thing in this whole universe that shall not pass away. Who can repeat that little text that tells what it is?

CLARA'S BEES, AND SOME SUGGESTIONS FROM HER IN REGARD TO BEE-KEEPERS' IMPLEMENTS.

Five years ago papa bought a swarm of black bees of our neighbor. We now have bees in 122 hives. Last summer papa gave me a hive of bees. He is to have the increase for taking care of them, and I am to have the honey for helping him take care of his. I now have 106 lbs. My! don't I feel big, though? We've taken off 1040 lbs. altogether. I think that Charley Scherf (that is our hired man's eldest son) and I look something like the picture in the JUVENILE, only we do not wear veils, and our smokers are Bingham's. Charley is 14, and I am 11. We have taken off two or three hundred lbs., and hived several swarms alone. A swarm came out and alighted on the top of a maple about 30 ft. high. The worst of it was, they were scattered along a limb at least six feet long. Papa climbed the tree and sawed it off without getting a single sting. We like a turkey feather with the edge clipped off, much better than a yucca brush, for brushing bees off the combs.

CLARA JONES.

West Bend, Wash. Co., Wis., Aug. 2, 1883.

A BOY'S TESTIMONY, AND SOME OF HIS IDEAS IN REGARD TO SWARMING.

Tell "Old Foggy," who states on page 242, May number, that he has never seen or heard of a swarm going off to the woods without first clustering, that he is mistaken, for I had one that did. Father bought 2 colonies the first of June, and I commenced my first lessons in bee culture. Last Sunday one of them swarmed and started for the woods as soon as they all got out of the hive, without alighting on any thing. Father and I started after them with the looking-glass, and followed them about half a mile, when the sun came out bright, and I threw its rays through them with the looking-glass, and they

came down and alighted on the top of a dead hemlock-tree that had been blown over. We hived them and got them home all right, and they have filled their hives nearly full already. This is the first time I ever saw bees swarm; and if they all act like this one, my bees will never swarm again, if I can prevent it.

H. L. HUTCHINSON.

P. S.—They swarmed again, just as I had signed my name, and alighted on a plum-tree in the garden; we hived them all right. I guess swarming is not as bad as I thought it was.

H. L. H.

May, Mich., July 21, 1883.

We have 10 hives of bees. We had only two hives last summer. We have a garden, and pa is so busy that mamma and I have to take care of the bees. I help papa pick strawberries, but they are all gone now. I help him pick beans and pears for market. Mamma said she could not do without your smoker and GLEANINGS, and I think ever so much of your JUVENILE.

Mamma found a wild plant the other day, and the bees were thicker on it than she ever saw them on any other plant. I will send you one of the flowers. Do you know what it is? They work on one of our tame flowers a good deal; it is the sweet scabious, or mourning-bride. Do you know of it as a beehive-plant?

ADDIE KENDRICK, age 9.

Boulder City, Colo., Aug. 1, 1883.

We can't tell the name of your flower, Addie, because you did not give us any leaves. We always want leaves as well as "posies" when we undertake to name a flower. I'll explain to the friends that it is a good-sized bright yellow flower, that tastes awful bitter. You see, I always taste of every thing when I can't find out any thing about it any other way.

GRACIE FOSTER AND HER FATHER'S "DAY STAR."

Pa visited you five or six years ago, but you were so busy he said that he didn't get much time to talk. He visited you when we were on our way to New York in a horse and wagon. We have the horse yet. It is about 20 years old, and we call her Flora. She is so gentle that we children can go up to her any time or anywhere. I take drawing lessons every afternoon for 1½ hours. Papa wants me to be an artist or engraver. I like to draw pretty well. When I am not tired, I set type for our little paper. I began when I was six or seven years old, but never set much until I was eight. I am now 12. I am going to try to get a library. I have two or three books now — a very small beginning, but they will help.

Mt. Vernon, Ia., Aug. 6, 1883. GRACE FOSTER.

Why, Gracie, I did not know that your father paid me a visit. Why did he not say, when he came up, that he was A. F. Foster, editor of the *Day Star*? I want to explain to the juveniles that the *Day Star* is a queer little paper, published about "Peace," and the funniest thing about it is that friend Foster sends it everywhere without any pay. Any of the children can have it right along if they will just send friend Foster their names. If you want to put in some postage-stamps, no doubt but that they would come very handy, for friend Foster sends it free and pays postage. This is the paper that Gracie sets type on. If you write her, I suppose it will do just as well. May God bless you and your father, my good little friend.

## Our Homes.

Thou shalt not take the name of the Lord thy God in vain.—Exodus 20: 7.

THE first part of this number I have told you a story of a boy who was tempted and led to drink. In my talk I dwelt especially on the danger of having our boys exposed to such temptations as saloons. I endeavored there to show, that although the boy was perhaps at fault, he was not alone to blame. Now, we who are laboring for the salvation of souls work in two ways. While we earnestly strive to have temptation kept out of the way of the youth of our land, we also try to instill into the minds of these same youths principles that will keep them from the temptation. We try to have their minds so firmly anchored "on the Lord's side" that even the saloon-keeper with poisoned lemonade would be unlikely to get them from the path of duty. It is true, that almost any boy might be persuaded to take a glass of lemonade, and might in that way get a taste for strong drink; but we should want that boy so brought up that, when he discovered that he had been entrapped into taking something that he did not understand, he would go to his mother, father, or best friend, or guardian, and inform him in regard to the matter. Almost all departures from the path of rectitude and virtue come about gradually. In the story I have already told you it would seem almost certain that the boy was a victim of evil influences and surroundings, rather than bad at heart. On questioning closely I was led to believe, however, that there was something back of it somewhere. Those conversant with crime will often find out where the trouble lies by a little questioning, much as a kind mother would take hold of a sore finger. She might say, "My child, when did this come? what makes the swelling and inflammation on that little finger?"

"Why, mother, it just came of itself. I don't know what in the world makes it so awful sore."

"I think, my son, there is a sliver in it, and we must take a needle, and may be a very sharp knife too, and get the sliver out."

"But, mother, I am sure there isn't any sliver there, or I should feel it. I have not had any sliver in my hand at all."

The mother has, however, seen many boys, and she knows pretty well all about slivers; and so she quietly sits down by a good strong light, and in due time she carefully and lovingly picks out a great black naughty sliver. The little one may cry during the operation, but she knows full well that its tears of pain will soon be changed to tears of joy and smiles; and she saw, too, perhaps, there was no other way than to dig right down into the soft little hand to get at the seat of the mischief. Well, I felt something the same way about this young friend of mine. When I would start to go away he would say, "Oh! don't go just yet, Mr. Root;" and I knew he was willing to talk, and tell me about even the bad part of his life, if I sought to get at it with a view of

helping him to a better state of mind and a better life. He admitted that he not only drank, but used tobacco. But he said he knew nothing of the habits until within the past year. I asked him what he worked at when there was no school. It had been mostly farming.

"Have you learned to swear also?"

He admitted he had.

"Can you remember the first time you ever uttered an oath?"

"Yes, Mr. Root, I can."

And then he told me all about how it happened. It was not while he was in company with bad boys; it was while he was alone at work in the cornfield. He got tired and warm, and rebelled against his lot in life. He was "weary in well doing," and Satan entered into his heart and made him take in vain the name of the God who gave him life. My friends, I fear many a sad life is commenced in just this way. Instead of taking up patiently the lot in life that God had given him, or working quietly and steadily until he could honestly command a place more to his liking, he cherished rebellious and wicked thoughts, and encouraged them in his heart, until they broke forth in *blasphemy* toward his Maker. Not long after, he got hold of a book,—the life of Jesse James. Other boys might read such a book as this without any apparent harm, perhaps; but to one in his state of mind it was rank poison, and acted on him as the poisoned lemonade acted on the brain of the other boy. To his rebellious and disordered imagination these adventurers seemed something worthy of emulation, and in one sort of way he honored the man who robbed honest people of the money they had earned by the sweat of their face, of the money they labored for and saved up. Drink, of course, fed and inflamed these feelings, until he thought it would be a grand thing to defy the laws of our country, and to live upon the hard earnings of others. How many are there who read these Home Papers who have not some time in their life read with interest the daring exploits of highwaymen? I believe the number is less now than a few years ago. Things are changing, and our boys find sufficient excitement and adventure in legitimate business, and, I trust, enough fascination in such simple, harmless, and innocent industries as keeping bees for a living. Think of the contrast. In keeping bees we take from dame Nature, and she smiles her approval by rewarding us with the gains of a bountiful harvest. God smiles, too, and gives us a feeling of peace and enjoyment in our hearts, which is, perhaps, one of the sweetest rewards that fall to the lot of humanity. Now, what happiness can there be to him who robs his fellow-men, even though he does it in such a wholesale way that he defies the authorities who seek to arrest him? Do you not see, boys, that swearing, drinking, tobacco-using, and the like, all proceed from a wrong attitude of the heart? If the heart is right, the actions will be right. If one in the inmost recess of the heart has deliberately decided to do wrong, then all these other things follow.

We sometimes hear of men selling them-

selves to Satan. Such things are heard of now only in old traditions; but I have thought there was a world of truth in it. It is not an easy thing to break away from strong drink, and there is some sort of reason why it is hard to break away. The same applies to the use of tobacco, although it seems a little hard to show why young men should commence in the first place. But, why should anybody swear? During all these years that I have employed boys, I have seen some who started quietly and honestly, and with great promise, but who finally learned to swear. Why should it ever happen? I have watched their decision, and have noted the state of mind leading to it. I have noted their attitude before they ever uttered an oath or took God's name in vain. The transition from a meek and humble spirit to that of swearing was much like the case I have mentioned of the young man in the cornfield. It was a gradual receiving and giving way to bad impulses.

God has implanted in the human heart what we term reason; or, we might say, wisdom or judgment. There are certain things we know are right, and there are things we know are wrong, or, at least, seem so to one accustomed to self-control and of mature years. The child, or even the young man, may have mistaken notions or ideas; but when the judgment is matured, every intelligent human being is capable of having correct opinions on almost all questions. There seems to be a kind of instinct that prompts in the right direction—something that tells us when we have done wisely and well, and something that also tells the contrary.

Within the past few years I have been questioning myself, or seeking and asking the best wisdom and judgment of *myself* (if you will excuse such an expression), of what is probably correct or right in regard to certain problems. One of these problems is the future existence of humanity. Well, friends, I presume you are well aware that the Bible tells us very little in regard to this future existence; but it is asserted plainly and unmistakably that there is such a future state of existence. Well, now, a sort of instinct tells me the same, and I think it would also tell me the same if I had no knowledge of the Bible at all. This instinct, or conviction (which is, perhaps, a better word), does not say what that existence shall be; but, like the Bible, it says very plainly there is something beyond this life. This conviction is strong and clear when I am striving to do right, and laboring for the good of humanity and for the saving of souls; but when worldly cares throw me off the track, and make me forget the highest call I know in life, or God's call if you choose, this conviction seems faintest. I presume you have all had similar feelings. "If any man will do his will, he shall know of the doctrine." When I am doing God's will, the conviction is strong and clear, and I have no doubts. When I am violating his commands in thought or deed, doubts generally come up, and this conviction of the future state seems dark and uncertain. Well, many times of late the question has come up, as one after another was taken of

those I knew intimately, Is this one or that one saved? Of course, these questions rest with God alone, and we have hardly a right to discuss them, unless it be in some way that will be for our own good, or warning to us. I have known men who were suddenly stricken with death while in the midst of intemperate habits. This conviction I have been speaking of would indicate to me that such a one could not well hope to receive God's promise. Another who is taken away while intently occupied with worldly matters, almost forgetting God. I should fear would be among the lost. Men have sometimes died in a fit of anger, and I have thought that, if their general lives had been lives of humility and obedience toward God, *this* act might be forgiven. I have also thought that God *might*, under some circumstances, pardon a suicide, though I confess, that perhaps my feelings are prejudiced where the departed person was an intimate friend of mine. In considering these things I have wondered what kind of a sin would be most unpardonable in God's sight. You know the Bible speaks of an unpardonable sin. Well, the result of my deliberation on this matter has been that the most grievous sin that a human being can commit in the sight of God is to curse his Maker. Sins against your fellow-men are bad enough, but they are not to be compared with sins against God. Sins against your own self are bad enough, and for one to take his own life would seem about as great a crime in God's sight as it were possible for a human being to meditate on; but, my friends, taking God's holy name in vain, I am ready to believe, is worse than this. It is true, in the former case the sinner can not repent, because he has, by his own act, cut off all opportunity for repentance, while the sin of taking God's name in vain may be repented of.

We come into this world to do good or evil. How many times do we read in the Old Testament, "And he did evil in the sight of the Lord"! So it is now. We are all doing right in the sight of God, or we are doing evil; at least, every human being proposes to do good or to do evil; and there is no one act in this world that seems to so plainly indicate that a boy or man has made a deliberate purpose of doing evil, as when we hear him uttering oaths. If there is such a thing as selling one's self to Satan, I should take it for granted that one who deliberately curses God wishes to announce it to the whole universe that he has sold himself to Satan.

Last winter I met a middle-aged man in our county jail, who was in there for selling whisky. Several saloon-keepers were there, and I asked each one of them singly if he had ever made a profession of religion. This man replied that he had, and I talked the matter all over with him. He told me in sadness that the best hours he had ever known was when he was a consistent member of the Methodist Church, and it was only one short year before that he stood among his neighbors and friends, and declared to them his purpose of serving the Lord. Soon after, he was induced to buy the village hotel, and in it was a bar. He made money by his liquor trade; but as the money came, his re-

ligion went. He could not be a Christian, and sell drink to his fellow-men. The place finally got to be so bad that he was fined and imprisoned. I found him in the jail, and had long talks with him, and he seemed almost ready to give up his hotel, and every thing else that stood in the way of his serving the Lord. At our last meeting in the jail I took him by the hand, and asked him to hold fast to the strong Arm, no matter what happened. He looked up and smiled, although he did not readily give a positive promise; and as I saw him no more, I had almost forgotten him. Last evening a friend told me the following:

He went back to his old business, and became intemperate; not only himself, but one of his boys about fifteen years old learned to drink. One day last week he had occasion to leave home; and before doing so he told his wife to be very sure not to let the boy get at the liquors. The father came home intoxicated, and learned that the boy had been drinking also. He asked his wife why she did not do as he told her. She replied that she did do the best she could, and told him he would have to stay at home and take care of the boy himself. She went into an adjoining room, and heard him say, "Good-by, Rhoda," and immediately afterward heard the report of a pistol. He had shot himself, but it did not kill him immediately. Physicians were called, but he ordered them off the premises, and declared he had shot himself with the intention of making a finish of it, and die he would; and, turning over to the opposite side of the bed, declined any treatment. He died last evening. Now, friends, if such a spirit is not the spirit of Satan, where do we find Satan? Some one has declared, that alcohol is the Devil's solution. Does it not seem to be just about that?

I have told you the above little story to show you the attitude of the human heart when it rejects God. My friend, are you rejecting him? are you a swearing man? do you ever take his holy name in vain? If so, pray consider we are all serving either God, or Satan, the adversary of man and embodiment of evil. We all have stubborn wills; and unless these wills are broken, or become subservient to God, we are on the ground of the enemy.

The sacrifices of God are a broken spirit: a broken and a contrite heart, O God, thou wilt not despise.—Ps. 51: 17.

I know the belief has gained ground in some, that a submissive spirit means a weak spirit. No greater mistake was ever made. Our young friend in jail, in giving a reason why people swear, said that it adds emphasis to their words. Does it add emphasis, boys? Do you have more faith in a man who declares with an oath that he will pay for a thing you trust him for? To be sure, not. Men who take God's name in vain, to emphasize their assertions, are almost invariably men who can not be trusted. If you look about you, I think you will find it so. My friends, it is surely true that nothing weakens your standing among men more than the fact that you are a swearing man. Men who are great in the best sense of the

word are quiet men. You see a man who commands great wages (and I have respect and honor for the man who can command a salary of from \$10.00 to \$25.00 per day), and he is always a quiet man. His mildest words have more weight than the loud tones of a profane swearer. People are often deceived for a time into thinking that recklessness means courage. The man who shot himself defied God and man, and, without care or compunction, flung himself into the fathomless abyss. He found his command over his boy was gone. Instead of helping his poor wife in her efforts to bring the boy up to an honest and honorable life, he shirked the whole responsibility, and left it all for her, by an act that we can hardly find words to express it as it should be. He sold himself to Satan irretrievably, and through all eternity. One who takes God's name in vain does this in another way. He curses every thing that is good, noble, and holy. Very often, after a man professes to be a skeptic, he declares he does not believe in Jesus Christ nor the Bible; but if he has good common sense, he well knows in his inmost soul that there is a wise and loving God over all. Now, the swearing man curses *his* God—not the God that anybody else has proposed, but his Maker and Ruler, the Architect. In other words, as everybody knows good from bad, the profane man rejects good and welcomes bad. If you do not agree to this, listen to the words that you hear such a man use, and study their meaning. Why do drinking men and criminals almost invariably swear? and why is it that the phrases and the words which they use are the holiest that they can possibly command? There seems to be sometimes a Satanic ingenuity exercised in coupling sacred words together. Another thing that indicates the Satanic origin of words of blasphemy is, that he who utters them seems to be impelled by some unseen power to go on from bad to worse, even on the slightest provocation. I have told you of the wife, who simply remonstrated for his punishing the children when they had committed no offense. Under the influence of liquor, he cursed her. This other one, under the influence of evil, and a slight provocation, deliberately shot himself. Do you remember when Jesus had given Judas the sop, that John says, "Satan entered into him"? Does it not seem in the cases mentioned, that Satan had literally entered and taken possession?

Now, my friends, when you are tempted to swear again, please consider whether I am not right in saying that the oaths you utter are a tacit acknowledgment that you have opened the door of your heart to Satan, and that he has entered in and taken up his abode. You have for the time yielded to the Prince of Darkness, and to evil, and have voluntarily banished yourself from the Lord, and from Him who is the light of the world. "Thou shalt not take the name of the Lord thy God in vain." This text comes to us down through ages, and goes through all eternity. No matter who you are, or what you believe, or whom you worship, have you any right, or can there be any necessity or defense, for setting at naught this command?

## Tobacco Column.

**A**FTER using tobacco in one form or another for 16 years, I came to the conclusion to stop and subscribe to GLEANINGS, which I did in April last. A few days since I got some bees; and now if you think I am entitled to a smoker, send it along; and if I ever use tobacco again, I will pay for a dozen smokers. M. W. SHEPHERD.

Wellington, O., Aug. 21, 1883.

As I have quit using tobacco, send me a smoker. Boyce, La., July 27, 1883. T. G. MORGAN.

I have concluded to stop smoking; send me a smoker. If I break over I will send you the \$1.00. Meredith, Del. Co., N. Y., July 16. O. R. MUNSON.

I propose to quit the use of tobacco, and I want a smoker to bind the bargain; and if I commence again, I will pay for it. A. L. MILLER.  
West Toledo, Ohio.

I am happy to say, that I may claim a smoker. I am now master of the weed. No more smoking or chewing for me. Should I ever fall by the way, I will sorrowfully pay for the smoker. Geigerville, Ky. J. W. JOHNSON.

I see by GLEANINGS that you present a smoker to all who stop the use of tobacco. I stopped 3 months ago, after using it 6 years. If you think I am entitled to a smoker, send me one; and if I ever use tobacco again, I will pay for the smoker double. Wellington, O., July 23, 1883. L. O. DYER.

I have quit using tobacco. Please send me a smoker. If I commence to use it again I will pay you for it; it was harder to stop than whisky, which I discontinued ten years ago. I like the spirit that breathes through your paper very much. Owen Sound, Can. DAVID WILLIAMS.

Thank God, friend W., that you are rescued from the bottomless pit.

I see you are giving a smoker to all those who quit the use of tobacco, and promise never to use it again. I have quit the habit, and will never use it again while I live. Mail me the smoker; and if I ever use another bit I will pay you for half a dozen for somebody else. I have 14 stands of bees. Bowman, Ga. E. A. HENDRICK.

We gladly send you a smoker, trusting that you will never use tobacco again.

### KIND WORDS FROM OUR CUSTOMERS.

I find the little slates very handy. Farmington, Tex. MRS. LIZZIE A. RODGERS.

The Parker machine works splendid. Sections fold nicely. C. M. HICKS.  
Fairview, Md., May 30, 1883.

The 50 Clark smokers I bought of you last spring are all sold, and are giving good satisfaction. LaGrange, Ind., Aug. 18, 1883. G. K. HUBBARD.

You will be pleased to learn that the two fdn. mills you sent us have gained prizes at shows for the work they do. GEO. NEIGHBOUR & SONS.  
London, Eng., Aug. 9, 1883.

I had fourteen of your queens last season, and there was only one that produced hybrids. WELLINGTON J. SAUNDERS.  
Meaford, Ont., Can., July 2, 1883.

I am very much pleased with the iron-jacket cans. They answer the purpose to perfection. Wheeling, W. Va., Aug., 1883. WM. BITZER.

I received the bees in good order, and am more than satisfied. They went to work right away. ARTHUR SHOEMAKER.  
Belvidere, N. J., July 20, 1883.

The planer arrived all right, and I like it very much. It does much better work than I thought it would. F. B. CARR.  
Acushnet, Mass., June 4, 1883.

Extractor was received two days ago; put it to work immediately; it works well. I am very much pleased with it. Thanks for the promptness in sending it. W. B. WELLS.  
Oxford, O., July 12, 1883.

Please send 50 of those cards which you send out free. We want them for our Sunday-school, which we have started in a little log school-house up here in the burnt country. Will try to put them where they will do good. J. C. MERRIMAN.  
Deckererville, Mich., July 3, 1883.

The 10 smokers and foundation came to hand all right; sorry I did not give you an order for two or three times the amount. We shall want more after awhile to make a show at our fair, about last of August. Bees have been doing pretty well. J. C. DEEM.  
Kughtstown, Ind., July 17, 1883.

Friend Root, I wish to thank you for the kind way you have done business with me. You sent more in place of the bees lost than I expected or even thought you would. I although I thought you would do all that was right. May the Lord prosper you in well doing, and help you on in the right way to the eternal city. ELBERT A. BOYD.  
Cannonville, N. Y., Aug. 2, 1883.

I don't think I can ever forget the favor, friend Root; for if you had not let me have the goods it would have been a tough job for me to have got my apiary started again without help. The Jones honey-pails, with the fancy labels, sell well at 20c for 1½-lb.; 35c for 2½-lb. and 65c for the 5 lb. The pails are weighed in with the honey. These are my prices by the quantity. E. J. SCOFIELD.  
Hanover, Wis., Aug. 20, 1883.

APIS AMERICANA DISCOVERED AT LAST, And in perfect development, especially the sting! I have been harvesting timothy for seed — and chaff to pack hives, *a la* Poppleton, and I have been chased a good share of the time, and stung a few times while binding on the machine. There was some red clover mixed with the timothy, and these were genuine red-clover bees. Among people who have never speculated on the "coming bee" (these were coming, for certain), they are called bumble-bees. HOWARD CENTER, Ia. BURDETT HASSETT.

I received the bee materials all O. K., and am much pleased with the honey pails and tumblers. Honey put up in those neat and attractive packages, is always sure to bring the top price. And I will say, in regard to the labels, that they can not be excelled, and I was highly delighted with the assortment you sent me. There are a few enterprising and wide-awake apiarists in Chenango Co., and are all to be seen with a "broad smile" on their faces, because of the enormous honey-yield this season. Sherburne, N. Y., Aug. 7, 1883. C. A. FRASURE.

CROSS BEES. Young received all right. Never be shy to send me a bill, if all is not clear; and if ever I have a little balance, never send it back, because I'm always wanting something. I have 5 black hives, and some of them are as wicked as sin. Their whole time seems to be taken up with looking for somebody to sting. I have had them 4 years; never an ounce of honey. I am tired of this kind of work. I want you to send me a \$1.00 queen, and I will try to change things. I tried it two years ago, but no go. I had two from you; they were splendid; in fact, they were the best queens I ever saw. N. ANSON.  
Cleveland, O., Sept. 5, 1883.

## SENDING QUEENS TO FLORIDA.

I received the queen yesterday all O. K. I gave her a new house to live in, with three frames of hatching brood, without one old bee. This morning she has a family of 500 young bees; and in addition to all of this, this morning I shook off from two frames the bees from a queenless colony. It is now 8 o'clock; and every thing is lovely with the queen. She is walking around as proud as can be, with a train of bees following behind. She is rather dark, but I suppose you will vouch she is pure Italian. I want to Italianize my 60 colonies. The bees that came with the queen look well. Are they of her progeny?

F. B. SACKETT.

Titusville, Fla., Aug. 4, 1883.

Now, friend Root, I have a great fault to find with you for cheating me so badly. I sent in June for a tested Italian queen, and now she has filled the hive of 9 frames full, and I started her on two frames, and don't you think I can handle them without smoke? and they are all so yellow that I need no artificial color for them. Now, if you "cheat" me again like this, I don't know but I shall tell every one who sees them where I got them. I shall take them to the State Fair; and then you will be exposed, of course. We talk about you a great deal now; and unless you conduct differently, I don't know how you will come out. I like an all-wood frame best, as they stay in place better when taking off cases or cloths.

ELISHA P. CHURCHILL.

North Auburn, Me., Aug. 17, 1883.

## A KIND WORD IN VERY TRUTH.

JUVENILE comes to us this month, in what—a new dress, or is it the old gown of its senior? Well, 'tis a great improvement over the old style, and is now of itself a first-class journal, and a wonder to all now two such journals as GLEANINGS and JUVENILE can be published for the small sum of one dollar a year. I must express my admiration and approval of the poem by Miss Lu, "The Early History and Life of GLEANINGS." 'Tis a just tribute to the founder of what is now a first-class bee journal, ranking in the very first rank with all the publications on bee culture in the known world. Long may GLEANINGS and JUVENILE live, and Novice and Lu be spared to watch over its destiny, and steer it clear of that rock, financial ruin, that has wrecked so many of its sister-ships!

A. W. OSBURN.

Water Valley, N. Y., Aug. 30, 1883.

## WHAT'S THE MATTER?

Infant GLEANINGS doesn't come for this month. I miss its prattle very much. What is the matter? "Has hers fall down and bumped hers head or sunn'n else badder?"

S. L. HASKIN.

Chandler's Valley, Pa., Aug. 20, 1883.

Friend H., none of those awful things have happened at all. I guess the only trouble is, you bee-folks have ordered so many labels to take care of the great crop of honey, that the printers have not had time to get the JUVENILE out on time. Besides she has grown larger, you know, and a little harder to manage. We hope to be able to get her in the new harness all right, however, and we trust she will make her appearance hereafter a little nearer on time. You see, if we do not pay any thing for the JUVENILE, she considers herself a privileged character, and takes a little more liberty in coming and going than her mother would think of doing.

I am a firm believer in the doctrine of compensation, even in the affairs of this world. Yesterday I took off a case of 28 sections, and did not have one empty one to replace them, and my bees hard at work; and to add to my dilemma, my Clark smoker, old style, collapsed—spring broke (a steel strap), and in getting to it I ruined the leather of the bellows. Well, in less than half an hour a message came from the depot that your last shipment had arrived. I felt grateful; and within two hours, over a hundred nice new white sections with good starters were on the hives. I had an old L. C. root smoker, but I could not keep a fire in it, so I had a hard time, until I thought to send to Dr. Temple to borrow his until you could send me a couple. I tie my cases to hold sections with hard-spun white-flax twine, and find it preferable to wire. I never had any true conception of a "honey boom" until now

this season. White clover, sourwood, corn, sumac, etc., are and have been booming. I have taken nearly 1700 lbs. of honey. In following your advice to get ready, I have my reward in a fine harvest of pure white honey. Goods all right and very satisfactory.

L. M. SHUMAKER.

Danville, Va., July 20, 1883.

## SHIPPING BEES TO CALIFORNIA.

I received the queen and bees Aug. 2 at 2 o'clock P.M. It appears you sent the queen and bees July 26, and notified me by card the same day. The bees came 3 days before your card. There were about 150 dead bees in the cage. The bees had more honey than they needed. The comb was in good order; and when I examined the card with wire in to keep it straight, and the care you had taken to pack, to come such a long road, I must say you understand your business. To-day I opened the hive for the first time, and the queen had improved, and is a beauty. The bees had greatly improved too, and are very nice large ones. I would not take ten dollars in gold for the queen.

JACOB WOLFE.

Lathrop, Cal., Aug. 6, 1883.

The above were sent in a nucleus hive on a wired comb of new clover honey. And, by the way, if I can have such a comb of new honey, I do not know but I like it better than any thing else that can be devised for shipping bees long distances. The reason why I emphasize *new* honey is, when first brought in and stored in open cells it contains quite a quantity of water not yet evaporated; and this water is in just the right shape to sustain the bees in such a journey as they have in going to California, Texas, and other remote points.

## SOME KIND WORDS VERY PLAINLY SPOKEN.

I do not claim any damages on hives, as the entire amount is but a trifle; but is it not for your interest to have every thing in good order, and as nearly right as possible? If I ask some foolish questions, do not be impatient, as I am inexperienced in this business. I like the A B C book very much, but would like to know which is right—the goods as they are sent out, or the book. I find one inch space in the hive after the 7 wide frames are in; the book says there should be but  $\frac{3}{4}$  inch space after the frames are wedged. I find the boxes are not all of a width, but of several widths. The book says they should all be of one width. It also teaches absolute cleanliness, which I admire; but I found about one-half of the tin separators smeared with grease and dirt rubbed in so it was nearly impossible to clean them. Now, which of these were right? If I had any idea the book was wrong, I could have rubbed the others with grease and stove blacking with less trouble than cleaning them. I expect to order quite a lot of hives next winter, but would like to be started all right before that time. Would it not be a good idea to publish a revised edition of the book? or if the other things are wrong, revise them.

Bennington, Vt., Aug. 1, 1883. J. N. SCRANTON.

Friend S., perhaps some of the friends may think this letter does not belong here, but I think it does. I presume your wired frames had shrunk considerably. However, an inch will do no harm; and as bees would not be very likely to build a comb in an inch space, even that would be no material harm. The same is true in regard to sections. Last spring we were obliged to give you half-seasoned sections, or none at all; and as the edges of the boards would be seasoned much more than the middle, when they came to dry all together, these varying thicknesses would occur. I can not explain how the separators came to be greased, unless the oil from some of the machinery got dropped on them. It ought not to have been so, and I will willingly pay for the trouble of cleaning them up.—Friend S., it would be a good idea to have every thing in this world all right; but where so many people come to me to have me do so much for them, I tell you it is a pretty hard matter to send them all away well pleased. Thanks for your criticisms, given in such a vein of pleasantry.

Your 10-ct "speck" are just such as sell here in the stores for 75 cts., and they fit us exactly.

L. C. SEATON.

Ellensburg, Wash. Ter., Aug. 12, 1883.

I would not do without one of the smokers for five times the price of them.

S. S. LEACH.

Quincy, O., Aug. 13, 1883.

I have had Thursday, the 20th, called American visitor's day, in honor of our American visitors.

Beeton, Ont., Can.

D. A. JONES.

And the heavens shall praise thy wonders, O Lord.—Ps. 89:5.

WM. FULLER, whose name you find in another place, has sent us a very nice paper-holder, made of oiled walnut.

THE Nickel-Plate Railroad will issue round-trip tickets from Cleveland to Toronto, for \$5.50; tickets good for eight days, commencing Sept. 17.

IN consequence of more changes of clerks, several advertisements were last month carelessly omitted. Among them was friend Alley's, which see in this number.

OUR label printer has just contrived an order-sheet for honey labels which he thinks will enable you to order labels with much less chance of making mistakes. It will be sent free with our label specimen-book on application.

IF, instead of having the orders crowded in on us next spring, you will send them in now, we will, until further notice, make a discount of 5 per cent on all goods purchased now to be used next season, providing you make reference to this editorial when you make the order.

### SLICED SECTIONS VS. SAWED ONES.

WE saw some beautiful sections made by slicing up the wood from steamed pieces of plank, instead of sawing. The sections seemed every bit as nice as those sawed from plank, and quite a large part of the basswood may be saved by this method, as no sawdust comes out. There will be one great difficulty, however; the pieces must be dried after be-

ing steamed, or we shall have mildewed sections again; and the steaming and drying, I fear, would occupy more time than the lumber saved by sawing is worth. If we had a slicing-machine that would slice dry lumber, it might be a great saving.

TO-DAY is the 14th day of September, and I have just returned from a flying trip to the Tri-State Fair and the Toledo Convention. Although I stayed but a few hours, I had the pleasure of meeting friends Newman, Muth, E. E. Hasty, J. B. Mason, and a host of others, including Mr. Fornerook. The display of honey was most excellent, as was also the collection of implements for the apiary. I saw our good friend Vandervort turning his foundation mill, while Mr. Pelham was taking out the beautiful sheets. They were working together as pleasantly as a couple of brothers. I tell you, friends, it does our hearts good to see the kind feeling that exists among bee-men at our conventions, and that, too, when they are in the same line of business, and, in one sense, rivals for public favor. I wish the tradesmen of the world in general could take an example from them.

ON page 562 there is a suggestion that the bees that Samson found in the carcass of the lion might have been the work of spontaneous generation from the decaying flesh. I believe it is generally supposed the bees found a lodging-place in a partially decayed spot in the lion's body, which had dried up by the arid wind of that country until it was something like dried sole leather, and, in fact, was not a very bad place for a swarm to cluster beneath the ribs. May be they imagined the ribs were top-bars to movable-frame hives. In regard to Virgil's soaring imagination, I would suggest that he must have seen a swarm of bees passing over the carcass of some animal while it was infested with swarms of great blow flies, and that he somehow got the flies and bees confused together in his mind, and imagined they were generated from such a source. If friend Hasty does not like my explanation, will he please give a better one?

### OUR NEW COUNTER STORE.

ELIZA is already installed in her new room, and the goods are scattered over the counters. The shelves are being loaded up day by day, and we are beginning to solve the problem as to whether the new store will hold the goods. One great trouble in filling orders during the past months was that few if any clerks in the establishment knew exactly where to find the right article. Now each article is to have a place of its own, and the place is to be large enough to hold a whole lot, even though it be a wagon-load. The name of the article, as well as when it was bought, and of whom, is to be written over it as a guide to the one who makes the orders, to know how much we shall probably need in a season. A few days ago a clerk wanted some two-quart pails. He first went into the counter store, and then upstairs, then down to the warehouse, then into the "dark-room," and lastly found them stacked up in the tin-shop. As we frequently buy a thousand of these pails at once, we had been obliged to put them in all of these places to find room for them. Now, then, friends, we have the room; and the building, so far as it has gone, is all paid for. I thank you for your past patronage, and I thank God for giving me health and strength to manage this great sea of business.

MANY of the mistakes and misunderstandings we have had during the past season have been caused by changing clerks. Some have been absent, on account of sickness; others on account of business changes and various other reasons; and the best we could do was to install others in their places as soon as we could. In fact, I began to think that there was no safe way, except to have two clerks for almost every department, so that one might take the work

in the other's absence. The question comes to me often, and perhaps it does to some of you, as to whether I am really capable, after all, of managing a business extending and increasing in the way ours promises to do. In our new clerks' office, which is a room about 40 by 50, we are intending to have a separate desk for each kind of work, and each is to be provided with all the appliances that can be made use of to facilitate having one clerk take up the business of another without making blunders. That is, every thing will be mapped out so plainly that all the work the business demands will be easily understood and taken up. I have sometimes wondered, dear friends, if God were not trying to see how well I would manage after he had taken away one main prop after another. May it not be that he wishes me to become equal to the task of taking almost a new force of clerks, and still have every thing go on with order and system? I know I am a great way from it yet, and fear I am a dull pupil in some respects; but as long as the work is done for his honor and glory, I know he will help, for I have his written promise, "When thou passest through the waters, I will be with thee; and through the rivers, they shall not overflow thee."

## Humbugs & Swindles

Pertaining to Bee Culture.

We respectfully solicit the aid of our friends in conducting this department, and would consider it a favor to have them send us all circulars that have a deceptive appearance. The greatest care will be at all times maintained to prevent injustice being done any one.

**C**AN you give us any reliable information as to whether there is a real patent on the Mitchell & Buchana'l bee-hive? Parties here are selling the rights, and also territory. Some of us think the patent a humbug. But these men claim you offered Mitchell a big sum for an interest in it, and, failing to get it, published it as a humbug. If it is a fraud, I want to know it, so as to expose it. Please drop me a card, and oblige.

W. L. THURMAN.

Valley Creek, Texas, Sept. 10, 1883.

Friend T., we have never offered Mitchell, nor anybody else, a copper for any patent for any thing pertaining to bee culture; but we have showed up Mitchell and his work for the past four or five years, and we propose to keep doing so just as fast as he can find new localities to operate in, where GLEANINGS is not taken. We have published his patent-claim, and have explained that his patent was on an attachment to a division-board which he does not use himself, and the facts have been over and over again fully substantiated.

## Black and Hybrid Queens For Sale.

Black queens, 25 c.; hybrids, 40 c.  
Somerset, Ky., Sept. 5, 1883. J. H. COLVILLE.

I have 5 or 6 hybrid queens that I will sell for 20c each.  
Andover, Conn., Sept. 10, 1883. E. H. COOK.

## TO CLOSE OUT,

I offer a lot of nice, untested Italian queens at 75c each for one or more.  
J. P. MOORE,  
Morgan, Pendleton Co., Ky.

## Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it's often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

### CITY MARKETS.

**CINCINNATI.**—*Honey.*—The market for honey is very dull, and will remain so as long as our commission houses are so abundantly provided. The demand is slower than I have experienced for the last 3 years, at this season. Extracted honey brings 7@9 cts. on arrival. Comb honey, if choice and in sections, 14@15c. *Beeswax*, arrivals are good at 25c for clean yellow. CHAS. F. MUTH.  
Cincinnati, O., Sept. 10, 1883.

**CHICAGO.**—*Honey.*—Demand for good consignments of honey has been better during the past week, and stocks have been materially reduced. Choice comb, in one-pound frames, well filled, 18c; in 1½ and 2 lb., 16@17c. One fancy lot sold at 19c. Extracted is in light request, and sales are few; prices asked are 8@10c for yellow and white clover. *Beeswax*, receipts light, and there is not much call at 25@35c. R. A. BURNETT.  
161 South Water St., Chicago, Ill., Sept. 10, 1883.

**CLEVELAND.**—*Honey.*—Honey continues in good demand, and all lots of choice 1-lb. sections are sold on arrival at 18@19c; 2-lbs. not quite so ready sale at 17@18c. For extracted, there is but little call. *Beeswax*, 28@30c. A. C. KENDEL.  
Cleveland, O., Sept. 8, 1883.

**NEW YORK.**—*Honey.*—A few small lots of new comb in our city so far, which are selling at 17@18c. Extracted, white, 9@10c. No arrivals of new buckwheat yet. *Beeswax*, a fair demand, and is held at 28@29c. H. K. & F. B. THURBER & Co.  
New York, Sept. 10, 1883.

**BOSTON.**—*Honey.*—Best 1-lb. sections, 20c; 2-lb., 18 cts. Extracted, 8@9c. *Beeswax*, scarce.  
Boston, Sept. 10, 1883. BLAKE & RIPLEY.

Wanted—A quantity of extracted white-clover or basswood honey, to be shipped in tin cans holding 100 lbs. each. Write me the best you can do.  
Adrian, Len. Co., Mich. H. BARBER.

Wanted—1000 lbs. of extra white comb honey, 1-lb. boxes preferred. State price, delivered at Cleveland, Ohio. B. T. BLEASDALE.  
Warrens ville, Cuyahoga Co., Ohio.

I have 4000 lbs. light extracted honey in 200-lb. barrels; I will take 10 cts. per lb. on board of cars here.  
North Freedom, Wis., Sept. 1, 1883. F. MINNICH.

## 10 Chaff Hives, \$13.50

THE LAST TIME.

We have a small and choice lot of chaff hives (Root's style) that we will sell at the rate of ten for \$13.50, or five for \$7.00. We would prefer not to sell in lots less than five, but will do so at \$1.75 each. These are good hives, provided with tin roofs and rabbets, and we will positively sell at such low rates no longer than this fall. We can not do it. Send your order at once, and it will be filled promptly.

S. C. & J. P. WATTS,  
MURRAY, - CLEARFIELD CO., - PA.

**W**E will pay 10c each for the following numbers: January JUVENILE, February GLEANINGS and JUVENILE, 1883, and February GLEANINGS, 1882. A. I. ROOT, Medina, Ohio.

**CONVENTION NOTICES.**

CANADA'S BIG FAIR, AND OUR CONVENTION.

**T**HE attractions at this great fair, opening Sept. 10, and closing on the 22d, are so great that our space is utterly inadequate to enable us to reprint the programme for each day. But on the 18th we notice the following:

The Beckwith Family perform in a large glass tank; electric-railway trips; textile workers; gas vs. electricity; Prof. Hand, the great pyrotechnist, will descend from the main building in his "chariot of fire."

On the 19th, Farmers' Day is observed; horseback riding; balloon ascension; organ and piano recitals.

The 20th is known as "American Visitors' Day." Many of the attractions of the other days will be repeated, besides a grand review of all prize animals.

The whole affair promises to be a "big thing," and will doubtless well repay a visit. Seldom if ever will a better opportunity be afforded for the bee-keepers of the United States and Canada to "look each other in the face" than on this occasion.

In addition to what we published in our last issue relative to special excursion rates, we append the following, which is the latest we have received up to noon, Sept. 12.

**FARES.**

*Friend Root:*—I understand we can go from Lewiston, N. Y. (5 miles from Suspension Bridge), to Toronto and return for \$1 00. This will be the route taken by nearly all east and west, going via Suspension Bridge, as it gives a delightful ride down Niagara River and across the lake. GEO. W. HOUSE.

Fayetteville, N. Y., Aug. 29, 1883.

I have been to the Grand Trunk Railroad office, and had a talk about the Bee-Keepers' Convention at Toronto, Ont. They will give an excursion from Detroit to Toronto on the 17th of this month; the fare very likely will be \$3.75 for the round trip. Detroit, Mich., Sept. 7, 1883. OTTO KLEINOW.

The trains leave Suspension Bridge for Lewiston, where connection is made with boat for Toronto, as follows: 7 and 9 o'clock A.M., 5 and 7.15 P.M. Steamer arrives from Toronto at Lewiston 10.30 A.M. and 5.30 P.M. I send this, thinking perhaps it may be beneficial for those wishing to stop at Niagara a short time. GEO. W. HOUSE.

Fayetteville, N. Y., Sept. 2, 1883.

**BEE MEETING.**

The next regular meeting of the Mahoning Valley Bee-Keepers' Association will be held at Newton Falls, on the first Saturday of November, 1883.

E. W. TURNER, Sec.

**WANTED!**

**200** Swarms Italian Bees. Parties desiring Bees wintered safely in Florida, and returned next May or June, with half the increase (they swarm there in March) will do well to correspond with

T. GRAHAM ASHMEAD,  
Williamson, Wayne Co., N. Y.

*The best of References.*

**THE**

**British Bee Journal.**

The British Bee Journal is now mailed to our address in packages, semi-monthly. In order to dispose of them, we offer them at present at \$1.00 per year, postage paid, beginning Jan., 1883. Will guarantee safe arrival of every number.

A. I. ROOT, Medina, Ohio.

**Parlor Organs!**

Having contracted for quite a number of Parlor Organs, in order to sell some of them immediately I offer them to my brother bee-keepers at the ordinary wholesale price to dealers. I will send prices and catalogues to any who intend purchasing. Prices range from \$50 for a plain-case, 6-stop Organ, to \$125 for the finest possible case and 12-stop organ. The order with the money is to be sent to A. I. Root, Medina, O.; and if the Organ doesn't suit, you may return the same and get your money back from Mr. Root, after 14 days of trial in your own house. In this way I think nobody will run any risk.

M. R. KUEHNE, Dealer in Organs,  
9 1/2 CAIRO, ILL.

**E**XCHANGE.—Plymouth Rocks and Brown Leg-horns for Italian or Cyprian bees. Address T. G. ASHMEAD, Williamson, Wayne Co., N. Y.

**Isn't it Pretty!  
That is Nice! Neat! Handy!**

Is what people say of a wooden article that I will send you by mail postpaid for 70 cts. Have been selling them at \$1.00 each. I wish to show you how you can make some money at home.

9 1/2 c WM. FULLER, Woodville, Wis.

**Recent Additions to the  
COUNTER STORE.**

Postage.] [Pr. of 10, of 100

**THREE-CENT COUNTER.**

- 3 | MARKING-GAUGE, for carpenters' use ... | 25 | 2 25
- 2 | POTATO-PARER; a knife that will shut up | 25 | 2 25

**FIVE-CENT COUNTER.**

- 4 | SINK-CLEANER ..... | 45 | 4 00
- This is a pretty little shovel with a rubber edge, and nice for many purposes.
- 5 | TIN BASIN, 1 qt., retinned ..... | 45 | 4 00
- As bright as silver, and a very useful size.

**TEN-CENT COUNTER.**

- 7 | LUMINOUS MATCH-SAFE ..... | 85 | 8 00
- A very pretty ornament by daylight, and in the night shows in figures of fire, large and plain, "Matches."
- 5 | MUGS for children ..... | 85 | 7 50
- These are decorated with tables, and lettered for the little ones.

- 8 | MUSTARD-POT, China ..... | 85 | 8 00
- A very pretty utensil, with a mustard-spoon also China.
- 3 | NAPKIN-RING on stand, jet, enameled .. | 75 | 7 00
- A very pretty design.

**FIFTEEN-CENT COUNTER.**

- 10 | HEARTH-BROOM ..... | 1 25 | 12 00
- Just the thing for little girls. It is a neat, strong, well-made broom, only made small size. Just right for the "small-house-keeper."

**Twenty-Five Cent Counter.**

- HONEY-PITCHER ..... | 2 25 | 20 00
- This is a beautiful piece of glassware, and has a britannia automatic cover which keeps the pitcher always closed when standing on the table, but opens the minute you tip the pitcher to pour.

**Thirty-Five Cent Counter.**

- 10 | CRUMB AND BRUSH TRAY ..... | 3 00 | 27 50
- A useful adjunct of the dinner-table.

**FIFTY-CENT COUNTER.**

- 7 | HAMMOCK for children ..... | 14 50 | 42 50
- Made of strong cords of variegated colors.
- 22 | RIVETING HAMMER for tinners, black-smiths, or machinists ..... | 4 00 | 35 00

**SEVENTY-FIVE CENT COUNTER.**

- 17 | HAMMOCK, stout, and exceedingly well made for the money ..... | 6 50 | 60 00

**One-Dollar Counter.**

- 22 | HAMMOCK, like those for 75c, but stronger and better made ..... | 8 50 | 75 00

**TWO-DOLLAR COUNTER.**

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

\$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \*, use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

20 COLONIES OF BEES.

Mixed Italians and hybrids; part with Italian queens; in one-story Simplicity or 1½-story Langstroth hives; 8 frames of comb; division-board; cloth; say about 15 lbs. each of honey or granulated-sugar feed; all with more or less brood. Will place on the cars at Newark for \$6.00 per colony.

Address **W. EARLE CASS,**  
NO. 2 SUMMER PLACE,  
NEWARK, N. J.

50 STRONG COLONIES of Brown Hybrid Bees in new 2-story L. Merrit Hives; combs built last year. Single col., \$7; in lots of six, \$6.50, or \$300 for the lot. Would take young team as part pay. Safe arrival guaranteed. H. O. McELHANY, Brandon, Iowa.

216 COLONIES OF BEES FOR SALE!

A chance to get a first-class apiary South at a bargain. **ANTHONY OPP,** Helena, Phillips Co., Ark. 10tfd

GREAT REDUCTION! FOR THE NEXT 60 DAYS

I will sell the U. S. Standard Honey-Extractor at about 15% off the list price. Send for my new Price List. G. W. STANLEY, Wyoming, N. Y.

We will pay 10c. each for the following: January GLEANINGS, and May JUVENILE. A. I. ROOT, Medina, Ohio.

PLYMOUTH ROCKS & BROWN LEGHORNS. Superior stock. Prices reasonable. Address, T. S. ASHMEAD, Williamson, Wayne Co., N. Y.

Hive Manufacturers.

Who agree to make such hives, and at the prices named, as those described on our circular.

- A. I. Root, Medina, Ohio.
- P. L. Viallon, Bayou Goula, Iberville Par., La. 10tfd
- L. E. Mercer, Lenox, Taylor Co., Iowa. 4-3

FOR SALE!

52 Strong Colonies of Italian, Holy-Land and Hybrid Bees.

In 1½ and 2 story hives, with surplus arrangement. I will take \$400. For particulars, address

**H. J. SCHRECK,**  
Goshen, Elkhart Co., Ind. 10

Back Numbers of "Gleanings,"

Full and complete, and in good order. Vols. for the year 1878, 1879, 1880, 1881, 1882, 1883, nearly complete. Will sell or exchange any or all of them for bees, books, or any thing useful in the apiary; also

**HISTORY OF FREE-MASONRY,** and Digest. By J. W. S. Mitchel, M. D. Ninth Edition, 2 large Vols., handsomely bound in Morocco; Gilt backs, sides, and edges; cost \$18. Will sell for \$10, or exchange for Chambers' Encyclopedia, bees, or offers. *Speak Quick.* Address, 10d L. A. DOSCH, Miamisburg, Mont. Co., Ohio.

Strawberry and Raspberry Plants of best old and new varieties. Fall is the time to plant. Send for circular to **N. WHINERY & SON,** WINONA, COL. CO., OHIO. 10

## Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

### CITY MARKETS.

**NEW YORK.**—Our market is moderately active for honey. The fall movement thus far, however, is not equal to the corresponding date last year. The warm spell of recent date had a tendency to deter large buyers from placing orders. With cooler weather we look forward to a more active market. We are well informed that white honey will be more plentiful, and a lower price than last year is apprehended. While the buckwheat crop is lighter than last year, full prices are obtainable. We quote prices obtainable for all grades as follows: Fancy white clover honey in 1-lb. sections, no glass, 20¢@21¢; fair, 18¢@19¢; fancy, in 2-lb. sections, glassed, 17½¢@18¢; fair, glassed, 15½¢@16¢; fancy buckwheat, 1-lb., no glass, 15¢@16¢; 2-lbs., glassed, 14¢; ordinary bkwt. in 1 and 2-lb. sections, 1¢ less. Extracted, white clover, in kegs or small bbls, per lb., 10¢@11¢; buckwheat, 8¢@8½¢. Beeswax: The market is firm; prime yellow is worth 30¢@32¢. **MCCAUL & HILDRETH.**  
80 Hudson St., N. Y., Sept. 27, 1883.

**CHICAGO.**—The demand has been up to the average during this month for other years, with perhaps a better feeling on the part of purchasers that, for the present, the market would not be any lower. 1 quart comb honey, one-pound frames, well filled and white, 18¢; 1½ to 2 lb. frames, 15¢@17¢. Dark comb, offerings light, but really no demand for what there is. Extracted honey does not move with any freedom; consumers and dealers confine themselves to their immediate wants. Pure clover, of heavy body, brings 10¢; not quite so good, 9¢. Beeswax, 25¢@35¢. **Chicago, Sept. 24, 1883. R. A. BURNETT.**

**MILWAUKEE.**—Honey market here is very steady and the receipts of choice 1-lb. sections barely enough to supply the demand, and salable at 17¢@18¢; extracted, slow sale. Choice white in small packages, 10¢@11¢. Mixed and dark, 9½¢@10¢. Beeswax quotable at 25¢@30¢. per lb. **A. V. BISHOP.**  
Milwaukee, Sept. 21, 1883.

**CLEVELAND.**—Honey continues in good demand, and is readily placed as it arrives at 18¢@19¢. for best 1-lb. white, and 17¢@18 for 2-lb. Second quality and old, sells slowly at 15¢@16. **A. C. KENDEL.**  
Cleveland, O., Sept. 21, 1883.

**NEW YORK.**—Comb honey is plentiful this year. We are now receiving some very fine quality, and shall soon have a full supply of all grades and styles. We quote: Fancy white-clover, 2-lb. sec., 19¢; in 1-lb. sec., 20¢; in 1-lb. sections, paper boxes, 21¢. Fair clover, 2-lb. sec., 16¢; 1-lb. sec., 17¢. Buckwheat and dark, in 2-lb. sec., 14¢; 1-lb. sec., 15¢. White clover in bulk is selling at 9¢@10¢. on arrival. Market in beeswax is dull, and demand light. It is held at 27¢@29¢., according to quality.  
**H. K. & F. B. THURBER & Co.**  
New York, Sept. 22, 1883.

**ST. LOUIS.**—None save small sales reported; plenty offering and little demand. We quote: strained and extracted at 6½¢@7¢.; Comb at 14¢@16¢. Beeswax readily salable at 26¢. for prime.  
**W. T. ANDERSON & Co.**  
St. Louis, Sept. 22, 1883.

**BOSTON.**—No change. Best white 1-lb. sections 18¢@20¢.; 2-lbs. 18¢.; extracted, 8¢@10¢.  
**BLAKE & RIPLEY.**

Boston, Sept. 25, 1883.

I have about 150 lbs. of basswood honey yet to sell. It is in a nice, waxed 20-gal. oak cask. The honey was mostly sealed before extracting, hence is thick and nice.  
**W. H. UPTON.**  
Loveland, Iowa.

**WANTED.**—500 to 2000 lbs. comb honey in one-pound sections; must be first-class. State cash price and amounts. **GEO. W. LAWSON.**  
Centreville, Montgomery Co., Ohio.

**WANTED.**—A few barrels of white-clover and basswood honey. State lowest price, delivered.  
Springbow, Crawford Co., Pa. **CHAS. OLIVER.**

We have 4000 lbs. linn and white-clover honey in kegs holding 200 lbs. each, for which we will take 10 cts. per lb., delivered on board the cars here.  
Union City, Ind. **ROE BROS.**

I want to buy 1000 lbs. nice white-clover comb honey, 1-lb. sections, for which I will pay 17 cts. per lb., delivered here. **GEO. F. WILLIAMS.**  
New Philadelphia, O.

I wish to buy a few thousand pounds of comb and extracted honey. Parties having honey to sell will write me giving particulars as to style of package, and lowest price. **J. A. BUCHANAN.**  
Holliday's Cove, W. Va.

I have 2500 lbs. of white-clover and basswood honey, in barrels, for which I will take 11 cents per lb. Stayner, Ont., Can. **B. STONE.**

### CONVENTION NOTICES.

#### BEE MEETING.

The next regular meeting of the Mahoning Valley Bee-Keepers' Association will be held at Newton Falls, on the first Saturday of November, 1883.  
**E. W. TURNER, Sec.**

The Fall meeting of the New Jersey and Eastern Bee-Keepers' Association will be in New York City, at the Cooper Union, on Wednesday, Nov. 7, 1883.  
Bound Brook, N. J. **J. HASBROUCK, Sec.**

The annual meeting of the Michigan State Bee-Keepers' Association will be held at Flint, Dec. 5 and 6, 1883. All are invited.  
**Prof. A. J. COOK, President.**  
**H. D. CUTTING, Sec'y.**

The Iowa Central Bee-Keepers' Association will hold their regular annual meeting on Friday, Nov. 2, 1883, at the Court-house in Winterset, Madison Co., Iowa. All bee-keepers are cordially invited to attend, and let us make this one of the best ever held in the State.  
**J. E. PRYOR, Sec'y.**  
Arbor Hill, Ia.

The next quarterly meeting of the Central Ill. Bee-Keepers' Association will be held in Bloomington on Wednesday, Oct. 10, at 10 A. M. All interested in this and adjoining counties are invited to attend.  
**J. L. WOLCOTT, Pres.**  
**JAMES POINDEXTER, Sec.**

The next meeting of the Tuscarawas Valley Bee-Keepers' Convention will be in Newcomerstown, on Wednesday Sept. 26th 1883. We are endeavoring to make our meetings of interest to all apiarists, and, by so doing, to increase the interest in bee-keeping in the country.  
**J. A. BUCKLEY, Pres't.**  
**H. DENMAN, Sec'y.**

#### NORTHWESTERN CONVENTION.

The Northwestern Bee-Keepers' Association will hold its fourth annual convention at Owsley's Hall, N. W. corner Roby and West Madison Sts., Chicago, Ill., on Wednesday and Thursday, October 17 and 18, 1883, commencing at 10 A. M. on Wednesday, and holding five sessions.

The Rev. L. L. Langstroth (the father of American apiculture) has promised to be present, and many of the most prominent apiarists of the Northwest will be there and aid in the deliberations and discussions.

This meeting will be held during the last week of the Inter-State Industrial Exposition, and reduced railroad fares may be had on nearly all the railroads. A cordial invitation is extended to bee-keepers everywhere to attend this annual reunion.

Meals may be obtained at the restaurant near the hall at 25 cents each.

Beds may be secured at the Gault House for \$1, or at other hotels at regular rates.

**C. C. MILLER, President.**  
**THOS. G. NEWMAN, Secretary.**

Vol. XI.

OCT. 1, 1883.

No. 10.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00, 10 or more, 75 cts. each. Single Number, 16 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.

PUBLISHED MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

NOTES FROM THE BANNER APIARY.

No. 47.

**FRIEND ROOT:**— You think I was a little vehement last month. Well, for a long time nothing had been said against metal-cornered frames, and I thought it about time something was said, and said vehemently too. To the charge that I am sometimes just a trifle vehement, I will plead guilty; but not so in regard to being too intolerant of the opinions of others. I *do* respect the opinions of others, and most especially do I respect them when they are supported by good reasons. You think my remarks about metal corners will bring in a shower of protests. I presume they will. Now, if any of the protests are accompanied by *reasons*, please give us the reasons, and let the protests go — into the waste-basket. You say that you think I will change my opinions considerably in the next ten years. I *hope* I shall; there would not be much progression if opinions never changed. I have changed them considerably in the past seven years; but more, perhaps, in the past year than in the preceding six years, and I attribute the rapid change of the past year to the fact that I have, during that time, visited and mingled more freely with other bee-keepers; in fact, have been influenced by the opinions and *reasons* of others, and might write quite an article upon the

CONCLUSIONS OF THE SEASON.

I once thought the American frame as good as any other (and for the purposes for which I used it, that of raising queens and extracted honey, I still think so); but for raising comb honey, I now consider a shallow frame preferable; and as the

Langstroth frame is *very* much used, and is a shallow frame, I have changed to that. With a shallow frame there is more room for boxes over the brood; the bees enter and work more readily in the boxes, and the complicated side boxes, with their time-taking manipulations, are avoided.

I have made money rearing dollar queens; but although the present season has been a very poor one, I have come to the conclusion that, for me, there is more money in raising comb honey. I probably shall not drop queen-rearing entirely, but will continue it to this extent: When a colony having a good queen swarms, I shall wait six or seven days, and then cut out all except one or two cells. These cells will be kept in the lamp nursery until they hatch, when they will be introduced to nuclei.

Another conclusion at which I have arrived this season is, that, for the production of comb honey, pure Italians are *not* the most desirable. They do not enter the boxes so readily as the blacks or hybrids; do not build so straight nor so white combs, and are much more liable to crowd the brood-nest with honey, and to build brace-combs between the sections. They are also more inclined to swarm. In a poor season the Italians will gather more honey than the blacks, and are more agreeable to handle; and, taken all in all, for all purposes the Italians are to be preferred; but the producer of comb honey, who ignores the above-mentioned good qualities of the German bee, does so at a loss. I think it is better not to ignore the good qualities of *either* variety, but do as friend Heddon has done — combine them. So well satisfied am I of the superiority of a combination of the dark leather-colored Italians and the brown German varieties, that I

have bought queens of friend Heddon, and introduced them to full colonies, and reared queens from a tested queen obtained from him, and introduced them to other full colonies. I have also obtained a few queens of the Arkansas brown variety from Geo. B. Peters, and shall probably commence another season with few, if any, pure Italians in my yard. I had, perhaps, a dozen colonies of hybrids this season, and the work that they did will certainly bear me out in drawing the above conclusions. For fear that some may think that my having hybrids in my yard was not justice to queen-buying customers, I will say that, by the use of idn., the production of drones was controlled. Another season, comb honey will be my specialty; and if any one wants queens of the Heddon strains I can supply them. In taking this position in regard to the best bees, I expect that friend Heddon and myself, and perhaps a few hundred others, will stand alone; but if, by taking this position, we get comb honey by the carload, I think we can afford to "stand alone."

#### VISIT FROM ERNEST R. ROOT.

Two or three weeks ago I was sitting upon one end of the work-bench writing, when a young man stepped in at the door and asked if this was "Mr. Hutchinson, 'W. Z.'" I replied, "Yes, sir." The stranger said, "My name is Root;" and as I looked at him inquiringly he said, "Ernest." The pen was laid down and his hand was grasped; and as he had had a tramp of about 8 miles, not having come on the regular train, we sat down and chatted an hour or two, and then went out and caged queens, and introduced virgin queens, and "talked." In the evening, Ernest and my brother and myself held one of those unconventional conventions, and we showed Ernest the "fixings" that I was getting ready for the State Fair. The next morning friend E. went on to the north-west. He was swinging around quite a large "circle," visiting bee-keepers. Friend Root, if I am any judge, you have, in Ernest, a good son — one who will be generally liked and respected.

#### OFF FOR THE STATE FAIR.

Yesterday morning, half a carload of bees, honey, bee-keeping implements, etc., were started on their way to our State Fair at Detroit, and to-morrow morning I shall start. If I have time, and I will try to, I will send you a short description of the bee-keeping part of the Fair, in time for the Oct. No.

W. Z. HUTCHINSON.

Rogersville, Gen. Co., Mich., Sept. 13, 1883.

Friend H., the great reason why we prefer metal corners is, that they make the combs movable, and it seems to me a movable comb was really never movable until metal corners were put on them. You object to their being so very movable, I know; but we want every comb in every hive so it can be picked up with one hand, if need be, without any jar or snapping, or without being obliged to use the screw-driver, or lever of any kind. Again, our metal-cornered frames weigh, on an average, about 4 ounces, whereas some of your old wooden frames weigh pretty nearly a pound; and even then they are not so stiff and true as our wired metal-cornered frames. It would seem almost like box hives to think of going back to the old way. Whenever we want frames fixed in their places, we do it by spacing-boards. But I would by no means think of having all my frames stick in their places,

just because, when a hive is to be moved about, we want the frames immovable. It has been objected, that the metal frames cut the fingers. We have never experienced much if any trouble of that kind; but perhaps it is because we do not handle large crops of honey. We are now considering a plan for obviating this difficulty. — It seems you have also decided to drop queen-rearing, and, if I am correct, you rather take exception to pure Italians. I should think, old friend, you had been visiting around lately. May an old friend caution you about being hasty, and taking up many new departures? — Thank you for your kind words in regard to Ernest. — Judging from your report in this number, it seems no one can any more say that W. Z. Hutchinson, who occupies the first place on the pages of GLEANINGS has never yet raised a crop of honey. I am very glad indeed you have succeeded so well, even if you have seen fit to change your views on several things.

#### THE CONVENTION IN TORONTO.

THIRTEENTH CONVENTION OF THE NORTH-AMERICAN BEE-KEEPERS' ASSOCIATION.

ON Sept. 17th I started for the meeting in Canada. I went by the way of the Nickel-Plate Railway, getting an excursion ticket from Cleveland to Toronto and back for the small sum of \$5.50. The regular fare would have been \$17.00. It is an excellent idea to have our conventions, and especially our national conventions, held at such a time and place that the bee-friends of America can take advantage of these low rates of travel. Our trip on the Nickel-Plate was more pleasant on account of the presence of the gentlemanly manager, Mr. Pate, who attended us the whole way, made arrangements for our hotel lodgings, took us to the right boat, and made himself a general father to the many who, like myself, were comparatively unused to travel. The Nickel-Plate is a beautiful new road; and when I expressed my surprise to him that our cars moved with so little noise, he explained to me that we were traveling on car-wheels made of paper! if they can make the wheels for railway trains of paper, why can we not have paper bee-hives? I presume we might do so without any trouble; but the chief obstacle in the way now is the expense compared with our modern wooden hives. When we arrived in Buffalo, our manager took us to a very pleasant and comfortable hotel. After supper I began to wonder whether this hotel, too, had a bar somewhere behind the scenes. In truth it did, and I remained in the room much of the evening, just to study human nature — especially human nature as we find it in beer-saloons. I must confess, friends, that when I went to bed at 9 o'clock I could not help a sort of feeling that it would be in some respects a little hard to close up such a place as this. The man who stood behind the bar seemed full of the milk of human kindness, and it was hard to imagine that he would harm any one. His customers seemed pleasant, well-to-do people, about of the same class as I used to be when I used to take a glass of beer of an even-

ing with a friend or two. This second amendment, you know, must cut off this luxury, as many doubtless esteem it, from all such places as this. Well, you know I usually get up about 5 o'clock in the morning; but in consequence of change in the time in Buffalo, I arose about half-past 4 o'clock; and as no one seemed moving, I thought I would take a look in there. What do you think I saw? A room full of ragged, dissolute, besotted-looking human beings, stupefied with beer or something worse, and a perfect jargon of low-lived and filthy oaths and curses. One man, as he called his comrades to drink, spoke of his wife and children at home, and about his own blasted and sin-cursed life; with a sort of maudlin leer he made light of it all, and condemned himself and all present to the bottomless pit, and so it went on. The man behind the counter had lost his cheerful, kind look of the day before, and acted and spoke as if he were tired of life, and all that life could furnish. I went out into the open air, and drew a breath of relief, and declared to myself that I would never more be deceived by the mirrors and silver-plate and cut-glass furniture, even though accompanied with gentlemanly manners and a thin outside show.

That day, a little before noon, by standing on the platform of the car I caught a glimpse of Niagara Falls. To tell the truth, I was a little disappointed. It was a little strange, it is true, to see that great swift river, a little more than half a mile wide, tumbling over a precipice; but the feeling was a little like that of the Irishman who replied, when his attention was called to it, "Well, but what is to hinder its 'rowling'?" You see, it looks so natural to see it tumble when it comes to the tumbling-off place, that it was not so very surprising. More of this anon. When I next stepped off, at the steamboat-landing, I saw waving in the breeze, for the first time in my life, a strange flag, and I realized that I was really and truly for once outside of the fostering care of the stars and stripes. I confess I felt a little bad and homesick; but when I expressed something of my feeling to a bystander, he pointed across the bay, where, sure enough, the old flag waved. The two flags were not very far away. I wonder how it is with the two peoples. What sort of friends are these Canadians, anyhow? There is one good thing about them, certainly. They raise lots of peaches. The platform in front of the steamboat was literally covered with baskets of the most beautiful large yellow fruit, with ruddy cheeks, that it was ever my fortune to behold. Not even at our fairs had I ever seen such a display of peaches. It took the steamer an hour to load them on. Somebody said there were 15,000 baskets, unless I have made a big mistake. It may be I have. But there were a great many indeed. In a couple of hours more the great city of Toronto was before us. In the foreground we had Hanlan's Island, named after the great English oarsman, who, it is said, has outstripped both England and America in his especial calling. The island is a most beautiful piece of verdure. The buildings

and shrubbery are beautifully arranged; and when a bystander explained to me that it was the playground of the great city of Toronto, I could readily understand why it was so nicely kept. The finest building on the island belongs to Hanlan; and although it was originally intended for a large hotel and beer-saloon, I was told that the Canadian people had become so aroused up in the matter of temperance, that for two years prohibition had been successfully maintained on this island. The Canadians seem to be proud of the fact; and where heretofore had been such a scene of drunkenness and debauchery, now not even a glass of beer can be had. Parents can let their children attend a picnic over on the island, without fear of any of the consequences that inevitably follow beer-saloons and beer-gardens.

Our good friend C. F. Muth was down at the boat, looking for bee-friends; but as he is a very large man, and I am quite a small one, he did not see me, and I did not see him, and so I made my way to the exhibition grounds. I very soon blundered on to the apiarian building. It would hardly be proper to call it a hall, for it is so large; in fact, it was about as large as the "Floral Hall" building to many of our county fairs. I very innocently stepped inside; but the pyramids upon pyramids, and tier upon tier of boxes of both extracted and comb honey, towering clear to the lofty rafters, caused me to open my eyes (and my mouth too, I fear) in mute wonder. What did it mean? I was not prepared to believe that old Mother Earth could produce such a spectacle as this. I soon got my tongue, and began to talk; and when they found out that it was Novice in veritable flesh and blood, I soon found a warm welcome awaiting me. The association in the city was telephoned; and while I waited orders, I had a lively chat with some of the Canadian bee-keepers—strong, sturdy, vivacious, cheerful, funny fellows I found them, and I very soon began wondering whether our stars and stripes would not be largely benefited by having the Union Jack still a little closer to her side. There was one man in the hall, with a most magnificent show of comb honey, whom I shall long remember for his quaint mirth and wit, and the provincial brogue that distinguishes most Canadians from United States people, that gave an added charm to his conversation. Although I spent only half an hour with him, I felt almost lonesome when I left him to go to the convention. My wife was born on the shores of "Merry England," as you may know; and how I did wish she could have been with me, and heard my good friend J. B. Hall talk, for that was his name.

When I made my appearance at the convention, some meddlesome body called right out, in the midst of proceedings, that A. I. Root had got away from the "Flome of the Honey-Bees," and was there in the convention. They made so much noise, that for a while I felt a little foolish, and did not know where to go, or what to do. I was very soon warmly received among their number, and at the first intermission I received such an enthusiastic welcome that my poor right

hand has hardly got over it yet. Of course, I began to look around me; for it has always been one of my peculiarities to want to know where I am, and to see what every thing looks like. Very likely our blue-eyed baby at home came very naturally by his disposition to twist his head and roll his eyes in every conceivable direction to see what is going on, and what there is new under the sun. I very soon got my eyes on a full-length life-size portrait of a beautiful woman standing at the head of the room in which we were congregated. A beautiful woman is always a nice thing to have around. But, why did these Canadian people have one in such a conspicuous place as this, in one of their public buildings? Pretty soon it slowly dawned upon my understanding, and I said to myself, "Why, you blessed piece of old stupidity! can't you scrape up sense enough yet to know that that 'woman' is none other than Queen Victoria?"

Before we left, I found my eyes wandering toward her as the convention progressed, and caught myself saying, mentally, a great many times, "God save the Queen!" The room they had given us was none other than the council chamber of the city of Toronto. It was furnished free of charge,—gas-lights, janitor, and all,—and, what is still more, His Honor the Mayor of Toronto came before us and gave us a short address of welcome. Well, I tell you, friends, somehow it made the whole thing pass off very pleasantly. After one of the sturdy sons of Canada, Mr. McKnight, had stood up and given us a little speech of welcome, I began to feel that I really loved old England and all her sons. I need not mention her daughters here, because I commenced loving one of them a great many years ago; and as the investment has turned out well, I do not believe I am going to stop now, even if I *am* toward fifty.

Well, I should like it if I could tell you all that I learned here; but I do not know how I can, unless I wait till something draws it out, and so you may expect to hear me say, for the next year or two, every little while, "When I was in Canada." Our friend D. A. Jones was D. A. Jones still, just as he always has been—a natural born leader, and a man kind and liberal to a fault. He was the acknowledged leader and father of apiculture in Canada, as he always has been. It was D. A. Jones who secured the beautiful building on the fair-grounds; it was D. A. Jones who taught Canadian people that they could raise honey, and they bid fair to beat the world (by the way). It was D. A. Jones with his great influence who brought the convention to Canada, and it is still D. A. Jones whom the city of Toronto delights to honor; and if he has ever asked for any thing he did not get, without any trouble, it is something that I have not yet heard of. He is in every respect a large man; and although some few friends do take exceptions to the at times reckless way in which he acts and speaks, I am sure that those who know him will see clearly the amount of business our good friend has to look after, and let a broad charity cover and excuse all his little sins of omission and commission, if any such do exist; and if there were none, he

would be more than human. Prof. Cook and his twin brother (?) C. C. Miller were there. Friend Langstroth came in a little time after I arrived. C. F. Muth told us about buying and selling honey. Rev. W. F. Clarke had wandered from away up north, to come down among the bee-friends again. Vandervort and Pelham were there with their samples of comb foundation, and mills too, I presume, although there was so much to see that I did not see them. Friend Poppleton, of Iowa, and Judge Andrews, of Texas, were there, and Mr. House, of New York State, and Mr. Hart, of Florida, and many more whom I can not now remember.

#### CANADA-THISTLE HONEY.

One of the funny surprises was to find tons upon tons of the most beautiful white honey, both comb and extracted, that it has ever been my good fortune to taste, all made from the Canada thistle. The flavor is so much like basswood that I insisted that some late-blossoming basswood-trees had yielded enough to give it a flavor, although my Canadian friends think I am mistaken. Friend Jones thinks that a great part of the wonderful yields that they have had in Canada have been from this same Canada thistle; but as there is a law against raising it in this country (and a right good law it is, by the way), I presume we shall have to let the Canadians hold the laurel on this sort of honey. For whiteness, transparency, and beauty of flavor, I have never met any thing anywhere like it, and I must doubt if the world has ever before seen any such magnificent display of beautiful honey as the convention gave. I have remarked elsewhere that the exhibitors sold honey at wholesale and retail all along through the whole exhibition, and it seems to me that this is really a wonderful advancement in the matter of making fairs a success. The bee-keeper who gets the money is paid, and the purchaser who has come out with his family for a holiday, and takes home a good big pail of honey, is also happy. Why, I feel ashamed of myself, as I think it all over, to consider how little I knew about the honey industry before I set foot on the Canadian shores!

The first business of the convention was delegates' reports. Our friend C. C. Miller reported a crop rather unfavorable in Illinois; but as he made something like 60 lbs. per colony of comb honey from his entire large apiary, I told him I thought his report was one he ought to thank God for. Dr. J. P. II. Brown reports Georgia as quite unfavorable—not over 20 lbs. per colony, on an average. Judge Andrews, of Texas, gave their crop as very light, although the honey was of a very superior quality. He thinks 10 lbs. per colony would be about right. Horsemint so far has been a failure. Friend Poppleton, of Iowa, reports the white-clover yield as heavy; but after that was gone, he says they had the worst season for honey he ever knew. Friend Hart, of Florida, reports the crop as an average one. They have swarming as early as the middle of February. Along the coast counties they get large quantities of honey from the black mangrove, which, although rather dark in color, is ex-

cellent in flavor. Prof. Cook thinks that Michigan had about half a crop; about 50 or 60 lbs. per colony, he thinks, would be a fair average, one-third comb honey. From this we infer that Michigan people would consider 100 lbs. or a little more about a fair average. Friend Pelham, of Kentucky, gives the yield as much above the average, where white clover prevails. Mr. Porter, of Colorado, thinks their yield would run about 100 lbs. per colony. A great deal is gathered from the Rocky-Mountain bee-plant in their State. Friend Muth reports the yield good in the southern part of Ohio; thinks the average would be 130 lbs. per colony, but it is mostly from clover. He says it has been offered for 8 to 8½ cents, but advises bee-men to hold their crop rather than sell it at that price. Mr. McKnight gives the report from Canada as over 100 lbs. on an average, and reports a total yield of 211,772 lbs. The honey was from clover, basswood, and Canada thistles. Canada bee-men winter but little out of doors now. Friend Vandervort, of Pennsylvania, reports about half a crop. James D. Long, of Quebec, reports a yield of 100 lbs. per colony. Friend Hayhurst, of Missouri, reports the loss, during the past winter, at about 10 per cent, and an increase, during the summer, of 50 per cent, and an average yield per colony, spring count, of 35 lbs. of comb honey, and 30 of extracted. The honey is of a superior quality, and principally clover and basswood. But little wax is reported; thinks they have in Missouri about 200 practical, progressive bee-men, owning an aggregate of about 20,000 colonies, and thinks perhaps the total honey crop is not far from 1,300,000 lbs.

Some of the subjects discussed were as follows:

#### HOW HEAVY SHOULD OUR FOUNDATION BE?

Mr. Vandervort says if honey is coming in fast, thin fdn. does very well; but when the flow is scarce, they are apt to make holes in thin fdn. D. A. Jones prefers about 8 to 9 feet to the pound. Mr. Taylor, of Michigan, thought 7 feet to the pound was safer, but considered the form of the cell more important than the weight.

#### INFLUENCE OF THE SOIL ON HONEY.

Prof. Cook thought that the secretion of honey is an evidence of health in the plant, and this agrees with my experience. If we want spider plant, or any other, to yield large quantities of nectar, the plant must be enriched, and the growth strong.

#### DOES IT PAY TO CULTIVATE HONEY-PLANTS?

No one could state positively that it ever yet paid to grow plants exclusively for honey. It is well enough to grow honey-plants for the fun of it; but those who wish to do it as a money investment, had better choose some plant that brings a crop aside from the honey.

#### TO PREVENT THE LOSS OF QUEENS.

D. A. Jones says they breed thousands of queens, and have but little trouble by their missing their hives. They have the hives not much more than 6 feet apart.

#### WHAT IS THE BEST WIDTH FOR SECTION BOXES?

The decision seemed to be about 2 inches, or a little less, where separators are used; without separators, from 1½ to 1¾ inches. A great many are now managing without separators, and it seemed to be the voice of the convention, that, with proper management, separators might be dispensed with, and, by so doing, a much larger crop of honey be secured.

#### RIPENING HONEY.

Messrs. Hart and Poppleton thought that the sun was the very best agent for the purpose. Great care should be exercised in evaporating thin honey over the fire. Mr. Corneil suggested that we should have a standard specific gravity for honey. Your humble servant suggested that there is a vast difference in this respect, for many of the glass jelly honey-tumblers that hold one pound of California honey could not be made to contain nearly a pound of much of the honey we have in our markets; and also that honey stored in a deep tank or barrel would be very apt to be heavy on the bottom and lighter at the top, the heavier portion settling. Mr. McKnight corroborated this statement. Mr. Hart declared that honey will absorb moisture from the atmosphere, if not kept in some dry warm place. Prof. Cook thinks that no man can afford to wait for the bees to ripen the honey, and also states that no honey should be put upon the market until it has a good body.

#### TO PREVENT HONEY CANDYING.

Several plans were given, but Mr. Jones thought that none of them were sure. Sometimes it will not candy, and then again it will, in spite of treatment. C. C. Miller said, that if you drain off the liquid portion from candied honey, and then melt the residue, you would get a much finer quality than could be obtained by any other process. I indorse this statement.

#### WHAT IS THE BEST TIME FOR INCREASE?

The question was asked, "If 100 colonies are to be increased to 150, will I get more increase by making the increase before, during, or after the honey-flow?" Prof. Cook said before, if possible; if not, afterward; during, never. Miller, Poppleton, and others, strongly favored *during* the honey-harvest.

#### WHERE SHALL EXTRA ROOM BE GIVEN — OVER A CASE PARTLY FILLED, OR UNDER IT?

J. B. Hall puts the empty sections under the partly filled ones, in the fore part of the season; but when the crop began to wind up, put them on top.

(Concluded in next issue.)

#### MAPLE SUGAR FOR A "SPRING FEED."

##### HOW IT TURNED OUT.

THREE years before this last, has been a failure with me, my bees always dying in the winter. Last summer, having two empty hives filled with comb, and wishing to save the comb, I concluded to have some bees put into them. Mr. G. Thomp-

son took the hives and put his first swarms that came, into them—one swarm weighing  $7\frac{1}{2}$  lbs., and the other  $5\frac{1}{2}$ . One was Italian, the other hybrids. I think I paid him 60 cents per lb. They did not make any surplus honey to speak of. Last summer I paid but little attention to them, thinking they would die in the winter, as usual. Last March I began to hear reports of mortality among the bees. I looked at my two swarms and found them alive; gave each a large cake of maple sugar, and let them alone until about the last of May, when I divided them (as they seemed crowded, and did not swarm), making two swarms of one and three of the other. And now I must tell you the biggest story I ever read of. In about a week after I divided them, No. 1 have began swarming, and they kept at it until I got 8 swarms, besides one or two that left me. One I know, and I think two, went to the woods. I was telling an old bee-man about my luck. He says the most of them will, of course, die, perhaps before winter, as it is impossible for so many swarms from one to be strong enough to make a "live." Well, I have just looked them over, and I find them pretty strong with bees, and a "right smart" of brood in all the hives but one (that is queenless), but the most of them are lacking in honey. I suppose it took a large quantity of honey to raise such an immense number of bees. Well, then, to sum up, I have from No. 1 hive 8 good ones, one poor one, all well stocked with bees; four have sufficient honey to winter; the other four will have to be fed; No. 2 hive did not swarm, and now, after examining all my hives and getting, on an average, about twenty stings to each hive, and feeling sick at my stomach, you will not wonder that my enthusiasm in apiculture is cooled off, and I would like to sell out.

IRA BENNETT.

Medina, Ohio, September 20, 1883.

Friend B., it seems a little funny to think that you are the same man who wrote us a funny piece for *Blasted Hopes* two years ago or more. I am very glad of your letter above, for it has given abundant proof that your locality is a good one, and the plain moral is. I think, that you do not give your bees the right care at the right time. Putting a big cake of maple sugar over the frames in the spring was tiptop, and it produced the great result you have mentioned, or, at least, it contributed to it largely. Well, you should have followed this up, and, instead of letting the bees run the thing after their own fashion, you should have managed it intelligently. Had you kept all that monstrous quantity of bees that that queen must have produced, steadily gathering honey, and filling sections, or filling combs to be emptied by the extractor, you might have given us a story of a tremendous yield, instead of such a great quantity of swarms. Now, I would not feed them maple sugar in the fall, but feed them well and strong with granulated-sugar syrup, and next year you can give us a Report Encouraging, such as Medina County has never yet heard of, may be. You need not have twenty stings from each hive; in fact, you ought not to have one sting from twenty hives, if you take a smoker and go at it rightly. And besides, you probably would then have no disposition to "sell out," as you talk of in your concluding sentence,

## THE OLD WAY AND THE NEW,

WITH A LITTLE PICTURE OF THE OLD WAY OF GETTING HONEY.

OUR bees are in the old-fashioned box hives. We commenced with one box 7 years ago. Some summers they would do right well, as far as swarming was concerned, but we seldom got any honey, except when a colony died, which happened quite frequently in winter. Some springs we would have just one colony left, which was the case this spring, but it was a very strong one, and swarmed four times. After reading some of the letters in *GLEANINGS* I got a little enthusiastic, and concluded we would have some honey from our bees, as it is quite a luxury here, there being very few bees kept in this part of the country. Well, the first thing to be done was to put what we call rent boxes on. It was a long time before any of the bees commenced working in them; but at last one colony started, as we discovered by lifting the box and peeping in, which it required an immense amount of courage to do. After waiting what seemed a sufficient time for them to have it filled, I equipped myself in bonnet, veil, and woolen mits, for, oh! they do sting me unmercifully when they can get at me. Not having a smoker (in fact, we never heard of them till we read about them in the journal), we made a big smoke with shavings and gas-tar. I lifted the rent box off and held it right over the smoke, but the bees would not leave, and the heat melted, or, rather, softened the combs, and, finding the bees refused to leave, I got very courageous, and determined to have some honey at all hazards, and attempted to take the combs out with the bees on, by cutting along the edge of the comb with a case-knife, and then lifting them out with my hands. Well, I did succeed in getting some little honey, about 4 lbs.; but such a time! There must about 300 bees have lost their lives by drowning in the honey and burning in the fire, and by being smashed and mutilated in various ways; but they were quite active in the battle, and warmed me up considerably, which did not cool my enthusiasm a bit, only I want to know what we ought to do with bees, and how to do it, so we are all anxiously waiting the arrival of the ABC, as the whole family are now very much interested in bees, although sometimes for months during part of the time we have been keeping bees we have forgotten them entirely.

ALICE PICKLES.

Woodland, Pa., Aug. 24, 1883.

Friend Alice, I am very sorry indeed to know of the difficulties you encountered in your first attempt at bee culture. I trust you will soon be in the beaten path; in fact, I have given the above letter mainly to illustrate the wonderful stride that bee culture has made in the last few years. And those who are familiar with the modern methods will probably smile at the difficulties you have encountered. What a vast difference it does indeed make in working at any thing, whether we do so understandingly or intelligently, or whether we start out blunderingly in the dark, as it were. I presume our friend Alice took time enough in getting the four pounds of honey as she did, to take off 400 lbs. by our improved methods, to say nothing of taking the lives of so many poor little innocents.

**OUTDOOR WINTERING IN THE NORTH.**

HOW TO WINTER WITHOUT ANY UPWARD VENTILATION.

**I**N my articles last spring I didn't say a word about my wintering experiences; I just thought I'd hold on till wintering talk became seasonable again; and perhaps some of the comrades thought I had had bad luck, and wanted to sneak out of confessing it. I went into last winter with 130 colonies, reached April 1st with 122, came down 5 colonies more during the spring, and commenced the present season with 117. These figures are not bad, and yet they do not give me nearly a fair showing. The loss was mainly out of 13 colonies that I tried to winter in various experimental ways. All these perished but five—noblely perished in the interests of science—but I think the experiment was worth what it cost. I hope in some future article to give the details; but, as I think I have never given fully in GLEANINGS my approved method, I will write this time of that. Of 126 colonies packed in that way, only 4 were lost. According to the coroner's inquests that I habitually hold over departed colonies, two of these died of dysentery. one was destroyed by injudicious moving after they had become weak, and one was too warm when first packed, and formed the center of cluster with the queen in a cold place, where she and part of the colony perished. The survivors could have been re-queened and perpetuated, I think, but I chose to unite them with another colony.

It is pretty evident that bees *enter the winter, pre-disposed to dysentery some seasons*, while other seasons they have a full stock of vigor and vitality, and will not fail to go through, unless the circumstances are very much against them. My bees last year showed signs of dysentery very early. By January 9th three colonies were losing bees seriously by coming out to die on the snow—a state of things that soon spread to most of the apiary. On February 8th I was able, by means of a fresh snow, to make a crude estimate of the number of bees that came outside to die, and averaged it at 40 bees per colony each day. I ventured a hope that there were enough bees being raised to partly balance the loss, in which I think I was correct. Feb. 13th the air about the apiary had a smell of dysentery in it. Also other bees in this vicinity died badly, and many colonies were lost. After all this, to scare a fellow I finally came off as stated above. I think it was because of a very excellent method, although in that I am, perhaps, a partial judge; but I'll proceed to dilate upon it, any way. Somebody has said, "The best packing for bees is bees;" and I have rather taken that as my banner. I reduce every colony to four frames, and then chuck two of them into a hive. I do not feed up to get the combs heavy with honey, but just take the best ones there are. There will be mild days in March, and probably in February, when an empty comb can be taken out, and one of those removed in the fall put in its place. In case all the frames were very light, of course there would have to be feeding; but that never seems to happen in our locality. If the four frames contain, exclusive of comb and pollen, eight pounds of good honey, they may be trusted, I think. To fit a hive for two colonies, of course a partition must be put in. I use two thicknesses of enamel cloth tacked to a square frame made of thin strips of wood. With this arrangement they cuddle up against the enamel, and form the winter cluster just as if they were all in

one colony. Having but one hive to warm, they use, I think, but little more honey than one colony would.

The combs, as hung in the hive for winter, should be spread a little, making the spaces between about twice as large as the bees left them. As an eight-frame hive will not allow of this, I feel very strongly in favor of having a hive admit of at least ten frames, although in summer use I commonly reduce to seven by division-boards.

Upward ventilation I suppress totally by tucking down an enamel sheet as closely as possible. I do not wish to argue that porous covering is a failure; many use it, and do well; but I wish herein to give my own method just as it is. So far as there is any change, I think the present movement among thoughtful bee-folks is in the direction of the bees' own method, making all above them as close as it possibly can be.

I use folded cushions instead of sewed, wheat chaff, and three or four inches of it. Not so much is needed as when it is being constantly dampened with moisture from below; and having the chaff above always dry and warm is quite an important advantage.

It is almost needless to say, that I prefer hives with double and chaff-packed walls. If the hive is big enough, however, it can be made tolerable by using a division-board at each side.

One of the most important items of my plan is the bottom packing, which is accomplished by setting the hive on a tray of sawdust two or three inches deep. A smooth and non-porous bottom will be covered with dampness, filth, or ice, a good part of the time, to the great injury of the colony above, while thoroughly dry sawdust below keeps things "just lovely." The center of the tray must have a strip of board across for the enamel partition to shut down on, lest the bees dig under and get at their neighbors. The tray used in winter makes the bottom-board for summer by just turning it the other side up.

In the tray below them each colony has its separate vestibule boxed off with thin lumber, and not filled with sawdust, but empty. This vestibule extends in under the front ends of the frames  $1\frac{1}{2}$  or 2 inches, so that dead bees may drop in considerable numbers, with no danger of the entrance closing up with them. It can be cleaned out at any time, and should be looked into occasionally. Only a loose bit of board held by a half-brick separates the front side of it from "all out doors."

Last, but not least of the "wrinkles," is one made possible by the one last named. The entrance of the hive is closed, and a winter entrance 2 or 3 by  $\frac{3}{8}$  is made in the vestibule; and it is made three times as effective as an ordinary entrance would be by having it vertical instead of horizontal. That is to say, it is  $\frac{3}{8}$  wide and 2 or 3 high. The loose bit of board, armed at the end with a projecting row of wire nails, to circumvent the mice, is slipped to one side just far enough to make an entrance nearly under one corner of the hive. I advise quite earnest care to keep the entrance unobstructed at all times, except during a severe "blizzard." The quickest way to open things on the morning after a snow is to take a tea-kettle full of boiling water, and give each entrance a little tiny bit of a spill of it, being very careful not to pour enough to make steam rise up inside the hive. So the separate items of my plan are, 1, two colonies in a hive; 2, spreading the

combs; 3, no upward ventilation; 4, chaff cushions; 5, chaff walls; 6, bottom packing; 7, the vestibule; 8, the vertical entrance.

But, I see a practical bee-man rising and saying, "Mr. Hasty, is it not a great deal of work to get a large apiary ready for winter by your method?" Ah, me! it is lots of work — and perhaps you don't want it just for that reason.

E. E. HASTY.

Richards, O., Sept. 15, 1883.

Friend H., I am glad you told us in the commencement that you succeeded with your plan; for had you not, quite a number would have been ready to find fault with it. In fact, I felt inclined to find fault myself; but when I reflected that you did so well, I concluded I wouldn't. I have been satisfied that bees can be wintered safely under the enameled sheets, and with no arrangement for upward ventilation; but to do it we need some *sure* arrangement for lower ventilation, just such as you describe, and I do not know but you would be obliged to keep the snow away if you close the top up entirely, as you suggest. I like the idea of your perpendicular entrance very much, for I know it is a bad thing to have the bees drop and close up the entrance. We have had it happen a great many times. I like the idea of your vestibule, but it would be quite a difficult matter to have it in chaff hives. I am inclined to think that I should prefer a little ventilation through the covering over the bees, such as burlap instead of enamel sheets, although I confess I like your plan, and hope it may be tried quite extensively.

#### OBSERVATIONS BY FRIEND STEPHENSON.

**I**N accordance with my promise, I send you a few notes from my bee journal, which I hope may prove interesting to some of my friends. I have been very careful in making observations and drawing conclusions, as I have no desire to mislead myself or any one else. My remarks are arranged under headings, and on perusal you will find instances both confirmatory of and exceptional to some of our generally accepted bee laws.

##### WEDDING FLIGHTS OF QUEENS.

Within the last few weeks I have been the privileged though uninvited guest at the nuptials of quite a number of young queens. No. 1 was amongst the progeny of one of your imported Cyprians, and hatched out in one of the original 1-frame nuclei in which the brood-combs were shipped. These little boxes, with the addition of a cover and an auger-hole entrance, answer splendidly for queen-rearing in warm weather. I also find them very useful for transporting royal cells when on Italianizing expeditions. As soon as I have closed cells sufficient for my purpose in one hive, I get them all attached to one comb; and by next day all is safe for the road. Just before starting I place the comb with its adhering bees into my box, stop the auger-hole, and tack on my gauze-cover, and nothing could be better. On arrival at my destination I liberate the bees, substitute a wooden cover for the gauze, and I can remove my cells at leisure. I have thoroughly tested this plan, and by using wired foundation my combs have borne horseback transportation with perfect success. To return to our queen: I noticed her condition during one of my periodical examina-

tions. She had evidently returned quite recently from the wedding, as a whitish substance from which two horn-shaped filaments depended was clearly observable. This was on the fourth day after her emergence from the cell, and in three days more she was laying. The increase in size after impregnation was very remarkable, as in some young queens this is not so noticeable.

Another young queen, reared from the fine yellow Cyprianness purchased from you was also observed. She presented the appearance so well described by Huber, "The last segment of her body appeared to be filled with a whitish substance." On examining her later on, the sack had become nearly detached, and the bees were in full chase after her, evidently endeavoring to remove it. She then looked very much like a bee from which the sting had been partially torn out.

My next young queen, one of the finest I ever reared, gave me the opportunity of seeing her actually on the wing, and timing her flight. I was watching her nucleus, and happened to see something like the glint of a golden sunbeam flashing before the entrance, and it immediately occurred to me that it must be "Her Majesty" out for an airing, and so it turned out to be, as she shortly entered in all her virgin beauty. Presently she took flight again for a 5-minute sally. Then she rested awhile, and, after a good square meal of honey, which I noticed her enjoying, she rushed forth again, and this time she was absent some 26 minutes. But, alas! in vain. It had then grown late in the evening, and she rested for the night. Next day was fortunately fine, and about 2 P. M. she took a preliminary flight of a few minutes, and then she was absent for about half an hour. Again she rested, and after once more disappearing for nearly 45 minutes she returned at length, bearing in her body unmistakable proofs of a successful flight.

##### IMPREGNATED QUEENS TAKING AN AIRING.

Next day I observed this same queen whilst taking a short flight of 5 minutes or so, but I have never seen her on the wing since. Another young queen I intercepted on the alighting-board of her nucleus, on her return from a successful flight. Those flights were taken from the fourth to the tenth day after emergence from the cell, and eggs were laid 3 to 4 days after.

##### QUEEN-REARING, WITH ORIGINAL QUEEN CAGED IN THE HIVE.

I chanced to verify this in a hive containing a caged queen, but it was evidently done under protest, as only one cell was completed, though suitable brood abounded.

##### PERSISTENT DESTRUCTION OF ROYAL CELLS.

I have experienced considerable trouble in getting some hives of bees to accept royal cells, even after all ordinary precautions had been taken. I think, though, I shall now succeed, as they have exhausted all brood of suitable age. I find friend Doolittle is not strictly correct in saying a royal cell is never torn down when substituted for one built in the hive, as I have had several most unaccountably destroyed, even when placed where the original cells were removed; I do not think fertile workers are present, but will endeavor to satisfy myself on this point by watching for their eggs. I should much like a few suggestions from you or other apiarian friends on the subject.

##### ACCEPTANCE OF CAGED QUEEN IN A HIVE ALREADY CONTAINING A QUEEN.

This occurred in a nucleus containing a virgin

queen. The caged queen, also a virgin, was cordially received—not simply ignored, as is usually the case with such juveniles. Had the other queen been in a laying condition, possibly the reception might have been otherwise than cordial. What think you, friend Root?

The bees in this section are gathering just now from buckwheat and wild hemp in the early morning, and later on in the the day from polymnia, or stickweed, ironweed, and touch-me-not. I have failed to see them working on goldenrod, though we have it in endless profusion. My bees are now bringing in a deep orange-colored pollen. I wonder what flowers it can be from.

H. STILLINGTON G. STEPHENSON.

Charlottesville, Va., Sept. 7, 1883.

Thank you for the interesting facts you furnish, friend S. I have long been aware that young queens fly out after they are impregnated; but why they do this I am unable to explain. It is also pretty certain that they become impregnated the second time. I should cure them of refusing to rear cells, by giving them several combs of brood—enough, in fact, to hatch out a better generation of bees.—I did not understand friend Doolittle to say that a royal cell is *never* torn down when put in the place of one already built. I know that the bees will sometimes accept the queen where they have one already; but where they will keep two queens right along, the case is an exceptional one. I think that much depends on the temper of the bees. We usually find some hives in our yard that will accept of any queen; and I think very likely that such a one would accept and take care of two queens, provided the two queens did not molest each other.

## QUEENS ACROSS THE ATLANTIC, BY MAIL.

HOW DOOLITTLE DID IT.

SOME time during last winter, Mr. Angus Cameron, of Scotland, wrote me that he wanted one of my best queens sent him by mail, during the summer of '83, if I was willing to try the experiment of sending one in that way. I wrote him, that although I had little faith in getting a queen alive through the mails to him, yet I was willing to test the matter; and if I did not succeed, I would stand the loss of queen. Accordingly, on the morning of Aug. 1st I made a cage as follows: I got out a basswood stick, 2 in. square and 6 in. long;  $\frac{3}{8}$  inch from either end I bored a 1-inch hole nearly through, into which the candy was to be placed. I now turned the block  $\frac{1}{4}$  over and bored two  $1\frac{1}{2}$ -inch holes, 1-16 of an inch toward the center; from the two 1-inch holes at the ends, which made the two  $1\frac{1}{2}$ -inch holes come together. I next poured melted wax into the holes on either end, so as to prevent the moisture in the candy from soaking into the wood, after which I cut a  $\frac{3}{8}$  hole through each into the  $1\frac{1}{2}$  hole, as a means for the bees to get the feed. I next made the candy by taking pulverized sugar, and stirring honey into it till it got rather thick to stir. I then took to kneading it till I had it so I could roll it into a ball (as we boys used to pack snowballs), and placed it in a saucer, having it retain its shape, except flattening a little on the under side where it lay on the saucer. If it would not do this, I kneaded in

more sugar till it would. This is the way I have made all my candy for queen-cages this season, and I have not lost any, except one that I think was injured before she left. I have sent several to Texas, California, and even as far as Oregon, without loss; hence I have been particular in telling how I made the candy. I next filled the waxed holes with this candy, pounding it in with a stick till the holes were full within  $\frac{1}{8}$  inch, when a cork was driven in, thus preventing any escape of the honey. At about 11 o'clock I caught the queen, together with 25 worker bees which were about six to eight days old, as nearly as I could judge, and placed them in the cage, tacking wire cloth over the top of the  $1\frac{1}{2}$  holes. In catching bees to ship by mail, I always take those filling themselves with honey, waiting till they are nearly filled. After tacking down the wire cloth on the cage, I placed it, wire cloth down, on two  $\frac{1}{8}$ -inch strips, and left it till next morning, thus allowing the queen to rid herself of eggs, and the bees to clean the cage all out, so they would not be trying to carry out little pieces of wood and dirt on their journey. At 6 o'clock the cover was nailed on, which was a strip 3-16 thick, and covered the whole of the block on the side where the wire cloth was, except two  $\frac{3}{8}$  holes, one over each  $1\frac{1}{2}$  hole. The whole was now wrapped in strong manilla paper, except the two  $\frac{3}{8}$ -inch holes, thoroughly tied with a strong string, and a tag bearing the address tied thereto. At Mr. Cameron's suggestion I registered it, so as to secure safe delivery after it passed the boundary of the U. S., as queens are not supposed to pass in the foreign mails. At 7 o'clock on the morning of Aug. 2d the queen left for her home in the Old World, and I awaited the result. The evening of Sept. 4th brought this letter from friend Cameron:

You have done it, my friend! you have done it! Shortly after 8, on the morning of the 16th inst., I received the package containing the queen bee. You may be sure I very quickly peered inside, and as quickly had the satisfaction of seeing *probably the first live bee that ever crossed the Atlantic in the mails*. I delayed as little as possible before I opened the cage, or royal palace—for such it proved to be—clean, sweet, and in perfect order. On opening I found the queen in splendid trim, as were her attendant bees. Two only of the bees were dead. The candy was not half eaten, and it had kept its place in the cage. No spot of dysentery; in short, every thing was first class. I allowed the queen her liberty in the hive, and this morning, while I held the frame in my hand, I saw her deposit eggs. Success to her. With kindest regards, and many thanks for sending her majesty, I am yours, etc..

ANGUS CAMERON.

Blair Athale, Scotland, Aug. 18, 1883.

I have been particular in giving all the minutæ of this, thinking that perhaps the plan might be improved upon, so we might yet get queens from Italy by mail, thus saving the heavy expense of importing.

G. M. DOOLITTLE.

Borodino, N. Y., Sept. 13, 1883.

Well done, old friend! I am glad indeed to know that the matter has been accomplished; and when I first read your letter I remarked to our proof-reader, that it is no wonder you succeeded, because you always do your work so well and carefully that success is pretty sure to come. I am rejoiced to know, too, that it was done with the very same bee-candy that we have been using for more than a year past. There is one thing greatly in your favor: the queen was only 14 days on the route. If I am correct, that was rather quick sailing. We have had

queens live after being two weeks on the route; that is, where they were misdirected, or something of that sort. Now, friends, the way is open toward having queens mailed direct from Italy. We must forward cages to our foreign friends, and get them to put the queens up so carefully that at least a part of them will reach our shores. If it can be done, a very great saving indeed will be made over the expensive and comparatively slow way of having them sent by express.

### FROM L. M. SHUMAKER; THE FIRST 1000 LBS. OF HONEY.

SHALL WE GO TO FLORIDA?

**M**Y FRIEND, I wrote you a very gloomy letter in February, on the subject of bees, honey, pasturage, and failure, and asked your advice as to a removal to Florida. The sum of your answer was, that you doubted if I knew enough to travel so far from home; that Florida was no better than Virginia to a green hand, and advised me to study — learn, and to get and keep ready for the harvest when it came. Of course, the phraseology was courteous, but the substance is about photographed. Well, I didn't go to Florida, but pulled off my coat, donned my apron, and set to work to get ready. I doubled down from 43 to 34, fed 200 lbs. of granulated-sugar syrup; but, with all my work and skill, I had only 26 colonies that gave me as much as 50 lbs. of surplus. These, with about half a dozen large swarms, gave me 1220 lbs. of extracted honey, and a few over 700 perfect sections. I took off about 300 unfinished sections, and put back 250 over colonies that had brood-chambers full, but they seemed to consume the 100 lbs. of honey I fed back, as they did not complete more than a couple of dozen. Friend Root, when I looked upon my first barrel (42 gallons) of pure white honey, and, turning, saw stacked up eleven of your large shipping-cases filled with white capped sections, I felt very grateful for the timely words of advice.

#### HELP IN THE APIARY.

I am almost an invalid; have been a sufferer from gravel and stone from the time of the war with Mexico; I am now sixty years old, and the only assistant I could get was a dram-drinking, pipe-smoking negro, whom I found idling around the depot. Nevertheless he is a good-tempered, willing, and industrious soul, and doesn't care a button for the stings. If he were not so very forgetful, and would not get tipsy on Saturday night when he gets his money, he would become a fair help. Have I done well, or not? White clover and sourwood boomed; and if we could have had two or three timely rains, our harvest would have been doubled; but a drought of eleven weeks dried up the blossoms. It is now storming and raining — the only rain but one, the 21st of August, since the middle of June; yet horse-mint and sumac have given us some honey. If I had been stronger, or had had better assistance, I would have taken six or seven hundred pounds more; still, three-fourths of my 51 colonies (increased 17) have the brood-combs all ten, filled. I lost four swarms, and, singularly enough, two of them left without clustering within a mile. Alec followed the first one about a mile, and they made him cross Dun River twice. The other circled up and up, and away down the river. I think both left be-

cause the entrance, being the full width of the hive, and blocks being removed on account of the heat, they came out with a rush — all in a minute. I at once narrowed all my entrances to four inches — widening them at dark.

#### SECTIONS, TROUBLE WITH.

I have had some trouble with the last 1000 sections. They do not fit close, and hold where dovetailed. I have had to clinch them by bruising with a small hammer; and in casing them for the hives they then very often came apart. In other respects they are satisfactory.

#### PUTTING IN STARTERS; ANOTHER WAY.

I have adopted a very satisfactory and much more expeditious way of fastening the fdn. starters. Before folding the section, I fasten the starter firmly, and exactly in the middle of the top side, and so that it hangs square. I find my bees work it as they find it; if it hangs crooked, they work it crooked. I lay the one piece out on my bench, the wide or uncut side to me, and with a piece of narrow yellow wax I rub back and forth on the middle of second side, or the one next beyond the saw-cut; then with my left hand I take a starter from the pile and lay it square on the wax-rubbed line, and a little beyond the line; then with the right hand I take up my try-square, wet the end of blade, lay it on the fdn., and press hard, drawing the square from left to right, to make it firm. I then put both thumbs to the wide piece, pressing it down into the slot, and lifting the other end nearly to a right angle; I then move thumbs forward to third side, and repeat. I then turn the piece end for end, and bend the third wide side. Now bend the second from me in the same way, gently pressing the dovetailed ends together, and tapping with small mallet or hammer, and put it in the case which is ready for it. I very rarely see a broken or warped starter.

#### MAKING WOODEN MATS WITH WIRE INSTEAD OF TWINE.

While following your advice I learned one or two things that I am persuaded can be utilized to the good of bees and keepers. I find that the bees will bite through the best enameled cloth, and will bite and fray the twine on the wooden mats. Suppose that, in place of flax or hemp twine, you weave the mats with fine plated wire, and then weave them so that the slats run crosswise, and make them of tough sapling or poplar, and only  $\frac{3}{8}$  in. instead of  $\frac{1}{2}$  in. wide. I think you will get the very best covering for the frames yet made or discovered. I am willing to back my opinion by asking you to make me fifty, as per above, to lie over ten L. frames, in L. live, crosswise.

#### PATENT RIGHTS.

Friend Root, I salute you, and say amen to the firm resolve and purpose expressed in Sept. GLEANINGS, on the subject of the one-piece section. I felt concerned lest, in your extreme reluctance to go to law, you would permit Forncrook to win by default a case that every lawyer will say is only *prima facie* as to title. His patent is not conclusive, by any means, and Fiddes' letter, the three sketches, and McConnel's testimony, prove that he did not invent, and can not claim even priority in its use, or in any combination of the several principles involved in forming the one-piece section. Why, we had here in Danville, a year ago, just such a case, or cases. Our planters for years have been curing the bright yellow tobacco with flues made of stone, and covered with cast-iron, then with sheet iron, then with com-

mon stovepipes extending from a stove outside into and through the barns, and they gradually made the pipes larger and larger, and built a furnace outside to increase the heat and smoke. Well, a Mr. Jack Milner got up a sketch and model of what the planters had been using, hurried to Washington, paid the fees, and got letters patent for curing tobacco with sheet-iron flues (big stove-pipes), extending from a furnace outside, into and over the floors of the barn, etc. He came home and brought suit against every man who made big stove-pipes to cure tobacco, and threatened to sue every man who used them and refused to pay him a royalty for barn-right. A year ago the cases were tried before District Judge Robert W. Hughes, sitting as a Circuit Court. After but little testimony, and much speaking, Judge Hughes instructed the jury to the effect of turning Millner out of court, after wiping his face with the coarse rough towel of costs. I hold myself bound with all those bee-keepers whose paramount rights you are guarding, and propose to defend; to pay my pro-rata share of all costs incurred in resisting Fornerook, Flick, or any other frauds, in their attempts to levy black-mail upon our fraternity.

#### HIVING-BOXES, AND BASKETS.

Friend R., I have no use for a hiving-box, basket, or even apron, though Miss Cyula Linswik's hiving-apron is unique. I take the hive filled with ten frames of comb, or fdn.; and if the cluster is low (and all my trees, nearly, are low), I put it on a table and block it up with extra covers, etc., until I can bend the limb so that the bottom of cluster will touch the frames, and shake hard once; the queen nearly always falls with the cluster on the frames or into the hive. I wait a few minutes, shake any bees that may re-cluster, brush all the bees around the edges of hives on to the frames, and put on the cover, and shade if necessary. In half an hour I remove it to where it is to stand. If the cluster is rather too high for a table, and not high enough for climbing and sawing, I take my folding ladder, having top-board wide and long enough to hold an L. hive, and, spreading the legs, I fix the hive, and, by bringing the legs together, raise the hive under the cluster; even when I saw off a limb I carry the cluster and shake the bees down on the open frames. I rarely have a swarm to come out, if the hive is cool and otherwise in order. Alec forgot one last July, and left the bees exposed to the hot sun for several hours. Of course, they sought a cooler place.

Danville, Va., Sept. 11, 1883. L. M. SHUMAKER.

I am sure, friend S., I am much obliged for your very kind words, although I did not mean to say that you did not know enough to go to Florida.—In regard to your help in the apiary, you have surely done well; for not only have you done a kind thing for the friend you speak of, but you have unconsciously taken your first lesson in teaching pupils bee culture. If you can teach an old darkey (begging our old friend's pardon), you will surely succeed in teaching a bright, intelligent boy or girl. And now, friend S., go on. Do not let your light cease shining.—I am very sorry that any of our sections were made so loose they did not hold. Tell us what it cost to fix them, and we will pay you.—In regard to your manner of putting in starters, I thank you for the suggestion of a try-square. I think the blade of a try-

square would answer nicely in rubbing in starters.—Wire instead of twine has been suggested in making wooden mats. The objections are, that the mat would be so stiff it would not lie down anywhere, unless extremely fine wire were used. In that case, the repeated bending would be quite sure to break it.—Thank you for your kind words in regard to the patent-section business.—Your plan of using a hive filled with combs for a hiving-box is not quite new; but for all that it may be liked by many. I should say they are too heavy and unwieldy, compared with a basket or box.

#### NOTES FROM GROVESIDE APIARY.

##### NEED OF AN EXTRACTOR, ETC.

I HAVE to-day completed an examination of my twenty colonies of bees. I found them strong, and apparently healthy, with an excess of honey in the brood-combs, but not so well stocked with eggs and brood as I should like to have found. Some of the swarms that were cast the latter part of June have fifteen American frames that contain an aggregate of 60 lbs. of nicely capped comb honey, by actual weight. Perhaps it may be asked, why I did not extract, or put on supers, and obtain some of the surplus in boxes. Until the present season I have not felt the need of an extractor, and delayed procuring one; but, if Apis and myself do not dissolve partnership, ere another season we shall procure one, probably.

Supers were put on. As soon as the swarms had drawn out the foundation supplied them at hiving, and stocked it with eggs, brood, and honey, sections were put on and occupied in force; but the occupation was of short continuance, as the cold stormy weather that soon followed retarded the flow of nectar, and the bees sought a more congenial atmosphere in the brood-chamber, where they have remained most of the time since. The racks, instead of containing sections of nicely capped comb honey, have only sections from  $\frac{1}{4}$  to  $\frac{2}{3}$  full of clean white comb as evidence of what might have been done had "good corn weather" prevailed in its season.

##### EXCESS OF POLLEN.

After cold and wet, came cold and dry, and the storing of pollen appears to have been in order, the lower third of some of the combs being a complete mass of it. Should I conform to the monitions of those of greater experience than myself, I should remove this superabundance of pollen from my hives; but as I have not done so heretofore, I have concluded to let it remain, not considering it detrimental to the health of bees, unless it becomes decomposed by age or improper conditions inside of the hive. I have not as yet observed any dysentery among my bees, and do not believe that "sound" pollen will produce it; but I do believe that decomposed pollen (when eaten by bees after their digestive and assimilating organs have become debilitated by a protracted winter's confinement in a cold damp atmosphere) will aid in its development.

##### VENTILATING FOR COMB HONEY.

My experience this season and the one preceding has not been favorable to the acceptance of a blank space above the brood-frames, as delineated in

GLEANINGS, p. 441, Aug. No.; at least, not in this climate, when Italian bees or their hybrids are the subjects of manipulation. My brown and black bees, old colonies and new, that commenced working in the top sections early in June have continued their labors uninterruptedly, and are at present finishing the capping of the *outside* sections. No, Mr. Editor, the comments on pp. 442, 443, appear to embody about the right ideas "in a nutshell." Conditions must receive their due consideration, in attempting to apply radical rules in apiculture, as in other pursuits, where the weather and animal or insect nature are expected to co-operate. During the middle of sultry summer days I usually raise the caps of my hives and let the air circulate around the supers, but close them in the evening; exercising this precaution to prevent my bees being driven from the sections by a "cold wave" during the night, as they have been several times this season, with the caps closed. In a locality exempt from sudden extremes of temperature, such precautions would be unnecessary; but in Maine I think they are necessary. Right here I feel like venturing the assertion (although based on short experience), that the sudden changes noted in foregoing are a great drawback in working bees for comb honey, especially Italians of the orange-colored variety or their hybrids; for when once driven from the surplus boxes, they seem loth to return, except under extremely favorable conditions. How say others?

Although not ready to report in full the result of our bees' labor, it can be approximated as follows: Nine colonies in spring. Increased from eight colonies — eleven natural swarms, and one by division. Honey, at a safe estimate, 200 lbs. Two of the original 9 were transferred and united, making our present number 20 colonies.

J. F. LATHAM.

West Cumberland, Me., Sept. 6, 1883.

## NEW ZEALAND,

AND THEIR NEW BEE JOURNAL.

**I** DO not often see letters from New Zealand in GLEANINGS; but now that Mr. Hopkins has started a bee journal, you will have regular reports on the position of the science in this part of the world. Your big reports often astonish us; but when we have emerged from our infancy we hope to hold our own against the best of you. We have no basswood, to be sure; but I am sure you can't beat us in white clover, thistles, and such plants common to all countries. In this part of New Zealand the honey season may be said to open about the end of August, with the weeping-willows, which abound everywhere. Then in September the native bush begins to flower, and honey comes in steadily till the end of October, when white clover and almost every plant that grows seems to be in flower; and if the weather is not too dry, there is a great glut of honey for a few weeks. With January comes the thistle, that best of all the honey-plants, and continues yielding till the end of February, when a prudent bee-keeper ought to consider the surplus season at a close.

I am but a beginner in the art, having had only one year's experience. I have 80 colonies in Langstroth hives; but my bees are all blacks, and I am very desirous of having the apiary Italianized next season. Mr. Adams, of Gisborne, tells me he is im-

porting queens from several American breeders; and if he is successful, I shall be able to get stocked from his apiary.

Though I have no doubt that this is as rich a honey-producing country as America, we are handicapped in two ways; first, we have not the unlimited market you have for honey; and second, we pay three times the price for our supplies. This last evil is gradually mending, I am glad to say; opposition is beginning to tell its inevitable tale. I have great pleasure in the study of GLEANINGS and the *A. B. J.*, and hope to have a good yield next season by following the instructions of your masters in the art.

GEORGE STEVENSON.

Poverty Bay, N. Z., August 10, 1883.

Thank you for your kind words, friend S. We have received a copy of the *New Zealand Bee Journal*, and extend the right hand of fellowship. No doubt it will be a great aid to you in your country, which differs from ours in so many ways.

## QUEEN-REARING.

ABOUT ARTIFICIAL DRONES.

**W**E are told, that "out of the abundance of the heart the mouth speaketh." I don't want to claim, Mr. Root, that I know all about this queen business, but I do wish to intimate that I am deeply interested in the business, and now about drones from unfertilized queens.

My experience, though limited, is, that the drones are always of good size when the queen is perfect; most drone-laying queens are caused to be such by having imperfect wings; and almost all the queens with imperfect wings are under size, crooked, or deformed in some way, and I think this accounts for the drones being so small. I may not be right in this; however, if I am not right, somebody else is not right too; for if the drones are really less when the queen is not fertilized, the fact partly gets away with the theory, that the queen being fertilized does not affect her drone progeny. Surely here is quite an opening for valuable discussion, and I think we shall find that a great many of us are partly in the dark.

While I am on the subject of small drones, I should like to mention that I once had a queen whose progeny was very small; some of the workers were very little larger than the large green "sweat" bees that work so much on sumac and other small flowers. I am pretty sure this queen was fertilized by a drone from a fertile worker, as I had a hive full of them at that time.

## INSERTING QUEEN-CELLS.

Some one has said, that it will do just as well to lodge the cell between the top-bars of frames, instead of inserting into the comb. This I have given a thorough test, after depriving 25 hives of their queens, and smoking, as usual, until I saw they had missed their queen. I lodged the cells in between the top-bars of frames, and out of the 25 there were only six that did not destroy their cells, and begin the construction of other cells. Now, an idea occurs to me which, if it does not prove to be old and discarded, that I intend to test another season. It is, that the top-bar of the frames could be made of two pieces of equal length, and disconnected in the center about  $1\frac{1}{2}$  inches, but held together by means of

folded tin tacked on the edges of the top-bar; we could keep the comb cut out so as to lodge the cells straight above the range of comb.

CHAS. KINGSLEY.

Greeneville, Tenn., Sept. 14, 1883.

Friend K., you have certainly given us a new thought about this matter of small queens. I agree with you, that the drones from a queen fully matured, even if she is prevented from meeting the drone, should be full size, and good drones in every respect. It is the drones from fertile workers that are so small as to be a little suspicious. We practice inserting queen-cells almost entirely by putting them between the combs, but we do not put them between top-bars, for we have had abundant experience like yours. They are very apt to be torn down. We take the queen-cell between the first and second fingers, reach it well down between the combs, so as to be caught by the brood on one or both combs, when they are moved up so as to squeeze it slightly. I am sure I should not like a top-bar divided as you suggest.

## MICHIGAN STATE FAIR.

### BEE AND HONEY EXHIBITION.

IT is admitted by all, that the exhibition of bees, honey, wax, apiarian implements, etc., at the Michigan State Fair, now held at Detroit, is the largest and finest ever shown. Here, take my arm, and, in imagination, let us enter the hall.

At the left, as you enter, is the exhibit of Mr. H. D. Cutting, of Clinton, Mich. He makes the largest exhibit of implements, there being 63 different articles. He also obtained the first premium on bee-keeping literature, having copies of almost fifty different publications, all of which were arranged in a fancy show-case. A medley of bee-keepers' photos in the show-case pleased many a pair of eyes. The premiums awarded to Mr. C. amounted to \$33.00. By the way, Mr. C. deserves great credit for the general success of the exhibition. Several years ago, when the bee and honey exhibits, if any there were, were sandwiched between the limburger-cheese and cabbage exhibits in Agricultural Hall, Mr. Cutting resolved not to rest until the Agricultural Society recognized bee-keeping as an industry; and in this resolve he has been untiring. The result is, that a building has been erected, and a department created for bees and honey; and although Mr. C. has labored under great disadvantages in his thankless task, he now feels fully repaid. Bee-keepers of Michigan, we owe Mr. C. a great debt of gratitude.

Well, let us step along. Here is the space occupied by E. T. Lewis & Co., Toledo, Ohio. Just look at that mammoth smoker, two feet in height, labeled "Take me out to see your hybrids." Well, if it hasn't a whistle in the nozzle, and a mouth-organ at the back! Cutting had the "blues" until that arrived, not afterward. Mr. Lewis exhibited bee-keepers' supplies, and secured first premiums upon his honey and wax extractors.

Hell! here is a display of goblets filled with honey; also fancy cases of comb honey, beeswax, and Mason jars of extracted honey; they are from James Fry, Leslie, Mich. He also had a colony of Italian bees out of doors.

Are those drawings of plants over in that corner?

No, those are the plants *themselves*. They are specimens of honey-producing plants, pressed and mounted by C. M. Weed, of the Agricultural College, Lansing; and so well has he done the work that the natural colors are preserved. There are about 50 specimens, and, as he well deserves it, you see Mr. Weed has been awarded the first premium.

What is this we have run against? Bring that box here; let me climb up and look into it. Why, it is a mammoth honey-extractor, capable of receiving six combs at a time; or if only three combs are put in at a time they can be quickly reversed inside the can by a single touch of the finger. This extractor is exhibited by August Koeppen, Flint, Mich. He also had on exhibition, not a chaff, but a *tow* hive. Not only the walls, but a movable bottom-board, six inches thick, was filled with tow.

Here is a complicated hive called the Queen home, or winter protector. Well, if they haven't given it the first premium! Yes; but one of the committee said, if he could have had *his* way, the premium would have been given to a plain, simple, unpretending, eight-frame Langstroth hive.

Well, if here isn't a fine exhibit! how it *does* shine! I wonder whose it is. Well, you *needn't* wonder; just look up there on the wall; there are the letters, built in hives by the bees; they are M. HUNT. Well, where shall we begin to look at it? Oh! commence at one end, and take things in their order. Here are chaff hives, and out of doors are two colonies of bees upon which are awarded a first and second premium. Over there in the corner is a very tastily arranged collection of bee-keeping literature. Here in front, under bell-glasses, is honey "fixed up" in such beautiful fancy shapes that it is impossible to do it justice. Here is a crate of white honey, here sections with glass sides and fancy, turned wooden corners, pyramids of octagonal sections with openings in the center filled with fine bouquets, several elegantly finished cases of fine white comb honey, extracted honey in glass pails, bottles, cans, jars, tin pails, and large tin cans, all of which are adorned with showy labels. There is a round pyramidal stand of shelves, about four feet wide at the base, and the same in height, the shelves of which are filled with little pails and cans of extracted honey, and surmounted with a large glass jar of honey, all of which makes a very fine display indeed. And just look at those three fine pyramids of wax, molded in fancy molds. I wonder why they didn't award it a premium. Look at the bee-keeping implements. There are *lots* of them, aren't there? Yes, enough to take the second premium. Mr. H. receives first premium upon extracted honey and comb fdn. His premiums, in all, amount to over \$50.00. Oh! I came near forgetting; he had two 1-frame nuclei — one of Italians, the other hybrid. Mr. Hunt occupies just one-fourth the building.

Well, here we are at the exhibit of W. Z. Hutchinson; and although I don't like to talk about it, I suppose I *must*. The part that first attracts visitors is the display of comb honey, some 2500 pounds of which are piled up tier after tier, in pyramidal forms, until it can go no higher, for the simple reason that the *roof* has been reached. The base of the pyramid is 20 feet long, and many, many an old bee-keeper and traveler (and *one* traveler had visited the bee shows of Europe) exclaimed, "That is the largest and finest exhibition of comb honey that I ever saw." Each "step" of the pyramid formed by

pling up the bases of honey, is surmounted by a small pyramid of tin pails of extracted honey, and tin pails of extracted are hung upon nails all along the "plate," rafters, and cross-beams. Above all this, nailed to the roof, is a huge placard, "3000 lbs. honey!" Right where visitors could poke their noses against them are 3 glass hives containing full colonies of bees, while large gilt letters upon the glass announced that one hive contained "Blacks," another "Syrians," and another "Italians," while a one-frame nucleus contained an "Italian queen and bees." All these glass hives turn upon a revolving pivot, and visitors can turn them so as to get the best light. A dozen queen-cages containing queens are attached to a board that turns upon a pivot in a similar manner, and many a person who had never seen a "queen bee" saw one. A shipping-crate, covered with silver paper, trimmed with gilt paper, filled with sections, is surmounted by a pyramid of sections, some of which are covered with silver and gilt paper, and over the whole is a square case of glass, the corners of which are trimmed with silver and gilt paper, and letters on the front, in gilt letters, "Gilt-edge Honey." Dr. A. B. Mason said that it was the finest thing of the kind that he had ever seen. The sections in the shipping-crates were awarded the first premium, as was the large display of comb honey. A tall pyramid of wax, surmounted by an old-fashioned straw hive formed of wax, also received a first premium. A collection of honey-producing plants, pressed and mounted, and bound in an Emerson binder, interested and pleased many a visitor, as the leaves are turned and returned. It received a second premium. A show-case, lettered on the front in gilt letters, "Bee-Keeping Literature," contains 47 copies of periodicals and publications, and was awarded a second premium. Then there is a fountain pump, a folding tent, queen-excluding honey-board, supers, shipping-crates, etc., that make up a collection of implements. First premiums were awarded Mr. H. upon Italians and Syrians. His premiums in all amounted to about \$80.00. The aggregate value of all the exhibits is \$2000.

The reporters of the city papers were much interested, and, of course, we "stuffed" them, and they gave us good long notices, and mentioned the bee-keeping show as the "new feature."

But the best of all is, that the officers of the society have become very much interested, and have promised to do any thing reasonable that we may ask of them. The exhibit of this year has opened their eyes to the attractiveness and importance of an apianian exhibition; and all that is now necessary is that bee-keepers come forward and make displays, and we shall soon have so large and attractive a premium list that bee-keepers can come to the fair, and find it profitable in dollars to do so.

W. Z. HUTCHINSON.

State Fair Grounds, Detroit, Mich. Sept. 20, 1883.

Friend H., I am pretty well satisfied that you and I have both of us done a wise thing in deciding to attend the conventions and displays of honey at our fairs. They are, without question, one of the greatest helps in the way of educating the people in the way of apiculture that have been devised. It is true, there are objectionable features in all fairs, but I suppose it is because those who are hungering and thirsting after righteousness have been too much in the habit of

holding aloof. You say the display was the largest and finest ever made. Well, that is just what I thought about the exhibition at Toronto. But I think we shall not have any discussion on this point. I congratulate you on the happy vein in which you have described what you saw there; and it has occurred to me that it might be desirable to know what you heard, as well as what you saw there. My recent visit has firmly decided me on one thing, and that is, that our next county fair shall witness an exhibition of honey such as has never been seen in Medina County before. In Toronto, the exhibitors were permitted to sell honey while exhibiting the mode in which it was obtained, and in this way they had ample pay for all the trouble and pains they took in carrying their product to market. Friend Jones has the credit of this idea, I believe. Did you have similar arrangements at Detroit? The retail trade that was kept up in the honey-house at Toronto was deemed one of the pleasantest features, and it afforded a most excellent opportunity to discuss and decide in regard to the proper kind of packages to put honey in, so that consumers might carry it off with them with the least trouble and inconvenience. Who shall say that the time may not come when wide-awake honey-producers will dispose of their whole crop at a good round price while exhibiting it at our honey shows, in connection with our State and county fairs?

#### A PARASITIC HONEY-PLANT.

THE DODDER.

ON several occasions, while walking through alfalfa fields, I have noticed honey-bees visiting the tiny blossoms of the dodder. They seemed very much in earnest in prosecuting their work, for at times one bee would crowd another out of the way, in order to get in first. The dodder, or *cuscuta*, as you are undoubtedly aware, is a curious plant of a parasitic nature. The fact of the bees working on the dodder does not of itself attract any particular attention; but when we come to look into the matter more closely we find that it is one honey-plant, so called, feeding upon another. The flowers are abundant, and give forth a pleasant fragrance. Although we are all very desirous of encouraging the cultivation of honey-plants, we would not recommend the least attempt to try it, for honey or otherwise.

To give your readers a better idea of this parasitic plant, the writer thinks he can't do better than to quote the following extract from an article by Jos. F. James, custodian of the Cincinnati Society of Natural History, in *Viek's Magazine*, Vol. V., p. 330:

The yellowish-colored plant commonly seen climbing and twining over other plants, and which sometimes causes great mischief in cultivated fields, is the dodder. It starts in life like any other plant; that is, it germinates from a seed, and has at first a root. But as it grows, and the stem reaches far and twines on other plant-stems, the root dies, the stem severs its connection with the earth, and depends for the rest of its life on the nutriment it can secure from the plant upon which it has fastened itself. It sends its suckers deep into the stem of its benefactor, and, absorbing all of the vitality from it, is eventually the cause of its death. One species of the genus, *Cuscuta racemosa*, has been very injurious in Europe, and lately in California. In Europe it appeared quite suddenly, and for ten or twelve

years was an awful pest in alfalfa or lucerne fields. By energetic measures it has almost disappeared from the Old World, and within a few years has again made its appearance in alfalfa seed imported from Chili, and cultivated in California and other parts of the country.

The pest spreads rapidly, as it radiates in all directions. Its effect is something as if a barrel of salt were dumped in the middle of a clover-field. As the rains fall, the salt brine is washed gradually into the earth in all directions around the pile; the clover becomes blighted, so in a short time a large circular patch will be left barren. Just so with the dodder. No matter how much nectar it contains, set me down as its enemy.

W. A. PRYAL.

N. Temescal, Cal., Sept., 1883.

## MRS. HARRISON STILL IN THE GREAT CITY.

SHE VISITS THE "MAGAZINE" FOLKS AND THE THURBERS.

I VISITED the office of the *Bee-Keepers' Magazine* Sept. 12, and had a pleasant chat with Mr. King. He showed me some Carniolan bees that he had in his office. They were a dark-striped bee, and the tips of their tails appeared to me to be blacker and sharper than other bees. Mr. King said they didn't sting. I do not know whether he meant they were only good-natured, or *stingless*. These Austrians would be poor bees for me to own, if they are stingless, for the boys broke open surplus boxes last night, and, meeting a warm reception, fled without obtaining any honey. Mr. King had also some Holy-Land bees, brought from his apiary on the roof. We had them climb a string, so we could turn them around and view them easily. We had visited Mr. King's apiary on the roof, and watched the Cyprians, Italians, and Holy-Lands, going in and out, and could perceive no difference in them. But when we had this Holy-Land bee climbing the string, we could see a difference. It looked as though it had some time or other been in the flour-barrel, or been dusted with lily-white — a yellow bee dusted with white, and a bright-red mouth.

We next visited the mammoth establishment of the Thurbers, and found it to be a great hive of industry. The different departments of trade, including desks and paraphernalia, were inclosed with wire screens, and all was activity and life. The polite usher conducted us to the "Honey Department," where we found samples of honey on the manager's desk. We requested him to show us their supply of honey, but he said their honey had not arrived, but was expecting two or three carloads this week. A sample of honey on the desk was from the apiary of J. C. Newman, Peoria, N. Y. It was in a small box glazed, and was very pretty and white; it did not join the sides of the box very closely, looking as if the bees had been playing bo-peep from side to side. It weighed one pound seven ounces. We desired to purchase it, in order to compare New York honey with white clover we had brought with us, when the gentlemanly manager presented it to us. This honey was put upon the table for tea, at our friend's house, in lieu of the white clover from our apiary. While the head of the family was eating the honey, he remarked that it must have been "dropped into soap-suds." This man knew nothing of comb foundation or its manufacture, and we mention it only as a caution to those who use suds

to keep foundation from sticking. We know by the use of fdn. in surplus boxes that honey can be put upon the market in much better shape, not so liable to break or run, as without it, and the trade like it better. But if we were going to eat it, we should much prefer honey without it. When we ate this honey there was a strong beeswaxy taste in the mouth, and the wax was also discerned by others, the proof being in numerous cuds of it upon the plates. The honey itself was very light and thick, and possessed of a flavor new to us. For aught we know it might have been teal.

Peoria, Ill., Sept. 20, 1883. MRS. L. HARRISON.

Mrs. H., I am very glad indeed to know about our friends in New York city. The idea of getting a bee on a string is a new one. Whose invention is it? you see, we want to see the bees on all sides. I have often wished that I could turn them around; but by the wings or body, it doesn't work pleasantly always. Since you suggest it, getting them on a lead-pencil would do as well. Your description of a true Holy-Land bee is, I believe, correct. The Carniolan bees, we have never seen. I think friend K. must have meant they were gentle, but not stingless. Now, Mrs. H., comb made on the modern style of fdn., made as it ought to be, does not have any thing sudsy or waxy about it. Are you sure that section came from the apiary of J. C. Newman? if I am right about it, he is a man fully posted, and also a careful honey-producer. The time has passed by, it seems to me, for comparing comb honey built on fdn. with that made by the natural process. If the fdn. is as it should be, there is no difference. Soap-suds has not been used for years, to my knowledge, for making foundation.

## FROM NORTH CAROLINA.

ITS HONEY RESOURCES, ETC.

I CAME to North Carolina from Connecticut in 1869. I kept a few bees there with a view to a little honey, but more for sake of pleasure than profit. In 1870 I purchased a few stocks, and have had more or less, with varying success, ever since. The conditions and circumstances of bee-keeping in North Carolina are, as doubtless you are well aware, greatly different from those in Connecticut. Two things are especially noticeable; one is, that it requires more honey, perhaps two or three times more, to winter a stock in the former than in the latter, owing to the fact that the bees fly out during some days of nearly every week; and, except in unusually cold terms, several days in each week. The other is, that the honey season is remarkably early and short. Sometimes the jessamines, alders, willows, etc., are in bloom, and the bees gathering honey lively by the middle of February, and swarms issuing by the last week in March. They are ordinarily gathering honey in March, and swarming by the middle of April. I might add a third peculiarity, which is, that many plants accounted at the North to be excellent honey-producers are here of no value whatever. I set out a row of 25 locust-trees not long after I came down here, thinking they would soon yield many pounds of honey; but though they have sometimes been exceedingly beautiful in the exuberance of their blooms about Easter, I have

never seen a bee upon one of their blossoms. I have sown buckwheat for them, which grew and thrived finely, but the bees visited it very sparingly in the early morning, and never after eight or nine o'clock. The honey season ceases as suddenly as it commences. Although there is an abundance of summer and autumn flowers, few of them produce any honey, perhaps on account of the dry hot weather. I never had a pound of surplus honey made after the middle of July — seldom after the first of that month. The bees fly constantly, and seem to be as industrious as ever, but do no more than support themselves, and keep their stores good. These things being so, it requires a little time to accommodate one's self to the changed condition of things — or, as the boy said, "to get the *hang* of the school-house." Four or five years ago I began to experiment a little, with a view to work up a hive and a system which should be simple enough to commend itself to the people who were using "old gums," or plank hives, the only kind to be found about here. I have succeeded in securing their approval and admiration, but no one, so far as I know, has used the hive. My plan is to establish apiaries in the "regions round about." There are twenty little steamboats now plying between this city and the numerous places upon the different rivers and creeks which are tributary to the Neuse. I propose to put 25 hives together, in places of easy access, and visit them from time to time. I have seen bees in six places — in some more, in others less, to be evened up this coming winter. I have had no difficulty in getting places to put them. All I ask of the persons with whom they are located, is to protect them against depredations, and hive the swarms. I put on the cases at the proper time myself, and take them off. They should be put on from the middle of May to the first of June. There is a little "knack" in putting them on, which is easily learned. I can put on a dozen before breakfast, and not have a bee escape from the hive. They must be taken off during the first half of July. Ninety-six sections of honey and a swarm is a good yield for a hive.

I think I can establish 40 apiaries — a thousand stocks — in two or three years. EDWARD BULL.

Newbern, N. C., Sept. 17, 1883.

Friend B., your plan is a feasible one; in fact, we have quite a number among our readers who are managing apiaries in different localities, as you suggest. But it may require more ability than perhaps you are aware of. You can no more expect to manage forty apiaries without having grown up gradually to the business, than you could expect a schoolboy to manage algebra without a gradual process of taking the successive steps through months and years until he is able to grasp it.

#### MORE ABOUT R. WILKIN.

A DESCRIPTION OF HIS LARGE APIARY, BY FRIEND NORTON.

**FRIEND ROOT:**—You complain that my report from San Buenaventura is a brief one; but you should consider that I had to think of the overflow of MSS. that usually comes in upon an editor, as well as of the fact that I am a stranger to you, and that better articles than mine will be the general rule. I herewith add a little to my last letter, for I found, on reading it in print, that I had

said less about Mr. W. than I intended. You already have the picture of his *Sepe* apiary. A good engraving of it is to be found on page 208 of the A B C. More than 700 hives are at present arranged in hexagonal form with the extracting house in the center. The hives face in various directions, and the every-day business, flying and humming of the bees, is as if many swarms were issuing at once. The walks are wide and convenient, and to get to any portion of the apiary from any other portion is very easy. A four-wheeled cart is run by the operators while extracting. On this a Langstroth hive with a hinged cover is fastened for empty frames. On it, also, is room for the comb-baskets that take the full combs. Beneath hangs a pail with water and rags, for cleaning purposes. The sides of the house are composed largely of wire cloth. On one side (the side toward you in the picture) are two sliding doors, or, more properly, windows. The full combs are handed in at one of these to the uncapper; the empty ones are taken out at the other from the extractor. I omitted to say that each is on a level with a cart or wheelbarrow of average height. Within the extracting-house every thing is admirably arranged. In the end seen in the picture are kept the various small fixtures, such as rotten wood, matches, water, tools, etc.

A large tank holds the cappings. Over this are cross-bars with a sharpened iron point fixed in the center of each. With the balancing point of an end-bar resting on this pivot, the frame turns with great facility. The cappings drain into a pipe, and the honey is conveyed therein to a tank. The uncapped combs are placed in the eight-frame extractor. This is admirably geared. When once started (and it starts quite easily) it goes with surprising ease. A fifteen-year-old girl turned it during his busiest season. The comb-holder turns on pivot hinges like the leaves of a book, or, perhaps, like little doors would be more expressive. Combs are thus handily reversed without removing from the extractor.

In this connection I will mention the six-frame extractor of Mr. Lewis, of Matilija Canyon. By an ingenious device, the lifting of a rod will reverse the six frames at one stroke. He winds up a weight, and then the extractor turns automatically while he continues uncapping, till it has run down. At *Sepe* apiary, with the eight-frame extractor, five of us could extract a ton of honey per day without extra effort. At Mr. W.'s Matilija apiary, with a four-frame extractor, your old acquaintance, L. A. Best, and your humble servant extracted on one occasion three-fourths of a ton in a day. The honey at *Sepe* apiary is run from the extractor through an underground pipe to the basement of the larger house seen beyond. Here it remains in a large tank whose capacity I have forgotten. The drained cappings are placed in metal trays in a sun-extractor at the south end of the larger building. This has sashes like a hot-bed, with tin reflectors behind it. Wax cakes, and some dark, thick honey are here obtained. On the upper floor of this building are the tin and carpenter shops. All the tin work of the apiary, including the making of one, two, and twelve pound cans for the twenty-four tons raised, and additional quantities bought for shipment to England, is done there. Heretofore Mr. Wilkin has extracted none but ripe honey. Next season he intends to extract a thinner article, and ripen it afterward, something after the method of

L. C. Root, Doolittle, and others. The bees are Italian and hybrids. This season he added some Holy-Land queens for further crossing.

Let a swarm issue from a single colony, and the bees working at other hives will join it till an immense swarm accumulates. He often puts new swarms at once into three, four, or five story hives.

R. Wilkin and Nathan Shaw are two of the pioneer bee-keepers of Ventura County. They came at the same time, eleven or more years ago. They located apiaries in the valley of the Santa Clara River, where their bees had access to the wild mustard of the lowlands and the white sage of the hills. From that time they struggled faithfully for their calling, reaping rich harvests in good seasons, and bravely stemming the tide in poor ones, till others were attracted to the country in the same pursuit. Ventura is now one of the three foremost honey-producing counties in the State; and the list of her apiarists is rich indeed, including as it does such names as Corey, Touchton, and many besides. In the early days, as well as at present, grizzly bears have been great enemies of bees, such as eastern bee-keepers have never experienced; and Mr. Shaw's adventures while shooting or poisoning these depredators are interesting to hear.

If this is too long, you have yourself to blame for it; and if it is not long enough, I can add at a future time something about Mr. Wilkin's treatment of the apiary proper; i. e., the bees in the hives, together with something of the bee pasturage of this region.

Gonzales, Cal., Sept. 17, 1883.

Many thanks, friend N. Your communication is exactly what we want, and we shall welcome the further article you allude to, and we will try to pay you something for your trouble besides.

A. NORTON.

### AN AID TO CELLAR WINTERING.

DEISHER'S IMPLEMENT FOR CARRYING HIVES.

ENCLOSED you will find a sample of a hook which I use in my apiary to carry bee-hives about, which I thought would be a great benefit to some of your readers. Of course, it takes 2 hooks. They are made of  $\frac{3}{8}$  in. iron, and are 1 foot long. The lower ends are

one foot apart, and bend in the shape like cut, and are sharp-pointed. With a pair of these hooks, two boys can carry a chaff

bive with bees into cellar almost as easily as a basket of potatoes. This is just the thing to put bees into the cellar, and I thought it would be just the right time for Oct. GLEANINGS. Wm. K. DEISHER.

Kutztown, Pa., Sept. 18, 1883.

For hives that are to be carried very much, no doubt an implement like the above would be very handy; but I believe it is not customary to carry chaff hives into the cellar at all. I do not mean to say by this that it is not a good thing to do, for I think it might be found a nice plan of proceeding, for the bees would be less likely to dwindle in the spring when carried out. The hook is quite ingenious, and we tender our thanks to friend D. With the above illustration and directions, I presume any country blacksmith could make them.

### ARE BEES CANNIBALS?

DO BEES CONSUME THEIR EGGS OR BROOD?

ON page 457 you have an item on bees moving, or otherwise disposing, of their eggs and larvæ.

I do not believe bees rob one another of these; if they did, they would have been seen carrying them into the hive, and we would find eggs and larvæ in our queenless colonies. But I think bees may move the eggs in a hive, for I have found a single egg in a queen-cell remote from the brood, and this in a colony that had been deprived of a queen, to raise queen-cells. This is the only case of transferring of eggs I ever saw. But regarding your question, "What became of the eggs?" on page 538, I have been fully convinced that bees do put away with eggs during scarcity of supplies. I first noticed it a few years ago when my colonies were weak; I was anxiously watching them to see if they would strengthen up for winter. Each time I looked I would feel quite hopeful over their future prospects on seeing a good lot of eggs. But each time as I looked I found eggs and no larvæ, so I no longer counted on a frame of brood when I saw it full of eggs, and concluded that the bees foresaw that the demand was now greater than the supply, and wisely forbore becoming more seriously involved.

I noticed a similar occurrence this year, though under different circumstances. Having disposed of some queens, I put 4 or 5 nuclei together with their best frames of brood to form a colony. In 2 or 3 days from that time there was not an egg in the hive, and only a few straggling larvæ left. Again, in one of these nuclei quite a few bees clustered on the side, so I put in a frame, which had eggs and capped and uncapped larvæ, but no honey, intending to take it out shortly, but did not do so for a day and a half; when I came, the eggs and uncapped larvæ were all gone, and the capped brood was uncapped and half eaten up. Here, then, I thought, was the solution of the difficulty. They had eaten the eggs and larvæ first, and then attacked the more unpalatable capped brood. Much of it, the bees were fully formed. As soon as I gave them some honey, the partly eaten brood was left untouched. I was not surprised at the bees eating their eggs; indeed, I was almost convinced of it long ago. See with what eagerness they will eat royal jelly; and do not fowls eat their own eggs? But bees eating their young was unexpected.

J. O. FACEY.

New Hamburg, Ont., Can., Sept. 20, 1883.

Friend F., it is well known that bees will destroy the young bees, and suck out the juices, when driven to it by starvation, but I do not know that they will under any other circumstances. It has been many times suggested that they devour the eggs whenever they do not wish to rear brood; but I have never heard it intimated that they also devour larvæ. It is true, hens sometimes eat their eggs, but I never heard of their eating hatched chickens, and I hardly think bees do, unless, as I said before, when driven to it by starvation. I, too, have noticed the disappearance of eggs, or, as you put it, I have noticed fresh eggs every day, and yet no larvæ. Very likely when the stores come in slowly, late in the season, they consume the eggs rather than attempt to make brood of them; and I suppose the queen soon stops laying under such circumstances.

## Heads of Grain, From Different Fields.

I SHOULD like to have you answer a few questions for me, if you will be so kind as to do so.

I am a beginner in the bee business. I received from you, through Mr. Elstun, one tested and one hybrid queen, and I can say that I am very much pleased with them, especially the Italian. I want to ask you some questions about the different kinds of hives; and if you will be so kind as to answer them, I shall be obliged to you. I want the hive that is the best to extract from.

What is your opinion of the Mitchell hive? I am using six of them, but I don't think they are good to extract from, as all the frames are in the main part of the hive, and will have more or less brood in all of them. Can you extract when there is brood in the frames? I find they are very good to get comb honey from. Is there a patent on your Simplicity hive? If not, will you be so kind as to give me the dimensions of it, and the Langstroth, and how to make them.

I have a friend here who takes your GLEANINGS, and I take the *American Bee Journal*. We swap reading, so you see we get the benefit of both.

Increase in bees and bee pasturage was very great here. Mr. Elstun increased from 18 to 65; Mr. Bowles, from 2 to 12, and several others did as well. Milroy, Ind., Aug. 25, 1883. J. A. SMITH.

Friend S., the Mitchell hive is a one-story hive—that is, the frames are spread out sidewise, instead of having a part of them over the other part. That style of hive was tested very extensively ten years ago, under the name of the Adair, or "New Idea" hive; but it has been abandoned almost universally. I hardly know of a large honey-raiser who uses it now.—We can extract from brood-frames just as well as any other. But you will see by the price list that I have advised not doing so, because of the danger of letting the bees starve.—There is no patent on the Simplicity hive, or on any thing that we make in the way of hives and implements. Our A B C book gives you full measurements of every thing, and also very plain directions how to make them. I am glad to know that you and your kind neighbor exchange journals. It indicates just the kind of a neighborly feeling that ought to exist, not only among bee-keepers, but among all neighbors.

### SUMAC AS A HONEY-PLANT.

Can you or any of your many readers tell me whether the sumac is a good and reliable honey shrub or plant? There are places in Southwest Missouri where a man could get the benefit of hundreds of acres of sumac. It is in bloom from the first of June to the 10th of August. I saw comb honey there the 10th of August that was as white and fine-flavored honey as I ever saw, that was supposed to be sumac honey. I found no person who could give me positive information in regard to it. Friend Dougan, of Seneca, Newton Co., Mo., thought sumac furnished large quantities of honey, but was not sure. By the way, friend Dougan has a fine little apiary of Cyprian and Italian bees, and is per-

fectly at home among them. His Cyprians appeared to be gentle and quiet, but I don't wonder at it, as he appears so pleasant and agreeable that his bees could not be otherwise than good-natured. He has the Simplicity and chaff hives, and was the only man I saw in Southwest Missouri who used the movable frames and improved hives, etc. North Missouri is rich, and in good trim for winter; but a drought set in about the 12th of August that cut our surplus honey about a half short.

ALEXANDER FLOYD.

Guilford, Mo., Sept. 12, 1883.

Sumac has often been reported as one of the best of honey-plants, and I believe that large crops of nice honey are often taken from it. By consulting our back volumes you will find many reports.

The three-dollar Italian queen which I ordered from you arrived here on the 23d of August, and I proceeded to introduce her immediately, according to directions on the cage. At the end of three days I made a hole through the comb, and let her out, and she seemed to feel quite at home; and I think that she commenced laying within 24 hours after being liberated. Present appearances indicate that she will have a large stock of young bees before winter begins. I feel well pleased with the result so far, and begin to feel in a hurry to see the "yellow-jackets" begin to crawl out and fly.

### BEEES THAT WON'T DEFEND THEMSELVES.

I think that I shall have to send you another order, for I have another colony that appears to be without a queen. Have tried to keep the colony strong by giving them brood from other hives, but the neighboring bees seem to come and carry off their stores of honey with impunity, and they make scarcely any effort to defend themselves. There appears but little chance of saving them from destruction, unless it can be done by giving them a queen. I suppose then they would be more resolute in protecting their stores.

### WINTERING QUEENLESS COLONIES.

Please tell us whether a swarm of bees could be successfully wintered through without a queen.

### SKUNKS AS AN ENEMY.

I have been seriously plagued this summer and fall by skunks destroying my bees. Some colonies that seemed to be full and strong would, in a few days, appear to be dwindling away, and the hive almost inactive, when I was sure no swarm had been sent out, and I was at a loss to know the cause until one moonlight night my attention was attracted toward something around one of my hives; and as I approached near to it I discovered that it was a skunk standing by the side of the alighting-board. When a bee made his appearance outside of the entrance, Mr. Skunk would brush him off on to the ground with his paw, then catch him in his teeth, and eat him. I watched until I was fully convinced of what had become of my bees. Is it a common thing for skunks to eat bees? JOSHUA BULL.

Seymour, Wis., Sept. 13, 1883.

I have never failed in making any colony defend themselves when I gave them combs of brood enough from other hives. In fact, this can not fail; for when the bees hatch out we have a new race of bees instead of indolent ones. A swarm of bees can be successfully wintered without a queen; but in order to have plenty of young bees, which

are a necessity, they should have a queen till just before winter sets in. — Thanks for your report in regard to skunks eating bees. We have had several similar reports in times past.

#### QUEENS THAT WERE NOT ALLOWED TO LAY.

On the 8th of August I introduced (for a neighbor) several queens; and three days later, upon examination, I found in the colonies no indication of a queen (eggs), but queen-cells instead, and I came at once to the conclusion that they had killed their new sovereigns. I very carefully cut out all of the cells, with the intention of trying once more as soon as queens could be had. You can imagine my surprise, when, ten days later, they swarmed; and still more was I surprised to find in each swarm the queen I had introduced and was mourning over as lost. They began laying at once as soon located in their new home, but not an egg could be found in the old colony. Why those queens should go 13 days in the old stock and not lay an egg, and should commence at once after getting in the new hive, is more than I can see through. It would seem as though a part of the bees mourned the loss of their "nimbus;" that they were aware of the fact, that "all is not gold that glitters," and so interfered with the operations of the new layer. The rest were undoubtedly reconciled to the change, and, after spending 13 days in debating the question, concluded to move out — to go west, and grow up with the country.

#### FERTILE WORKERS.

It is generally supposed that fertile workers will neither accept a queen of any kind nor a queen-cell, and the only sure cure is to unite with some strong colony. It is said, there are exceptions to all rules, and in this rule there seems to be one surely, for I have had this season a nucleus infested with fertile workers that twice in succession reared a queen. They seemed to accept a queen-cell as readily as any colony would.

We have had a poor season here. Through white clover it was cold and rainy, and the fall yield promises to be a complete failure.

#### HOLDING SWARMS BY BROOD.

I have been considerably interested in what Do-olittle and others have had to say in regard to the efficacy of brood in detaining runaway swarms. My experience goes to prove that brood will hold a swarm when queenless, but if they have once made up their minds on an old hollow-tree, nothing but a good fountain pump well used will stop them.

Roger's Park, Ill.

J. V. WOODRUFF.

Friend W., your case is a rather uncommon one, but still I have seen behavior somewhat similar. As a rule, the building of queen-cells indicates queenlessness, but not always; and when we find them building cells in spite of having a laying queen in the hive, it is a pretty sure indication that there is mutiny in the ranks, and sooner or later they swarm out or ball the queen. It seems a little singular that you had two colonies that behaved in exactly the same way. I know that we often decide a queen is lost, and afterward find her, or, rather, find by the eggs present that she is still in the hive. — A colony infested with fertile workers will often accept a queen-cell and sometimes a laying queen, without any caging whatever. — I am well aware that brood will always keep bees from deserting a queenless and

broodless hive, and a frame of young larvae will almost invariably induce a colony to defend their stores where they would not otherwise.

#### MOVING BEES NORTH TO KEEP UP WITH THE BASSWOOD FLOW.

I read in your last issues of GLEANINGS and JUVENILE of moving bees northward to keep pace with the receding bloom. Basswood is our last bloom here, and commences to bloom here from the 12th to the 15th of June; this year on the 14th of June. It lasts from three weeks to one month; this year, 33 days exactly. The rest of the year, bees will not make a living, always, and frequently 100 lbs. of honey will not carry a swarm through till the following spring. There is but one successful plan here, and I have practiced it with satisfactory results. Colonies must be depopulated after the basswood dries up. A small colony here gathers enough to breed upon, while, if left to themselves, they consume all their stores in brood-rearing.

Now, friend Root, if I can not make arrangements with Northern men to take these surplus bees the 10th of each July in each year, they will have to be subjected to the brimstone pit to the amount of 7 or 8 lbs. to each hive, as a matter of necessity. They raise an abundance of brood after this for winter here. If I could make arrangements with you to take from 5 to 8 lbs. of bees from each of my hives the 10th of each July, I would put them up and guarantee safe arrival to you, for 50 cts. per pound; and if a queen is required with each, will furnish them for 60 cts. each.

A. W. CHENEY.

Kenawha Falls, W. Va., Sept. 20, 1883.

Friend C., I am much obliged to you for your liberal offer, but with the amount of business I have on hand now, I would not dare to promise to take your bees, though there are doubtless some among our readers who would be glad of them at the price you mention.

#### CAN WE PREVENT THE BEES FROM BUILDING ON THE TOP-BARS?

In regard to the bees sticking up the frames and building little pieces of comb around the edges and tops of the frames, can't we melt the wax, and flavor it with something, and coat the frames with it, so as to keep them from working where we do not want them? I am using some of the metal corners, and I like them much.

G. D. ADAIR.

Talbotton, Ga.

Friend A., your plan of covering frames with melted wax containing something distasteful to the bees would be a great deal of trouble. If you want the top-bars clean, plane them smooth and paint them. As a rule, I believe bee-men do not want tops unattached, for we want the attachment you speak of to induce the bees to go up into the sections above. If you had clean top-bars they would be much less liable to do so.

#### KING-BIRDS EATING BEES.

Do what we call king-birds catch worker-bees? I saw them catching my bees; and, going to a neighbor's orchard, I followed and found two nests — one with eggs, and the other with three nearly full-grown birds, which I decapitated, and proceeded to hold a post-mortem, which resulted as follows: I found several drones intact, also 3 or 4 large green bugs, larger than potato-beetles, with a mass of par-

tially digested bees, of what kind I could not tell. Now, should these birds be killed or not?

Italy, N. Y. A. F. ROBSON.

Friend R., I should be very glad indeed to think these birds eat drones only. See what is said about them in the ABC book. I think, if you will look over carefully the mass you mention, you will find stings in it, and drones never have stings, you know.

#### QUEENS FOUND NEAR THE ENTRANCE.

I have 4 stands of bees — 3 Italians and one Holy-Land. I like the Italians best; think they are the easiest to handle. As I was passing one hive I saw quite a number of bees on the alighting-board, and outside of the hive; and on looking closer I saw the queen crawling slowly away from the hive. I tried to make her go back, but she would not; so I took her with 6 bees, put them under a glass, and took them in the house. One side seemed to be paralyzed, and she soon died, although the bees licked her all over, and tried to feed her. I examined her with a microscope, but could find no bruise or sting anywhere. What do you suppose was the trouble? I don't know how old she was. There was brood, but no eggs in the hive. The bees were very much excited while I was lifting out the combs. A lot of them crawled inside my coat-sleeves, but only one stung me when I pinched her. A. J. HAYNER.

West Sandlake, N. Y., Sept. 21, 1883.

Friend H., I think you will find a good queen in the hive, even though you do say you find no unsealed brood. At this season of the year, old queens are frequently driven out of the hive, and sometimes found dead at the entrance: but as a rule a young one will be found inside. She may not produce any brood this year, for queens often stop laying at about this season, and sometimes even brisk feeding will not cause them to commence again before spring. I would look the hive over very carefully before deciding it to be queenless. If it really is queenless, of course you will have to get a queen somewhere, of some kind or other, in order to winter them safely. It is true, they will do very well if a queen is given them very early in the spring, but I would hardly think it advisable.

#### BEEES THAT WON'T RAISE A QUEEN.

Did you ever know or hear of a queenless colony of bees that would not raise a queen, when brood was given them? About the 15th of Aug. I discovered that one of our colonies of black bees was queenless. I gave them brood at once from one of my Italian stocks. The next day I opened the hive, expecting to find a nice lot of queen-cells started, as it was quite a large colony, but they had started none. Thinking that perhaps I had made a mistake, and they were not queenless after all, I made a thorough examination of them, looking the combs all over, but there was no other brood in the hive, except what I had given them, and they had started queen-cells on the edges of the combs where there was no brood. I gave them brood several times, but they would not raise a queen. The brood that I gave them was all right, for it hatched into workers in due time. As it was late in the season, I concluded to unite them with another colony, but I was very busy, and neglected to do so for a few days. The next time I opened the hive, almost the first comb I

lifted out contained eggs, and lots of them too, but I saw at once they were not laid by a queen, and concluded they must be the eggs of fertile workers. The eggs were scattered around in the cells just as it happened. Some cells contained several and some none at all; some were attached to the sides of cell, instead of the bottom, where the queen lays them. But I stopped this business at once by uniting them with another colony, and I had no more trouble with them. O. G. RUSSELL.

Afton, N. Y.

Friend R., it is not unusual for colonies having a fertile worker to refuse to raise a queen. That is one great reason why we consider fertile workers bad to manage. Had you given them several frames of hatching brood, the bees as they hatch out would ordinarily start queen-cells. I have given your letter, chiefly because it describes so well just the way in which fertile workers behave, or just the way in which colonies having fertile workers usually behave.

#### A REPORT FROM WEST VIRGINIA.

As we seldom see any thing in GLEANINGS from this State, I will give a few items. West Virginia as a honey State will not come up to some of the Western or Southern States; but if it had more Doolittles or Houses there would be more honey produced than there is now. There are about 400 colonies of bees kept in this county (Marion); about 100 are kept in Simplicity hives, as many in American, and about 200 in various other kinds, but mainly in the old box hive. This summer has not been a good honey season here. Fruit-bloom and poplar-bloom furnished a fair supply of honey; but the heavy rains during the white-clover bloom destroyed a great amount of honey from that source. Basswood furnished more honey than any thing else, but it is confined to certain localities. We never get any surplus honey here after basswood is out of bloom. The average yield of honey, so far as I can gather, is 35 lbs. per colony, spring count, comb honey. The extractor is not used in the county, to my knowledge.

#### AT WHAT RATE CAN BEES FLY PER HOUR?

I see this matter discussed, so I will give my experience. I have a field of buckwheat situated something less than half a mile from my apiary, with no timber between. Now, for me to place myself at about an equal distance between the buckwheat field and apiary, on a still clear morning, I can hear a constant humming of bees, going to and coming from the field, and I can occasionally get sight of a bee, which, upon comparing with the flight of a wild pigeon, I think fully as fast. It is said by Morris, in his work, "Science and the Bible," that the wild pigeon flies at the rate of 60 miles per hour. I have been very careful in my observations, and am sure that I am not mistaken in comparing their flight. I have no doubt bees can easily attain 90 miles per hour in flying longer distances.

Now, with due respect to Mr. Shotwell's experiment, as given on page 435, I think his test was not a good one, as the air in a car is carried along at the same speed the train is moving, and a bee could as easily reach the window in front of the car, as if the car stood still. L. H. WILCOX.

Farmington, W. Va., Aug. 10, 1883.

Friend W., are not you and many others making a mistake in regard to the rate at which carrier pigeons fly? While on the

cars my eye caught a report of carrier pigeons owned by sporting men. Of course, these pigeons were expected to be speedy, or notes of their flight would not be given. Figures were given of quite a number of different birds; and although they seemed to think the results were great, none of them exceeded 25 miles an hour. But this was on a test stretch of over 100 miles. Have we not a sporting man among our readers who is conversant with carrier pigeons? If so, let him speak out. Do they fly 60 miles an hour, or only 25?

#### PERIOD OF BASSWOOD BLOOM IN THE SOUTH, ETC.

I will answer the question on page 571. We have basswood bloom here from the 1st of May until June. Started in the spring with 5 colonies; increased to 8, and have not got any honey yet. It was so cold and wet in the spring that bees could not get out to suck basswood bloom — only from sawwood bloom. It did not rain any from the 25th of June till the 15th of September; so you see bees could not do much. Sawwood blooms from June 20 till August; then there is nothing that will bear or yield honey till September. I will send you some flowers and leaves of a plant from which my bees are making lots of honey, and I also send you the twig of another plant from which my bees are getting pollen by the pound. You will please give me the names of these plants. The latter is called the charet weed, but the other has no name here. It blooms the first of September till frost. I see much about goldenrod in your journal, but I never saw a bee on the bloom here yet, and I don't believe it yields honey here.

J. A. DILLAHAW.

Bowman, Elbert Co., Ga., Sept. 20, 1883.

Friend D., your honey-plant is one of the large family of asters. The one that you say yields pollen by the pound is the well-known ragweed. With us, bees get pollen from it only occasionally. I usually see them in the morning, perhaps three or four days in every season, gathering pollen from ragweed; and sometimes they gather very rapidly from it. Do you not mean by "sawwood" what is generally termed "sourwood"?

#### RIVER-BOTTOM LANDS FOR BEE FORAGE.

I live in a large bottom surrounded by a levee; and of all the places for bees, this is one. Although I and my father have had bees all the time for three years, we have not made much from them, on account of old-fogy notions; but of late I have turned my attention to something new, and have about got father out of the "old-fogy," but not in all things. He uses your smoker to perfection, and has made some movable-frame hives, and reads GLEANINGS. I have my bees all in movable-frame hives. Both of us now have 130 stands, and have sold lots of honey at from 15 to 20 cts. per pound — mine in frames, and his nearly all in caps.

WM. ROUSE.

Shepard, Ill., Aug. 24, 1883.

Friend R., I have often thought of keeping bees on this low land surrounded by a dyke or levee. The soil is usually remarkably rich, and furthermore it seems to me it would be a very simple thing indeed to have arrangements for irrigation. Has this matter ever been developed? — Don't be too severe on old fogies. If old-fogy ideas exist in our neighborhood, it is, to some extent,

our fault. Talking is not always the thing to be done; but faithful, steady work will bring a reward anywhere.

#### HOW TO MANAGE SECTIONS DURING THE HONEY-FLOW.

We aim to have at least one frame of sections partly worked out to put in each hive when we put the sections on in the spring, to induce the bees to work, which they will do if there are lots of bees and honey. We tried part of our frames without separators last year, but will do so no more. Place the frame between cleats nailed on the bench, to hold it square; drive a little wedge between a cleat and one end of frame, so as to spring the latter in a little; nail on your separators with four wire nails in each, and the frame will stay square, and the tins tight; when the little wedge is withdrawn, put in your sections, and if they do not fit in tight, wedge them up. This will hold the sections square, and prevent the bottom-bar from sagging.

#### TO GET THE SECTIONS OF HONEY OUT.

Lay the frame, tins up, on a table; run a knife in between the top-bar and sections, just in the middle; give the knife a twist; this will loosen the bar from the sections the whole length. Do likewise at bottom and ends; also loosen the tins where they are stuck to the sections, by raising them up in the middle. Now raise one end of the frame; with the other hand and knife shove the sections loose, down and out, by pressing in the corners of frame with knife. It is too slow to get one section out first, when all can be got out just as quickly.

#### SUNSHINE AND HONEY.

The bees in Simplicity hives that stand in the sunshine part of the day have made us more honey this year than those in the shade. Is this always so? who knows for a certainty?

20 C. PER L.B., 18 C. PER L.B.

Our first honey brought 20 cts. in Chicago this spring. Some old honey shipped at same time sold at 18 c. Why is it quoted at 12 to 14 c.?

Penrose, Ill.

J. SYKES WILSON.

Thank you, friend W., for the fact you furnish in regard to hives placed in the sun. I am quite well aware that there are times when letting the sun full on the hive would increase the amount of honey stored; but if I am correct, there are also other times when this full blaze of the sun makes the hives so hot that the bees are driven out, and work stops. Ventilation would, however, I presume, fix this latter point; and you will recollect we have had discussion in regard to this very matter by Langstroth, Grimm, and others. Now, then, it seems likely that the intelligent apiarist will have to keep a careful watch, and guard against both extremes — take advantage of the sun whenever it is needed, and ventilating or shading when the bees are too hot. It is some trouble, I know; but it will pay. Thanks for your fact in regard to handling sections. — In regard to the honey market, in our last number you will find comb quoted at from 16 to 18 cents. It is comb you allude to, is it not? Perhaps you retailed yours out. Of course, it will bring more in that case.

#### PRICKLY ASH AS A HONEY-PLANT.

I mail you a sample of the blossom and leaf of one of the best honey-producers, I think, that I ever saw for this scarce season of the year. The only

name it has here is prickly ash. It comes in bloom the 20th of August, and is now in full bloom, and will last 10 days longer. It grows in small trees about 6 inches in diameter, and about 12 feet high. I see them grow here in different soils, and wild, rough places; the older stalks send up numerous sprouts off from the main tree, which bloom the second year. The pod resembles that of sumac, only much larger. They get as large as a bushel basket, and the bees work very strong on them from morning till night. The pod produces seed. I never tried whether the bush could be raised from it or not, but I should think it might. S. P. RODDY.

Mechanicstown, Md., Sept. 9, 1883.

I have been wanting to write to you for some time; and when we read you had a six-weeks-old baby, the temptation was too great to be resisted. I congratulate you, with all my heart. If there is any one thing I have a liking for, it is a little soft sweet baby. We have one almost three years old. She is a great admirer of little Blue Eyes in the A B C book. My husband takes GLEANINGS, and we both read it very thoroughly. I tell him your views are sound on the subjects of temperance and religion, and we would be made better by knowing you. We have about 30 swarms of bees; have taken off over 100 lbs. of section honey, and, "there's more to follow." I am not a bee-womann, or ever want to be, their stings hurt me so; but my husband does not mind it, even when they sting his nose until it looks like an elephant's trunk.

#### A SUGGESTION ABOUT CANNING IN GLASS.

One thing I will mention about putting honey or fruit in glass cans for canning. Just wet a cloth in lukewarm water, and wrap around the can, and you can pour boiling hot sauce or honey in without any danger of breaking the can. It has saved me lots of trouble heating cans, and it may help some one else. Rupert, Vt. MRS. L. SHELDON.

#### A FEW WORDS FROM THE SUMMIT APIARY.

Great dearth in the honey supply. Bees have barely honey enough to live on; drones by the thousand. If anybody had wanted drones I could have supplied him with a large amount.

#### DRONES; CAN THEIR REARING BE STOPPED?

I went out to the apiary a few days ago about sundown, and saw quite a large bunch of bees near the entrance. On examination I found them drones. Not having the password, they could not go in.

Clio, Mich. JAS. A. SHELDON.

To be sure, the raising of drones can be stopped, friend S. Since the advent of fdn. the matter is easily under our control. Give the bees all worker combs, and you will find it a very great saving of money, compared with killing them after they are full grown and fat and lazy, or even slicing their heads off when they are in a state of capped brood, as we used to do.

#### TWO QUEENS IN THE SAME HIVE.

No new subject, I hear you say. Not at all. I have even had three old queens to remain for several weeks in the same hive that had, with their bees, been united in the spring of the year. But I never saw two young queens abide in peace in the same colony. On my way a few weeks ago to visit the Shenandoah Valley, Va., with a view of learning something about the honey resources of that far-famed place, I met a friend, Emerson Henderson, a

young man of quite a little experience in bee culture, who related the following: "I had three second swarms come off about the 4th of July, which were all hived together. Some days after, I examined to see if the young queen was all right and laying, and, to my wonder and surprise, discovered, on the same comb, two plump young queens busy depositing eggs. I often look to see how they get on together, and frequently see them meet and pass, showing no disposition to dispute the sacred ground." It is not at all rare to find an old queen and daughter harmoniously dwelling, for a time, together. Whether both at the same time are in a normal condition, I have not yet decided; but I think this case reported by friend H. of two young queens in an apparently normal condition living harmoniously together, is a new departure. It is to me, anyhow.

J. A. BUCHANAN.

Holliday's Cove, W. Va., Sept. 19, 1883.

#### FROM THE ROANOKE APIARY.

As I see letters from a great many of the A B C class, I concluded to write one too. I began bee culture in July, 1882; bought 3 colonies in old box hives; found 3 trees, and cut and saved the bees. I have taken 4 colonies on shares, all in box hives. During this summer I got two swarms only, making in all 12. Bees did not do well this year. In the spring, when bloom was plentiful, the cold, high winds kept the bees housed, so they lost nearly all the honey crop. When it got warm and still, it turned off dry, and has been so ever since, and now they can't get any thing at all, only as they get it at our table when meal time comes. You may guess they then get their share, although they drive me and family out and take possession of the table until I get Mr. Cold Blast after them, and then "you bet" they scatter, and we get a sip once in turn with them.

I took 75 lbs. comb honey from my bees when I transferred; sold at 16 $\frac{1}{2}$ c. I sent to Mr. Root for two \$1.00 queens. I think I can raise queens for all my colonies, then I shall raise some for sale if they prove purely fertilized. I raised some queens this summer, and think it easily done by one who understands the business. I am using the Simplicity hive and metal-cornered frames. W. J. CROWLEY.

Roanoke, Texas, Sept. 14, 1883.

#### CORN HONEY.

On page 625 of GLEANINGS for Dec., 1882, in reply to Mr. T. M. Fort, you came nearer being a scientist than you thought, perhaps. Why? Because, on the 8th and 9th of this month there was frost enough here to kill almost every green thing. Corn was frozen badly, and farmers went right to topping and cutting it up. Now comes the bee part. One man told me that his cornfield looked as though there was a swarm of bees in it, after he had cut his corn up. The bees were at work on the starch in the stubble, "turned to grape sugar by the frost," as you put it. Bees worked 4 days here on the above plan.

#### GRAPEVINES FOR SHADE.

I have often thought of trying your plan of having grapevines for shade; but when I go to a hive I like to be able to get all around it, if I wish to.

The stones represented in the picture, on our shade-boards, are about one-half the time left off, and the same shade-board is the cover to our winter packing-boxes, so you see they answer two purposes.

W. H. SHIRLEY,

Glenwood, Mich., Sept. 18, 1883.

## SWARMING WITHOUT CLUSTERING.

I know that bees will swarm and go to the woods without clustering. When I was a young man, over 40 years ago, my father had an old box gum that the bees hung out of for 3 weeks. We watched them closely. One day after dinner, father and I were sitting close to them, watching them, when they began to swarm; and before they all got out, the first out started for the woods. I started with them on the double-quick, and kept up with them for about 300 yards, when they struck the timber and rose up above the trees, and were soon out of sight and hearing. My father said some of the last that came out started, but, not finding the body of the swarm, came back to the old gum. I had one of my own, which, as soon as they all got out of the hive, started off. I went with them; they went straight to a tree, and went in it. I cut the tree and got the bees.

Belmont, Neb.

WM. ALLHANDS.

## QUEEN-CELLS IN THE PRESENCE OF A LAYING QUEEN.

Looking into a hive the other day, I found a fine large queen-cell started, where one of my best queens belonged; and, of course, I thought I had lost a valuable queen. But upon looking through, I found her all right, and laying. How is it that they would start a queen-cell, and at the same time have a queen among them? I removed the frame with the queen-cell to another queenless colony, and they have finished it up. I bought out friend Draper, thereby falling heir to his subscription to GLEANINGS and the A B C book; which, by the way, came through all right, and is just the thing needed by persons as ignorant in bee culture as—

MRS. NETTIE C. LOCKE.

Farmington, New Mexico, Sept. 21, 1883.

My good friend, if you will examine our back volumes you will see that this is not an unusual occurrence. Queens whose bees will keep a queen-cell in the hive are valued very highly, because these cells can be taken out, and used as needed. Several queens have been reported that would keep a laying daughter in the hive; and Doolittle pronounces such queens equal to any.

## THE DEVELOPMENT OF THE STANDARD LANGSTROTH HIVE AND FRAME.

## MR. LANGSTROTH'S EARLY EXPERIENCES.

**T**HIS form of hive was the result of many experiments. In the spring of 1852, as early as the weather would allow the bees to be shaken from the combs of my bar hives (18½ x 18½ and only 6 inches deep), uprights and bottoms were nailed to these bars, so that in a few minutes they became movable-frame hives. In the latitude of Philadelphia, at least, I never knew good colonies to increase faster, if as fast, than in such shallow hives.\*

Not to speak of hives 13x13x13, whose cubic contents were about the same with the standard Langstroth, and of other discarded sizes, I made, in 1854, hives 12 x 12 x 36, with frames now called "Gallup frames." The surplus honey was taken in boxes or frames in the rear of the main breeding-apartment. They had movable tops as well as movable sides.

\* Bingham, Marvin, and I others, prefer hives about six inches deep.

The slide doors, being chamfered on their edges, in opposite directions, could always be easily opened, and being suspended like frames, by top-bars upon the frame-rabbets, the size of the hive could be changed at will. Two such hives were placed, Dzierzon fashion, side by side—with entrances in different directions; crosswise on these, two more were placed similarly, and the pile continued, in the same fashion, as high as could be conveniently reached for manipulation—the whole colony having a common movable roof. Although my judgment was against such an arrangement, I could not rest satisfied until I had given this system a fair trial, and proved, by actual experience, that the necessary manipulations were so tedious as greatly to outweigh the advantages promised by such a compact arrangement. However it may be with our German friends, with us economy of *time* is of vastly more importance than economy of *space*. I, therefore, took down the stack, and used the hives as top as well as side openers, until I left New England. I also used frames even larger than the Quinby size, but found them objectionable, because of the weight of the combs when full of honey.

These facts are sufficient to show that the standard Langstroth hive was not the result of mere theoretical notions, or traditional prejudices, nor did it come by what some would call a chance "happy-go-lucky" hit. Born out of my experiences, it was deliberately adopted, with the knowledge that at that time the great majority of our best beekeepers did not approve of such "low flat things." So deep was my conviction that its shape was better than the approved forms, that I could not consent to recommend any other.†

Although the chief reasons for the shallow form have been often given, it may be well, in this connection, very briefly to repeat them. Those who wish to see the subject more fully discussed, are referred especially to the old volumes of the *American Bee Journal*, where they will find the merits and demerits of the standard Langstroth hive very thoroughly canvassed.‡

My tenacious adherence to the Langstroth form led some to imagine that perhaps, in some way or other, the validity of my patent might depend on this shape. This reminds me of a once noted writer on bees, who, while warning persons against infringing upon his patent (although he had never taken out a patent), closes thus: "Even an external imitation of my hive will not be suffered to pass with impunity!"

The broad and low shape which I introduced, in addition to giving the much-desired top surface for surplus-honey receptacles, has the following advantages:

1. It is obviously much better adapted to the use of upper stories, than taller hives. It seems more natural to bees to place their stores *over* their central brood-*nest*, than anywhere else. When extracting unsealed honey, I kept neither honey-board nor anything else over the tops of the frames to interfere with handling the frames, as soon as the roof over them was removed. A glance at the tops of the frames was enough, with Italian bees, to show if extracting was needed, for they would begin to ex-

† In latitudes where bees can be either safely wintered in the open air, or in proper in-door depositories, a still shallower form of hive may, perhaps, be found preferable.

‡ Of all editors whom I ever knew, Mr. Samuel Wagner was the most judicial in his attitude on all matters pertaining to bee culture. Fair play was to him a precious jewel indeed.

tend their comb-building upward, even if they had plenty of room for this work on empty side frames. Now, why should bees attempt the difficult work of upward comb-building, against the law of gravity, by which their suspended combs are kept in a perpendicular position, while they have ample side room for building them in the natural way? Why, I say, do they act thus, unless it is most in accordance with their instincts to place their stores above the brood-nest?

If honey, to have its choicest flavor, ought not to be extracted — as the Dadants and others of our leading apiarists assert — \* before it has been capped; and if, when all bee-work is most pressing, more colonies can be taken care of by piling hive upon hive, filled with empty combs — to be emptied when more leisure comes — then the advantages of shallow hives are easy to be seen.

2. If we do not make the number of frames so small that, to get the requisite comb surface, they must be too heavy for easy handling, then for cheapness, and other obvious reasons, the fewer frames the better. For this reason, if there were no others, frames of the Gallup size seem to me objectionable.

3. Long and shallow frames are more convenient for most of our necessary manipulations.

(a) In handling them the arms take a natural and easy, instead of a cramped position.

(b) With such a frame the eye commands the whole surface of a comb, in searching for the queen, etc., without that uncomfortable craning of the neck which deep frames compel.

(c) As has been already explained, there is less danger of hurting bees in removing or replacing the shallow frames.

(d) Less motion, and of course less time, is needed to take out or put back such frames.

(e) It is very much easier to make such frames hang true, than deep ones. If their hives had glass on their backs, many who use deep frames would be surprised to see how much "out of true" they often are.

Whatever may be the case with bee-keepers, in a small way only, those who are manipulating for hours together, in large apiaries, and to whom, in the press of work, time saved means more money, than in any other season of the year, will find the above reasons for giving the preference to the long and shallow frame worthy of careful consideration. They are submitted, however, in no spirit of dogmatism, and I am far from claiming that the standard Langstroth is demonstrably the best under all conditions, and for all parts of our widely extended country. The time will probably never come when uniformity will be as much insisted on as in the standard weights and measures of the same country. If by a simple volition I could, without pecuniary loss to any one, or violence to any one's feelings or prejudices, change every movable-comb hive in America into the standard Langstroth size, I would will no such change. Let the Dadants, Hetheringtons, and others, have full scope for testing on the largest scale their different forms, only let there be, as far as possible, *uniformity in each style*, so that any purchaser will know precisely what size, under

\* I use the word apiarist both as adjective and substantive, without the authority of Webster or Worcester, because it sounds much better than apiculturist, and is repeatedly so used by Dr. Edward Bevan in his work on the honey-bee — than whom there is no writer on bee culture who is higher authority among English-speaking people.

a given name of hive, he is getting. I am sure that Mr. Root, and others, will be willing, when requested, to make hives of the standard Langstroth size; and if Mr. Root will call his size of frame the *Simplicity-Langstroth frame*, there will in the future be plain sailing, at least before all who use the shallow Langstroth frame. L. L. LANGSTROTH.  
Oxford, Ohio, Sept., 1883.

### JAMES FORNCROOK'S PATENT ON SECTIONAL HONEY-FRAMES.

AND SOMETHING ABOUT PATENTS IN GENERAL.

AS considerable interest has been manifested in this matter, and as a wholesome lesson can be gathered from it, I will present the matter to our readers as it now stands. In 1870 a patent was granted to Wm. Gilbert for an improvement in making boxes of one piece of wood. The cut below is an exact copy of his claim, and shows the way in which the strip of wood is grooved that it may be turned up and nailed together.

We make the following extracts from his claim:

Be it known, that I William Gilbert, of Catskill, Greene County, State of New York, have invented a new and useful improvement in the construction of wooden boxes, for service as fruit-boxes, salt-boxes, spice-boxes, housekeepers' boxes, ladies' work-boxes, or for any use where light strong boxes are needed. My present object is to save the expense of construction-labor in forming the angular joints at corners, and making them without a break, in the cheapest and promptest manner.

The sides are prepared by getting out and properly dressing strips, Fig. 5, of the material, which may be of any kind of wood having toughness enough of fiber for that purpose.

These strips are made of the proper width for the sides of the box. \* \* \* The thickness is from two-sixteenths to three-sixteenths of an inch.

The strip thus prepared is next subjected to a soaking in hot water, or a steaming, in order to insure the bending of the wood without breaking its fiber. The above-described method of construction, it must be manifest, is one which will introduce a better and cheaper article of its class into use and sale, than has been or is now in market; in other words, a new, better, and cheaper article of manufacture.

Well, friends, this combines pretty nearly the principal point in Forncrook's honey-box made of one piece of wood; but in the year 1874 one H. W. Hutchins, of East Livermore, Maine, got a patent on the idea of dovetailing the ends instead of lapping or gluing them, as Gilbert had done. We give below a cut of the Hutchins patent.

This effectually disposes of the plan of making boxes of one piece of wood, and folding them up so that the dovetailing ends may lock together, and, of course, all that remains for Mr. Forncrook to get a patent on is the insets to give an entrance to the bees, and the groove for inserting the strip

## The "Growlery."

This department is to be kept for the benefit of those who are dissatisfied; and when anything is amiss, I hope you will "talk right out." As a rule, we will omit names and addresses, to avoid being too personal.

**M**R. A. I. ROOT:—Several weeks ago I wrote you an order for your A B C book, inclosing \$1.25 to pay for the same, which I am prepared to prove, if necessary, by the man who works my farm, and by the P. M. where the letter was mailed. The book came; and soon after it came, your card, saying that I owe you \$1.25 for the book. Now, before paying for the book the second time, I wish to ask you a few questions, and shall expect you to give me an unequivocal answer to each one.

1. Did you send the book in obedience to my order? and if not, by what authority did you send it?

2. If you sent the book in obedience to my order, how did you get the order without getting the money, as both were inclosed in the same envelope? On page 3 of your price list I find the following: "Cash must accompany every order, unless we have some personal acquaintance with you." Now, 3, do you pretend to say that in *this case* you so far departed from your published rule as to send the goods to an entire stranger without the cash, or even without being ordered? I should have said, in the fore part of this letter, that the book did not come as promptly as I expected, and I wrote you a card telling you that I had sent you the money with the order, and the book came a few days after.

And now, my dear sir, I do not wish to accuse you wrongfully; but truth compels me to say that I am fully satisfied, in my own mind, that the order and money were both received at your place of business; but what happened to it afterward, I am not prepared to say; but every circumstance goes to prove conclusively that the money was received, and was probably overlooked by careless clerks. I await your reply with some little interest.

Yours truly, W. S. G. MASON.

Morenci, Mich., Sept. 24, 1883.

Friend M., there is just one word in your letter that seems unnecessarily unkind. It is the word *unequivocal*—as though you had reason to suspect that, in my reply to you, I would probably try to equivocate, and try to excuse myself for keeping your money, and the goods you had paid for also. Perhaps I had better answer your questions without "equivocating," as you desire. We did not send you the book in obedience to any direct order; but we did send it because of the card you allude to, and this card was the first, and, in fact, the *only* thing we ever received from you when we sent the book. We publish the card below, and by so doing answer your No. 2:

Some three weeks ago, or perhaps a little less, I sent you \$1.25 for your A B C book. Now, I do not wish to hurry you at all, but I begin to fear that my letter may have failed to reach you, as I have heard nothing from you.

W. S. G. MASON.

Morenci, Mich., Aug. 31, 1883.

You see, the want of an A B C book is often of much more moment than the value of it. On this account we often deviate from our regular rule, and send goods without a

direct order. I do not know that it is really deviating, after all; but it is this way: In our price list we tell our customers that we do not send goods without cash in advance; but where we find a brother in great need of something, and where we have reason to think the delay might cause him inconvenience, we take the liberty of sending it right along, to save him time, as we did in your case. Also, we feel a little anxious to do *more* than we agree, for any one who has lost money through the mails, although we distinctly declare we can not be responsible for money sent in an unregistered letter. You see, we may depart from the *letter* of our established rule, but not from the *spirit* of it.

Now, friend M., there is another very important point which, it seems to me, you and others thoughtlessly overlook or ignore, as it were. Even if I were a selfish and dishonest man, which I am sure I am not, I should hardly be likely to take your money and keep your book. Please note this: The A B C book has been the greatest work of my life; in fact, it is the best I ever did on anything, for it has been the work of years, and I expect to devote more years to it. But it is no sort of use to me, unless it is put into the hands of the people. The book is no kind of value to me to lay on the shelf. The sole end and object of its existence (if you will allow me so to speak) is to have it in the hands of the people, or the hearts of the people, if you will excuse me. I ought to know pretty well what the book is by this time, for the thousands of kind words that keep coming thick and fast assure me that I have not labored in vain. Do you not see that, in view of this, I take pleasure in handing over the book to every one who orders it? I feel this pleasure because I have learned to know beforehand how pleased my customer will be when he reads it. I am speaking strongly here, and, some of you may think, boastingly; but I have earned the right, so to speak. Now, keeping this in mind, can you not see how it hurts me when any one intimates that I have kept the book when I have received the money?

You speak of my clerks. Now, I am sure my clerks share with me in this enthusiasm in regard to our work and our A B C book. We may be careless, it is true, for sometimes people by carelessness wrong their very best friends; but surely, friend M., we do not equivocate on such a matter—not one of us. Where we receive the money for an A B C, and it is lost on the way, we replace it without charge; and where any trouble comes up in getting the book into the hands of one who has paid for it, we would much rather give it away than to have any ill feeling; therefore I will freely cancel the charge which we have against you, if you feel anywise hurt or unpleasant about it. I have just interviewed the clerk who wrote in answer to that card which we have given above, and I find she wrote you as follows; or, at least, it is the copy of what we supposed was written when the bill was sent you:

Friend M., after a careful search we do not find your order for A B C. Will mail you one to-day, however, which, in order to keep matters straight, we will charge to account; and if order comes to

hand, we will notify you. Hoping above will prove satisfactory, I am yours, etc.

A. I. Root.

*Per Kitty.*

The full amount was charged to you to show that we had never received any thing for the book, and also that it might be made straight if your letter should come to hand after a while, as stray letters often do. Sometimes they come in three or often six months after they were written, with the amount inclosed all right.

I wonder if the friends know how myself and my clerks study humanity — how we study people and their ways of doing. Just a few weeks ago our good friend — sent us \$115 in a letter, unregistered. Weeks passed, and no tidings came of it, and I confess I was almost tempted to think it could hardly be true, that any one was so thoughtless as to send such an amount in such a careless way. Finally I was one day surprised by an exclamation by the clerk who opens the letters. We all stopped work to see what was so wonderful. Mr. —'s letter was at hand, and there the money was, all safely inclosed in the letter, exactly as he had said. Where had it been all this time? We were never able to discover. We were so glad to be able to find it all right that we did not investigate very much. Just one more point:

Every little while somebody accuses us of keeping back GLEANINGS after we have received the money for it — as if we could possibly have any object in so doing! Why, friends, surplus GLEANINGS that are left over almost every month are of no possible use to any one, and are then taken down to the warehouse and sold for waste paper, when they are out of date. Does some thoughtless one ask why we do not give them away, and also, while we are about it, give away the A B C too? Why, friends, for the simple reason it will not be using all alike, and you know we must have a uniform price for all. I believe no one ever accuses us of having this uniform price too high.

Perhaps, friend M., you only meant to intimate that we wanted the pay twice for one book. But even that is a pretty hard charge to make. Or did you simply mean that we had lost the money by our carelessness, and then asked you to send it again? Could you visit our office, and witness the precautions we take to prevent the possibility of such a thing, I hardly think you would make such a charge. Our postmaster puts all our letters into a leathern sack belonging to us. He then locks it up, and our book-keeper (who, by the way, is a lady) unlocks the bag and opens the letters herself. She also carefully notes the money, and makes it her business to see that it is credited on her books, where credit is to be made. Then the letters are distributed to the clerks over the different departments; and when they are through with them they are filed in such a way that we can, in a few minutes, lay our hands on any letters that have ever reached our office.

Now, then, to conclude with, please bear in mind that when our publications give you pleasure and profit, we receive pleasure and profit; and, therefore, it would not only be absurd, but almost idiotic to publish books

and papers, and then keep them, after the money had been paid over. Come to think of it, there is a point here where I am selfish. I have a selfish motive in wanting our publications in your hands just as soon as possible after they are out of the press; for every student and pupil of A B C and GLEANINGS eventually becomes a good, permanent customer. Just see how that takes the romance out of it all.

## Blasted Hopes,

Or Letters from Those Who have Made Bee Culture a Failure.

THE DROUGHT IN TEXAS.

**W**E have just been through the longest drought in this part of Texas for at least 25 years.

Think of it, not to have rain to any amount from March 23d till Sept. 8th! Our bees are, therefore, in a poor condition, and we are in Blasted Hopes. After one of the coldest winters known in Texas, they built up fast, and every thing looked promising till swarming time, when it was very windy and dry. As they held back from swarming, I divided some, but lost all the queens in mating. After trying one hive six times, to have a queen fertilized (the last proved a drone-layer), I had to double up at the end of June; in all I inserted about 50 queen-cells, and got 6 fertilized. Should we have some more rain, our bees may gather enough to winter from cotton, which is starting to bloom again, if the worms do not destroy it. Every thing else is dried up, and the fall crop is blasted too.

My report for this year will now sum up as follows: In spring, 24; increased by natural swarming and dividing to 42; doubled up to 22. Last year Texas stood against the world for honey; this year the world stands against Texas, though we will try another year. In our locality, where we have nothing to depend on for the honey crop as annuals, you can think how bees can gather honey when it does not rain for 5½ months, with the thermometer every day from 100 to 108° in July and August. If you like more reports for B. H., I can furnish you some of box-hive men in the neighborhood.

J. SCHUDEMAGEN.

Black Jack Springs, Fayette Co., Texas.

HONEY CROP A FAILURE.

Our bees quit storing honey in June, and since then have not gathered enough to live on. If it doesn't rain this month we shall have to feed for winter. We are feeding nuclei now; shall double up soon. From 100 hives we extracted only 2000 lbs. this year; 43 lbs. was the best, and 20, you see, an average. Last year 300 lbs. was the best, and 5000 lbs. the total crop. We sold, last year, at an average of 15 cts. per lb. None sold this year for less than 15 cts.

Waco, Texas, Sept., 1888.

GUYTON BROS.

Be of good cheer, friends. It is now pretty clearly demonstrated that almost every locality gives a bountiful yield of honey now and then if the apiarist is up and dressed, and ready to care for it. When friend Muth reported last year "not a pound of honey," I looked around on the hills about Cincinnati, and, without saying so, I settled down to the conviction that there was not much use in trying to keep bees in a city like Cincin-

nati. Now, however, he reports more than an average crop, and over 100 lbs. to the colony; and so it seems to be the world over.

## “Remindery,”

Or Department for duties to be attended to this month.

**W**ELL, bees not fed for winter are now to be attended to at once; and the question is asked, season after season, “How can we do it with the least trouble, and without danger from robbing?” I notice that Doolittle, in the *A. B. J.*, recommends taking combs out of the hive that are to be fed, and laying them in a deep dish or tub, and pouring honey into the cells with a coffee-pot or any thing that will make a fine stream. The syrup is to be poured a foot or more, or else it will not displace the air in the combs. When the comb is pretty well filled on one side, it is turned over and filled on the other; then hung in a comb-bucket or other receptacle until the combs have ceased dripping. Now they can be put where needed, and a comb filled with thick syrup is almost as good as a comb full of sealed stores. The syrup may be made quite thick for this purpose. Fill every comb in the hive as full as it can be, and they will probably have enough for winter. Friend D. remarks that this dispenses with feeders; and after you are done, you are done, and have no loose traps to gather up.

Where one has 100 or more colonies to feed, it is quite a nuisance as well as an expense to be obliged to have a feeder for each hive, and, after you are through with them, to store them away for another season. Now, all this is true, and I like the plan very much in some respects; but in other respects I do not.

For instance. We have now a comparatively new hand in charge of our bees, for the boys have gone to college; and should I direct him to feed our bees for winter in this way, I hardly think I could instruct him in such a manner that we should not have a perfect uproar of robbing before he was half through. The principal obstacle with us would be to get the bees all off the combs before the combs can be filled with syrup. It is true, we might take other combs; but even then we shall have to get as many out of the hives as we put in; and to do this would incite robbing, and prove quite a task. Our bees are mostly on the combs where we wish them, and the combs are arranged as we wish them; and for me it is least trouble to feed them syrup in a feeder until the combs are filled and bridged, just as they will remain till spring.

In regard to feeders, the bread-pan feeder is perhaps the cheapest and the simplest, were it not that bees are apt to get drowned in them, unless especial care is taken; and they also work slowly in cool weather. The pepper-box feeder is more trouble, but the bees will empty them, even during cool weather, for they can be inverted right over the cluster, and the space around them fixed

warm with a mat and cushion. The Good candy, made into little biscuits, and laid right over the cluster, works nicely, and the bees take it all up very quickly. The only objection is the trouble of kneading the pulverized sugar and honey up so as to make the biscuits, and also the extra expense of powdered sugar over the granulated.

I rather think we shall do what feeding we are obliged to do, with a pepper-box feeder this way, and we are going to give the Good candy a pretty fair trial. Perhaps I might add, that the plan of filling combs was given a great many years ago by Mr. Quinby, but I can not learn that it has ever been used very generally.

## Notes and Queries.

**I** THINK you will rejoice with me. I can report 16,000 lbs. of honey, nearly all extracted, and beautiful quality. Was in hopes to get some fall honey, but a severe drought prevents.

Hartford, N. Y., Sept. 9, 1883. J. H. MARTIN.

I took 10,000 lbs. of comb honey and 4000 extracted this season.

J. B. KAPP.

Owensville, O., Sept. 1, 1883.

Send me a crate of Clark smokers, and I will whip those hybrids, or die in smoke.

W. S. BROOKS.

Conshohocken, Pa., Aug. 6, 1883.

I had 30 colonies in fall of 1882; 29 in spring of 1883; 46 in fall of 1883; 508 lbs. comb honey, 700 of extracted, and 45 lbs. of beeswax.

J. R. CROOKS.

Keiths, Noble Co., Ohio, Sept. 15, 1883.

Bees have done fairly well in this locality this season. Heavy frosts last night and night before. Comb honey in small sections, \$14 00 per hundred; ext., \$10.00 do.

J. Y. KEZARTEE.

Cerceno, Michigan.

EFFECT OF COOL WEATHER ON HONEY-STORING.

We have had two weeks of very cold weather here, and all work in boxes has stopped dead still. The weather is more favorable for a day or two back, but cold yet.

GEO. E. DUFFIN.

Galesville, Wis., Aug. 11, 1883.

Our bees have done well since the 10th of Aug. I shall average over 100 lbs. to the colony, spring count. We can beat the most of them, on the “home stretch,” any way. If weather keeps good, I shall get honey till 10th of Oct.

E. W. PITZER.

Hillsdale, Mills Co., Ia., Sept. 15, 1883.

FROM 8 TO 27, AND 717 LBS. OF HONEY.

My report for this year is as follows: Spring count, 8 swarms; 2 were queenless; they had to raise their own queens. Built these 8 swarms up to 27; extracted 693 lbs. of honey, and had 24 lbs. of comb honey. I have on hand 35 frames of good sealed clover honey to keep for next spring's feeding.

WM. LEITZ.

Hurtisford, Dodge Co., Wis., Sept. 10, 1883.

FROM 3 TO 11, AND 500 LBS. HONEY.

My report for this summer is as follows: Started with 3 swarms; increased to 11 strong swarms, with ample stores, and 500 lbs. of as nice comb honey as I ever saw—basswood and white-clover; no fall

honey at all. How is that for Minnesota, and an A B C scholar?

GEO. E. JONES.

Northfield, Rice Co., Minn., Sept. 25, 1883.

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE  
OF READING MATTER.

MEDINA, OCT. 1, 1883.

The Lord is with you, while ye be with him; and if ye seek him, he will be found of you; but if ye forsake him, he will forsake you.—II. CHRON. 15: 2.

SUBSCRIPTIONS seem to be coming lively this fall, and we have now 6160 names.

### JONES'S NEW HONEY-PAILS.

THESE are exactly like his old ones, only that the cap screws on, just about as the cap goes on a Mason fruit-jar. We can furnish them any size for one-fifth added to the price of the old ones.

FIFTY imported queens have been received since our last. All orders are filled, and another fifty is expected daily. Remember, they are just half now what they will be in the spring; and if you can winter your bees it will be quite a saving to buy now.

### A CORRECTION.

ON p. 565, last JUVENILE, last column, in the 7th and 10th lines from bottom, read *broad* for *brood*. If the friends will always say *wide* instead of *broad*, this chronic trouble will disappear. Sometimes we can tell neither from the meaning nor writing which word to use—*brood* frames or *broad* frames.

MESSRS. COLGROVE & ULERY, who for a short time had charge of the *Bee-Keepers' Exchange*, at present stand in a pretty bad light. The editor of the *Bee-Keepers' Magazine* tells us that nothing can be found of their whereabouts. If the eyes of these men meet this notice we beg to notify them that, if they do not wish to be considered humbugs and swindlers, it would be well for them to speak out. If they have any friends who might say a few words in their defense, we should be glad to hear from them.

IN answer to the many inquiries for books on shorthand writing, we have now in stock, ready to mail, Longley's Eclectic Manual of Phonography, a beautifully bound book of 140 pages, which we can send for 75 cents; also the Phonographic Reader and Writer, a pamphlet of 48 pages, which we can mail for 25 cents. The 75-cent book should enable any smart boy or girl to learn to read and write shorthand. The 25-cent book has one page in common print, and the opposite one in shorthand. The paper and typography are beautiful.

### JONES'S NEW LABELS FOR SECTIONS.

NO wonder that friend Jones thought we would be surprised when we got a sight of these. They are truly beautiful. We are at present unable to send out samples, but shall be as soon as a large lot arrives which Mr. Jones is to send us. They cover

the outside of the section, and lap over so as to hide from view the spaces left, oftentimes, next to the wood. The purchaser has only a view of a clean, square comb of honey. For retailing, friend Jones has a very pretty pasteboard box, just right to hold a single section of honey. These boxes are covered with beautiful and appropriate labels, and will not exceed two cents in cost, if I am correct, label and all. The box is so handsome that the honey will sell for enough more to pay the cost of it, and the honey can be shipped with perfect safety, so as to stay in these boxes. We shall soon be able to furnish samples.

### SELLING BEER ON THE FAIR-GROUNDS, ETC.

IT seems that the Tri-State Fair, as well as our State Fair at Columbus, Ohio, has thought it necessary to sell beer on the fair-grounds. Not only men and boys were drinking, but girls and women too. The crowd was so great that arrangements for feeding the multitude were wholly inadequate, and some of our bee-friends preferred to go to town for their meals, rather than endure the jam and uncleanness on the grounds. I asked neighbor H. if he supposed we could find a restaurant where they did not sell beer and cigars. We passed by a good many, and began to fear the search was in vain; but at last we alighted on a dining-room that seemed too clean and wholesome looking to be a reality on that crowded street. It was sandwiched in between two large liquor-shops and billiard-halls; but within we found intelligent and refined looking women; every thing was as faultlessly clean and pure as—things at home. Prices were very moderate; and as we paid our fare I could not help expressing the pleasure I felt at finding a place free from tobacco, beer, and gambling. In reply, a delicate little card was handed me with the following inscription on it:

WOMAN'S CHRISTIAN TEMPERANCE UNION  
DINING - HALL,  
53 SUMMIT STREET, TOLEDO, O.

Then for the first time I noticed a large water-tank at the door where passers-by drank freely without money and without price, and saw in large letters over the door, W. C. T. U.

### OBITUARY.

DIED, one mile east of Newport, Ind., Sept. 21, 1883, of hasty consumption, Mrs. Debba J. Cook, wife of Theodore J. Cook, aged 23 years and 16 days.

Mrs. Cook's maiden name was Debba J. Hopper; she was born in Ripley Co., Ind.; moved to Decatur Co., in the spring of 1868; joined the church at the age of 14 years, and was joined in the holy bonds of matrimony, Sept. 5, 1880, by the Rev. A. M. Loudon, to Theodore J. Cook, with whom she lived a true, kind, and affectionate companion and wife. She lived a true and devout follower of Jesus, until he came and relieved her sufferings.

She is gone; but only a few more days or years separate us. The Lord gave, and the Lord taketh away. Blessed be the name of the Lord.

T. J. COOK.

Newpoint, Decatur Co., Ind., Sept. 24, 1883.

## Cards for Bee-Keepers.

Your name and address printed on a fine quality of bristol, with cut of queen in colors on one corner; 50, 75c; 100, \$1.00. Send for specimen book of Honey Labels.

GEO. M. GRAY, Medina, Ohio.

500 LBS. BEES for sale at 80c. per lb. Queens same price. F. L. Wright, Plainfield, Mich.

## KIND WORDS FROM OUR CUSTOMERS.

There has been a great rush for chaff hives, 1-pound sections, and your style of fdn. Thank you for systematizing this great industry.  
Sterling, Ill. A. F. STAUFFER.

Thanks for your indulgence, and also to the boys and girls for the nice packing, etc. May the Lord continue to bless you all.  
Smithfield, O., Aug. 7, 1882. D. M. TWEEDY.

The bill of goods ordered of you two weeks ago came to hand last Friday, in the best possible shape; and although I expected something nice, I was really surprised to find every thing so much better than I expected.  
GEO. W. VANDERGRIFT, age 52.

I have used now for about 10 days your No. 10 honey-extractor, and will say that I am well pleased with it. I have extracted nearly 3000 lbs. prime quality white-clover honey. My vicinity is first class for bee culture. We have plenty of basswood.  
Preston, Ia., Aug. 4, 1883. CHRISTIAN HENTON.

I see that you are building some addition to your factory, in order to have more room. It may be that subscriptions in advance will be acceptable. To that effect I inclose \$1.00 for GLEANINGS for 1884. If you should make any change, so that the subscription would be more, then I will make it all satisfactory.  
Hooper, N. Y. D. F. LASHIER.

We have received the honey-pails and labels all O. K. They just look tiptop. Hurrah for the JUVENILE GLEANINGS with her mother's bonnet on! Tell Judge Harriman we want him to be sure to represent Arkansas at the B. K. Convention in Toronto. Also send me his address.  
Dobyville, Ark. A. R. NISBET.

[Who can answer friend Nisbet?]

Well, friend Root, I am sorry to hear that you are experiencing some trouble with intemperate brothers in your town. I will just tell you how it is with us. When the temperance people of our town do their whole duty, then we are on the mountain-top; and when we fail to do that duty, then the whisky men get upon the mountain-top, and we are down. Just now I think we are pretty well down, and the fault is all our own. United we stand, divided we fall.  
Hooper, N. Y. D. F. LASHIER.

JUVENILE is just at hand. Up goes our hat — hold on! it is just brand new, so it can't go up; but our prayers have, and will. Glory to God! the temperance ball is rolling at last, and in the right direction too. When a nest of vipers is stirred up, you both see and smell 'em; hence, that "man and brother" across the way. Turn on the electric light (spiritual), strong, and "keep your powder dry." Sooner or later we or our children will have to fight the issue out in blood. Let it come.  
Smithfield, O., Aug. 24, 1883. D. H. TWEEDY.

I suppose you omitted "Our Homes" in last GLEANINGS, to find out how it is appreciated. That is too practical for me. Great was my disappointment when, on Sunday evening last, I took up GLEANINGS, looking for "Our Homes," for a sort of recreative reading after my duties of that day, not to find a shadow of it. Now, curtail GLEANINGS if you will, or anywhere you have a mind to; but give us "Our Homes;" it is the best part of it.

ALFRED MOTLAZ.

Ottawa, Ill., Sept. 9, 1883.

[Friend M., you have not read "your book" carefully, or you would have seen that Our Homes is now put in JUVENILE. I am glad to know that you noticed it; and I can assure you that Our Homes will be kept up so long as I have strength to edit GLEANINGS; and when I am obliged to lay it down, Ernest will probably take it in hand. In fact, he is now being educated for that very purpose.]

I have read your journal for years, though I have not been a bee-keeper. Especially have I been interested in your Home department. I watched with much interest, and I can say truthfully with some solicitude, the stand you took in the first introduction of this into your journal. It did seem to be revolutionary, if I may be allowed the expression. I had been a subscriber and correspondent for years for poultry papers; and could understand what amount of moral stamina it required to introduce an entirely new feature into a bee journal, and one so many people would consider so foreign to the interests of bee-keepers. Yet I am one who fully believes in carrying our religion into our business; and if we do, both must thrive, as we have the promise of the life that now is as well as the life to come. I am certain that God has blessed you in your efforts to honor him in connection with your work, and I have no doubt but that he will continue to bless you. I hope you will not think I am making too free on so short acquaintance, but I have felt for years like writing to you and bidding you God speed.  
Lefroy, Ont., Can., Aug. 7, 1883. STANLEY SPILLET.

## SOMETHING MORE ABOUT "J. R."

I wrote you a few lines last spring, "How J. R. Transfers Bees," and requested you to send J. R. a smoker, because he needed one so badly, and did not seem to have the money to spare to buy one, and I mentioned the fact that he had quit the use of tobacco, and I received one so promptly that it made me think still more of the bee-man, A. I. Root. I just felt like writing a few lines more to let you know that I had not forgotten you yet. I stayed with J. R. until only a few days ago; while there I learned to like the bees, and I was sorry to leave; but it seemed that duty called me away.

I said I learned to like the bees; and why should I not? During all the time I was there I did not get the first sting, and they pushed out *early in the morning* too. Bee-boys, did you ever notice that? Now, was there not something wonderful about the bees not stinging me? It may be that I shall become a regular bee-man. I have thought sometimes (if it were the Lord's will) that I should like to go to Medina, and work for Bro. Root, since there is so much to do, and that is the part that I like. Where all hands are so busily at work, we don't have time for things that are wrong and mean. Yes, if I were there I could run that powerful engine. I am an engineer. Men write on paper, and sign their names to it, that I am a good engineer, and a good hand, and easy to get along with, and it just strikes me that all of Bro. Root's hands are agreeable, because the superintendent says, or repeats, "Not by might nor by power, but by my Spirit, saith the Lord." Now, if I am agreeable, I ought not to have any credit for it, for it is because I am yoked with Christ, and he leadeth me, and he keepeth me. Pray on, brethren; don't lay thy "armor down," nor think the "victory won;" thy work will ne'er be done till thou obtain the crown.

J. R. has sold over 2000 lbs. of honey. He started some three years ago with 3 stands, and has pulled through much discouragement from his neighbors. If he keeps on at that rate, even in a few years he will need that little blue-eyed boy of his whom he calls Sammy, to help him. This will be my first letter with 2 cts.  
C. V. LINDLEY.

Indianapolis, Ind., Sept. 23, 1883.

I wish you would send me some of your circulars, so that I could give them away. Everybody admires my colony of bees you sent me. They are the finest in this section; that is why I ordered the second one of you.

JAMES H. BOSWORTH.  
Taunton, Mass., Aug. 27, 1883.

I received extractor and other goods all right, and am well pleased with them. My neighbors think it a wonder, as well as myself. Those rickel-plated shears are grand sale; every one that sees them thinks they are such nice ones.

ANN SCAIFE.  
Barboursville, Lyeoming Co., Pa.

#### OUR TEN-CENT SUSPENDERS.

Inclosed find 15 cents. In return, please send me soon one pair of those cheap suspenders you sold 2 or 3 years ago, no elastic in front part, but good stiff elastic in the back. They are the easiest I have ever worn; can't get them in this city.

E. S. COTNAT.

Des Moines, Iowa, Oct. 3, 1883.

The imported queen that you sent Aug. 20, 1883, is doing well. The day I received them, I gave them plenty of honey and brood. She commenced to lay the next day, and I must say she makes things "get." as a layer. I found plenty of young bees from her three days ago. They are beautiful bees. Please receive many thanks for same.

S. F. BOSLER.

Rockport, Ind., Sept. 17, 1883.

#### THE GOOD CANDY.

On the 18th of September, I mailed a customer of mine 4 queens, which did not reach their destination until Oct. 3d. Queens were all lively, but a good many dead workers. They were sent in Peet cage with candy made of powdered sugar and honey; no water. What do you think of that?

Albion, O., Oct. 9, 1883.

J. R. LANDES.

I have all the GLEANINGS bound from first number complete, for which I would not take \$5.00 per volume. I am very busily engaged in my other business matters, and no time for bees at present; but I expect to keep them again some time, as I made them pay aside from the pleasure I take in working with them. I enjoy reading GLEANINGS also, aside from bees, especially the Home Papers; and although I have little time to devote to them, I do not want to be without them. I wish you much joy and abundant success in your good work.

N. H. ALLEN.

Kirkwood, Mo., Oct. 9, 1883.

#### A LESSON ON THE NEED OF A WHEELBARROW IN THE APIARY.

My wheelbarrow has failed; and seeing the drawing and your description of the gas-pipe barrow, I hereby send an order for one forthwith, as I hurt myself yesterday in lugging in honey from the yard, so I can't accomplish much to-day. Our honey is very good up to date—all light colored. The third car-load of California honey in Syracuse has overstocked the market at 15c., 1-lb. sections, no glass. Our yield is fair—perhaps over an average.

S. H. CORBIN.

Fabius, Ononadaga Co., N. Y., Aug. 16, 1883.

#### ONE-PIECE SECTIONS MADE OF VENEER.

I have not got my honey all packed yet, so I can not tell how I am coming out; but I have enough to keep me out of Blasted Hopes. I think I have 50 lbs. to the swarm—just half a crop, as compared with my crop for the two years past. I still use veneer sections, and don't think I want any others; but then, like friend Hutchinson, I may change my mind. Now, friend Root, as regards one-piece sections, they have been made and used for the last six or seven years to my certain knowledge; so you just fight Mr. Fornerook; and after the battle is over, let us know what the cost amounts to, and see if we don't help to pay it up.

WM. L. KING.

Benton Harbor, Mich., Oct. 12, 1883.

Do you want a name for "Peter"? We have buried two of the sweetest baby boys you ever saw, in the last three years. Their names were Fred, and Wallace. I think those the nicest names, and only a good boy would be worthy to wear them. How do you like the names? George and Will are good names too. Bees are not paying their rent this year. We have 23 swarms now, from 8, spring count,

and don't get honey enough for the table. Have sold 50 cts. worth.

MRS. C. Y. STEWART.

Altouna, Boulder Co., Col.

[As far as the name "Wallace" is concerned, my good friend, our proof-reader says he has the monopoly of that around here. He says, too, that he has a brother named Fred, and one named George, which seems rather a queer coincidence, from the fact that you mention all three, and are yet an entire stranger.]

## Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 40 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

#### CITY MARKETS.

CHICAGO.—Honey.—During the past two weeks we have enjoyed the best trade of the season of 1883. The receipts have been large, but demand has kept pace with them, and prices have been very firm; choice lots of 1-lb. frames bringing 20c per lb; 1½ to 2 lb., 16@18c., mostly at 17@18c. Extracted, a little better demand, but not very active. Prices obtained, 8@10c. *Beeswax*.—Sales are few at 3½ for yellow; and dark, 25c.

R. A. BURNETT.

Chicago, Oct. 15, 1883.

CLEVELAND.—Honey.—Honey continues without change; 1-lb. sections of best white sells readily on arrival at 18@19c; mostly at 18c. When, by some accident, it arrives in bad order, it does not sell very readily. Our experience is, that freight lots, when in full glassed cases, arrive in far better order than by express, because there is more time to handle properly. The 2-lb. unglassed sell at 17@18c; all glassed sections about 2 cts. per lb. less. Extracted very dull; no inquiry.—*Beeswax*, 25c.

Cleveland, O., Oct. 13, 1883.

A. C. KENDEL.

MILWAUKEE.—Honey.—The market here for honey remains very much the same as when reported, although there is a better supply on hand, the receipts having increased, and a fair trade enjoyed, and can quote choice clover, white, 1-lb. sections, 17@18c; larger sections, below choice, 15@16c; extracted, choice, 10@10½c; dark, 8@9c. *Beeswax* wanted, and salable at 25@30c, if pure.

Milwaukee, Oct. 13, 1883.

A. V. BISHOP.

CINCINNATI.—Honey.—The demand for honey is extremely slow, and our commission houses are too well supplied to expect any thing else, and prices rule low. Manufacturers complain of slow business. Extracted honey brings 7@9c on arrival. I have bought for less. Comb honey in good order, 12@15c. *Beeswax*, good yellow brings 27@28c. Offerings few.

Cincinnati, Oct. 13, 1883.

CHAS. F. MUTH.

I want to buy some comb honey in large frames, or in boxes, or in 1 or 2 lb. sections.

Georgetown, Ver. Co., Ill.

J. R. LINDLEY.

I have 1200 lbs. of heart's-ease and basswood honey for sale in 10 and 17 gal. kegs, for which I will take 10 cts. per lb., delivered on the cars at Plattsmouth, Neb., charging 85 cts. each for the kegs. The honey is very nice and thick, and warranted good.

J. M. YOUNG.

Three Groves, Cass Co., Neb., Oct. 13, 1883.

Wanted, 1000 to 2000 lbs. clover comb honey, in one and two pound boxes. State prices and quality.

S. WHAN.

Raymillan, Venango Co., Pa.

Wanted—Extracted Honey.—All having any to sell will please state kind, price, and how much.

CHAS. D. DUVALLE.

Spencerville, Mont. Co., Md.

Vol. XI.

OCT. 15, 1883.

No. 10.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00, 10 or more, 75 cts. each. Single Number, 10 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

*Established in 1873.*

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canada. To all other countries of the Universal Postal Union, 18 per year extra. To all countries NOT of the U. P. U., 42c per year extra.

## VIRGIL'S TREATISE ON BEES.

### DISEASES OF BEES. (1)

If with some sad disease their bodies waste  
 (Since of our ill life gives it them to taste),  
 The same by signs not doubtful one may know,  
 For soon the sick an altered color show. (2)  
 Disease deforms their looks with bristly hair; (3)  
 Then from their dwellings forth anon they bear  
 Those bodies whence the light of life has fled,  
 And lead the sad processions of the dead; (4)  
 Or feet to feet they close together cling,  
 And from their dwelling's threshold idly swing; (5)  
 Or in their inmost shrines they linger all,  
 Sluggish with hunger, and in torpid ball  
 Condensed and cold: (6) then deeper sound is heard  
 Than e'er is wont when healthy bees are stirred; (7)  
 They murmur lightly with a drawing wheeze,  
 As sometimes cool south wind among the trees;  
 Or as the sea its watery bosom laves,  
 And troubled hisses with reflowing waves;  
 Or as fierce fire, inclosed in furnace walls,  
 A trembling sigh with smothered fervor draws. (8)

### REMEDIES FOR DISEASE.

Here I advise sweet galbanum to burn,  
 And honey through a pipe of reed to turn, (9)  
 Rousing them well, moreover, lest in vain  
 Thy help be proffered to the sluggish train,  
 And loudly calling, in an urgent mood,  
 Their sleepy senses to the well-known food. (10)  
 To mix with feed it may be well to try  
 A little powdered galls, and roses dry; (11)  
 Or grape molasses use, well simmered down;  
 Or wine, from the vine's bunches dry and brown,

With thyme that loveth the Athenian dells,  
 And centaur-plant that very strongly smells,  
 And there's a flower that in the meadows grows,  
 Amellus, for a name, the serf bestows,  
 An herb by those that seek it easy told;  
 It springs a thicket from the turfy mold,  
 Golden itself, but in its leaves around,  
 With which in great abundance it is crowned,  
 The lurking hue of purple richly glows,  
 A purple dark as oft the violet shows;  
 And with its wreaths, in deft profusion flecked,  
 Often the altars of the God's are decked;  
 Acrid in flavor to the mouth it seems;  
 This shepherds gather by the bending streams  
 Of Mella, and adown its pastured vales;  
 Simmer in wine, which fragrance sweet exhales,  
 The roots of this, and place their doorways by  
 Full canisters of food for their supply. (12)

(1) Virgil is hardly at his best in this passage. Starvation, exhausted queen, constitutional debility, spring dwindling, dysentery, and we know not what else, seem to be jumbled all together, and an equally miscellaneous lot of remedies given for the batch; to wit, fumigation with galbanum, feeding pure honey, feeding honey mixed with powdered nut-galls and roses, feeding grape molasses, feeding fluid extract of thyme and centaurea in raisin wine, and feeding sweet wine in which amellus roots have been simmered. At the worst, however, these are harmless remedies; and if applied to a case which is curable by stimulation, some of them may be quite useful. His head is level on one thing: feeding pure honey will cure starvation. Moreover, it's plain that his idea of medical practice was to have the

medicne good. Three cheers for Dr. Virgil (!) (!) (!) We would be glad to know if Virgil had met any cases of foul brood; but he mentions no unmistakable signs of it. The smell of glue, the glue-like masses in the cells, and the little ragged holes in sunken caps, these are prominent signs; and as they are not mentioned, most likely foul brood was not known to the writer.

(2) The color of the juices of the body and of the contents of the stomach have some effect on external color. In fact, you remember that some of our strong Italianists wanted to make it out that the black bees friend Jones saw near Rome were only pure Italians that had been eating too much huckleberry pie. But the change of color in ailing bees is mainly owing to the contraction of their bodies, which slides the light-colored portion of each scale in out of sight.

(3) Probably a sick bee has no more hairs on him than a well one; but he certainly looks as though he had, and that is sufficient. He feels to lifeless to brush himself as usual, and so goes looking like — hold on, we won't have her name in print — when she comes to breakfast with pillow-bangs streaming all around her head.

(4) These bees have been superseding a worthless queen; and, having got so far as to raise one smart enough to kill off her rivals, they will come through all right. Nothing better for them now than good stimulative feed; so Virgil is a safe guide so far. How do we know this? Why, strange as it may seem, bees do often form a sort of funeral procession where a dead queen has been dragged out, and keep crawling back and forth along the line which their keen sense of smell tells them she has passed over; but they always treat dead drones and workers with perfect contempt.

(5) You rather stump me here, dear Virgil. Surely you haven't let them get so full of honey and brood that they have to hang out. I rather fear that the interior is so corrupt with dead brood that they hang out for fresh air; if so, I don't believe amellus root and wine will save them. But you may try it though.

(6) Starvation is what's the matter with these bees; but there may be some disease behind it that made them get so poor, and run out of food. When bees fear that they are going to run short, it makes them quite enterprising to snatch and rob, oftentimes; but when want actually comes they do not behave at all like starving animals would do — no tearing around like a hungry bear among them. By clinging all together in a dense mass, and entering the semi-torpid state, letting animal heat run down to the lowest point, they can live a considerable time on almost nothing, hoping and waiting for a change of weather, and a flow of honey, and this is the course they almost always take, I believe.

(7) The tone of a sound is high or low according as the undulations are rapid or slow. Bees torpid with cold or hunger wave their wings very gently — only fast enough to make the lowest possible buzz. From this upward through all the bee-moods and tenses there is a long scale of sounds, ending with the horrible "sing" of a frantic one that is digging in your hair, trying to get down where he can give you a taste of the "bitter end."

(8) The variety and richness of Virgil's resources is well shown by these comparisons to illustrate the sounds made by ailing bees; the last especially is very striking, and within the experience of all.

(9) Virgil shows familiarity with two kinds of feeding. The food mentioned at the end of the next caption, amellus root and wine, was not too exciting to be fed outside the hive, and so it is placed in proper vessels by the entrance. The vessels, I believe, were baskets made tight by the use of pitch or wax. A float to keep the bees from drowning is not mentioned; but perhaps the "canistra," made to carry liquids, usually had a floating cover to secure the contents from slopping over. Soakage through the wall of the basket itself might be made to supply the bees, if the thing was got up just right. The kind of feeding proposed at (9) is substantially the Jones method. Trusting that the hive will be waxed tight at the bottom, it is tilted back a little, and a small hole made, through which honey can be poured by means of a reed pipe. Whatever honey does not adhere to combs or bees, rests on the bottom-board till the bees carry it up and store it.

(10) This is a quite important point. Bees, if far gone, may starve very near to plenty, if the keeper does not make sure that they get started at the food.

(11) To counteract dysentery by the use of astrinents is a thought that easily occurs to intelligent minds; but I believe modern experience indicates that it is not often worth while to medicate food; possibly we are too heedless in this, and the ancients wiser than we.

(12) See under note (9).

The translation and notes on pages 562 and 582 I will mostly defer till next time, when the same passage will come under consideration. It is with some feeling of regret that I tell you we have reached the end of the scientific part of the poem. The fourth Georgic is composed of two very different parts; the first, as we have seen, is rich, meaty, and wise; the second is very light reading indeed — a batch of enormous mythological yarns — which same the poet knew his countrymen loved so well — put in to keep the sensible part from sinking into oblivion. The account of the spontaneous production of swarms of bees forms the natural stepping-stone between these two parts.

And what shall we do with the rest of the poem? At first I thought to stop when bee-ology played out; then I planned for a sort of review of the latter part, with selections here and there; and now I don't know but that we could extract fun enough out of it to pay for going over the whole. By the time we get through with that well-pounded bullock, we will see what shall come next. E. E. HASTY.

Richards, O., Oct. 8, 1883.

Friend H., I, too, feel sorry to think that we are at the end of your interesting translation — especially so because so many valuable facts have been brought out by it. Our good friend Mr. Langstroth, in talking to me in regard to Virgil when we were at the convention — by the way, I want to digress long enough to say that friend L. and I roomed together, and we not only talked until after 12 at night, but he waked me before 6 in the morning to tell me of some more grand ideas he had just thought of. I would not for the world have you think that I objected to being wakened so early, for, my friends, if there is a pleasant bee-enthusiast on the face of the earth, in the way of colloquial powers, it is good friend L. Well, among other things we talked about you,

friend Hasty, and we talked about Virgil, and Mr. L. made this charge against you — if it can be called a charge. He said you had, in your translation, greatly helped Virgil, or that you had made him out greater and wiser than he justly deserved. At any rate, I think we all owe you a debt for having shown us how much real intelligence there was in Virgil's time, and for having let us see that all wisdom and knowledge does not belong entirely to us of the 19th century. Now, friend H., I do not take much stock in mythology; that is, I do not like very much of it at once. But I think we can safely trust you to bring out all the good there is in it. We like fun, don't we, boys? But we want something substantial pretty close by.

### A CART FOR MOVING HIVES.

ALSO, A PLAN FOR HIVING SWARMS IN CONNECTION WITH THE CART.

**I**N regard to the usefulness of this machine, there is no guess-so work about it. I have tested it in my own apiary the past season, and am satisfied with it. I never had to call for help to move heavy hives this year. My way of using it has been this: I have all my new hives prepared and set on the stands they are to occupy; then at one side of the apiary I have some stands prepared *without* hives on them. Now we are ready for swarming. As soon as the swarm comes out, cage the queen, raise the cap, and lay her on the quilt inside; then as soon as the bees are all out, pick the hive up with the cart and wheel it away to one of the vacant stands; unload it there, and leave it for the present; now step around and pick up one of the empty hives, and place it on the stand where the swarm has just issued; and as soon as the bees begin to return, turn the queen in; and while the swarm is settling, the old hive can be opened, and the queen-cells cut out. Now, if the swarm is quiet, take the cart and carefully wheel it to its proper place; then return the old hive likewise, and the operation is complete. The cart can also be used for carrying the extractor, comb-bucket, tool-box, section-cases, crated honey, etc.; and when not in use in the apiary it makes a splendid plaything for the juveniles. We can furnish a *limited* number of these carts for \$15.00 each, complete.

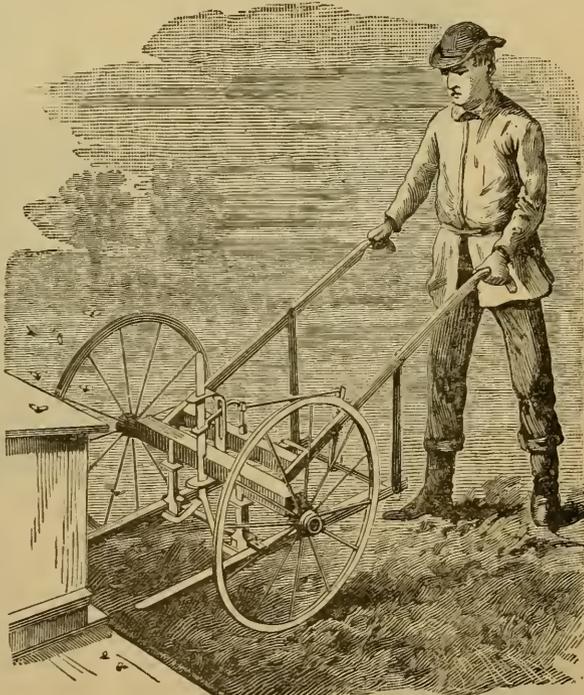

Now, Mr. Root, it is against my rules to "brag" on any thing I have for sale. I want it to sell on its *merits* alone, or not sell at all. I should like to have you and other bee-keepers say what you think of the machine. Your criticisms will be a great help to me. There is one mistake in the picture. It should show the cart approaching a hive resting on four half-bricks, instead of upon a bench, as represented. The picture shown is not of your humble servant. CHAS. R. THOMPSON.

Fort Omaha, Neb., Oct. 1, 1883.

Friend T., your cart seems very ingenious, and doubtless might prove quite handy in

moving hives in the way you indicate. It seems to me, however, that we have easier methods of swarming than to lift large heavy hives about. Yet there are doubtless many who will like the plan you give. If I were going to move hives, I should very much like such a cart. For cellar wintering it will doubtless be a fine thing. Have the floor of your cellar covered with sawdust, and you could run your hives in and set them in place very quietly and easily. I should judge from the engraving that the cart is not well suited to other kinds of work besides hive-moving; and as you invite criticism, I will also take the liberty of saying that \$15.00 seems to be quite a price for such an implement. If they were made by the hundred, at some manufactory, it seems to me they ought to be gotten up so as to be sold for about one-half that price. Nevertheless it is quite ingenious, and we thank you for the plan you give in regard to handling swarms.

Concerning this plan for natural swarms, it will be noticed that the result of moving the two hives as you mention is to leave the

THOMPSON'S HIVE-CART.

old hive finally upon its old stand, and the swarm is put into a new hive on a new stand. Well, friend Brooks' swarm-catcher accomplishes the same result, if I am correct, without moving the hives at all. All that is moved is the light cloth, and sticks that keep it in place. This seems a very simple arrangement; and as friend B. describes the plan, it would seem to be easily managed. But as we have had very few reports about the working of the device, I presume a great many who are accustomed

to moving hives would find it less complicated. Hives we always have on hand any way, and a swarm-catcher might not be right at hand when the swarm issues.

### A FOUNTAIN PUMP FOR A SMALL SUM OF MONEY.

SOMETHING THAT WILL ANSWER, EVEN IF NOT QUITE EQUAL TO THE WHITMAN.

**A** FEW months ago a friend sent us a fountain pump made of tin, with which I was so well pleased that we set the tanners at work making some which I thought we could make for about a dollar. Before we got any done, however, neighbor H. swooped down upon us, and said they had got a fountain pump down at "his house" that would "knock the spots" off from Whitman's, or ours, or any other. He

### SMITH'S NEW IMPROVED PATENT FORCE SPRINKLER,

*The most perfect and effective hand apparatus ever invented for throwing water.*

This sprinkler supplies a want long felt by all who are in need of a force sprinkler. In bringing it before the public, I dare say, since its improved construction, I am fully convinced that I have it perfect in every particular. In variety of service, simplicity of construction, and ease of operation, IT HAS NO EQUAL.

It is always ready for use, not liable to get out of order, and so light and convenient that it can be used easily and effectively by a lady or child. It combines all the features necessary for a first-class force pump, which is a very essential feature to be considered. The valve rim and hinge are made of copper. Nothing can get into the valve to put it out of order, owing to the perforated bottom. This is an article which no family should be without. The operation of the pump readily speaks for itself, for the many purposes for which it can be used, and thousands can testify to its usefulness. Owing to the great demand, I have been compelled to increase my facilities for their manufacture, and I

SMITH'S NEW IMPROVED FORCE SPRINKLER.

said a man came along and offered to sell his wife one for 50 cents, if she would feed his horse and give him his dinner. Neighbor H. said so much about it that I asked him to bring it up. I took it out to the pump and gave it a good test; and, sure enough, it would throw water further and easier than the Whitman. The only drawback is, it can not be carried in the hand with a pail, as the Whitman can, to chase a swarm of bees. Besides it is made of tin, while the Whitman is made of solid, heavy brass. Nevertheless it is a splendid pump for a bee-keeper, or almost anybody else. I wrote to the patentee, and received the following circular. Below is his description, and I give you a cut of it:

SAVE YOUR PROPERTY, SAVE YOUR FRUIT,  
SAVE YOUR FLOWERS, SAVE EVERY  
THING THAT  
MAKES HOME PLEASANT AND PROFITABLE.

am now shipping them to all parts of the country, and they are received with universal satisfaction wherever introduced. Many of the numerous fires that occur, attended with great loss of life and property, might easily be prevented were there some requisite means of applying water, which is at once supplied by the use of this pump.

*It throws a strong stream fifty feet or more, while with the sprinkler attached it spreads the water in a gentle shower or spray. For washing windows and carriages, and showering lawns, gardens, and green-houses, it has no equal. It is adapted to throwing liquid solutions of all kinds to destroy noxious insects and bugs of every nature, on plant, vine, or tree, and should be kept in every house, store, and factory in the country, for fire protection. In fact, in a diminished degree, it is capable of every use of an ordinary force pump, and far more convenient.*

The best quality of charcoal tin is used in the manufacture of these pumps, for which the highest mechanical skill is provided.

PRICE REDUCED, \$2.00.

Now, then, friends, for what shall I sell them? I have purchased 100 pumps for \$50.00; so you see that the traveling agent

paid for the pump with the 50 cents he received, and got his dinner and horse-feed free. At the same time, he conferred a benefit on neighbor H. in selling him one, even at that price. Now, although the patentee has fixed the price at \$2.00, it seems to me that 75 cts. would be about what I ought to charge you, and I will furnish them to you at that price until he objects. I believe he will sell more pumps, do more good, and make more money, in asking 75 cents rather than \$2.00. However, as it is his invention, I suppose he has a right to say what they shall be sold for. Now, in consideration of the above, perhaps it would be well, if you want one, to say so pretty quickly, if you want to get it for 75 cents.

### FROM ITALY TO AUSTRALIA.

#### OUR FRIEND BIANCONCINI STILL PROGRESSING.

IT is a long time since I troubled you with any bee news from this quarter of the globe, and I do so now more to show the skill and readiness to try to oblige of your old friend Charley Bianconcini.

Something more than two years since, I wrote him asking if he would try the experiment of sending queens to Australia; and if so, would he inquire at his end the best mode of transit. He expressed his willingness. Inquiries were instituted at both ends, and the Orient line of steamers, calling at Naples at short intervals (monthly), were selected for the experiment. Twelve queens were despatched in June, 1882, and arrived at Brisbane, Queensland, in August, being about 48 days cribbed, cabined, and confined, having to be trans-shipped at Sydney, New South Wales. On opening the little boxes, five queens were found alive. These were severally introduced to prepared stocks, with one exception, and did well. So far so good for a first attempt. Thus the second batch of Italians was introduced by the writer to Australia.

Having so far succeeded, it was determined to make another attempt for the present season, just commenced with us. So, on the 23d of June another parcel of 12 queens was despatched by Bianconcini from Naples. These were landed at Brisbane on the 10th of August, and must have been confined 49 days, some a day or two longer. On opening this parcel of 12, ten living queens were found, all lively, and some of the boxes had very few dead bees. I shouted, "Hurrah Charley!" All the ten queens have been safely introduced to prepared strong nuclei, and are laying well, little the worse, apparently, for their long confinement. No doubt when they have fully recovered they will put on a better appearance than when first relieved, although some of them are really fine queens.

Thus the difficulties have been overcome. Proper packing, good supply of water, and care on voyage, have secured for Australian apiaries a long-desired boon — the pure Italian. No doubt as this becomes known, and the excellent traits of these bees are better understood, great demand will arise for them. Bianconcini has our thanks for entering so heartily into the project, and in doing his part so skillfully.

CHAS. FALLWOOD.

Brisbane, Queensland, Australia, Aug. 30, 1883.

And I, friend F., want to say, "Hurrah for

the two Charlies;" for I think you both deserve credit, do you not?

## Bee Botany,

### OR HONEY-PLANTS TO BE NAMED.

SEND you a specimen of a plant found in the woods; very fragrant; bees working on it; from 3 to 5½ feet high; large leaf; it is nearly out of blooming. I should like you to name it.

Williamson, N. Y., Aug. 21, 1883. R. J. NASH.

Prof. Devol replies as follows:

Plant is probably *Collinsonia canadensis*, L. (horse-balm, rich-weed, stone-root); but from the specimen sent I am unable to say to a certainty that it is this. It grows 3 to 5 feet high, a little pubescent, leaves 6 to 8 inches long, ½ as wide, thin, acuminate, coarsely serrate, abrupt at base. Flowers in a loose panicle; calyx cup-shaped, with 5 slender teeth; corolla tubular, slightly two-lipped, upper lip 4-lobed, lower one longer. Stamens two, exerted; anthers much divergent; pistil much exerted, with a two-lobed stigma. It is a strong-scented perennial herb, flowering most of the summer, as is usual in *Labiatae*. It is rich in honey. W. S. DEVOL.

Columbus, O., Sept. 15, 1883.

Please name this flower for me, and oblige

"AUNT CARRIE."

Prof. Devol replies:

Plant from Mrs. C. L. Stallard, Darter, Putnam Co., Ind., is *Daucus pusillus*, a plant nearly related to, and closely resembling the wild carrot (*D. Carota*). It is a slender plant, 6 to 18 inches high, retorsely-hispid, leaflets pubescent, bi-pinnatifid, divisions deeply lobed with acute segments. It has a copious involucre of deeply pinnatifid bracts surrounding the umbel, which is 1 to 1½ inches broad; flowers white, central ones abortive; calyx 5-toothed; corolla with 5 emarginate petals, those on the outer flowers larger; fruit oblong, smaller than that of the carrot, muricate with barbed or hooked prickles. Found principally on dry soils; common south. W. S. DEVOL.

Columbus, Ohio, Sept. 14, 1883.

### AWARDING PREMIUMS AT OUR COUNTY FAIRS.

#### DUTIES OF JUDGES, ETC.

AT our county fair we had a very good exhibition of bees, honey, and wax; also extractors and foundation machines. There were five or six different makes of hives, three or four of which were double-walled. There was a single-walled hive to which the judges gave the first prize. Almost every one thought it was unjust to others; also they gave the second prize to a colony of bees that had no queen, which I think was wrong; as the bees were on the ground about 28 hours before they were examined, there were no eggs, and there was a number of queen-cells ready to cap. I would like your opinion as to whether the judges ought to have given a premium on a colony without a queen. Davenport, Ia., Oct. 1, 1883. W. W. HUNTER.

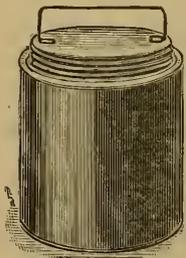

Friend H., I should hardly think that it was the thing to do, to award a premium on

a colony of bees not containing a queen; but very likely the judges were not expert beekeepers, as is very often the case. Perhaps this would explain why they gave the premium to a single-walled hive. Now, this is rather bad; but it seems to me it was not as bad as getting into the too common habit of finding fault with the judges at our county fairs, who, as a rule, work for nothing and board themselves. If they awarded the premium according to the best knowledge they had on the subject, what more could they do? Very likely it would have been better to have appointed bee-men as judges, and this throws the blame back on the ones who gave them their appointments. Now, then, do all who complain make it their business to be on hand at the preliminary fair meetings in the fall, and assist in having arrangements made as they should be? Are the men who are competent to fill positions as judges, on hand and ready to serve? If I were you, I believe I would submit to almost any thing, rather than find fault with the awards as they were given. Beware about thinking evil of your neighbors. I think it is many times far better to let wrongs go unrighted than to go to the other extreme of fault-finding. Is it not so, friend H.?

**SOME NEW TINWARE FOR HOLDING HONEY.**

MORE PATTERNS FOR HONEY-PAILS.

FOR two or three years back I have been thinking, every time a new honey-pail was suggested, "Well, now, we certainly shall never need any thing more;" but in a very little time something new started out; and as people preferred it, nothing else was to be done but to make it for them: and when the trade ran up into the hundreds and thousands, I began to think perhaps it was good to have something new under the sun, after all. I told you in the last number that the Jones honey-pails were exactly like the old ones, only that the tops screwed on instead of being slipped on as before, and being fastened with cement. Well, here is a picture of the improved Jones honey-pail. Prices are as follows:—

JONES'S NEW PAIL.

Capacity in gallons	Price of 100 pounds	Price of 10, pounds
6	\$5 25	55
7	6 50	63
8	7 00	70
9	8 00	78
10	9 50	98

These caps are made by machinery, and made so accurately that, when the cap is screwed down closely, it is almost honey-tight, without any rubber, waxed paper, or any thing of the sort; in fact, I believe the honey may be put into these pails, put out in the cold, and allowed to candy, and then it

can be shipped and handled without any trouble, just as it is, and no amount of throwing it around would ever burst the caps off, as often happens with the former Jones pail, even if the caps are cemented.

By the way, while in a conversation with friend Muth on the cars, he told me that it seemed funny to think how long he and others had fussed with tumblers, pails, and bottles, to keep the honey from oozing out, before they learned how. The whole secret consists in filling your packages, and then allowing them to stand 24 hours or more before they are closed up. Unless you do this, the honey will be sure to ooze out around the caps or corks. He said he supposed it was owing to the fact, that the honey in pouring contained more or less air by a sort of mechanical admixture, and this air must be allowed to rise to the top and pass off, or it will push the honey out. Friend Jones uses rings made of paper, and these rings are dipped in melted paraffine, and then cooled by shaking a lot of them on a stick. When dipped so as to contain a sufficient quantity of paraffine, they are put under the caps before screwing down. I have never used them, for our caps seemed to be sufficiently tight without it.

THE IMPROVED DADANT PAIL.

THE MILK-PAIL HONEY-PAIL.

Here are some pails for honey that I found at a large tinware factory in Buffalo. The milk-can is made in two sizes — 1½ and 2½ quarts. Price 10 and 15 cts. each respectively. Prices by the 100, \$9.50 and \$13.50. The advantage of this can is, besides being neat and attractive in appearance, the neck prevents the honey from slopping when it is put in in a liquid state. The utensil is also something that is wanted for milk in almost every family. The ones we have are very nicely made indeed. The other, which I have termed an improvement on the Dadant pail, is made sloping so that one pail will nest in another. They slip down inside of each other until they are stopped by their ears, and the covers may then be nested in a similar manner, and we have a package of honey-pails so solid and compact that it can be shipped at the rate of stamped ware, or about third or fourth class freight, while ordinary tin pails have to go at first class, or sometimes double first class. The price of this improved Dadant pail, which holds 2½ quarts, is \$9.50 per 100. The pail is very nicely and strongly made by special machinery. It seems that this matter of getting tin pails to nest into each so as to get little bulk and low rates of freight, is something we shall eventually be obliged to adopt.

## THE TORONTO CONVENTION.

(Concluded from page 595.)

### SINGLE-STORY OR TWO-STORY HIVES.

**F**RIEND JONES, Prof. Cook, and Poppleton, held to one-story hives with frames spread out horizontally. I objected, and Mr. J. B. Hall was called on; said he used hives ever so many stories high. There seems to be a wide difference of opinion in this matter.

### WHAT SHALL WE PUT AROUND THE ENTRANCES?

A variety of plans was suggested. I gave our plan; friend Jones mentioned ashes; but others said it made the grass and weeds grow too well. Mr. Hall prefers a board one foot wide, and two feet long. Although I did not have time to say so, I wanted to object to this board, on the ground that it would foster toads and other like enemies of the bees.

By a unanimous vote, the convention, on the second day, was devoted to visiting the fair. Mr. Langstroth was among us; and after the building had been viewed and reviewed, Jones and Clark introduced the bee-men to Mr. Langstroth. He shook hands with them as long as he could stand it, and then he was taken away to rest awhile. Knots of bee-men were scattered about, not only through the honey-house, but among the bee-hives and implements, and on the grass outside. Small discussions were held around at various points; and such a friendly, pleasant meeting it were hard to imagine anywhere but among a lot of bee-men. It seemed to be emphatically a season of giving and receiving knowledge. There was not much chance to argue with our Canadian friends, because they had only to point to their piles of honey to back up their special beliefs and ways of doing things; and I verily believe that no one feature on the fair-grounds attracted so much general attention as the apiarian department; and the way the questions were asked by young and old indicated strongly the amount of information that was given to whole crowds of people by the bee-show. In the afternoon we held a session again.

### BEE-VEILS.

This matter was discussed at length, and there was a variety of opinions expressed; but I believe it was pretty generally decided that there is nothing yet in the market that is just what we ought to have. Silk and Brussels net, woven of *fine* thread with a large mesh, makes the best material to put before the eyes; but it is objectionable, because it is so frail. If we had something made of very fine wire, with a mesh so large that a bee could not quite get through it, it would come pretty near filling the bill, although it would probably obscure the vision more than the Brussels net. No such wire cloth has ever been made, to my knowledge. Somebody called me to order, asking how it was that I had so much to say about veils, when I claimed that I never used them. I replied, that my work and talk were principally for the benefit of the A B C class, and those

whom I would not dare to advise to work with bees without the use of the veil.

### L. L. LANGSTROTH.

At this point, Mr. Langstroth was ushered into the convention; and at a signal every member arose to his feet, while our friend was conducted to the Mayor's chair. The afternoon was consumed in speeches of welcome from our Canadian brethren, and responses from different friends. Mr. Langstroth concluded with some interesting facts in regard to his earlier experience with bees and bee-hives. Friend L. was feeling extremely well, and his remarks were given in his happiest vein of humor. Those who have never heard him speak can not well imagine the kind, pleasant, winning way in which he talks, and no one can for a moment doubt his disinterested love for all of the bee fraternity, as well as fervent and earnest devotion to the great God who gave us this world of wonders. In the evening, business was resumed as follows:

### CLIPPING QUEENS' WINGS.

This, also, was discussed with much energy; while many prominent bee-keepers declared they would not have an unclipped queen, other apiarists there stoutly maintained that they wanted their queens to have the full use of their wings. I presume each man will have to fix his queens' wings to suit himself, as the matter stands.

### AT WHAT AGE SHOULD A QUEEN BE SUPERSEDED?

Mr. Hall thought no definite age could be given. Some queens are young when they are old, and others are old when they are young; therefore we should keep queens just as long as they are profitable, and no longer. Mr. Langstroth thought that it seldom paid to keep them beyond two seasons, and also that the Italians generally reared their new queens as soon as the old ones began to fail.

### BEST METHOD OF FEEDING BEES.

Mr. Jones advised granulated sugar, and recommended tilting the hive back and pouring the feed in the entrance in the evening. Mr. Locke recommended the Mason fruit-jar, with the cover perforated with a number of holes.

### DOES FDN. DETERIORATE BY BEING KEPT?

Mr. Jones said it becomes hard on the surface, so that the bees find difficulty in manipulating it, but that if the sheets were dipped in water, just as hot as it could be without melting the fdn., they would be *annealed*, as it were, and would be worked by the bees just as quickly as if it were made the very day it was put into the hive. Others related their experience in regard to using old and new fdn.; and while some found it to answer well after it was a year old, others strongly objected. Friend Jones said a bee-keeper could make no better investment than to hang frames of fdn. in the hives in fall, so as to get them partly built out, or, at least, to get the bees to go over them before winter; these sheets would then be worth double price for use in the spring. From what experience I have had with this partly drawn

himself, during hours of trial and temptation, "Now, what would friend Root do under just such circumstances as these?" It took hold of me in a way I can hardly tell you, because it made me feel how poorly I was fitted to be held up in that way as a guide for others. I do not want anybody to follow me; but I do want all to follow the Savior, whom I love and have tried to follow in my own stumbling way.

We not only had peaches to eat at friend Cork's, but we went right out among the trees and picked them from the branches. I can not really get over the memory of friend Cork's peach-orchard. The only thing about it that made me feel bad was because I had not one at home exactly like it. Although we have had heavy frosts in Ohio, every thing was as bright and green and growing at friend C.'s, on the border of Lake Ontario, as it is here in August. A very nice apiary extended along the side of the yard, and friend C. said the bees had been coming in heavily laden the day before. He had followed them to an oak grove a mile or more away, but did not find what they were working on. The word "oak grove" waked me up; and early next morning, finding the bees were doing a land-office business, we followed them. We got into the grove, but — not a bee. Where could they be? They surely seemed to dodge into this wood. We walked in it, but no bees. Finally friend C. declared he heard them humming. If on one tree, why not on the others? Finally I heard them too, and then we discovered that they were on a kind of oak that had rough, dark, shaggy bark, with smooth shining leaves. The leaf had sharp points, or angles, whereas the white-oak has rounded points and angles, as you may know. Well, what were bees doing on these black-oaks, or yellow-oaks, whatever they were? If we undertook to climb the trees, we should tear our Sunday "trowsers" — at least, I should tear mine; and as friend C. is superintendent of the schools at Niagara, he was obliged to wear tolerably soft clothes too, and so we stared at the tree-tops, and wished for a ladder, with little hope of being able to get one by the time the train came. Did you ever! Just then a man drove up with a long ladder on his wagon, stopped his team, and he and his boy carried it over to us, and friend C. was soon throwing down branches of oak with honey-dew blotched over the leaves. Why are people so accommodating in Canada? and how did this honey-dew get on those leaves without there being any on the leaves of the white-oak — that of which the forest was principally comprised? Friend C. solved the conundrum about the man and the ladder, but none of us could do so in regard to the honey, for he could not find a single aphid in the tree-tops; nevertheless there might have been some away up high. I do not think the bees got any honey from the rudimentary buds, as has been suggested. I wish friend C. would tell us what the quality of it was.

Two hours later, and I stepped on the train to take a closer look at the falls of Niagara. How I did want a bee-friend who knew all about it, or some other friend, to

guide me! I got off at the railroad suspension-bridge, and thought I would take the path and go under the cliffs along down by the river. I did so; and when I found the perpendicular rocks towering away up above my head, I discovered that I could neither climb up nor get any further, and so I wasted another half-hour in getting back again. I was pretty well tired by travel when I got back, and I was something like the boy whom the policeman found. He said he wanted his mother; and added, by way of explanation, that he told her when they went to the city that he knew she would lose him. Well, I found myself, and plenty of water too. You see, I was just going right up close to the falls, where I could look up and see the water come down. But I found two obstacles in the way. One was, I should be as wet as a drowned rat, before I even got there; and the next was, there was such a fog that I could not see any thing besides. Of course, I could get oil-cloth fixings to go out under there with; but while a body could not see, what was the use in going out there in the wet? On Goat Island there was not so much fog, and I had a better view. I soon took back all my first feelings about being disappointed in Niagara. I turned to somebody near with the remark, "Why, do you mean to say, my friend, that this keeps doing so always?"

It did not "let up" any while I was there, and I presume likely it has not yet. For a long time after, I could hear the roar and rush of the mighty waters, whenever I let my mind run back to what I saw during my couple of hours' stay. A glass of soda costs only 25 cts. on Goat Island, and a piece of pie and a sandwich makes it about 50 cts. They were very good, however, and my climbing up and down among the rocks, and over the rapids, gave me a keen sense of the "beauties" of such things, as well as a taste for the romantic.

In Buffalo, a few hours later, I enjoyed hugely a visit through the great factory of Sidney Shepard & Co. On another page I give you a picture of some of the tinware I found there that I thought would be nice to hold honey. My sleeping-car that was to take me home would not be ready until half-past nine in the evening. It was Friday night, and I had been away from home the better part of a week; had missed the Thursday-evening prayer-meeting, and to-night was our regular teachers' meeting. I began to be hungry for the companionship of Christian people, and the atmosphere of the prayer-room. Strangely enough, while these thoughts were in my mind I met a prominent bee-friend and his wife. The evening was pleasantly passed with them; and before I started for the train they had told me about a young minister who was laboring most zealously in their own neighborhood at home, and who had many times invited them to become one of their little band of Christ's followers. You may be sure that I seconded his appeal to them with all my energy; and when I shall hear from them, that they two are "on the Lord's side," it will be one of the pleasantest remembrances of my trip to Canada.

### HOW I WINTER MY BEES.

A REPORT FROM THE MAN WHO WINTERED 241 COLONIES WITHOUT ANY LOSS.

JUDGING from the numerous articles in the newspapers upon the subject of wintering our bees, one would justly conclude that we ought to be able to surmount all of the difficulties that have heretofore existed. But from the numerous inquiries I have received of late upon that subject, it is evident that, with the average bee-keeper, wintering is attended with much uncertainty, and disastrous losses are not uncommon, even among those who have had many years of experience. In view of these facts, I shall not attempt to tell you how to winter your bees, but will describe as well as I can how I winter mine; and in doing so I am aware I shall run against the *pet theories* of many very substantial bee-masters.

#### THE BEE-HOUSE,

In which I winter my bees will first claim a brief notice. The building is double walled, packed with seasoned sawdust 12 inches thick, with sawdust also on the floor overhead, making it frost-proof. It is divided into two or more rooms, one of which is used for an ante-room between the bee-rooms and the outside, and also through which the air must pass before reaching the bees, and thereby modifying it, a *la* sub-earth ventilation.

The house that I have used longest has three rooms—two in which to store the bees, with the ante-room between. This room also contains a stove, used for raising the temperature, expelling the moisture, and facilitating the ventilation whenever occasion requires. A scuttle opens into the chamber from the ante-rooms. The chamber is ventilated by a window in each gable, all of which may be opened or closed at pleasure. The ground floor is cemented upon a layer of pounded stone, and is as firm as a rock, thus preventing any disturbance by jarring. The windows are small, and provided with shutters inside, by which the rooms can be made perfectly dark. The doors are also double.

#### THE HIVE I USE.

This is a deep 8-frame hive, flat movable cover on top, open bottom,  $\frac{3}{8}$ -inch bee-space on top of the frames under the cover.

#### CONDITIONS FOR WINTERING.

I prefer to have the bees breed late as possible, and go into winter with plenty of young bees, a good queen, and plenty of sealed stores gathered in the fore part of the season. I disturb them as little as possible late in the season, when they are disposed to become dormant.

#### SETTING IN THE BEES.

I set them into the bee-house as near the 15th of Nov. as the weather will permit, and let them remain until Apr. 15th, if favorable conditions can be maintained. I choose a cool but not cold day, having previously prepared the rooms by covering the floor with seasoned sawdust; then having lettered and numbered the hives with a piece of chalk, so as to render mistakes impossible in setting them out on the same stands again, I take each hive up from the bottom-board or stand, and carry them into the bee-house, and set them upon stringers, previously placed to receive them, so that when so placed the air will have free access beneath the hives, which are now bottomless. Having set one row around the outside, I lay stringers on the top of these, upon

which I set another row of hives, and so on as high as I can conveniently set them. I use 2x4-inch stringers on the bottom, and one inch on the top of the hives. A thermometer is hung in each room, and a careful record kept of the temperature in the rooms, and also outside, visiting the rooms at least once each day for that purpose, noting also any thing I may think important.

#### VENTILATION.

The hives are ventilated only at the bottom. The rooms are kept well ventilated, and at a temperature averaging near 45°—somewhat below in the fore part of the winter, and above in the latter part. After being set in, the bees remain very quiet until some time in Feb., unless disturbed by an unusual warm spell.

Sometime in Feb. there will be a noticeable increased activity, accompanied by a rise in temperature. This is an indication that brood-rearing has begun. If the weather continues warm for a long time, and the bees become very uneasy, I sometimes set them out during Feb. or March, and return them again as soon as they have taken a thorough flight; but I consider it of no benefit, if the temperature can be kept under control, which I endeavor to accomplish by opening the outside doors at night, and closing them by day time. I have observed, that when the temperature is quite low for some time after the bees have commenced raising brood, that a bad condition is almost sure to follow, and dysentery and spring dwindling are often the result. Therefore I am careful, at this time, that the temperature continue favorable for the brood, and the result is a hive full of bees when I set them out in the spring, and a considerable portion of them are young. If the temperature is inclined to continue too low, I resort to

#### ARTIFICIAL HEAT,

And from several years' experience I am satisfied that there is no means of ventilation for the bee-house in winter equal to artificial heat; and when judiciously used I think it will always be attended with good results. When the warm days of spring come, and bring the birds and the flowers, and the bees can find employment gathering pollen and honey, I feel that the time has come to set them out. Then on a warm pleasant day I set them each out upon the stand from whence they were taken in the fall, and the warmer and pleasanter the weather, the finer will be the condition of the bees; but if the weather is cold and damp when set out, a bad condition will be induced, however perfectly they may have been wintered. H. R. BOARDMAN.

East Townsend, O., Sept. 24, 1883.

Our friends will notice in the above report that friend B. secures downward ventilation, if that is the way to express it, by having the bottom of the hives entirely open. There is no question but that this arrangement will give all the ventilation they will ever need; and it also allows the bees to form a pretty warm cluster up in the body of the hive, from the fact that warm air always ascends. If the colony is a strong one, I should not fear that they would suffer from too much air. Another thing: The dead bees as well as the sickly ones drop out on the ground. I suppose, however, that this plan will hardly be practicable, unless their wintering-room is kept pretty well up to the temperature mentioned—45°. Another secret of friend Boardman's success is, that

his bees have the best of care and attention—in fact, he says he visits them *every day*. How many of us have the enthusiasm and zeal to do this? Another thing: He has perhaps 100 or more colonies in each room. This of itself would give a pretty even temperature—providing, of course, the room be properly ventilated. Then, again, he warms them up judiciously and carefully by artificial heat. How many of us are willing to take the pains to do this? I do believe it is a pretty wise idea to make the covering overhead pretty close and warm, and then give the principal part of the ventilation from below, allowing a space for dead bees to fall clear out of the neighborhood of the living ones above them. You will notice that friend Hasty is on pretty nearly the same track with his “vestibule,” as he calls it. One thing is certain: We can not afford to ignore the moral taught us every winter by the reports of the bees that have wintered all right in hives cracked, split, etc. By the way, who has thoroughly tested the idea of wintering bees in the open air, without any bottom-board? Friend Hill, of the Bee-Keepers’ *Guide*, has for years advocated a hole 4 to 6 in. square in the bottom-board of all his hives. Who will give us some reports in regard to this matter of abundant lower ventilation?

### SOME OF THE PRINCIPLES OF BREEDING.

#### THE COLOR-LINE, ETC.

**I**NDIVIDUAL experiences with the different races of bees and their modifications, strains, and crosses, may disagree materially. But, in all probability, nothing in these experiences, or the lack of harmony among them, will affect theoretical and established principles of breeding and development by descent. Hence in comparing results and arriving at a correct estimate of the experience of others, it is well to inquire how far these principles have been overlooked, and whether, in each case, the judgment has been founded merely on the ground beneath, or on a basis of broader extent.

It is very easy, from the coincidence of a few facts, to establish an impression that will circulate and grow rather beyond the bounds of careful reasoning; and a good example of this is the idea that a preference for golden bauds among Italians must necessarily sacrifice the vitality, industry, and business value of the race, which impression is founded upon the coincidence of reports from several quarters, that the lightest or the best banded bees, while mild and harmless, are also inferior or useless. It now seems in a fair way of being generally taught, that we should disregard “bands” in the pursuit of “business.” None can gainsay the fact, that profit is the main question at issue; but, let us consider whether that object lies in a different direction from color, after all. Yellow bands are not in themselves incompatible with hardiness, courage, and industry.

Of the four principal races of bees, three are acknowledged to be, in most respects, superior to the fourth. These three races are all golden-banded; the fourth, and inferior race, is black. This does not prove that bands are either the cause or the result of superior qualities; but it does prove

that the two may be found together as contemporaneous development in the same race of bees.

If, then, the Italians can excel the blacks, though having a tendency to yellow in varying degrees; if the Syrians also can excel them, being even more fixed in their yellow marking; if the Cypriaws, as is claimed by some, surpass them all in length of flight, and value in times of scarcity, while they are thought to be perhaps the brightest and yellowest of all, how can we base the claim, that, to perpetuate the color of the Italian race of bees, is to lose its vitality? and, conversely, if a darker-colored Italian is worth more than a light one, why is not a black one worth the most of all?

It is an established fact in science, that nature can develop different characteristics of a species together, even though they have no dependence on each other; and scientific breeding is but a more rapid transit over nature’s road. The feathered legs in Asiatic breeds of fowls have no connection with the size; and the “breeding-out” of vulture hawks has not, therefore, involved any reduction of vitality or of weight. The careful selection and breeding of games and bantams into different races, founded on strict standards of color and marking, has not affected their well-known fighting tendencies in the least. The gold-laced and the silver-laced sebright bantams, the most carefully and wonderfully bred of fowls as to coloring, are among the most saucy of the race, not considering the regular game-bantams. In the same manner, some of the most golden and most tractable of the Italian bees are also among the most industrious, and their bright yellow mothers are among the most prolific to be found.

How, then, it may be asked, are we to account for the inferiority of some of the brighter strains of bees? and wherein lies the danger—as I admit there is danger—in breeding for yellow bands? Geo. E. Waring, deprecating the practice of breeding too exclusively for black points in Jersey cattle, said in substance that he did not charge that a Jersey cow with black tips to her horns, a black nose, black hoofs, and a black switch at the end of the tail, could not be as good a dairy cow as any. He only feared that fancy breeders who did not add up their columns of profit and loss might, in their craze for this peculiarity, forget all others. In other words, that, being in possession of cattle with good black points which *happened* to be inferior for butter, they would breed from such stock just as extensively as if its dairy qualities were the very best; and that thus the strains with black points were liable to deteriorate through carelessness, and not from their actual demerits. This is exactly the fact with Italian bees. Those breeders who do not care for cash returns, or who care only to sell queens and bees that will take well at first sight, may breed from bright yellow bees, even though they are inferior in other points, and strains may thus result that will start a prejudice against bright-colored bees in general. But we can breed for more than one thing at once. When hounds first began to attract the notice of poultry fanciers, the crest was inclined to be irregular and even scraggy, and many straw-colored feathers were prone to show in the hackle and saddle of the cocks. Breeders, however, took the case in hand, and carefully bred out the straw color till the average houndan cock of to-day is of a beautiful pearly white and black, in the place of straw and black; and right along with this they

so modified the crest as to make it compact and symmetrical, falling right, left, and backward, from a parting behind the comb. This breeding did not change them from non-sitters to sitters. It did not affect the fifth toe. It did not, that I am aware, decrease the size of the egg, diminish the prolificness of the hen, nor injure the quality of the flesh. Nature has done far more, and left us less to do with the Italian bee than was the case with the houban fowl. She has brought it to us in a high state of advancement, having developed in common hardy, industrious, and prolific character, gentle disposition, and golden bands. Let us carry on the work as she has carried it, and breed, not for any one, but for all three.

A. NORTON.

Gonzales, Cal., Sept. 24, 1883.

Thank you, friend N., for the valuable facts you have furnished us, and also for the happy way in which you have presented the whole matter. As you put it, so far as I can see, your position is correct.

### HIVING BEES ON SUNDAY.

HOW CAN WE BEST REMEMBER THE SABBATH-DAY,  
TO KEEP IT HOLY?

I WAS much interested in your article on hungering and thirsting after righteousness, and am much interested in your efforts for the spiritual welfare of those under your care. The Lord bless and prosper you in this, more and more. The children were highly entertained with the JUVENILE, and I came very near thinking that your papers were both a necessity on the place. Now, I am not writing for the press; so let me ask you a few questions. I want to know how you can prove from the Bible that it is right to hive bees on the Lord's day. I never had one thought that it is right, and I was both surprised and sad when I saw that you advocate it. Are you right, sure, Bro. Root, that you are not wrong? We think that putting a swarm of bees into a hive is *work*; and the Bible, in speaking of the Sabbath-day, says, "In it thou shalt not do any work, thou, nor thy son, nor thy daughter, thy manservant, nor thy maid-servant, nor thy cattle, nor thy stranger that is within thy gates." We are commanded to "remember the Sabbath-day to keep it holy," and I can not see any thing holy in saving swarms of bees on Sunday. "Ye shall hallow my Sabbaths," seems to exclude the idea of saving bees. I know you are a busy man, and perhaps feel as if you have not time to read this; but with all your subscribers and patrons you must have a great influence; and what if you should lead them wrong? "Blessed is the man that keepeth the Sabbath from polluting it." "If thou turn away thy foot from the Sabbath, from doing thy pleasure on my holy day, and call the Sabbath a delight, the holy of the Lord honorable, and shalt honor him, not doing thine own ways, nor finding thine own pleasure, nor speaking thine own words, then shalt thou delight thyself in the Lord, and I will cause thee to ride upon the high places of the earth." Perhaps in the loss of Sunday swarms you might have the feeling of Amaziah when he said, "But what shall we do for the hundred talents?" Do you remember the answer? "The Lord is able to give thee much more than this." "Them that honor me I will honor." "The Sabbath was made for man." God saw that we would need rest, its holy influences, and the

great blessings that would arise from giving to him, in obedience to his command, that time he required. It is a trial to a farmer to have his hay and fodder destroyed by rain on Sunday when he could save it by work; but it is doubtless his duty to rest, and let that which he has earned by hard labor go to loss rather than work on the Lord's day. I once lived near a foundry, and the owner thought, or acted as if he thought, that it was necessary to keep the work going on, on the Sabbath. He thought that it never would do to let the fire get low on Sunday, it would take so long to get the furnace heated up again. He had some unconverted young people in his employment, and at one time they attended church, and seemed much interested. One young man in particular seemed anxious for the salvation of his soul, but the work must go on day and night on the Sabbath. Whether this young man or his comrades who were so anxious to attend church ever became Christians or not, I know not; but the busy owner of the foundry has long since been laid in the grave; and unless he was much changed from what he was, his soul never attained to the rest above. The foundry has stopped, and the roar and din is no longer heard; but who can tell if some of those youths whom he compelled to work on the Lord's day are not now in turn compelling other youths to violate the Sabbath, or, at least, using such an influence that they do it? The Lord showed by his laws for the Jews that he loved kindness to the poor. You remember that gleanings were left for them. Now, why could not the swarms which fly away on Sunday be counted as gleanings for the poor who might find them? and, indeed, if a wealthy man would take the trouble to get them out of a tree afterward, and we knew they were ours, we might cheerfully resign them, and feel that we had God's approval.

The idea, Bro. Root, that work *must* be done on Sunday is doing much harm in the world. While we are sitting in the sanctuary on the Sabbath-day, enjoying the prospect of heavenly rest, how many of our fellow-creatures are hard at work — and many with aching hearts, too, just on account of mistaken notions about the necessity of work being done on the Sabbath! Now, if all the Christians would plant their feet on the ground that God's blessed day shall be kept holy, and would do all in their power to prevent its desecration, it would do a vast amount of good.

If once all the lamps that are light  
Would steadily blaze in a line  
Wide over the land and the ocean,  
What a girdle of glory would shine!

So, lift your lamp higher, my brother. Your words of Christian encouragement have done me good. They have doubtless done good to many others. I thank you for them. God bless you in every effort to do good. Allow me to add but one more verse from our precious guide-book: "Abstain from all appearance of evil."

I hope the tickets you gave me will do much good. I could send many of them to the colored Sabbath-schools around where they would be highly appreciated. Remember our work here among the colored people in your prayers.

MRS. M. A. TAPLEY.

Columbus, Miss., Sept. 18, 1883.

I thank you, my good friend, for your kind words on this question that has seemed to lie near the hearts of so many of our bee-

men and bee-women. By all means, let us hold to the command, to "Remember the Sabbath-day, to keep it holy." I confess I feel troubled about arguing on a matter so important and so sacred; and before I attempt to answer, I pray that the kind Savior may guard me from saying any thing that might have the appearance of argument or controversy. You will remember, dear friend, that our Savior vehemently reprov- ed the Pharisaical class that seemed to hold to the letter of this law, without having the spirit. You will remember, too, that they with awful presumption presumed to dic- tate to Jesus what he should do on the Sab- bath-day, and what he should not do. They found fault with him because he healed the sick, and did good, as if their foolish inter- pretation of the law were higher authority than the word of the Lord and Savior him- self! They also found fault with his disci- ples because they plucked grain on the Sab- bath-day; and you remember what he told them. I presume you know, too, that there are very difficult points to decide in this very matter. For instance: Your position might be carried to such an extreme that cows should not be milked on the Sabbath- day. Of course, every one admits that farm stock must be fed, and animals should not be allowed to suffer. Well, if this is so, who shall draw the dividing line, and say what labor is necessary, and what is not? It seems to me, as I said, that it is proper to have a swarm of bees hanging on a limb, even though it be on the Sabbath; yet it seems to me I should hardly want to remain away from church, or ask anybody in my employ, for the sake of, saving the bees that might come out. I do not believe in running factories or railroads on the Sabbath. In regard to harvesting grain, although I should hardly want to dictate to others what their duty is, it seems to me I should never feel right to be found in the harvest-field on the Sabbath-day. A very good friend of mine, and the one who first led me to the Savior, in fact, had a very wise way of answering such questions, as it seemed to me; and this answer was, to tell every inquirer to do that which he thought would give the most honor and glory to his Savior.

My natural disposition is restless, and I want to be busy at something. I used to think, that, if I became a Christian, I must sit down and read all day Sunday, or listen to sermons. Now, I can not tell you how it rejoiced my heart when I found, or at least thought I had, that God did not call on me to do any thing of the sort. I am as busy on Sunday as any day in the week, and surely as profitably employed. If one were to ask me, amid all my busy duties what ones I enjoy most, and in what way I feel God's approv- ing voice most, I should say, with the in- mates of our county jail. I often work very hard with them, for most of my talk is plead- ing and teaching. I suppose many might think that some of my talk with these friends was hardly the proper thing for the holy Sabbath; but for all that, I feel sure that in it I am doing the very work that God has especially called me to. If the heart is full of love to Christ, and a devotion to the cause

of humanity, which always springs out of this love, how can one go very far astray? and if such is the case, should we not be very careful about deciding what course our neighbor ought to follow? If you think it wrong to hive bees on Sunday, I would say, by all means let them go; for no great harm can come to the bees, or to anybody that I know of, by so doing. But if I had a good neighbor whom I had every reason to think was following the text, "thou shalt love the Lord thy God," etc., and he at the same time thought it right to hive his bees on Sunday, or perhaps to even stay away from church to look after them, I should hate to find fault with him for so doing. In regard to the latter part, I might suggest to him my views.

Do you remember, my dear friend, which one of the virtues it was that Paul says is greater than all the rest?—"But the great- est of these is charity." Now, then, shall we not unite, by precept and example, to do all we can to induce mankind to "remember the Sabbath-day to keep it holy"?

## BEES AND HONEY IN THE BLUE RIDGE COUNTRY.

### ADVANTAGE OF LARGE WINTER ENTRANCES, ETC.

**L**AST winter was numbered as one of the sever- est here as elsewhere; but there was not a week when the bees were not out flying one or more days; and, judging from appearances, I don't think a table-spoonful of bees to the hive per- ished. At intervals through the winter, when the sun was bright, and bees out, I would examine the quilts, and those I found damp I removed—all but the under one—dried and warmed them at the stove, and covered the colonies again with the dry warmed cloths. The colonies with the widest entrance kept their covering driest, while one with a four-nick V- shaped entrance cut in the bottom-board was invari- ably very damp when examined, and had to be dried frequently. The colony I purchased late in the fall with but five or six frames, some of them only partially built out, leaving a wide vacant space at the back end of those frames, came through bright and lively.

The first day of March was a warm bright day, and the bees were carrying in natural pollen, which they found somewhere in the mountain glens. One warm day in early spring, when the bees were sporting in front of their hives, I noticed the Italians in the L. hive were showing no signs of life. I knew at once something was wrong, and opened the hive. There they sat, still and quiet on the combs, with scarcely a bee moving. Every drop of honey had been con- sumed, and the colony had huddled together with the calm of despair settled over them. With no honey in the combs, and no nectar in the fields, the little folk felt that death stared them in the face. I was not long in placing a shallow pan with warm syrup in the bottom of the hive, and the next day they were out as lively as any in the yard.

I had 500 lbs. of honey from 5 colonies, which as- tonished the natives, and they want me to get them "some of them Italian king-bees."

My season's experience in the "land of the sky" as a bee country, will make another and more inter- esting paper.

E. E. EWING,  
Highlands, N. C.

## HOW TO RAISE BASSWOOD-TREES FROM CUTTINGS.

ALSO SOMETHING ABOUT SOWING THE SEEDS.

SINCE August number of GLEANINGS, wherein you state that basswoods can be raised from cuttings by an expert, with my name attached to the article, I have received quite a number of letters asking for the *modus operandi*, that others might become "experts." I would remark, by the way, that one needs just a little more than simply being told how to do a thing, in order to fairly succeed — much more to become an expert.

I answered some by letter; but now comes the "scratchetary" of the Ohio State Bee-Keepers' Association, Mr. Daniel Spear, asking for specific directions, through GLEANINGS, how to treat both seed and cuttings. So, with the editor's permission, I will tell all I know in about a minute.

First, you must know that the wood used for cuttings is of the current year's growth, and thoroughly ripened; cuttings not less than six inches long, and cut, in this latitude (41° N.) from the 15th to the last of October. Tie the cuttings in bundles of 50 each. Pack them in clean sand, in a cold frame, with tops down, butts within two inches of surface. Put on your sash, and cover enough to keep from freezing. As soon as weather begins to warm up in spring, say in March, uncover the sash each sunshiny day, and let the bed get warm, covering each night to retain warmth. Keep the top of the soil damp, but not too wet. As the weather grows warmer, the sash will often need to be raised and the bed aired, as it must not get too warm.

About the last of April or first of May take up the cuttings, and you will find the butts well healed over, and ready to root. Now put them in the propagating-bed, with good bottom heat, and in sharp sand. Keep the sand well moistened, and cuttings partially shaded when the sun shines hot. When I speak of propagating-bed, I mean a forcing-house, of course. I do not think they can be rooted out of doors, as we grow grapes, currants, etc. Any one who has ever grown roses from cuttings, or who understands the art of green-house propagating, can grow basswood trees from cuttings successfully. Now, in two or three weeks the cuttings will be rooted, and can be potted off, or transplanted at once to out-door bed, and the after-treatment must be good. Mulch them, and hand-pull weeds; water when the ground becomes dry, if early in the season; after they become well started they are quite hardy.\*

Now in regard to the seeds: They are gathered in October, and either sown at once, or packed in sand over winter, and sown in drills in the spring. The ground is mulched, and weeds kept off by pulling, or with scuffle-hoe, not stirring the ground deep enough to reach the seed. The plants will not appear until the following spring, and a fair per cent will germinate. It is said that young trees yield more seed than old, but a larger proportion of the seed from old trees will germinate.

Rantoul, Ill., Oct. 8, 1883.

H. M. MORRIS.

We have tried the seeds just as you recommend, friend M., but we got very few little trees. I think I would prefer to buy them of you, at the prices you usually sell them.

\*The point is this: If put out like other cuttings, the vitality will spread itself in top growth, to the detriment of the root; hence the object in starting the root first.

## A LETTER FROM ENGLAND.

OLD FOGYISM STILL ALIVE.

I HAVE a few minutes to spare, and I thought I would drop you a line and tell you a few facts about bees here. They are in the same old channel they were thirty years ago. I have seen several lots of bees, and they are all kept in the old-fashioned straw hives, and all whom I have talked with know no other way. When I talk with them they look at me with a suspicious eye, and seem to think it can not be so. They keep their bees all summer; and when the winter comes they put sulphur under them, and then what they have (the honey, dead bees, burnt sulphur and all), what a muss! and they do not seem willing to learn.

This part, I should think, is a grand place for bees. The winters here are very mild. Bees live all winter on their summer stands, and they are now working, and I should think are doing well. The straw hive in use here is a small concern; will hold only about  $\frac{1}{4}$  what my hive will hold. When I tell folks the amount of honey taken from my bees they seem to say to themselves, "This can not be true." They have no late improvements here for handling bees; they do not know any thing about the chaff hive or the movable frames, or the extractor, or the smoker, or any thing else for handling them; and I find there is not one as yet who knows any thing about the queen bee. All they do know is, they know bees will sting if you get near them, and so they let them alone.

I expect to call on friend Abbot next week; will then report to you about what he is doing. I expect to remain here in this place but a few days; will return to America about the 15th of October.

W. A. WICKHAM.

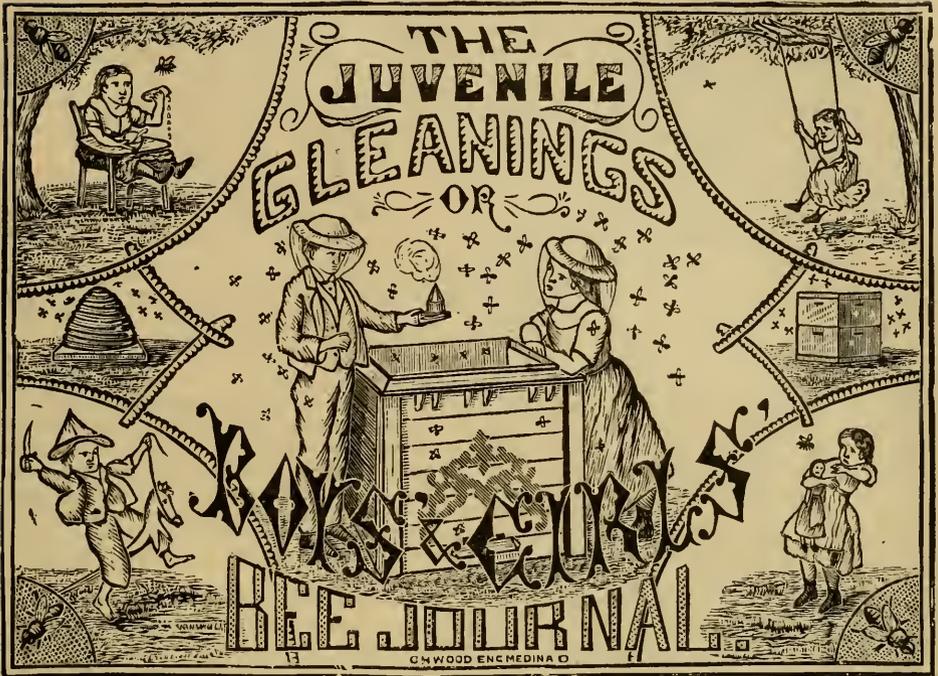

Murden, Kent, England, Sept. 18, 1883.

## A HONEY REPORT FROM MISSOURI AND KANSAS.

SOME friend has sent us a record of the honey report of the Western Bee-keepers' Association, held at Independence, Mo., Sept. 20 and 21. The friends will notice, that although their reports are not extra large, the table indicates a progressive state of affairs both in Missouri and Kansas.

	No. colonies in spring.	No. colonies in fall.	Comb honey pounds.	Extra honey pounds.	W.A.K.
W. C. Harroldson, Buckner, Mo.....	40	80	2000	150	
Young & Lane, Lexington, Mo.....	175	475	3000	500	100

No. 10.

#### MYSELF AND MY NEIGHBORS.

WHO IS MY NEIGHBOR!—LUKE 10:29.

Whosoever therefore shall confess me before men, him will I confess also before my Father which is in heaven.—MATT. 10:32.

SOME years ago, when on my way home from my Abbeyville Sabbath-school, for some reason, I hardly know why, unless it is that I was full of the spirit of wanting to do good wherever it was in my power, I stopped at a house by the wayside. As this was not far from my father's, our old homestead, these people were, in fact, neighbors, and I stopped for a little neighborly call. They were elderly people, and had had sickness and affliction; but the saddest of all trials and afflictions was the fact that a son was an intemperate man. At one time he had done quite a flourishing business as a cabinet-maker, but he was induced to give up his trade and go into a saloon. I wonder if anybody ever prospered in a saloon. He soon became intemperate, and lost all he possessed. At the time I called, his family were in destitute circumstances, and the mother begged of me to give him something to do, that they might be relieved from want. In a few weeks more he was in my employ; and while on the way to the Abbeyville school one Sunday afternoon he told me some of his experience with the delirium-tremens. He had been off on an excursion. While, I think of it, what is it

about excursions that makes people drink oftener than at any other time? or why does an intemperate man want to go off on an excursion? While absent on this excursion he drank heavily; and on his return home it took him a day or two to recover from the effects of the deadly poison. While sitting quietly in the house one day he saw a lizard creeping along the floor. He was astonished to see it in the house, and began wondering where it could have obtained access. He soon noticed, however, a hole in the floor, and was more astonished still to see a knot-hole where he had never observed it. The lizard ran down the hole. Strange as the whole matter seemed, it never once occurred to him that it was not real, and he went for a hatchet to make a plug to stop out such reptiles. When he came back, the door-knob was spinning like a piece of machinery. Then he knew that his mind was impaired, and formed a resolution to reform; in fact, he began to fear the retribution of a just God. It was at this time that his mother spoke of him to me; and he told me, as we rode along, that it was his purpose to serve God the rest of his days. He did every thing, in fact, one could ask him to do, except standing before men and confessing his allegiance to his Savior. This he some way stubbornly refused to do—or, at least, he excused himself from so doing by a variety of excuses. He read the Bible in his family, had prayers, and seemed determined to take

up every Christian duty, with the exception of the one I have mentioned. While he was in my employ his life was pretty fair; but before a great while he left, and started in business for himself. Like many another who starts out well, he got back into his old habits, and in time his poor wife died of a broken heart; and his family of children were scattered, and his poor old mother was brought down with grief and sorrow.

As years passed, he rallied again, married another wife, commenced his old business again of cabinet-making, and by an ingenious invention promised to rise up soon to be an influential man once more. Saloons were almost in plain sight from his place of business; and after about the usual time he was drinking again. Last Sabbath evening, while a second-amendment meeting was in progress but a little way from his home, a disturbance was made at his residence. The neighbors came in, and finally the marshal was summoned, and took him to jail. His poor wife, in despair of his ever doing any better, packed up her things, gathered up the available effects, even to pulling the beets and other valuables from their little garden, closed out every thing, and left. There he lies, poor man, in jail—deserted, forsaken, an outcast, with probably no ray of hope left. Delirium-tremens must be near him again, and the awful remorse tormenting him, and his past life reminding him that there is probably no use of struggling any longer against the temptation that has so many times crushed out every attempt he ever made to rise up and be a man like his fellow-men. When I see him again, what can I say to him, friends? His will power is probably pretty nearly all gone. He has promised so many times, and then broken the promises, that it would be almost folly for him to promise again. Where is there salvation or peace and rest for such as he? As I have been thinking it over this morning, it seems to me that the one thing that has been lacking in all his life was that he refused to stand up boldly and fearlessly before men, and avow himself a soldier of Christ. The Bible has said plainly,—

Whosoever therefore shall confess me before men, him will I confess also before my Father which is in heaven.

Why is it that some men seem to struggle hopelessly against evil? I presume almost every intelligent boy or girl will tell you in a moment that no one does struggle hopelessly—that we have the power given us to do right or wrong, as we choose, and that this matter of life or death, of this doing good or evil, is a matter that we have in our own hands; that since the time God created us in his own image we have all of us had the power to choose. Joshua said, "Choose ye this day whom ye will serve." Now, friends, is it not a fact, that when a man has chosen—chosen honestly and truthfully, deliberately and decidedly, he is never ashamed or afraid to say so before men?

Whatever you do, boys, that is good, do it with all your heart. If you make a good resolution, keep it with all your heart; if you promise not to drink any more, keep the promise with all your heart; and if you promise not to use tobacco any more, keep

that promise as you value your future happiness, and as you hope for eternal life. Beware of spoiling your will power by resolving, and then feebly breaking your resolves. Do every thing with the thought that God's all-seeing eye is upon you, and nothing can be hidden from him.

### THE MOTHER-BEE.

MRS. HARRISON TELLS THE CHILDREN ABOUT THE DUTIES THEY OWE THEIR PARENTS.

CHILDREN, did you ever think about the queen being the bees' mamma? And did you ever notice how they cry when they lose her? They do not cry like children, but like bees: they make a mournful noise, and you could not help pitying the little orphans, if you heard their wail when they have lost her. They can do something that you can not—they can follow her scent; they can tell a leaf or stick where she has been. You have seen a dog follow a trail, have you not? I lately caged a queen, and tied it on to the grape-arbor, where they had clustered, and her children stayed by her, and fed her. I threw flour over them, and took their mamma into the house, and then I saw the white bees return to their hive.

Do you love your mamma? Oh! I know you put your arms around her neck, and tell her you love her; but when she tells you to bring in coal or water, do you start off with a pleasant face? If you love her, it makes you feel good all over to be able to contribute to her comfort and happiness. The bees form a ring around their mamma, just as you do when you play "ring around rosy," in order to keep off strange bees that might sting her, and also to wait upon her—bring her meals to her. While these bees are waiting upon their mamma, others go out and bring in water, bread, and firewood. Why, I see your hands all raised in holy horror, saying, "Mrs. Harrison has told a fib. Bees don't have any fire." Well, they get warmth in this way: They put honey into their stomach, which is their stove, and it makes a fire—warms them up.

Peoria, Ill.

MRS. L. HARRISON.

### OUR HARRY.

SOME OF HIS JUVENILE TRIALS AND TRIBULATIONS.

IN this letter I am going to tell you about our Harry. He is the cunningest baby that you ever saw. One day he had a very unfortunate time. Mamma and I were hoeing the cabbage, and he would have my hoe all the time; so I let him hoe, and I pulled weeds, and he cut one of my fingers with the hoe; and while I was gone to the house to tie it up he cut two of his toes; and as he went to the house to get them tied up, a bee stung him. Another day we were going to Ipava, and we were going to take him along, because his papa and three little sisters live there. After he was dressed he fell down stairs and made a big bump on his forehead; and as we were riding along, he fell off the seat and bruised himself some more, and after we came home he fell off the horse. He is my little cousin; his mother died when he was a little baby, and we took him to raise. He has been here two years now; he calls my papa "papa John," and his own papa "papa Lew." Every day we go down to gather hickory-nuts; and if anybody asks him how many he has, he says 8, 6, 5, 3.

## ALL ABOUT THE WEDDING.

Last week I went to a wedding. The bride was my cousin; last summer she taught our school, and I liked her very much. She was dressed in cream-colored nun's veiling, trimmed in cream-colored silk lace, and she had a beautiful bouquet in her hand, and she looked very pretty. The bridesmaid was dressed just like her, but she was not so pretty; all the folks had little bouquets pinned on their dresses and coats, and they all kissed the bride, and wished her much happiness, and her mother cried. They had six kinds of cake for supper; the coconut was the best of any. The girl's name was Mary Ann. They gave her lots of presents, and the next day she went to her new home, and they had lots of folks there, and seven kinds of cake.

Vermont, Ill. JESSIE CHADDOCK.

Thank you, Jessie. It seems to me, that if that baby Harry is so prone to tumble, it would be well to have somebody look after him pretty carefully, especially as he is a poor motherless little chick. Your description of the wedding is very lifelike. I presume there will be a great many smiles both by young and old when they come to read it.

## A BOY'S LETTER.

WHAT HE THINKS ABOUT TOBACCO.

ON Tuesday I sent for a copy of your GLEANINGS. Since then I have been to see Mr. Ballantine's apiary. From him I got the Sept. copy, and have read it almost through, and am well pleased with it. I was surprised when I read over the Tobacco Column, and found you were giving a smoker to all those who quit the use of tobacco, and promise never to use it again. Well, I think that is very kind of you, to give so grand a present as that. I do not use tobacco. I never did, and never expect to. Although a boy in my teens, I probably have many years' temptation before me. But I have resolved never to let it find its way to my mouth. I have no smoker yet, but I will not ask you to give me one to keep me from using tobacco.

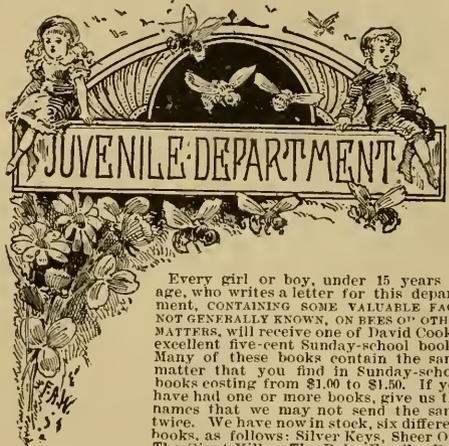

Well, I must tell you something about my apiary. I worked away from home last spring and summer till I got money enough to buy 5 colonies of bees. I brought four of them home the first of Aug.; the other one I will not bring home till spring. I am feeding them granulated sugar every night now, to prepare them for wintering. I bought one of your A B C books of Mr. Ballantine, and I think it is worth five times the price of it.

How many colonies have you? Is it possible that you have so grand an apiary as what is represented in your A B C book?

N. A. GEYER.

Sago, Musk. Co., O., Sept. 29, 1883.

I am glad to hear your good resolutions, my young friend, and I am glad you like the A B C book.—We have now about 200 colonies. We have just reduced them from something over 300. Our apiary is exactly as shown in the picture, except that it is not full of hives. The grapevines are all there, and the walks are just as you see them, except that the new factory has encroached upon one side of the apiary, and has somewhat marred its appearance; but Mr. Gray and the men are busily at work removing the debris, and restoring it to its original appearance as you see it in the A B C book.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Off, The Giant Killer, The Rohy Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chiel's amang ye, takin' notes;  
An' faith, he'll prent it."

Like as a father pitieth his children, so the Lord pitieth them that fear him.—Ps. 103: 13.

I SUPPOSE, children, that many of you are aware that a good shepherd knows every sheep in his flock. To an outward observer they would look about all alike, and yet there is difference enough so that the owner knows each one, much as you do all your acquaintances. Stranger still, you can tell your friends without seeing them, by simply hearing their voices. You are acquainted with, may be, a thousand people or more, and yet no two have voices just alike. Still again, those thousand acquaintances would probably have their handwriting so different that no two would be so near alike but that you could distinguish one from the other. Well, it is not only in looks and voices and handwriting, but our dispositions are different. Even small children need different treatment; and I have begun to think that babies four or five months old need to be understood to be treated intelligently. I suppose you know what I am driving at. It is something more about Peter. And this is what I want to tell you about him: Peter has little peculiarities, and needs to be understood to know how to care for him. He is a nervous baby. I discovered some time ago that he would often cry, and seem to be in pain, where it was simply nervousness, or because he wanted to go to sleep and could not. Well one day I came in and he was crying as if in pain, throwing himself backward, and putting his thumb in his mouth and then taking it out again, and then acting as if he wanted something, he hardly could tell what. Even mamma failed in her efforts to soothe him and get him to sleep. I told her that perhaps papa could entertain him, and she quite willingly handed over the soft little burden. I took him in my arms, then sung a hymn while I walked the floor, swinging my body so as to give him a sort of rocking motion; in a minute he turned over against my breast, put his little pink thumb in his mouth, lay quiet and still, and in a lif-

tle while more his baby troubles were all over, and he was sleeping the peaceful sleep of childhood.

What agency or power was there in his father's voice or his father's arms? had we given him any sort of medicine, we might have thought that the medicine had by magic soothed his distress; but he did not have any thing—no, not even little pills; but for all that, his troubles all seemed to vanish, and sleep came as if by magic. Perhaps I can explain a part of it by telling you that Peter and I have already become very good friends. He loves his pa, and his papa loves him; in fact, it does not seem as if the word love half told the story. You know how it is, the most of you; there was perhaps a sense of peace and rest came into his little heart by feeling his father's loving arms around him that perhaps nothing else in this world could give. You need not any of you think I am forgetting the mammas just now, for I am very well aware that a mother's love is above and beyond any thing that our sex ever knew, perhaps; but I want to emphasize the fact that a father may often relieve poor mamma; and when baby is tired and fretful, perhaps he can, for the time, easily do what she can not possibly do. The tired child sees its mother all day long, and the sight of papa is a change to it that is a little different; and God has intended that the father should hold a place in the baby's affection that is perhaps a little different from the mother's. He has such a power to soothe the pains and drown the sorrows of a little "chick," that no other one on earth can fill his place. Can you not remember, dear friends, the time when the privilege of resting on your father's arms with your head against his loving breast soothed and almost drove away sorrow, the earache, the toothache, or almost any other childish trouble or pain? The consciousness of that great love and willingness with which that father would give his life for you was perhaps one great reason why such a soothing quietness came over you when he with his strong nature undertook the task of comforting you in your little sorrows. Do you suppose God ever intended that you should look up to him as trustingly and fearlessly as you look to your father? Can you have faith to believe that God loves you as a father loves his children, or, if you choose, as you love *your* children? If you look back and think of it, you will recollect that you never feared your father might consider *you* a burden; his great love for you assured you to the contrary. You were not a bit afraid that he would ever think you intrusive or a bother, the least bit, in any way. He put out his arms, and you just nestled right down into them, and that was the end of it. Now, then:—

As a father pitieth his children, so the Lord pitieth them that fear him.

HONEY FROM THE VINE-MAPLE; SEE PAGE 503.

We have not any vine-maple honey now, as we sold ours all off; but I will send you some next spring. I will send you some leaves of the vine maple. I have two brothers and one sister. The bees are doing very well now. CLARA M. WILCOX.

Salkum, Lewis Co., W. T.

#### A SHORT LETTER.

"Pa keeps bees," and has taken over 800 lbs. this year, and is taking more to-day. My baby brother is one year old to-day. ANNE FULTON.

New Berlin, Ill., Aug. 20, 1883.

#### A NEW USE FOR A BEE-HIVE BUZZ-SAW.

Our bees have done well for a wet season. Pa has taken off a belt and the saw from our sawing-machine, and put on an emery wheel for grinding plow-points. He has made lots of money; he charges 25 cents for grinding points.

MARY L. BEDELL.

Kawkawlin, Mich., Sept., 1883.

Well done, Mary. Your fact is surely a valuable one.

#### ORLAN'S REPORT.

We bought some bees this summer. They went to work right away. Their hives are full of honey, and caps too. They are young swarms. They have not swarmed any this fall. Pa sent to you for a bushel of buckwheat. It did well, but that frost killed it, and we shall not get our seed; but the bees got their share of honey out of it.

Geneve, Ind.

ORLAN KRANER, age 12.

#### REPORT IN REGARD TO QUEENS HATCHED IN CAGES.

My father keeps bees, and I help him to watch them. They are Italians. He raises his own queens. He tried hatching them in cages, but thinks they don't do so well as when hatched in with the bees. He thinks the bees feed them as soon as they are hatched, and they make better queens. I have a little brother five years old, and he says he is going to be a bee-man. CHARLIE C. EVELAND, age 12.

Goshen, Ohio.

#### SORGHUM AND BEES.

My father has kept bees for a number of years. He has 11 swarms now, and he says he thinks he will have to sell the most of them. He commenced to make sorghum last fall, and thinks the bees will bother on account of the sweet.

NELLIE W. CAMERON, age 10.

Judd's Corners, Mich.

Friend Nellie, I do not think the bees would necessarily trouble about the sorghum. When they can find honey to gather in the fall, they will very often not notice the sorghum-mills at all.

Pa had two colonies of bees last spring; he increased them by artificial swarming, to 21. He packed them in chaff in the fall, and they are all living yet. We live on a farm; we raise a good many strawberries, and we like the Crescent the best. We have to go a mile and a half to church and Sunday-school. We have Sunday-school all the year; our superintendent has been in for four years.

Swan, Ind.

BIRDIE SIMON, age 11.

#### HOW ETHEL POUNDED THE HIVE, AND WHAT SHE GOT FOR IT.

When I was a little girl, I went out and pounded the bee-hives, and the bees came out and stung me on my head so badly as to make me almost sick. Pa has invented an introducing-cage which he warrants to introduce a queen safely every time. Mamma would like a few of those little printed cards for her Sunday-school class; if you please, I would like Silver Keys. ETHEL DYKE,

Pomeroy, O., Aug. 23, 1883.

## FLORENCE'S PETS.

We like to keep bees. Ma often hives a swarm without getting a single sting. I have 3 pets—a canary, a red bird, and a big white cat. I think the most of my cat. He will sleep in my lap; but the birds are afraid of me. We think you a nice uncle to send us JUVENILE GLEANINGS.

North Lawrence, Kan. FLORENCE C. SMITH.

## LETTER FROM A LITTLE GIRL IN TEXAS.

I live in Eastern Texas; am on a visit to my aunt, who has bees. She gave me a queen in a little box, but she got away. Cousin John has caught me a little mule-eared rabbit. I am going to raise it. I expect some of your little readers would like to see such a rabbit. They look big galloping over the prairies.

ADDIE FOSTER.

McGregor, Texas, Aug. 14, 1883.

## FRANK'S LETTER.

Pa keeps bees; he has 8 stands. He got them so late in the summer he has not robbed them. They are all well but one, which the hybrid bees were robbing until pa put a queen-cell into it, and then in about a week he looked for the queen-bee, and could find none. He then put two queen-cells and a brood comb in it, closed up the entrance, and moved it.

FRANK W. HUNT, age 12.

Kirklin, Tenn.

## THE HOUSE THAT HAS NO BABY IN IT.

I am interested in your talk about your baby. We have not any babies at our house, and there never were but two—brother and myself. He is in his 18th year. He has 6 fingers on each hand. Pa has got the smoker that you sent him. He is well pleased with it. He talks of sending for your A B C. Ma says that she is sorry when GLEANINGS is out.

ANNA B. BUTT.

Shermansville, Ky., Aug. 15, 1883.

## THE HARRIS FAMILY.

I saw your kindness in giving little folks books for writing letters, so I thought I would earn one too. My mother has five bees in the new hives, and they do well. We have one of your smokers, and we like it well.

BERDELLA HARRIS, age 14.

My mother keeps bees. I have a little white dog; his name is Daisy. He is my pet, and I am fond of him.

VICTOR HARRIS, age 6.

Richfield, Pa., Oct. 3, 1883.

## THE SWARM THAT WENT OFF AND DIDN'T "SAY ANY THING."

We started with one colony of bees which came to us. The next year it increased one, and the next to 5; but 3 of them went to the woods. I have one swarm which I call my own. The last swarm came out and did not cluster, but they went right off. We were at a neighbor's, hoeing corn, and they came right up where we were, but they did not say any thing, but went right past us. I go to Sunday-school.

JOHNNIE HOTELLING, age 12.

Dansville, Liv. Co., N. Y.

I saw in the A B C book that you sent papa, a great many nice pictures. I saw yours and Blue Eyes' pictures. I think they are nice. I looked clear through the book to find the picture of that little "rosy-posey, chubby, dimpled boy-baby," but I could not find it. I reckon you were afraid to put his picture in, through fear I would come up there and steal him, if he is as pretty as Blue Eyes. I will send him a name, if it suits him. As David was a

great king, and a righteous man, and Samson was a strong man, and could rob bees, I will call his name D. S. Root. How does that look?

Pisgah, Ala., Sept. 26, 1883. JOSIE DAVIDSON.

I saw in GLEANINGS that you sent a book to any little boy or girl who wrote to you. Pa hasn't any bees, but he is going to get some before long. I am in the fourth book, and can do "interest" in arithmetic. I go to school every day. I have lost a quarter of a day since school commenced. I live close by two ponds. I had a dog which would fetch the cows and dive in the water for sticks, and someone shot him. I have read Robinson Crusoe and the Swiss Family Robinson, and Ten Nights in a Bar-Room.

FREDDY R. MATTHEWS, age 10.

Houghton Beech Lane, Ont., Can., Sept. 24, 1883.

I can read JUVENILE, but can not write very well, so my ma writes this for me. My pa has 221 stands of bees, but they have not gathered much honey this summer. My ma is afraid of bees, but I help my pa sometimes. When two swarms go together he puts them in the shop cellar a couple of days, and then they stay in the hive all right. He has all the queens' wings cut off, so they can not fly away. We like to read Cyula Linswik's letters. She is my ma's cousin. I should like to go to school, but my ma thinks I am too little, so she teaches me at home.

CONNIE CARHART WARD, age 5.

Fuller's Station, N. Y., Oct. 1, 1883.

You talk so kind to us, I should like to hear from you every day. Papa's bees are doing well, except some which go out and get drunk when papa makes cider, and they get killed, as did Mr. Henry Gent. Papa was not at home, and mamma had Mr. Gent go and see the doctor for brother. He got to drinking, and got shot and killed, and never returned. I think it very bad to get drunk. Don't you think so, Mr. Root?

ANNA B. BUTT.

Shermansville, Ky., Oct. 2, 1883.

It certainly is the strangest of all things, Anna, that a man will destroy himself by means of liquor. Even the brutes know better.

## HOW BERTIE TAKES CARE OF 50 SWARMS OF BEES.

My pa bought 50 swarms this spring, and they increased to 93. I have worked with the bees all summer. Pa hired Mrs. Potter to take care of them at first. I have taken care of them since July last. Pa has about 1800 lbs. of white box honey, and expects about 1200 more of fall honey. We would have had more, had it not been for wet weather in basswood. Pa has a hive of fertile workers. I get stung, but I don't mind it much. How many boys and girls have nuclei set up? I have 5. BERTIE LOOPE, age 13.

I think, Bertie, you did pretty well if you took care of fifty swarms of bees very long; but perhaps at the time you took care of them they did not need very much care. Was not that the secret of it?

I am making a book of the JUVENILES, by sewing them together. The Aug. No. did not come. Please send it. Pa keeps about 90 colonies of bees, and 1000 lbs. of honey. He has built a new honey-room. I helped nail lath on it.

## BEES AND PEACHES.

Pa thinks that the bees gnaw holes in the peaches. I think so too; for when I go into the peach orchard I see a cluster of bees around a hole in a great many

peaches. I have a hive of bees. I have taken off 52 boxes of honey from my hive so far. My brother is a station agent, and I can telegraph some too. I have another brother at Philadelphia Dental College.

GEORGE H. DEUELL, age 10.

Bangall, N. Y., Sept. 23, 1883.

#### REPORT FROM AN ITALIAN NUCLEUS, ETC.

My pa has been keeping bees for several years, and I help him. We bought a three-frame nucleus of Italian bees the 29th of May. We built it up to 20 frames, and extracted 134 lbs. from it. We took 2 colonies out to our vineyard, half a mile from home. I watched them during the swarming season. I found several swarms hanging in shrubs. We increased those 2 to 10, but one went to the woods, which would make 11.

JOHN V. NEBEL.

High Hill, Mo.

I have a writing-desk, and this is the first time I have used it. When papa comes home at night we put on our veils and go to see the bees; and when he opens a hive I can find the queen. Papa had six hives last spring, and 13 this fall. Grandpa and I went to sell honey, and we sold 60 boxes. I made my veil. I feed the chickens nights and morning, so papa can tend to his bees. I have another black-eyed sister. She can just stand alone. Will you send me a bunch of those envelopes on the three-cent counter, in place of the book?

Washington, Ct., Oct. 1, 1883.

LENA D. FENN.

#### LETTERS FROM THE HAYES CHILDREN.

Pa had 13 stands of bees. I like honey. We have a fine locality for bees. We had a fine basswood harvest. You say a good deal about that baby at your house. Our baby can walk. Its name is Connie. Tell Blue Eyes that I have a little sister whom we call Blue Eyes, but her name is Lettie. I should like to see your baby.

LAUNA HAYES, age 11.

Our bees are doing very well. I like to work with them. Uncle Amos, you said you had a pretty baby at your house. Please name him Caradene; that is my name. You wanted to know which you were to have — the letter or the black hat; you may have the hat, if you will come after it. Many thanks for that book.

HENRY C. HAYES, age 8.

Sands, N. C., Aug. 30, 1883.

#### WHAT HAPPENED AT MAUDE'S HOUSE.

My pa has 50 swarms of bees. He took some honey from them to-day. Our house burned down four weeks ago last Thursday, and all of its contents. We saved only a little clothing, and we are living in the granary now. My ma has an uncle here living with us. He is 83 years old; and he drew the plan, and is overseeing it.

MAUDE B. LATHROP, age 11.

Marshall, Mich., Sept. 8, 1883.

Well, Maude, that is a rather sad story you tell. But I believe I admire your independence in going into the granary to live, rather than to trespass on the kindness of one of your neighbors. The granary will do very well in warm weather; but I hope you will have a good warm house by the time winter comes.

#### A GOOD REPORT FROM THE SWARMING-BOX, ETC.

My pa keeps bees. We have 13 stands; we had 20, but seven got foul brood, and pa killed seven of them. Pa is a carpenter, and so when the bees swarm, when he is away at work, ma tends to them. We have a swarming-box, and we can pick them off from the trees nicely. Ma had a bed of French

pinks, and the bees worked on them at the east end of the house, and did not work at the west end at all. We had lots of honey last year, and we have milk and honey all the time.

HARRY SMITH.

Two years ago my papabought one swarm of bees. He transferred them into a Langstroth hive, and the next spring they swarmed once, and pa gave them to me, because I watched them; and in the fall we put them into two chaff hives, and put an Italian queen in the new swarm, and last summer my little sister Mamie watched them, and the blacks swarmed once and the Italians three times. This is my first letter. Do you send boys books for their first letter?

Grafton, O.

LEON E. MATHEWS.

#### HOW TO MOVE AN APIARY, ETC.

Last Oct. papa moved his apiary of 80 colonies about a hundred yards; he was perplexed at first as to moving them; but finally he hit upon a plan. He made a sort of a litter, and, placing the hive upon the center of it, I took hold of the longest handles, and papa the shortest, and away we went.

#### WHAT ONE FRAME OF BROOD AND A QUEEN-CELL DID.

I have a colony of bees that I built up from a frame of brood with a queen-cell in it, and 2 lbs. of honey. It was in 1881 when papa gave me the frame of brood, and last fall I took out 5 lbs. of extracted honey, and 35 lbs. of comb honey, making 5 lbs. of extracted honey at 10 cts. per lb., 50 c., and 35 lbs. at 15 c. per lb., \$5.25, and the total, \$5.75 worth of honey.

C. M. MORRIS.

Rantoul, Ill.

#### NORA'S BEES AND HONEY.

I should like to see your little boy Peter; but I live too far off to come and see him. We have a little girl eight months old. Pa calls her Queen. I have one stand of bees that my pa gave me this summer; we have taken 669 lbs. of honey from it. Please send me a book.

NORA SHENEMAN, age 9.

Pharisburgh, Ohio.

Thank you, Nora, for your kind words in regard to little Peter. — You do not make your figures very plain about your honey. If it was 669 lbs. of honey from that stand of bees your pa gave you, your crop must have been a regular "stunner," as the boys say; but if it was only 69 without the 100, it was pretty fair, after all.

#### HONEY SOURCES OF TEXAS.

Well, uncle, this evening finds me trying to write to you about bees, and what they make honey of in this part of Texas. They have made the most of their honey from cotton bloom this year, but they do make honey from black-jack and post-oak, prickly pear, wild locust, and elm. Pa bought two stands of bees about the first of February. They have never swarmed, but he separated them, and made 4 hives; but one did not do much, so we put them back, and then we had three stands. We extracted 125 lbs. from them. For a good while they did not do much good. Our bees are Italians. We got a queen from Mr. Arwine, and she was part black, so some of our bees are black.

FANNIE G. BOBO, age 8.

Bedford, Tex., Aug. 31, 1883.

We were looking over the hives a few days ago, and taking the frames out of the upper stories, to pack for winter. I had intended to make a regular

report this fall, but have signally failed, by not weighing the honey just at the time it was taken from the hive. We increased from one to three colonies, and I suppose made an average of 60 lbs. of honey to the hive. I know I am within bounds in saying this much. The season has not been as favorable as might be — so many cold rains and very windy weather. Our bees appear very strong, and have brood and plenty of stores for the winter. Neighbor John McElwee has engaged in bee culture for a couple of years now. He has some twenty or thirty colonies in Simplicity hives, and other fixtures for working them to advantage, and has gathered a pretty nice crop of honey this season. I shall have to start to school now in a few days, and then for five months I shall not have much time to attend to the bees. Papa requests me to thank you for the nice cards you sent for the Sabbath-school. I have attended every Sabbath this summer, except the last, when I was not able to go. Papa hobbles along and gets there somehow every Sabbath; and when he gets to work in the school he appears for the time to forget his misery.

V. J. FIELDS.

Valley Point, Pa.

#### BEES AND CHICKENS.

My pa has nine swarms of bees; they are making honey fast. Pa will have some honey to sell this season. Our bees are Italians. I had an old hen that stole her nest under a bee-hive, laid 14 eggs, and hatched them all. One morning I heard a most pitiful noise under that hive. It was those little chickens. I reported the same to my mother; she told me it was the bees stinging them, and that I must see to them immediately, or the bees would kill them. Accordingly, my little brother donned pa's bee-veil and mother's gloves, made a dive for those little sufferers under the hive, handed them to me, and I went to work picking out stings. I found their little feet just as full of stings as one could stick by the side of another, and even in their eyes were stings. It was a horrible sight to see, and hear the cries of those poor little chickens. I picked the stings all out. My apron was covered with them when I got through. Four of them died soon after. I don't like bees now. I think they are heartless wretches, to kill little chickens. Still, I like honey.

Zearing, Ia.

ADDIE KING.

Do not be too hasty in condemning the bees, Addie. A great many quarrels come about from misunderstandings, and I guess that was the case with this one. You see, the bees did not understand what business the chickens had under that hive. They doubtless supposed they came there to steal their honey, so they just went for them as they would go for a bear or a skunk, or any other natural enemy. It seems pretty hard to have them sting those pink-footed chickens; but you know when bees get a going they just pitch in with all their might. They are like a raven Mr. Dickens tells about. Every little while he would cry out, "Never say die!"

Please allow me to write again. Our bees have not done so well this year, on account of dry weather. We have not had much honey to sell this year, and no swarms. But our bees are strong and heavy. They built up on poorland, parsley, and tangle-foot. The latter is now in bloom. Have you either of these great honey-producing plants in your country? Pa and I introduced an Italian queen

about 10 days ago, by uniting the nucleus and the other hive; caged up the queen, and let her remain so for five days. When we released her the bees would not receive her, but balled her up; so we tried them with smoke. It made them turn her loose; but in a few minutes they had her again, so we had to cage her again. We kept her two days longer, and turned her out, and they let her alone. Then pa gave me the colony. So you will please enroll my name on the bee-keepers' list, and I will report how I come out. If you know what makes our bees do so badly, please let me know. Pa says every thing is decidedly in favor of the Italian bees, and intends to buy an imported queen of you before long, and is delighted with GLEANINGS. I love to read the JUVENILE, and wish good luck for all its little writers.

NETTIE BRYAN.

Rome, Ga., Sept. 30, 1883.

#### HOW LULU GOT THE SWARM SHE FOUND IN THE WOODS.

My papa has nine colonies of bees. Last summer in my rambles through the woods after flowers I found a swarm of bees hanging high on a limb. Papa was too busy in the harvest-field to hive them, and mamma is not much of a climber, but I could not think of letting the little fellows leave, so I got one of papa's bee-caps and climbed the tree, and crawled out on the limb, and raked them into the box with my bare hand; as I could not climb with my bonnet on, I also laid it aside. I then climbed down with my box of bees, and took them home without getting a single sting. My pa takes GLEANINGS. I claim "baby GLEANINGS." If you think I deserve a book, please send me Ten Nights in a Bar-Room.

LULU MAY TYLER, age 12.

Knob Noster, Mo.

Why, Lula, you are almost worthy of being called a bee-woman already. I am afraid there are not many girls, or boys either, for that matter, among our readers who could have done what you did. Were you not a little tired when you got down with them?

We have raised some queens by curious methods. One hatched in my father's pocket, and several under a sitting hen. One hatched in bed with me. The queen-cells were in little bottles, attached to the cork with wax. I thought, one night, I was hurt by some one's foot when asleep; but I suppose I was lying on the bottle. When I got up in the morning, the queen had hatched, and we soon had her in a hive. One of those from the hen's nest became a drone-layer — the only one we ever had. Our apiary has not produced much honey this year; but somehow the following verse has been produced while taking off boxes that should contain honey:

Hark! from the toms when papa knocks his  
Knuckles on the empty boxes.  
They only give a hollow jar,  
And seem as light as A. I. R.

Still, my papa took the premium on honey and on his extractor at the county fair.

ADDIE C. BARBER, age 9.

Lancaster, Wis., Sept. 30, 1883.

#### ORANGE-TREES, ETC.

My sister Mary wrote to you, so I thought I would write too. I can't write very well as I have to walk two miles to school, which is kept only eight months in the year. We have oranges on our orange-trees, but they are not ripe yet. We have apple-trees and wild blackberry bushes with blossoms on them.

There are a great many wild and tame flowers in bloom here, and the bees are gathering honey and pollen. Papa is using one of the wax extractors that he got from you to melt his wax in, and when all the wax is melted out we burn the waste and it helps to melt the rest. **ELLA PORTER**, age 10.  
Sunny Side, Napa, Cal., Jan. 3, 1883.

#### HOW BELLA'S BROTHER FED THE BEES.

My brother keeps bees; he bought three colonies last summer, and one of them swarmed twice. He fed them melted sugar, as they had very little honey. He fed them in the evening, and put the sugar in dishes, and covered it with a cloth, and let the bees suck it out. I sometimes held the dishes for him. One day quite a large piece of the new comb fell off, and my brother gave me a piece of it to eat. I thought it very nice for such a young swarm of bees to make; but my brother said it was not very good. Now, will you tell me why that new piece of comb fell off? Was it because the young bees did not know how to fasten it on? **BELLA ECHLIN**.

West Flamboro, Ont., Can.

I do not know why the comb fell down, Bella, unless it was some that they built from the feed you gave them. When bees are fed heavily they often fill the combs before they have time to strengthen them, as they usually do with honey they gather naturally, and then they break down. Was it after they had been fed, or when they had been gathering honey? If the former, it would not be honey that you tasted, but only sugar syrup in honey-comb.

#### WHAT TO DO WITH LITTLE SWARMS, ETC.

My pa keeps bees; he has 16 stands. I help him take care of them. One day last September I found a little cluster of bees on a peach-tree, right over one of pa's hives. I thought they belonged in the hive, and shook them off two or three times, but they went back every time. My pa was gone. In the morning I told him, and he found them there. He put them into a hive with some frames of hatching brood, and they are now a nice swarm. There was not over a pint of bees in the swarm. My pa's bees come out a great deal in cold weather, and lots of them die. Pa takes GLEANINGS, and I like the JUVENILE. I have two little sisters and one brother. My brother and I go to Sunday-school. I won the prize in my class, and I went for three months. Which is the middle verse in the Bible?

Chester X Roads, Ohio.

**LYLE REED**,

#### THE QUEEN WITH TWO YELLOW BANDS.

Mamma bought her an Italian queen from Mr. J. Q. Ayers. She has only two yellow bands. Is she a pure Italian? We thought there ought to be three bands. Mamma has a young queen, and has given me the old one and three frames of brood; they are hatching out nicely. We started with but one hive of black bees in the spring; now have five. The old hive was stolen about two months ago, or we would have had six. **LIZZIE WITTE**, age 12.

McGregor, Texas.

Friend Lizzie, we are apt to think a queen that has *any* bands has hybrid blood in her, or Holy-Land blood. The Holy-Land bees have so many bands that they are sometimes streaked, almost like a barber's pole. A full-blood Italian queen does not, as a rule, have any bands; but her worker bees should all have three bands. The color of

the queen and drone has little to do with purity, for they are often just as they happen to be, and it is the workers only that are marked uniformly.

#### THE YOUNG QUAILS THAT WERE HATCHED IN A QUEEN NURSERY.

I live with my uncle, J. B. Rapp, the largest bee-keeper in Clermont Co., O. He has about 200 colonies of Italian bees. He takes GLEANINGS. I delight in reading the JUVENILE. He buys a great many things of you. I heard him say that he met you at the bee convention in Cincinnati. We have a pet quail; we call him Bob White. When left alone he will whistle and hunt for us from one room to another. My uncle found the eggs in a meadow. Ten out of fifteen hatched. It was funny to see them run around in the nursery. They would see themselves in the sides, and pick at the tin as if they were going right through it. We have a new use for your smoker. Take and put tobacco in it, in place of rotten wood, and smoke the roses with it, to kill the aphides. I have no use for whisky and tobacco.

**WHITCOMB MOTSINGER**, age 11.

Owensville, Ohio.

Thank you, Whitcomb. You didn't quite make it clear whether those quails hatched in the nursery or not. If so, it is quite an important fact. We are glad to know about your uncle, J. B. Rapp, for we have had a great deal of trade with him for a good many years.—Any bee-smoker may be used as a fumigator. Perhaps that is one way in which tobacco may be made useful. It is such a virulent poison that it is no wonder that it kills the insects.

#### ABOUT THE HONEY THAT GOT TIPPED OVER, AND DID NOT GET SPILLED, EITHER, ETC.

It is some time since I wrote to you, and I thought you might want another California letter. We live in the foot-hills, five miles from town. Papa goes to town every Saturday, and sometimes twice a week, for the mail. Papa sells honey every time he goes to town. We got the last JUVENILE to-day. Papa has honey in two stores in town, and to-day he went in one of them to change one of the jars. When he drove up to the store there were several teams along the sidewalk (as it is just before Christmas), so papa had to leave his wagon outside of another wagon. He was not gone very long; but when he came, he found a man holding the horses, and another man picking up the things. It seems a runaway team upset the wagon, and spilled every thing on the ground. Tin cans, bottles, boxes that the bottles were in, comb honey, and the seat of the wagon all in a heap on the ground, but there was nothing broken. Papa says the wagon must have been completely upset, but it was all right when he came out of the store. He could have been gone but a few minutes. He didn't know any thing about the accident until he came out. The bees did very well in the early part of the season. Papa's bees increased from 60 to 80 swarms, and he took out 2500 lbs. of honey, mostly extracted. Papa was sick last season and the bees began to rob; and when he got well he doubled up the swarms, and kept doubling, until he has only 20 swarms left. Papa had to feed back about 300 lbs. of honey to the bees. He sold a good many queens last season, and he sold a good many of your extractors.

Napa, Cal.

**MARY E. ENAS**.

## Our Homes.

The Son of man came not to be ministered unto, but to minister. — MATT. 20 : 28.

**D**ID you ever think of it, friends, that there are just two things to work for in this world? You can devote your whole life to working for yourself, or you can devote it to working for other people. Working for yourself is, of course, selfishness; and I have sometimes thought that selfishness swallowed up all other sins. The whole spirit of the Bible, and of the religion of our Savior, seems to be against selfishness, and prompts us to work for others. You know the golden rule gives a big clip right in the other direction—"Thou shalt love thy neighbor as thyself." It is not readily apparent to us that serving Christ is really serving our fellow-men — or, at least, we seem to forget it. Jesus made it very plain in those beautiful verses about being hungry and thirsty and in prison, and without clothing, and sick. And then he says that everybody who gives relief and help and encouragement to somebody else in this situation does it to him. When you forget self, you remember Jesus; when you help somebody else, you help Jesus. You remember the time he was at the well. He came there thirsty, and asked a woman for drink. On account of a foolish prejudice she refused his request. Did it ever occur to you what a pleasant thing it would be to minister to the wants of our beloved Savior? Suppose he had passed by your door; suppose it had been your privilege to meet with the Son of God in human form — to behold him in his matchless innocence and simplicity of character. Who has not felt his heart bound almost at the simple thought of the privilege they enjoyed in those days, of following him? And yet, friends, we can follow him now. The question often comes up, "Why, I do not know how to follow him, unless I see him." We feel something as poor Thomas did when he was all the while asking to have it made plainer. He wanted to see God with his own eyes; and then when Christ was raised he demanded proof that would be satisfactory to his own senses and to himself. We often think if we knew just exactly what to do — if the way could be pointed out very plainly, as it was to poor Thomas — we would go right to work without hesitating a minute. Well, let us see if the way is not plain. What does following Christ mean? What did he do? Why, our little text tells us exactly what he did. He ministered to humanity; to the multitudes. Ministering means waiting on. Jesus was a waiter. Were you ever a waiter, my friend? Sometimes at picnics there are a great many hungry ones to be fed. You may be hungry and faint. Perhaps you are in poor health, and it gives you a headache to pass the usual hour of mealtime. The healthy, eager multitude do not know this, and you do not want to explain it to them. Will you be a waiter, or sit down and have somebody else bring things to you? I think the first time I ever volunteered to act as waiter at such a place,

it at once occurred to me that Jesus was once a waiter, and I decided I would be a waiter too, if they would let me help. I would minister to the wants of the eager crowd for his sake. Do you think I enjoyed it? Yes, I did. I thought of the time when the loaves and fishes were passed about; and as I made it a point to see who there was that had been passed or neglected (perhaps by accident), I watched to see if I could catch any kindly gleam from their faces, in response to my proffers of food and drink, or to bring them something that had not been passed their way yet. Do you know how it turned out, friends? Why, it made me very happy, and I enjoyed it more than I ever enjoyed a picnic before. Even though I felt faint, and I had a headache, just from the lack of my accustomed food, I thought perhaps some of those I waited on were needing food just as much as I needed it; and this thought made me happy. After we got through I enjoyed having my dinner with the rest of the waiters, and I felt kindlier toward them than I had ever done before. Now, friends, is it not so all through life? There are almost always opportunities to be waiter, if you want to be waiter. You can almost always find places to be ministered unto, or you can find places to minister to somebody else. Let me give you two little pictures from real life.

The first one is of the young friend in jail, about whom I have told you. He told me a few weeks ago he presumed they would send him to the penitentiary for three or four years; and he also said, in a sort of complaining way, that he had been told that no boy of sixteen was ever any better after having served a term in the penitentiary. I could have told him I was sure they would not send him for even so much as three years, as his offense was the first one, and he was only sixteen years of age; but I did not do this, because I thought it would be better to prepare him for a full term as well as I could; and then if the sentence were a mild one, he would be more likely to feel thankful rather than to feel bitter if it turned out to be more than he expected.

He was sentenced for only one year. I asked him if he was not thankful. He at first said he was; but he said it with such a poor grace that I felt sure he was not very thankful at heart. Finally he came out with it, and said he thought the laws were unjust and cruel, to condemn a boy of his age to the bad society of the penitentiary for so trivial an offense. I labored nearly an hour with him, trying to show him how much better it would be to thank God, and to thank the officers of the law for so mild a sentence, while, by his own confession, he was a deliberate and willful transgressor. He finally said that he ought to be thankful, but these ugly, rebellious feelings would come up, and *he could not help it*. How is it, friends? Could he help it? I asked if he always had been in the habit of paying all his honest debts. He replied at once that he had, and I think he told the truth. I asked him if he did not think it was always the best plan to pay all debts fully and squarely, even though it seemed sometimes as though they were hard-

ly just. He said he thought it was, and the saloon-keepers who were there with him also agreed that the best way to get on in this world is to pay up all the bills one has contracted, and then resolve to do better next time, if the bills had been made foolishly.

Perhaps I might mention that these same saloon-keepers had declared that they would listen to none of my teachings, and had made plans to disturb me so much that I could not talk to them at all. I had especially prayed, however, that God would help me reach their hearts, and to impart at least one good moral lesson. The prayer was answered in just the way I have described. When I had got to pleading with Ellsworth, so that I had forgotten that they were in another part of the room — had even forgotten the noise they made moving chairs, etc., then they were attracted by our words, and very soon came over to listen. I turned to the one who seemed to be rather the leader among them, saying, "Mr. H., am I not right in telling Ellsworth to consider this whole matter a bad investment, and to pay the bill honestly and squarely, whatever it is, and then resolve to do better next time?"

"Of course, you are," said he at once.

"And is it not true, my friends, that all of you have made bad investments? and will it not be best for you to go to work cheerfully, and make the best of a bad bargain? The State of Ohio decides that you owe a debt which is to be paid either in money or confinement, or both. Now, without finding fault with the laws of our land, or cherishing any bitter feeling toward the officers who enforce the law, will it not be best to meet the bill in a good-natured way, and see that you do not make any more bad investments in the future?"

They all good naturedly assented, unless it was our young friend E. He asked me if I thought it was going to make him a better boy, to give him a year in the penitentiary. I told him I hoped it would. But he made a remark, something to the effect that, if they sent him to the penitentiary hoping to make him better, they would find themselves very much mistaken; but that if they would let him go he would do his best to live a different life, and do better. I had had a good deal of talk with him since his confinement, much in this same direction. He thought the laws were wrong, and the punishment too severe for a simple offense like his. He seemed to have no comprehension of the offense he had committed against God and against his fellow-men. To quote the language of the text, he did not propose to be a servant in any sense; he preferred rather to be ministered unto than to minister, even though the service that our country required of him was to serve in payment of a just debt. You see, friends, one who comes through the world demanding justice, and if his ideas of justice are human, to have it just in his eyes he would probably want considerable more than the strict line of justice. Jesus calls upon us to give more than is just. "And whosoever shall compel you to go with him one mile, go with him twain." Our young friend had doubtless come into all this trouble by getting a sort of feeling

that the world owed him something — owes me a living," as you have doubtless heard it expressed; and when he got hold of that book about the life of Jesse James, Satan had persuaded him to think it a fine way of doing to appropriate that for which he had not labored, and to reap the results of others' toil. What a sad, sad sight it is to see any human being who has once got the idea into his head that the world *owes* him something!

I can think of three states of the human heart. The one is a disposition to want to get or receive more from the world than you ever give the world. A better and more just way is to want to pay for all you receive—to give humanity the *exact equivalent* of all that you ever receive from it. This is well, as I have said; but, dear friends, is there not a far higher and better way than either of these, in working to give *more* than you receive of every thing? You see, in this latter case, even if you should be selfish (and who is not?) you would probably be in no danger of overstepping the line of strict justice. How could we ever live and go on if every one should insist on full justice for every transaction? If there were not any Christians to bear and forbear, how would the world ever be held in check?

I now want to tell you of another young man I know of, who is only a little older than the one I have just mentioned. Two or three years ago my attention was first called to him by pleasant letters he wrote us. Like other A B C scholars, he used to ask quite a number of questions; but as he sent us an order for goods occasionally, we never thought of considering him troublesome at all. Well, one day he wrote a letter inclosing money to pay up his account, and at the same time said he would send on the extra dollar to pay for the time the clerks had occupied writing him so many times. It attracted some attention, because the course of proceeding was so unusual; and after that I began to consider his letters a little more closely. By and by he came to work for us, and I watched him to see how he held out. It seemed to be a natural trait with him to be willing to render the world full pay for what he received, and, to make matters safe, a little more if any thing. As he was a new hand, for some time he was changed about from one kind of work to another; and one day I noticed that he was helping to unload plank with two full-grown men. Boy as he was, in some way they allowed him to lift almost every plank from the ground, and then *they* took it. I watched him much of the afternoon, because I wanted to see how much he would bear without complaining. He never complained at all, but seemed to think it all perfectly right, although he did look a little tired at night. I changed him about from one room to another, and afterward inquired of the foreman what kind of a hand he made. The invariable verdict was, "Tip-top, Mr. Root; can't you let us keep him all the while?" May be you think, boys, it was an easy thing for him to bear his share, and a little more. Some of you may say it came natural to him, and therefore no particular credit was due him. I tell you,

friends, it is not so. We all have selfish and lazy feelings, if we allow ourselves to give way to them. Elmer, for that was his name, happened to room with our friend Mr. House. Now, friend Elmer, with all his other good qualities, was not a Christian — that is, was not an acknowledged Christian, and this fact Mr. House soon discovered, and both he and myself had many talks with our young friend. He admitted the truths of Christianity, but was not quite ready; besides, he did not quite see the importance of fully committing himself. It would seem that it were a very easy matter for one who seemed to have the true spirit, to unite with Christian people and become a cross-bearer. But our friend Elmer, although he seemed willing to do almost every thing else, was almost stubborn for a time in this one respect. He became acquainted with our pastor, for, of course, he would attend our young people's meetings, and our pastor united with us in urging him to stand up before men as a Christian. One evening Mr. House talked with him till rather late at night, and closed by praying for him earnestly. To his great joy our friend yielded, and at our next young people's meeting many were the hearts that were rejoiced on seeing him rise up and express his determination to serve the Master henceforth and for ever. Did it make any difference with him? In some respects, friends, it made a very marked change. It gave him a new energy in every thing, and especially in seeking the good of others. It gave him an enthusiasm, as it were, for every thing good and pure, and an earnest desire to see all of his comrades give up every thing wrong and sinful. I do not mean by this that he ceased being a boy, like other boys; and I wish to mention one little incident right here, to illustrate this point. Friend Todd, of Wakeman, Ohio, made me a present of a basket of choice poultry eggs. The man who has charge of the warehouse and the poultry, very carefully put them under one of our biddies, which had the sitting fever, and we were watching anxiously for the eggs to hatch. One day I discovered the nest demolished, and the eggs gone, and my hopes in that line, of course, were blasted. Upon making inquiries, Mr. S., the warehouse man, said:

"Why, that new boy of yours tore the nest up and threw the eggs away."

"Why," replied I, "what in the world could have induced him to bother the hen? and why should he take such a liberty?"

I felt very much like scolding. It comes very natural for me to scold; and when I get into a scolding fit, I am very apt to forget what Paul said about charity. But then, it would not do very well to scold a young convert — one whom I had just helped to lead to the feet of the Savior. After my earnest exhortations to him he would expect, of course, that I would show a Christian spirit above all things. No, it would never do to scold him, although I could in no way think of any thing that could excuse him for breaking up my hen's nest. A voice within bade me "speak gently." I met him pretty soon.

"Elmer did you break up my sitting hen?"

"Why, Mr. Root, were those eggs any that you cared about?"

"Yes, Elmer, they were some choice eggs that were presented to me, and I was very anxious to see them hatch. How did you come to molest them?"

"Why, Mr. Root, I am very, very sorry. Some way, I do not know how, I got it into my head they were not good for any thing; and when the hen ran off while we were getting some straw to pack some goods with, I threw the eggs after her, about as we boys do at home. Just tell me how much they are worth, and I will willingly pay it."

I told him I did not want any thing; but as it was only a misapprehension, I asked him to let the matter drop. But it seemed to trouble him. Some time afterward, some bell-glasses were broken which he had packed and shipped, and he asked to be allowed to pay for them. I told him he might pay the wholesale price.

"No, Mr. Root, I want to pay just what you sell them for. You had your way about the hen's eggs, and now let me have my way about the glasses."

"But, Elmer, the fault may not have been yours at all. Perhaps the express companies handled the packages very roughly."

"No, I think the fault was mine, Mr. Root, and I want to learn to pack goods so they won't break, even if they are handled roughly. Please let me have my way about it. You had your way the other time."

And so I took the money he wished me to take, thinking to myself that I could take a part of it to keep the wheelbarrow full, just as I did the dollar he sent long ago.

Now, dear friends, I presume you see clearly the point I wish to teach. May be if you knew the young friend of whom I have been speaking you would see many faults in him, for I do not wish to represent him really better than or much different from average boys of his age, only he had this one strong distinctive trait: a disposition to be independent, or rather, perhaps, he did not want to feel that, in his passage through the world, he was taking more than his share, or encroaching on anybody. After he united with the church he seemed to have an intense ambition to learn, and to prepare himself for a life of usefulness. Although he was getting to be quite a valuable hand in the factory, before I knew it John and Ernest had persuaded him to go back with them to college. He is there now; and I am going to take the liberty of publishing an extract from a letter which he sent us.

You can very easily guess how I like "business" here; but lest you misapprehend, I will put the whole thing in a "nutshell" by simply saying that the object of the transitive verb "like," in the above sentence, includes *every thing*. I came here with great anticipations, and I have not been disappointed in the least. I like it better every day, and I think if I were to stay here a year, you wouldn't "know" me when I got back.

Every one here seems favorably disposed; and such a friendly sentiment prevails that I do not wonder that Oberlin has such a reputation. This is the place for those who haven't got "lots" of money, and are seeking after intellectual and moral development. I would like to write a little about details, etc., but can not take the time. Among the many favorable and pleasing features of this place, do you know what pleases me most? It is to see such prominence of Christianity, — "a city founded upon a rock."

## Tobacco Column.

**I** NEVER learned the filthy habit of chewing; but about three years ago I learned the filthy habit of smoking, and I have kept it up pretty steady ever since till a few weeks ago. While reading in GLEANINGS of so many throwing the foul stuff away, I concluded I could too; so I just laid the old pipe away; and, by the help of the good Being, I don't expect to have any of the bad weed in my mouth again. I will tell you a little dream I had. I dreamed that I was out at your house, and you and I were very busy talking; and before I thought what I was doing I took the old pipe out of my pocket; but I happened to think about your being so much opposed to smoking that I slipped it back very quickly in my pocket.

D. P. HUBBARD.

Graysville, Mo., April 16, 1883.

I am very much obliged to you, friend H., for your good opinion. I should be sorry to have anybody think he must not smoke, simply because I was around, for you know that would not be a very praiseworthy motive for giving it up. I wish to have you all act from the dictates of your own conscience. I am glad you have decided within your own heart that it is a dirty, filthy habit, even if nothing else could be said against it.

Please send me GLEANINGS and a smoker. I will abstain from the use of tobacco; if I should commence using it, I will pay for it.

L. LAWRENCE.

Wayland, N. Y.

I have quit using tobacco, and I want a smoker. I promise not to use it any more.

C. M. EATON.

Ithaca, Mich.

One of my neighbors told me to tell you he quit the use of tobacco, and claimed a smoker of you. I told him you propose to do that, and he has not used any for 5 months, so I reckon that I got him to quit. He says he will pay you \$1.00 if he uses it again.

W. J. CROWLEY.

Roanoke, Texas, Sept. 14, 1883.

Having heard of your offer to send a smoker to any one who quits using tobacco, and would pledge himself never to use it again, I thought I would send for one. I used tobacco 3 or 4 years up to the 12th of Aug., 1883, and I found it was injuring me. I pledge you that I will never chew again. If I do, I will pay you for smoker.

W. H. FROST.

Bloomington, Ind., Sept. 5, 1883.

### SOUND ON THE TOBACCO QUESTION.

This makes 16 names in all that I have sent for GLEANINGS, and I may send some more. I should like to have some of those cards that you send out free. I will just say, that I quit using tobacco some years ago, but do not want a smoker, as I have a good one. I feel that I have been paid a thousand times already for its discontinuance. From my best recollection I think I have persuaded about one hundred to quit using it, and I expect to fight it as long as I live, for I think it is one of man's bitterest enemies. I have been township trustee for 27 years, and have helped send 125 paupers to our County Infirmary, and I think the chief cause was whisky, tobacco, and dogs. So you will not blame me for fighting it to the bitter end.

Martinsville, Ohio.

AMOS R. GARNER.

I see by GLEANINGS that you are giving one of your smokers to all who quit "the weed." I learned to use it when a Kentucky boy, and kept it up till I saw that it would lay me in the grave, then quit it for ever. Years have passed, and I have not touched it, and have lost even my desire for it. I have had better health, am stouter, heavier, have an easier conscience, and can worship my great Master above with more satisfaction than before. If you think I ought to have a smoker, send to

JAMES E. BRADLEY,

Pastor of the M. E. Church, S.

Bastrop, La., Sept. 10, 1883.

Some men can be persuaded by a smoker! Alas, human frailty! Gentlemen, there are higher bids, among which are health, decency, economy, comfort of those around you; and above all, the future welfare of the dear little children nestling at your knee, and those that you meet here and there and everywhere. A father's influence is what saved me. He threw the pipe and "cud" away, saying, "It is a sin to use this tobacco." You have your influence, that will certainly reach some one. Use it to elevate, not to drag down. But if all these noble bids don't suit, take the smoker, by all means. Go on, go on, friend Root. If I can't pray for you, I can see the good that you are doing, and wish you well.

Your skeptical friend, J. SYKES WILSON.

Penrose, Ill., Aug. 5, 1883.

### THE TWIN SPRINGS.

I am learning the bee business with the Messrs. Israel Bros. They take GLEANINGS and the *Kansas Bee-Keeper*. You sent a very nice smoker to my companion for quitting tobacco. I have quit also. I quit a week ago. Will you send one to me too? I am 19 years old. We have school here too. We work till noon, clearing up to plant grapes and fruits, and then we get our lessons, and say them under the shade of the trees. Then we work late in the day. We have two large springs here, and we call this ranch the "Twin Springs," because they are almost exactly alike. Please send me as nice a smoker as you did to my companion; and if I ever break my promise, to use no more tobacco, I will send you the money for it.

JOHN E. JOHNSON.

North San Diego, Cal., Aug. 21, 1883.

I see by GLEANINGS you are giving a smoker to every one who stops smoking. About 3 months ago I quit using the weed; and if I ever attempt using it again, I agree to pay you double price for your smoker. About 2 months ago I purchased two colonies of blacks. I have entirely given tobacco up; I therefore look for a smoker.

VALENTINE L. FREER.

Fly Mountain, N. Y.

## Reports Encouraging.

### GOOD REPORT FROM CYPRIANS.

**W**ELL, friend Root, our fears of Blasted Hopes are over, and we stand as candidates no longer for that lamentable office. I have extracted, up to date, 130 lbs. of honey—pretty good, considering the great drought, which lasted from the first of March until the last of August—the longest ever known in the State. Our bees are now in fine condition, making honey rapidly from the squaw-weed and morning-glory. I extracted to-day 40 lbs.

of nice red honey. Our Cyprians are far ahead of the Italians. If we had had all Cyprians, they would have gathered as much again honey as they did. I will close this brief article (as it is my first) by telling you that I am an A B C scholar, only two years in the business. I am a brother of Dr. J. E. Lay, and superintendent of his apiary of 51 colonies.

JOSEPH R. LAY.

Hallettsville, Lavaca Co., Texas, Sept. 23, 1883.

Friend L., we are glad to hear this of the Cyprians, and we are also glad to hear more from our good friend Dr. Lay; but we are sorry to know that so many of our Texas friends have had such an up-hill time of it, this past season. Never mind; next year may give you another boom like that of last year.

In this country we get our surplus honey in Aug. and Sept. We are in the middle of a fine honey-flow just now from Spanish-needle, a rich fine honey. This is a grand, rich, and booming country, and fine for bees. Italians are ahead, or, rather, Cyprians, but they are hard to handle.

A. R. LUPE.

Cherokee, Kan., Sept. 20, 1883.

REPORT FROM A BEE-KEEPER WITH ONLY ONE YEAR'S EXPERIENCE.

I do not want any one-piece sections of anybody's make, as long as there is any place to get those to nail. It is true, they are less labor to put together; but what good are they when they are, especially when they are fastened to the frames in the brood-chamber? for then they are liable to come apart and collapse when I am removing one section at a time, as I do as fast as they get finished.

As I am writing, I will give you my report, and a description of my hive. In the first place, I just began to keep bees this spring, although I bought two the 20th of last October, and brought them through the winter good and strong. I bought four this spring, and one queen and 2 lbs. of bees, with five empty frames, from O. Foster, of Mt. Vernon, Iowa, which I would call a daisy, as I have got, in all my hives, young queens from her eggs, so all the bees I have are of her progeny. Increased to 20.

Paid for 6 colonies and one nucleus	\$ 40 20
" " Hives and frames	9 95
" " Comb foundation	9 15

<b>Total</b>	<b>310 80</b>
<b>Expenses</b>	<b>99 85</b>
<b>Profit</b>	<b>210 95</b>
<b>Average profit per colony</b>	<b>30 13</b>

I did not weigh my honey; sold it at 30c. per section of 5¼ x 6¼ x 2, and 45c. per quart, and counted what I have on hand the same way. My hives are nothing but a Simplicity brood-chamber, without any bottom or top, set inside of a box made like a Langstroth hive, with portico and cap; height, inside, 18; width, 20; length, 24 inches. The ad-

vantages that I claim for this are: It is cooler in summer, for you can raise this outside box and let the air circulate all around; and in the winter you can fill this box with sawdust, chaff, or any thing else; and when you want to divide, I don't think they can be beat, for the outside appearance is the same, only moving the brood-chamber, the same as you have to move on account of robbing.

Quincy, Ill., Oct. 1, 1883.

C. H. SMITH.

Friend S., we do not quite agree with you on one-piece sections. They are in use now the world over, and I do not know that I have heard a complaint before, such as you mention. Either your one-piece sections are very poor, or you have not the knack of handling them. As yours are rather large size, this may have something to do with it.—Your report is truly wonderful. I think you must have gone into the bees with some enthusiasm.—Your hive is virtually a Simplicity hive. I am glad indeed to know you have done so well.

WHAT ONE SWARM OF BLACK BEES DID IN A SIMPLICITY HIVE WITH WIRED COMBS.

How baby GLEANINGS has improved! It almost surpasses its mother, since the Home Papers have been added to its columns.

Last spring Mr. Samuel Palmer bought a full Simplicity hive, with wired brood-frames, sections, etc. On the 16th of June he put a swarm of black bees into the hive, and in just one month they had filled the upper story full of white honey, mostly bass-wood. He put more sections on, and they filled them again with dark honey, making in all 80 lbs. of comb honey, and have their lower story full to overflowing for winter. Of course, he reads GLEANINGS. My own colony of bees gave 105 lbs. extracted honey, and a swarm; they are Italians, and are gentle. I think almost as much of them as I would of a cage of canary birds.

BELL R. DUNCAN.

Black Lick, Pa., Oct. 1, 1883.

This has been a fine season for bee-keepers in this part of Southern Illinois. Until the first of June the season was very unfavorable. Honey began to flow in, in almost unlimited quantities; then in the latter part of May I wrote you a rather gloomy account of our prospects. You answered in June GLEANINGS that I was "borrowing trouble," and chided me mildly for murmuring. God forgive me. I thank you for your chiding. See Psalm 143 : 5. Bees have increased very rapidly this season, and the sale of hives and other supplies has been large. I have sold a fine lot of my five-frame colonies; increased my stock from 40 to 85 colonies; have sold quite a number of queens, and my bees, during the week, have stored honey enough to winter on, and I am going to get considerable surplus, if the weather continues for a couple of weeks longer. So you see that we had always better wait and see before we complain.

WM. LITTLE.

Marissa, Ill., Sept. 7, 1883.

Bees are carrying in honey by the ton from goldenrod.

J. W. ECKMAN.

Río Grande, Texas, Oct. 3, 1883.

I have 4 or 5 bushels of heart's-ease seed, the only honey-plant we have here in Neb., which I will sell cheap, and take goods. Heart's-ease has enabled me to take 100 lbs. of comb honey in 1-lb. sections from one swarm, and one of my neighbors to ex-

tract 300 lbs. from one hive. There are two varieties here — the white and the pink. The white does not secrete much honey, but the pink scents the whole atmosphere, and the honey can be seen and tasted very plainly in the middle of the day, and every fine day it is just swarming with bees.

SAMUEL L. STEVENS.

Beatrice, Gage Co., Neb., Sept., 1883.

I received the smoker and queens all right. I transferred the colonies, and introduced as prescribed, and they were received all right, and in 25 days had young hybrids flying. One colony, when I transferred, must have been queenless for 6 weeks or more, and did not have a queen-cell or any thing that looked liked it—not an egg, but 2 cards filled with pollen (the cells half full). Did you ever have any such experience? Do bees store pollen for winter use?

I bought an A B C book last spring, and 13 swarms of bees, for \$50.00, in box hives, and have sold box honey this fall to pay for them, and have 29 swarms now, although one of my best swarms and 20 lbs. of box honey walked off a few nights ago to parts unknown.

My bees are set 4 inches from the ground, and I wish to winter on summer stands; we have a large amount of snow almost every winter. Would it be best to raise them one foot from the ground? Some in this part of the State winter in corn-stalks. What do you think of it? Did you ever use a goose-quill for brushing bees in hiving, or from combs? I think it the best thing I ever used or heard of. The quill should be from the wing quills.

Fairdale, N. Y., Sept. 22, 1883. R. B. PERKINS.

Six weeks is a pretty long time to have a colony queenless, friend P.—Yes, bees do store up pollen so it often remains in the hive over winter; but in your case it accumulated because there was no brood to feed to use it up.—I do not think I would put the bees any higher from the ground than they are now. The snow keeps off the cold wind, and is quite a protection; but be sure to have the ground so the water will run off readily when the snow melts.—We have used goose-quills for brushing bees; but a brush with some sort of vegetable fiber is considered better, as it does not irritate the bees as any thing approaching hair and animal fur does. You know, bees are a natural born enemy to bears and many other furry quadrupeds. We prefer the yucca brush.—We are glad to know you got your money all back, and a little more.

#### REPORTS ENCOURAGING ALL AROUND.

The imported queen received in splendid condition, and safely introduced, and is laying now. I will raise a lot of queens from her yet this fall. I have been extracting honey this week. Bees are storing it very fast from fall aster (or stickweed); the honey is lighter in color than the clover honey taken early in the season. We have a fine blue-eyed boy 4 weeks old, which is quite a new advent to our mountain home, as he is our only son.

J. H. THORNBURG.

Chattanooga, Tenn., Oct. 8, 1883.

Last spring I bought 5 stands of bees. They were quite weak. I put Italian queens in them, and from them I got 25 stands more, besides 300 lbs. of honey, and they are in good shape for winter. I bought

\$25.00 worth, and sold this fall \$125.00 worth of bees and honey.

D. H. HASKER.

Cambridge, Iowa, Oct. 9, 1883.

## “Remindery,”

Or Department for duties to be attended to this month.

WHAT SHALL FRIEND DONNELLY DO WITH HIS BEES?

S HALL I let my bees die, or feed up 50 swarms? S and how is it most easily accomplished? Bees have not made any honey since July, and have used up nearly all to raise bees. I have plenty of bees and young queens; but how to save them, please tell me, or it will be too late—how to feed and how to make it—candy or syrup, if sugar is used.

L. C. DONNELLY.

Valmont, C. I., Oct. 7, 1883.

By no means let them die, friend D. It is true, it is pretty late in the season to get them right for winter now; but I think you can do it, if you set right to work. Feed them sugar syrup whenever the weather is warm enough to permit them to take it. The pepper-box feeder or the tea-kettle feeder will, perhaps, be your best way to do it. Double them up till the colonies are so strong that they can keep the hive warm under the influence of the heavy feed. Of course, if the weather is too cold to feed them liquid feed, then you will have to go back to the old plan of feeding candy, as described in the A B C book. Give them three or four lumps, the size of a hen's egg, or perhaps a little smaller, and cover them up warm with woolen cloths or chaff cushions. As fast as the lumps are used up, give them more. I would not give them a great quantity at once, lest it chill them too much in their efforts to work it up, for it must be warmed up by the heat of their bodies before they can use it. They will surely in the spring be worth enough to pay for all expenses and trouble; and doubtless you will have a good season next year. Although the matter has not been very fully tested, I feel quite sure that candy from powdered or granulated sugar and honey will be as safe as any thing. Knead it up like dough, and work it up into little biscuits, as I have before described. *Do not let the bees die.*

#### OBITUARY.

DEATH OF OUR OLD FRIEND J. OATMAN.

WITH much sorrow we have to inform you of the death of our dear father, on Oct. 1st, in his 71st year, passing home as he had lived, in perfect faith in his Master. He began his experience with Italian bees and modern management in 1871 having made a splendid success of the business, and loved it more than any other interest, giving his whole time and attention to it—left 600 colonies at his death. Very truly, OATMAN BROTHERS.

Dundee, Ill., Oct. 5, 1883.

This is indeed sad news. Friend Oatman has long been one of the veterans in bee culture, and his name was among the first among bee-men when GLEANINGS was started. Although he had his ups and downs in bee culture, like the rest of us, he held on to it undaunted, and eventually obtained his reward by becoming one of the most success-

ful honey-raisers of the present age; and, what is of far more value than bees or any of this world's industries, his faith was firm and unchanging in the love and care of the kind Father to whom he has gone.

## Juvenile Gleanings.

OCT. 15, 1888.

The Lord is my rock, and my fortress, and my deliverer.—  
PSALM 18: 2.

We can still use postage-stamps; but as you can get the new postal notes almost as cheaply, we prefer you should send them rather than the stamps, unless it be *one-cent* stamps. They are always just as good as the money to us.

We have just received our third shipment of 50 queens, direct from Italy. All came through alive but two, and we lost only one in introducing. We have between 50 and 100 queens to select from now, if you want to try your luck wintering an imported queen.

### ANOTHER OVERSIGHT.

J. P. MOORE, of Morgan, Ky., says the insertion of his adv't in our last issue was a mistake on our part, and he wants it countermanded, and thus stop orders from coming in which he can't fill. Two "morals" are obvious here: First, mistakes will happen; second, GLEANINGS is the place to advertise. Friend Moore says he can fill no more orders for queens now.

### BACK NUMBERS OF GLEANINGS.

We have on hand several tons of old numbers, including 1880, and still older, which we can mail to anybody who wants them at 3 cents per copy; i. e., providing you take such as we have. There are a few numbers which we are out of, which we could not furnish for less than 15 cents per copy. These old numbers are fully illustrated, and contain very valuable communications from our most successful bee-men.

### OMITTING THE NAME OF YOUR COUNTY.

QUOTE a number of our friends still persist in omitting the county in giving their address; and some, instead of their county, tell what railroad they are located on. Now, friends, the express and freight companies will not receive goods unless the county is clearly given; and therefore we must again decline to be responsible for errors unless you give your county, as well as town and State. No one in the world can tell what county you live in as well as you can yourself; for with all the railroad and postal guides printed, there is a liability of getting them wrong. The name of your railroad does not answer *at all*, in place of the name of your county.

### ALSIKE-CLOVER SEED.

SEVERAL are now asking us what we can pay for alsike-clover seed. I suppose you remember, friends, what a time we had last spring, and how it ran up to \$15.00 per bushel. As it takes a great deal of money to lay in much of a stock of it, it would be a little dangerous to buy until we know something of what the crop will be. I have not as yet offered more than \$8.00 per bushel; but if it doesn't come at that price, of course we shall have to pay more. If you will send me a sample of what you have, and tell me what you will take for it, we can soon decide

upon some definite price; and it is quite desirable for all parties that some uniform price be established for a nice article.

### THE ONE-PIECE-SECTION SUIT.

MANY are inquiring in regard to the progress of the suit on one-piece sections. I have this to say: I have employed on the case, as additional counsel, Gen. Leggett, whose name is almost a household word on every thing concerning patents, and who has been for many years Commissioner of Patents at Washington. After having looked the case all over carefully, he decides there is no possible chance for making our one-piece section an infringement. My advice to those who are thinking of putting in machinery to make one-piece sections is, to go ahead, although, of course, each one must do it on his own responsibility. We are ready for the case, and are anxious to have it come to issue; but I understand it has been postponed. I hope this postponement is not a plan to discourage others from going into the manufacture of these sections.

### LABELS FOR 10-LB. HONEY-PAILS.

I PRESUME our friends are aware the Jones labels are not made large enough for any thing above 5 or 6 lb. pails, while a good deal of honey is sold in 10-lb. pails. There are several forms of the 10-lb. pails; 10 lbs. comes so near a gallon that our gallon cans and pails will be about right for it; for, as you know, there is about 11 lbs. of good honey to the gallon. Our printers have gotten up a very pretty label for these gallon pails, which we can furnish for 50 cents per hundred, or \$4.00 per thousand; and by a little trimming they will answer for the milk-cans, and the improved Dadant pail, shown in this number. Postage will be 12 cents per hundred. They are printed on different-colored glazed paper, and present a very pretty appearance. Where we sell a customer 10 lbs. of honey, or a gallon, we can afford to make the price a little less than for smaller lots. These labels are exactly right for our 10-cent 4-quart honey-pails. This, you will observe, reduces the cost of the package to only one cent per pound, and the customer has a nice handy pail after the honey is used out. While we get 14 cents per pound for extracted honey, pail and all, for the smaller packages, we sell this one at 13 cents per pound. To make it even change, we sell a 4-quart pail of honey (10 lbs.) for \$1.25.

## Black and Hybrid Queens For Sale.

I HAVE about 25 colonies of hybrid bees that I intend to kill, if I can't sell them. I have more than I want. Are you buying now? If so, what will you give per pound for them, delivered on cars here? Could they be shipped in large boxes, say six or eight swarms in a box? I want the combs and honey; have only about half a crop of honey this year; think it will bring a good price, as I hear the same report from all quarters. Please answer by return mail, as I wish to do something with them soon. If you do not want the bees, what will you give for the queens, you to furnish cages, as I have none? They are hybrids?  
J. B. BROGAN.

Oak Hill, Pa., Oct. 1, 1888.

Friend B., we have all the bees we need; but perhaps some of the friends who see this may take them off your hands. I would not think of trying to ship more than one

swarm in a box. It is sometimes done, but they go much more safely where the quantity is not over four or five pounds in a package. I would not brimstone the poor little fellows after they have labored for you all the season. Do you think it seems just the fair thing to do, friend B.? We have no demand for hybrid queens.

I have nine swarms of hybrid bees. I kill some of them every year because I can not attend to them. I will sell you as many as you want at 75 cts. per lb., express prepaid.

ANSLEY HITZ.

Washington Heights, Cook Co., Ill., Oct. 2, 1883.

I have a friend who intends to kill about twenty colonies of hybrid and black bees in a week or two. Do you want them? What will you give me to keep them through the winter? I can do it, every one of them, on sugar syrup. To do it, I shall want a *cash* remittance for a little more than enough to buy the sugar; I can also Italianize them all yet this fall. If you want them, an early answer is required.

S. W. MORRISON.

Oxford, Pa., Oct. 1, 1883.

We do not want the bees, friend M., but perhaps some of our readers may want to take them. Your letter suggests the possibility of taking such bees and keeping them through on sugar. I am glad to hear you say you can do it. I am aware that others can do it also, if they will take the necessary pains.

## ATOMIZER, OR SPRAY-DIFFUSER.

The little instrument shown above is very convenient where bees are to be sprayed, or for any purpose whatever, whether for treatment of foul brood by salicylic acid, or for scenting a colony for introducing queens and uniting stocks. The instrument is very neatly made, the metal work all nicely nickel-plated. Extra valves, and needles for cleaning the tubes, accompany each instrument. It is worked by the rubber ball B. The whole packed in a strong neat box. Price \$1.00; by mail, 10 cts. extra.

A. I. ROOT, Medina, Ohio.

## MAGIC POWER OF SHORTHAND

WHEN the martyred President Garfield lay at death's door for so many weeks, and the whole nation eagerly read every word that came from the sick chamber, the Shorthand Secretary of the President, MR. STANLEY BROWN, was the medium through whom these important messages were given to the public. Only two or three years before that young Brown was working for his father in Washington, as a carpenter with hard hands and sunburnt face, earning a mere pittance the year round. But he had heard of the **Magic power of Phonography**, spent a dollar of his scant pocket money for a Manual of the Art, and during his evenings and rainy days had acquired some proficiency in the use of it. Then he began writing from dictation, in Shorthand, for members of Congress, at fair remuneration. His ability in this kind of work reached the knowledge of Senator Garfield, and he employed all the boy's time as a Shorthand clerk; then when the American people made his employer President, young Brown went with him to the White House as Shorthand Secretary, on a liberal salary.

Other senators are wanting Shorthand clerks, and other Presidents will need Shorthand secretaries; the presidents of railroad companies, insurance companies, manufacturing companies, and the like, are daily calling for Shorthand clerks, and the supply is not equal to the demand. **Boys who have the capacity to see beyond their noses**, should at once procure the latest and best Manual of Phonography, and begin its study, in earnest, as they would the study of law or of medicine. There is not only "money in it," but influence, position, and power. We know of no better work for this study than the **"Eclectic Manual of Phonography"**, by Elias Longley, Cincinnati, Ohio. The price is only 75 cts., and it would be cheap at ten times that price, to any boy or girl who will buy it and study its invaluable lessons.

## PHONOGRAPHY

Is a philosophical method of writing the English language, by an alphabet composed of the simplest geometrical signs, which accurately represent the sounds of spoken words. In this important respect it differs from all other systems of Shorthand. It may be written six times as fast as ordinary longhand, and such is the simplicity of the art that its principles may be easily acquired and its use mastered without the aid of a teacher.

Books in aid of the study of Phonography have been published as follows:

### THE ECLECTIC MANUAL OF PHONOGRAPHY.

Substantially in accordance with the present style of ISAAC PITMAN, but incorporating with it all the *Valuable American Improvements*, that enable the writer to increase his speed 15 per cent over the strictly Pitmanic writer. 12mo, 144 pages. Price, in paper covers, 65c; cloth, 75c.

### THE REPORTER'S GUIDE.

This is an original work, in harmony with the Eclectic Manual. It contains *Complete Lists of Word-Signs*; 2000 *Contracted Words*, with 10 *Rules for Contraction*, that enable the learner to remember them; 14 *Principles, or Rules of Phrasing*, followed by a *General List of Phrases, List of Legal Phrases, Railroad and Commercial Phrases*, 15,000 altogether, concluding with samples of Court Testimony, Legal Decisions, Speeches, Sermons, Amanuensis Work in the way of Correspondence, etc., in beautifully executed shorthand, with keys on opposite pages. This is the only work published in which the philosophy of the Reporting Style of Phonography is fully explained, and copiously illustrated with Shorthand Signs and Phrases in the text. Large 12mo, 240 pages. Price, \$2.00.

### THE AMERICAN PHONOGRAPHIC DICTIONARY.

This elegant volume exhibits the *Correct and Actual Shorthand Forms* for all the useful words of the English language, about 50,000 in number, and, in addition, many foreign terms; also, the best Shorthand forms for 2000 Geographical Names, and as many Family, Personal, and Noted Names in Fiction. Large 12mo, 368 pages, cloth. Price, \$2.50.

ITALIAN BEES AND QUEENS, COMB FOUNDATION AND APIARIAN SUPPLIES. Send for Catalogue.

D. B. BROWN, Des Moines, Iowa.

CALIFORNIA WHITE-SAGE SEED

May be had from W. A. PRYAL, North Temescal, Cal., as long as his present supply lasts, at 10 cents a packet. It is of this year's crop.

HEADQUARTERS FOR Early Italian & Cyprian Queens.

Imported and home-bred; nuclei and full colonies. For quality and purity, my stock of bees can not be excelled in the United States. I make a specialty of manufacturing the Dunham foundation. Try it. If you wish to purchase Bees or Supplies, send for my new Circular, containing directions for introducing queens, remarks on the new races of Bees, &c. Address DR. J. P. H. BROWN, Augusta, Ga. Itfd

MUTH'S HONEY EXTRACTOR, SQUARE GLASS HONEY JARS, TIN BUCKETS, BEE HIVES, HONEY SECTIONS, &c., &c.

Apply to CHAS. F. MUTH, CINCINNATI, O. P. S.—Send Stamp of 10c for "Practical Hints to Bee-keepers." Itfd

FLAT-BOTTOM COMB FOUNDATION.—High side-walls, 4 to 14 square feet to the lb. Circular and samples free. J. VAN DEUSEN & SONS, Sole Manufacturers, 4tfd Sprout Brook, Mont. Co., N. Y.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

\$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \*, use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

## Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

### CITY MARKETS.

**NEW YORK.**—*Honey.*—In regard to our honey market, allow us to say: The demand for comb honey of all grades and styles is increasing every week, owing, undoubtedly, to the fine quality of goods and style of package. As soon as cold weather sets in, we are expecting a still larger increase. Buckwheat is an entire failure, and we are selling mixed clover and raspberry in place. Fancy white-clover in paper boxes is selling well at 21c; in 2-lb. boxes, at 17@19c; second grades of white in 1-lb. sections, glassed or unglassed, are selling from 17@19c; 2-lb., from 16@17c. The crop is not nearly as large as first estimated, and prices will hold firm at present quotations. Extracted clover and basswood find ready sale at 10c; dark, 8@9c. *Beeswax.*—The demand for beeswax is greater than the supply, and we are holding prime yellow at 30@31c.

Oct. 22, 1883. H. K. & F. R. THURBER & Co.,  
Reade & Hudson Sts., N. Y.

**NEW YORK.**—*Honey.*—There has been no change in prices since we wrote you last, which was Sept. 27th. The market at present in comb honey is very brisk, and we are expecting a very fine season.

Fancy white-clo'r honey, 1-lb. sec's, no glass, 20	@21
Fair " " " 2-lb. " " " " "	18 @19
Fancy " " " 2-lb. " " " " "	17½ @18
Fair " " " 2-lb. " " " " "	15½ @16
Fancy Buckwheat " 1-lb. " " " "	15 @16
" " " 2-lb. " " " " "	13 @14

Ordinary " " 1@2c. per lb. less.  
Extracted white-clover, kegs or small barrels, per lb., 10@11. Extracted buckwheat, kegs or small barrels, per lb., 8½.

*Beeswax.*—The quotations on beeswax are as follows: Prime yellow, 30@33c.  
Oct. 22, 1883. McCULL & HILDRETH,  
80 Hudson Street, New York.

**CLEVELAND.**—*Honey.*—Honey continues without change; 1-lb. sections of best white sells readily on arrival at 18@19c; mostly at 18c. When, by some accident, it arrives in bad order, it does not sell very readily. Our experience is, that freight lots, when in full glassed cases, arrive in far better order than by express, because there is more time to handle properly. The 2-lb. unglassed sell at 17@18c; all glassed sections about 2 cts. per lb. less. Extracted, very dull; no inquiry.—*Beeswax*, 28c.  
Oct. 22, 1883. A. C. KENDEL,  
115 Ontario St., Cleveland, O.

**CHICAGO.**—*Honey.*—Demand for choice lots of white comb honey is good, and prices are well maintained; 18@20c for 1-lb. frames; 16@18c for 2-lb. frames. Dark honey in combs not wanted. Extracted ranges from 8@10c, according to quality of body and color. *Beeswax.*—Yellow, 35c; medium, 28@30c.  
Oct. 22, 1883. R. A. BURNETT,  
161 South Water St., Chicago, Ill.

**ST. LOUIS.**—*Honey.*—Choice in better demand, but unchanged. Sales chiefly in a small way. We quote: Strained and extracted at 6¼@7c; Comb at 12½@16c; choice in fancy packages higher.

*Beeswax.*—Readily salable at 26@27c for prime.  
Oct. 27, 1883. W. T. ANDERSON & Co.,  
104 N. Third Street, St. Louis; Mo.

**KANSAS CITY.**—*Honey.*—Choice comb, 12@13c; in sections, 16@18c. Extracted with fine flavor and good body, 7@8c. Trade on extracted is very dull at this point; market well supplied and demand very light. There is good demand for choice comb.  
Oct. 27, 1883. JEROME TWICHELL,  
536 Delaware St., Kansas City, Mo.

**BOSTON.**—*Honey.*—Best 1 and 2 lb. sections, 18@20c. Extracted, 10c per lb.; and as we quote, it will sell quickly in barrels, or half-barrels, or kegs. No wax.  
Oct. 22, 1883. BLAKE & RIPLEY,  
57 Chatham St., Boston, Mass.

**DETROIT.**—*Honey.*—A good deal of honey is being sold, though there is no great activity in the market. The price is ranging from 16@17c. *Beeswax* is scarce at 30@32c.  
Detroit, Mich., Oct. 17, 1883. A. B. WEED.

I have 400 1-lb. Jones tin cans with white-clover honey in them. Each can is labeled with a Jones label; also 200 ½-lb. boxes (Jones style) with small labels. Can send small sample by mail. Who wants it, or can give the most for it?  
H. M. MOYER.  
Hill Church, Berks Co., Pa., Oct. 15, 1883.

I have 1500 lbs. of white-clover and Linden, well-ripened, extracted honey for sale at 10 cts. per lb. It is put up in new, well-made tin cans holding 40 lbs. each. The cans are given away with the honey at that price. I have also 500 lbs. of fall honey at 8 cts. per lb., cans included, delivered on board cars here. Small samples sent free.  
JOHN OLSEN.  
Nashotat, Waukesha Co., Wis., Oct. 22, 1883.

I have about 3000 lbs. of white extracted honey, mostly clover, thick and nice, in barrels and half-barrels, for which I will take 10c per lb.; the barrels are oak, waxed, iron-banded, and painted, holding about 360 lbs. each. Delivered at the depot, Union City, Branch Co., Mich.  
FRANCIS R. JOHNSON.  
Oct. 22, 1883.

FOR SALE.—1000 lbs. extracted clover and basswood, in 10-gallon kegs, for 9½ cents, delivered on cars here.  
M. ISBELL.  
Norwich, Chelango Co., N. Y., Oct. 23, 1883.

I have two barrels of honey in alcohol barrels to sell, at 10 cts. per lb., packages thrown in, delivered at nearest railroad station. Barrels are painted and waxed.  
S. ROESE.  
Maiden Rock, Wis., Oct. 20, 1883.

I have 8000 lbs. extracted basswood and white-clover honey; it is in 50-lb. tin cans; will take 10c per lb., delivered on board the cars here.  
WM. BARTH.  
Petersburg, Mahoning Co., O., Oct. 18, 1883.

Parties having extracted honey for sale, in quantities of 100, 201, and 300 lbs., will please send lowest price, delivered here, including cans, kegs, or barrels. Must be of best quality, and well ripened.  
J. G. LEHDE.  
Gardenville, Erie Co., N. Y., Oct. 24, 1883.

### ADDITIONAL "ADDITIONS" TO COUNTER STORE.

#### THREE-CENT COUNTER.

3 | JUTE TWINE ..... | 28 | 2 50  
A great big ball of it, and good fine twine, too.

#### FIVE-CENT COUNTER.

2 | LAUNDRY WAX..... | 40 | 3 50  
It gives an elegant, smooth finish to linen, prevents iron from sticking and rusting, saves labor, and preserves the linen. It is also a good substitute for beeswax for waxing thread, and costs far less. Directions for using.—Wrap a cake of it in a cloth and pass the iron over it frequently. The iron will then run smoothly and give a beautiful finish at a great saving of labor.

5 | SHELF PAPER ..... | 40 | 3 50  
One package of one dozen sheets for 5 cents. Each sheet is a yard long and the edge is beautifully ornamented by appropriate machinery. Just the thing in house-cleaning time. We furnish it in several different colors.

#### FIFTEEN-CENT COUNTER.

18 | JUTE GRAIN-BAGS..... | 1 40 | 13 00  
These are a good strong bag, holding 2 bushels, full measure.

A. I. ROOT, Medina, Ohio.

## Cards for Bee-Keepers.

Your name and address printed on a fine quality of Bristol, with cut of queen in colors on one corner; 50, 75c; 100, \$1.00. Send for specimen book of Honey Labels.

GEO. M. GRAY, Medina, Ohio.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 10 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries not of the U. P. U., 42c per year extra.

NOTES FROM THE BANNER APIARY.

No. 48.

A CORRECTION.

**I**N my report of the bee and honey exhibition at the Michigan State Fair, I gave the amount of Mr. M. H. Hunt's premiums as "over \$50.00;" I see, however, by the official report, that they amount to \$62.66. I presume that I also erred in calling the exhibition the "largest" ever shown; but at the time of writing I had seen no account of the immense amount of honey on exhibition at Toronto. You think it might be desirable to know

WHAT I HEARD AT THE STATE FAIR.

It certainly would be amusing; but as to the desirability, I am not so sure. For instance, H. D. Cutting had a show-case with a curved glass front, and a tall upper apartment with shelves. This show-case was to hold his exhibition of literature, which had not yet been put in place. A *bee-keeper*, after considerable conversation of a general character, asked Mr. C. if he did not find such glass *hives* rather expensive, pointing, as he spoke, to the show-case. Mr. C. replied, "Yes, rather," and then followed a string of questions as to the advantages and disadvantages of such a hive. For a wonder, he didn't ask where was the entrance; if he had, Mr. C. said he should have told him that he opened the door when the bees wished to pass out or in.

One evening, just about sunset, I had carried out my own bees, and was giving them a "fly," when one of them alighted upon the ear of a gentleman standing near. For a wonder, the bee remained un-

disturbed, and would probably have flown away unnoticed, had not a boy in the crowd shouted, "Say, mister, there's a bee on your ear; why don't you brush him off?" Quick as wink another boy replied, "Oh! I'll tell you, Jim, that bee is after *wax*." I don't think there was any thing that I heard during the fair that *ticked* me quite so much as this speech.

And then a great many visitors, especially ladies, would exclaim, upon seeing the bees in the observatory-hives, "Oh! here are some bees. Oh, my! how busy they are! I wonder what they are doing. Are they making honey?" This last remark would be addressed to me, and once again I would patiently go through the oft-repeated explanation, and then the visitor would pass on with a satisfied "Oh! that's it."

It is sometimes amusing to see how differently the public will sometimes "take" things from what one expects them to. For instance, quite a number were in doubt as to whether the honey in my case, labeled "Gilt Edge" honey, was *genuine* bees' honey, or whether it was some manufactured stuff. That newspaper story, about manufactured honey, that went the rounds two years ago, had so prepared their minds that, when they saw the smooth white sections filled with snowy combs that were as true as so many blocks, and read the inscription upon the case, it is not to be wondered at that I was frequently called upon to "explain."

But there is one thing that the people *are* learning, and that is the difference between strained and extracted honey. I heard a large number of people say "Extracted honey." I took one reporter "to do," because he called extracted honey *strained*

honey in one of his reports, and that, too, after I had explained to him the difference. He excused himself upon the ground that the public would not know what he meant if he called it *extracted* honey. I replied, "Well, then, *educate* it. What are newspapers for, if not to enlighten the people?" He laughed, and said, "That's so," as he went away, and there was no *strained* honey in his report the next day, but there was "extracted" honey. I tell you, that fairs *are* great educators.

One day I heard some one say, "Hutchinson;" and looking up to the other end of my exhibit I saw the smiling faces of Mr. and Mrs. J. H. Robertson, of Pawamo, Mich. We had a nice little chat. Mr. R. sold most of his bees last spring, and has been "building up" the past season. He has about decided to give up other business, and devote his whole time to bees, which is, in my opinion, a wise decision. The time when *everybody* should keep a dozen swarms of bees has passed away, and the time when the bee business can be *profitably* mixed up with other business is *now* passing away, and bee-keeping is becoming a *profession*. The specialist can do more work, do it more cheaply, and better, than the man who divides his capital, his time, and his talents among several pursuits.

"Hello, hello!" some one said; and upon looking up, there was Prof. Cook's smiling face, and close behind it that of Mr. R. L. Taylor. They were on their way home from Toronto, and were "chock full"—of enthusiasm, and there is "no use trying" to repeat what was said.

Since attending the State Fair I have made an exhibit

#### AT OUR COUNTY FAIR,

where I and my brother received \$16.50 of the \$24.00 that were offered as premiums, which just about paid our expenses. With the exception of a premium on a comb-foundation machine, which was awarded to Mr. J. L. Wilcox, the remainder of the premiums were awarded to Mr. M. S. West. At our county fair we sold our entire crop of comb honey to Mr. West. Perhaps I should not say our *entire* crop, as about 500 lbs. were sold at the State Fair, and a few cases had been sold at stores near home.

#### THE ALLEY, HUTCHINSON, POND CRITICISMS.

Had I condemned, in any particular, the Alley method of queen-rearing without giving *reasons*, the remarks of Bro. Pond, on page 66 of the *JUVENILE*, would have been *right to the point*; but, how is it now? Can friend Alley or Pond or *any one else* take up my review of friend Alley's book, take it up point by point, and meet reason with reason, argument with argument, and fact with fact? If he can, and *does*, you have but little idea, Bro. Pond, how gracefully will I yield the palm. Since writing my review I *have* given the Alley plan a thorough trial, and I can only repeat what I have already said, and repeat it with vehemence.

Please remember that I have not *condemned* the Alley method, for I think—in fact, I *know*—that good queens can be reared according to that plan; but I *do* say, that it is complicated, and any man who has the free use of his reasoning powers will say the same after a thoughtful perusal of the work.

Yes, it is true that I have had only four or five years' experience in the queen business; and it is equally true, that in nine cases out of ten, when a young man labors with an old veteran, and tries to point out his errors, and teach him better methods, be the parties lawyers, doctors, farmers, or what

not, a look of astonishment will steal over the face of the old veteran, and he will exclaim, "Why, young man, I have been in the business *twenty* years!" when, perhaps, the last year's experience may be a counterpart of the first. "Oh! you have had no experience, young man," is *not* a very "lofty" argument with which to meet solid facts.

#### CAUTION.

I sincerely thank you, friend Root, for your advice in regard to not being hasty in taking up new departures, and I will try to profit by it; but the "conclusions" that I mentioned last month were not hasty; they had been "lingering in my mind" (if that is the proper expression) for the past year or more, and at last I was forced to adopt them. There is another "conclusion" that has been "lingering" for a long time, and that is, that

#### SUGAR STORES ARE SAFEST FOR WINTER.

So nearly have I come to this conclusion, so certain do I feel that pure cane sugar is the key that will unlock this wintering problem, that I am feeding two barrels of it to 85 colonies. From some of them, *all* of the honey is extracted, and 20 lbs. of sugar fed; from others, no honey is extracted, but they are fed from 5 to 15 lbs. of sugar, just according as they are heavy or light with natural stores. This sugar will *probably* be the first to be consumed; will be used during the winter, and the honey that occupies the upper part and corners of the combs will remain untouched until spring comes, and the danger from dysentery is over; at least, this is how I *theorize*. Some colonies are left undisturbed with natural stores, and some are *fed* honey.

W. Z. HUTCHINSON.

Rogersville, Gen. Co., Mich., Oct., 1883.

#### SOMETHING MORE ABOUT SWARMING.

##### WHY DO THEY LEAVE?

**I** NOTICE in GLEANINGS for Sept. a letter from Anna Standliff, giving an experience with new swarms of bees. As I have had some of the same kind of trouble, I will report as requested.

I had a very large swarm leave the hive after it had been seemingly working contentedly two days. It had brood in all stages, given the day the swarm was hived; we found them clustered on a tree near the hive they had left. We knew them by the queen. They were hived again in a different hive—a box hive without brood or comb of any kind, where they remained. There was no advantage in the location of the second hive, so it was strange to me they left the first one, and yet they stayed in the last.

Again, I had a swarm leave a hive after remaining several hours. The hive stood in a cool shady spot, but near where the swarm had clustered. Did returning scouts lead them away? My neighbors laugh at that idea, but the bees left for parts unknown.

About ten days ago, late in the afternoon, we found a fine swarm of bees clustered on a tree; hived it; carried the hive 30 feet away; fed them that night, and they seemed all right at noon next day; but during the afternoon, away they went. The day was cool, and partly cloudy. The hive was clean, and set in a clear open space near a fence. Why they left, is another bee-puzzle. It was not the heat, I am sure; neither was it robbers, as I watched them closely during the forenoon. My bees are Italians, part of them raised from your stock of

queens, the rest from J. W. Keeran, of Bloomington, Ill.; and I want to say here, he is a prompt, honest man to deal with. I have ordered a number of queens of him (all untested), and they proved to be purely mated, producing large, gentle, three-banded bees; queens very prolific, and bees good workers. All my queens are laying, keeping the combs filled, although there is very little honey coming in. They have not gained 3 lbs. to a colony in 4 weeks. Goldenrod and other fall flowers are abundant, but bees do not work on them. It is, and has been for several weeks, very dry. The spring or summer yield of honey was heavy. Honey is slow sale at 12½ cts. per lb. I think it will bring a better price, unless the bees do better than at present. GLEANINGS is a most welcome guest.

D. C. AYARS.

Moawequa, Shelby Co., Ill., Sept. 5, 1883.

## INTRODUCING VIRGIN QUEENS.

### FOUL BROOD AND ITALIANS.

**A**S several of the friends have given their experience in introducing virgin queens, I will give mine. If I have one or more virgin queens to introduce, I proceed as follows: I go to the parent hive and take out all the combs that have these virgin queens on them, and stand the combs outside the hive (remember, this can be done only in a flow of honey, when there are no robbers about). I then go to as many queenless hives as I have virgin queens, if I have that many, and I smoke each colony well; then I take out of each of the queenless colonies a sheet of brood with the adhering bees, and I stand that outside of its respective hive (leaving the hive open), and so I go to the whole number, as many as I have virgin queens I wish to introduce. I now go to the first queenless hive, where I left the comb standing outside; pick up the comb, and go to where I left the virgin queens on the combs outside their own hive. I pick off one of these queens, and place her on the comb I have brought with me from hive No. 1 that was queenless. I watch the bees and the queen for a few moments, to see that all is well; but as a rule, the bees pay little or no attention at all to her. I take the comb with the queen, bees, and all, back to hive where they belong; set it quietly in its place in the hive; close all up, and wait patiently the result. I do not disturb them till it is time for the queen to begin laying. In the same way I proceed with all the hives spoken of above.

Now, I have been very successful in the way of introducing virgin queens; and the way I look at it is this: The trouble in introducing virgin queens to a queenless colony is, first, she is rushed into the midst of a strange lot of bees; and she, not being a fertile queen, they naturally take a dislike to a queen that is not prepared at once to go on and fill the proper duties assigned or expected of a queen, and, in most cases, they think it best to dispose of her and take their chances on getting something better. Well, now for my reasons for proceeding as stated above: As all old bee-men know, after you have had the hive open a few moments (if there are no robbers around), the bees fill themselves with honey, and become quiet. They get used to the light and to your presence, and generally they assume a kind of a "don't care" disposition, and are ready to accept almost any terms (only so they have peace). Well, now, after you have been to all

these hives, and set a sheet of brood out of each, by the time you get around with the newly hatched queen they that are on the comb, and those that are in the hive are all in the best nature, and, as a rule, all goes well. But, now, understand, it is not always sure. The bees either kill some of them, or they get lost on their wedding-tour. But as I said before, I have had better luck introducing virgin queens this way than any other I ever tried.

On page 537, Milton Hewitt speaks of a disease of bees, and wishes to know if Italians are affected with foul brood the same as the blacks. Now, friend Root, my experience is not at all like yours. After an experience of six years in California, where foul brood is the regular diet, morning, noon, and night, in the winter and in the summer, I saw but one pure Italian stand of bees that had foul brood, and this was a lazy, good-for-nothing queen; and in the spring of 1880 her colony had foul brood. But, blacks; whew! I have seen too many. Now, I do not say that Italians will not have foul brood; but I do say, I never saw more than one stand have it, while I have seen hundreds of blacks "go where the woodbine twineth," with that most of all dread disease, *foul brood*.

In some future number of GLEANINGS I will give my remedy for foul brood, and what I use to keep the disease off when in a locality where it prevails.

Water Valley, N. Y.

A. W. OSBURN.

Friend O., I should advise letting young virgin queens loose at the entrance of the hive, or, if you choose, by turning up the mat over the combs. It is true, some of them will "come up missing;" yet if they are well watched, the number is so few that we have decided to take the chances. If they have been hatched several days, and are running about on the combs, I would just swap combs; and if honey is coming in, there probably won't be any fuss "in the camp." Your plan may be safest, after all, and I have given it because it embodies very important points in handling bees. *When one has become sufficiently acquainted with the habits of bees, to know just what he can do with impunity, he pretty soon begins to find he can do almost any thing he wants to do.* — I am very glad to hear you pay the Italians the tribute you do, in regard to foul brood. It has always seemed to me that their energy would enable them to shake off disease, and also in the same way throw out moth millers and robbers; but I have never heard the idea advanced before, that I know of.

## PRACTICAL RESULTS.

### FINDING A BEE-TREE.

**W**HILE passing through the woods some half-mile from my apiary early one morning, just about sun-up, all of a sudden I heard the industrious hum of bees; and upon looking I found that they were sucking at the root of a large white-oak. On account of disease, the sap of the tree had fermented, and was slowly running out; and 'twas this that attracted the bees — or, at least, that was my supposition. It might, however, have been that the bees, like a great many of the fraternity, had become attached to the word "Root," and were working there on that account. To my surprise, they were all black bees. This being a fact, I

knew they must be "wild bees," so I determined to give them chase. I went home and procured some honey, mixed with water, so that it seemed almost of the consistency of water, and in this way I thought to have them load and unload quickly. I also procured some flour and three small pieces of boards, six or eight inches square. First I put some flour on the backs of a few bees, and found that they returned in from 10 to 15 minutes. I then placed the boards at three different places; poured what honey would lie on them, and then filled my hands, and rubbed it upon the bushes and underbrush near. As there was but little honey to be had from flowers at that time, the whole woods was soon alive with bees. They just fairly covered the little boards. It took about 15 minutes for them to get their courses, and as they all seemed to go toward one point, I soon found them about three hundred yards from the place where I first found them, and from where I had timed them.

One strange feature I wish to note here is, that after I had gotten them to work at the honey I noticed more three-banded bees than blacks; and upon cutting the tree I was surprised to find that about one-third were black, and the rest pretty fair three-banded ones. This was the exact characteristic of the progeny of a "dollar" queen I had sold to a friend about four miles away; and upon inquiry I found that this same queen had led her swarm astray in the direction of where I lived.

Greenville, Tenn.

CHAS. KINGSLEY.

Friend K., you have given us at least one valuable fact in the above. That is, to sprinkle honey around on the bushes and underbrush when you want to get wild bees working strong on the bait. Although I have never tried it, I know this would "just do it."

### CHICKENS THAT WON'T EAT BEES.

CHEAP MEAT FOR BEE-KEEPERS, ETC.

I HAVE read with some interest in the past, reports of chickens in the apiary, and complaints of their eating bees. Now, I have found a kind of chicken that will never eat bees. I have been very much annoyed by the grass and weeds growing in my apiary, and some time ago I built a close picket fence around it, and turned in this peculiar kind of fowl I speak of, and am well pleased with the result. The chaps are an English breed, generally gray in color, have large round eyes, four feet instead of two, and when they walk they *jump*; have ears from 4 to 5 inches long; and when given their own way, they roost in "holes in the ground." They are very prolific, increasing from two to 25 or 40 in a year; and when brought upon the table in the shape of a pie, potpie or roast, are fit to set before a king. They will dress from 3 to 5 lbs.; flesh, light, tender, and sweet. Mrs. F. says she prefers them to any kind of chicken raised.

But the great thing in their favor is the trifling cost of keeping them, as it is about impossible to find anything that grows out of the ground that they will not eat; every kind of weed and vegetable, both root and top, they eat with a keen relish, so the cost of keeping them sums up about 00.

Since putting them in the apiary I have not been troubled with any more grass or weeds, and they do

not keep the ground as filthy as do the dunghill fowls, and they and the bees get along well together.

A. A. FRADENBURG.

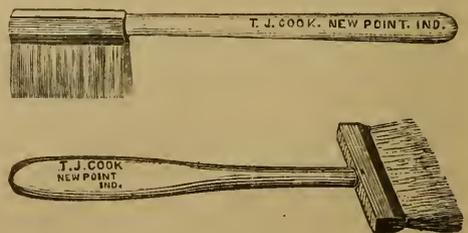

Port Washington, O., Oct. 29, 1883.

Friend F., no doubt your long-eared chickens (?) would keep the weeds cleared away around the house nicely; but as they don't lay eggs, we shall have to be under the necessity of chopping the heads off the poor innocent-eyed fellows whenever we want to get that cheap meat you speak about. I presume it is all right; but some way I can never get used to killing them, unless they are doing damage somewhere.

### BRUSHING BEES OFF THE COMBS.

T. J. COOK'S IMPROVED BRUSH.

UNTIL within a very short time, bee-keepers did not seem to be aware of the necessity of having a brush especially intended for this purpose, for it was supposed that a bunch of asparagus, some clover-heads, or any leafy branch, was good enough for the purpose. When the California brushes were introduced, I was a little surprised to see with what eagerness they were called for, and more than a thousand were sold last year, before I knew it. Then when our friend T. J. Cook suggested a brush made especially for the purpose, we, in our want of faith and ability to appreciate the situation of things, thought perhaps he might sell a few dozen. But to my surprise, in a little while the trade sprung up so it seemed he would have to have a little factory to make bee-brushes. Well, when we "were in Toronto" (do you know I told you that was what I was going to say every little while?) Dr. C. C. Miller, in his happy way, explained the little implement, and remarked that the brush was worth four times as much with the handle broken off and put on in another way, and others indorsed his view of it. I guess somebody must have told friend Cook what they said there, for he has just made a new brush; and to have you understand it, we submit a picture of both the old and the new.

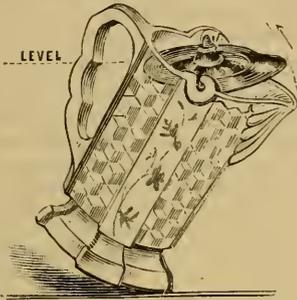

COOK'S BEE-BRUSH.

I believe the price is to be the same as it has been heretofore, and you can order them of us or of friend Cook, as you choose. At the same time, we can tender friend Cook a vote of thanks for having anticipated the need of such an implement, and we hope he will keep it always up with the times, and have the brushes ready to ship.

### HONEY CUPS OR PITCHERS.

WHAT SHALL WE USE FOR HONEY ON THE TABLE ?

I PRESUME the friends are well aware of the many utensils that have been recommended for the dining-table, to hold honey. The most obvious thing that presented itself at first was a syrup-cup ; but honey is usually thicker than syrup, and it also candies, but syrup does not. On this account, syrup-cups are not always convenient. We have tried them in our lunch-room, and at first thought the patent drip was going to be just the thing ; but the top was so small that the honey, when thick, would not run out. Then after a while it got candied. The women folks then set them in hot water to melt it out ; and as the cup was glass, it soon cracked. The cut we show you below has the following advantages :

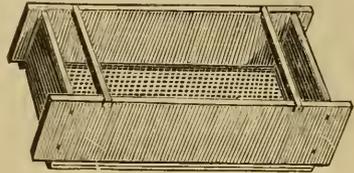

OUR NEW 25-CENT HONEY-PITCHER.

It is always secure against flies, because the simple act of setting it on the table closes the cover ; and who likes to see a fly struggling about in his honey ? I am sure I do not. It is true, you can take a fork or a spoon, and after some bother fish him out. But the next question is, where to put him. If you put him down he will crawl around and leave a sticky streak wherever he goes. If you kill him so he can not crawl, you have got a double piece of nastiness somewhere, and so about the only way is to carry him outdoors. Well, this cup is always closed against flies, as I have told you ; and besides that, if the honey gets candied you can just take the lid right off, and then you have a large opening to take out the honey as you would take out a piece of butter. In fact, this honey-dish would do very well for a butter-dish, if you had not any other. Besides the other qualifications, it is very handsome, as I think you must admit. And then, again, the price is only 25 cts. ; and if you want ten of them, you can have them for 20 cts. each, or a whole hundred for \$16.50. When you have not got any honey, you can use it for a cream-pitcher ; and, in fact, that is what it was originally made for, and the name given to it was " Magic Creamer." I forgot to say, that the tilting lid is made of britannia, and when they are bright and new, the lids are as pretty as if they were silver-plated. When they get old and tarnished, you ought to be able to get a new lid for about 10 cts. ; so it won't cost much to have a nice honey-cup always. I like nice new things ; don't you ?

### AN UNCAPPING-BOX MADE OF WOOD.

A SUBSTITUTE FOR DADANT'S UNCAPPING CAN.

SOME little time ago some kind friend sent us a description of the implement shown below ; but the engraver was a great while in making a picture, and so the letter was lost. We have decided to give the picture, and the friend who sent it may send us a description next month.

A BOX FOR UNCAPPING.

As the bottom of the box is made of wire cloth, we presume the machine is to be set over a can or tub, to catch the honey that drips, or may be a tin dripping-pan, if watched and emptied before it runs over. The box explains itself so well by the picture, that I presume but little description will be needed. The cross-bars are evidently intended for resting the combs on while the caps are being sliced off. Now, friend Whatsyourname, will you be so kind as to excuse us for losing your letter, and at the same time accept our thanks for telling us how to make an uncapping-box ?

### ARE THEY SWINDLES ?

RECIPES FOR PRESERVING EGGS, ETC.

As a copy of the *Bee and Poultry Magazine* is before me, I now know why the *Bee-Keepers' Exchange* does not make its appearance any more. It seems as though the *Exchange* had got into a whirlpool, and was engulfed in the *Bee and Poultry Magazine* ; and in order to smoothe up things the *Poultry Magazine* offers to fill out the unexpired time of the subscribers to the *Exchange*, with the *Magazine* ; but those who have sent money for "ads." and books will have to lose all, as I have found out. As the August number of the *Exchange* did not appear, and I did not receive the goods I sent for, I wrote a card to know what was the difficulty, to which I received an answer as follows : " The magazine will not be out on time, owing to the breakage of large presses in our office ; will look the books up. Theo. P. Peet, Ed."

I will also state right here, that the egg-keeping compositions, or preservatives, are all humbugs. There is nothing on earth that will keep eggs so that you can not tell them from fresh ones. You can easily tell the difference between an old or pickled egg, and a fresh one, by placing one of each in water. The pickled egg will always float higher than the fresh one. The recipe will tell you that, if the directions are carefully and particularly followed, fresh eggs will keep from spring to winter. Do you see the point ? There are always some innocent ones who get caught when such an "ad." goes its

rounds through the papers. Any person desiring such a recipe for preserving eggs can get one by paying 10 cents for a specimen copy of the *Farmers' Magazine*, that contains several of them that are selling at five and ten dollars apiece.

J. F. FLETCHER.

West Monterey, Pa., Oct. 24, 1883.

Gently, friend F. You are certainly right, however, in suggesting that it is time some explanations were made in regard to the unsettled accounts of the *Exchange*. Perhaps our good friend Peet can give us some light on the subject. It seems to me, also, that our old friend Nellis, even if he has sold out, might assist in having justice done to his old friends and patrons. Letters have come to us for some time back, saying that Mr. Nellis seemed to be in some way connected with the *Exchange* and its business, even long after he sold out; and those who went there to see about their accounts, after he sold out, say they found him there, apparently directing affairs. It strikes me, that if I were in his place I would at least make a suggestion, especially as the accounts all together do not amount to a very large sum, if I am correctly informed.—In regard to the preserving compound, I have been pretty severely cudgeled already for refusing to publish an advertisement of the secret. In times past I have several times invested considerable sums of money in secrets and recipes, and I have never yet received one that was not already in public print, either in recipe-books, or in class journals belonging to that particular industry.

## BEES IN THE SOUTH.

### A TRIP TO LOUISIANA.

**N**EVER before, Mr. Root, did I realize the true spirit of your talk about tobacco while traveling on the cars. Oct. 10th I boarded the cars at Greenville for Louisiana. Every thing was fresh and clean — no sign of the use of tobacco. At first I wondered how it was that you had found so much fault with the traveling public for using this *poisonous* weed; for I traveled all day without seeing any one using tobacco. However, at night I changed cars at Chattanooga, and I found, when I entered the car, that it was almost full of emigrants, bound for Arkansas and Texas. Well, the whole of it is, the air was just suffocating on account of tobacco smoke and the smell of liquors. But, people who go west are people who are dissatisfied; and people who are dissatisfied are, as a rule, to blame for their own dissatisfaction, as they don't conduct themselves in life so as to bring upon themselves happiness. I have come to the conclusion, that, as a rule, the use of tobacco is confined to the lower class of people; and it is certain, that no one can fight too hard against its use. How can man keep clear the mental faculties (the greatest earthly possession) that God hath given him, with his whole system filled up with the filthy and poisonous juices of this "master of man" and brother and partner of Satan? Ah! got the juice of Satan in him. Mr. Root, you and all who are engaged in this fight are doing a noble work, and richly deserve God's blessing.

A VISIT TO AMOS ABRAMS.

Friday evening brought me to the house of our

good friend Capt. Abrams. I was truly glad to meet with him, as some considerable dealing had already made us good friends. Mr. Abrams is quite a little (?) man. I believe he said he weighed only 243 lbs. However, notwithstanding his "dwarf" size he is a whole-souled man. His bees number about 225 colonies; and from the indications I get, they have been doing him good service. I suppose, from what he says, that he has already taken 6000 lbs. of extracted honey, and most of the hives are chock full of honey, some of them having at least 200 lbs. From what I can glean, the Red-River Valley is a No. 1 locality for the bee business.

### ABOUT HIVES AND FRAMES (SWINGS).

For the first time in my life I had the opportunity of working with the Root make of hive. I must say that the work is good, but the frames are not heavy enough. A great many of them fall to pieces before they will come out, and all of them sag down in the middle, both top and bottom bar, when full of honey. The most satisfactory frame I ever had was some I made of pieces  $\frac{1}{2}$  inch thick. They never gave way. I think at least the top-bar ought never to be under  $\frac{1}{2}$  inch thick. Now, I have some of Langstroth's frames made fifteen years ago; they are much heavier than the Root frame; and in addition to that, they have a block in each corner. They have been used a great deal, but are as good as ever.

### AN IMPROVEMENT ON THE CLARK SMOKER.

My experience is, that the greatest objection with the Clark smoker is its getting so badly stopped up, and the difficulty of getting it unstopped. Why could not a block be put on the under side of the bellows, just opposite the crooked spout, and through this have a hole so we could clean the crooked spout? The block would make the wood thick enough to screw a stopper in so there would be no trouble about the air getting out. I think, too, that it needs some kind of shield, as I have more than once burned myself pretty severely. Perhaps you may say 'twas carelessness. Perhaps so; but I dislike to have to spend time being careful about a thing that can be remedied otherwise. CHAS. KINGSLEY.  
Greenville, Tenn.

Friend K., it is cheerful to think we agree so nicely on tobacco, even if we do not on frames. I wonder if it is not getting to be a fashion to be a little vehement when criticising your editor of late. We sell frames by the carload, but I confess it is almost a new thing to be told they are not heavy enough; and in regard to pulling them to pieces, you surely do not mean to say you pulled metal-cornered frames to pieces, in taking them out of the hive. Our all-wood frames, when put together and nailed, ought not to pull apart either; but I have heard of friends who just pushed them together with their hands, and never thought of nailing. But it does not seem to me that our friend Abrams would do such a trick as that. In regard to the sagging, you seem to overlook the fact that the greater part of our frames are now wired; and with the diagonal wires, sagging is next to an impossibility.—Thanks for the suggestion in regard to making the Clark smoker easier to clean. I do not know how we could keep it from burning the fingers, without adding to the expense. Fifty cents is a pretty close price. Perhaps a shield might be added, so as to let those use it who care to. We shall see.

## A STORY ABOUT PEACHES.

FRIEND FRADENBURG'S ENTERPRISE.

**H**ERE is a little buzz, but not from bees. About the middle of last month I made preparations for, and thought I would evaporate a few peaches; and in order to do so I found I had to have help to prepare them for the evaporator; that is, to split them open and lay them on racks or frames. To do this I gave out word that all who would might come, and they did come. Several women and young ladies, and the school-children; any one who was large enough to cut a peach open and take out the pit, could earn a few cents every evening; and as I paid by the piece, they could work as long and as fast as they wished. But right on the start, trouble began, and it was where to find room for so many little juvenile workers. As I had no building or shop suitable, up came the parlor and dining-room carpets, and every nook and corner turned into a work-shop, which made my house resemble a bee-hive in clover time. Each one seemed to vie with the other to see who could make the most. Many of them earned the first pennies in their lives; and as the days rolled along, the peaches kept rolling in, until my work-shop and yard had piles and piles of the fruit, waiting to be dried. Every barrel, box, and basket, fairly groaned with peaches; it was peaches, peaches, peaches, everywhere. I often thought of you, with your rush of business. I was up day and night, scarcely getting more than 2 or 3 hours' rest in the 24; and as a result, I find I have about 3 wagon-loads of peach-pits, worth as much as so much coal for fuel, and 5000 lbs. of first-class evaporated unpeared, and 1000 lbs. of pared peaches, the product of over 600 bushels of the green fruit.

A. A. FRADENBURG.

Port Washington, O., Oct. 17, 1883.

Friend F., I am always interested in any industry that furnishes work for women and children. I am glad to know that you had such a crop of peaches. Very likely some of our readers can use the peach-pits you mention, and may be your evaporated fruit also. While I think of it, I wish you would send us samples of the latter. Now just go on, friend F.; study up some other industry to keep the idle ones out of mischief, and God will bless you in so doing, provided you do it all for his honor and his glory.

## THE SOLAR WAX-EXTRACTOR, AND SOME OTHER MATTERS.

SOME FACTS FROM THE NEIGHBORHOOD OF FRIEND AUGUSTUS CHRISTIE.

**I**N reading Sept. GLEANINGS I was much interested in friend O. O. Poppleton's solar wax-extractor, and I thought it would be well to give you a description of the one we use here. Make a square vessel of galvanized iron about 30 in. square and 20 in. deep. At about 5 in. from the top, put in cross-bars of 3-16x $\frac{1}{2}$  iron, edgewise; fasten by means of rivets through the sides of the vessel. This vessel, or iron box, should flare so as to let the wax rise easily; the bars should be about 7 or 8 inches apart. Fit a perforated zinc sheet inside of the vessel, resting on the iron bars, to support the combs or cappings to be melted. At the top fit on a frame outside of the iron box, and let one side rise about 3 or

4 inches, to shed rain. Nail tightly the top of the iron vessel to the inside of the bottom of this frame, and cover all with glass, having no cross-bars to obstruct rain or form shadows. Fit the sash tightly, that no heated air may escape and thereby prolong the melting process.

TO OPERATE.

Remove the cover and throw in cappings or comb; and if the cappings are to be melted, the honey will keep the wax from sticking to the vessel; but if combs are to be melted, it will require a little water in the bottom; and when melted, fill again, and so on. This, as friend P. says, works admirably, if the weather is suitable; but the summer has been cool here—at least the latter part and fall. You will notice this has one advantage, at least, and that is, that the sheet containing the matter to be rendered shades the melted wax, and thus prevents the hardening of which friend P. speaks. I have made some improvements recently, so that the wax-holder can be placed in a warm place where the sun will best strike it, and handles may be put on the sides so it can be carried from the honey-house to any desired place at any time of day, thus avoiding the trouble of bees in handling exposed cappings.

But now let me tell you of another—the “Boss,” as we call it, for we think it the best ever used, so far as we have read and have seen used. I made and operated it this season for my brother-in-law, Mr. Aug. Christie, of this place, by whom I am employed; and at the request of friends W. S. Van Meter and E. S. Foulks I submit it to you, hoping it may be of use to you and our bee-loving friends. Inclosed find diagram roughly sketched; but perhaps it will give you an idea of its form and attachments. I will send you a small cake of wax, a sample of its work; we have about 500 lbs. of such wax, and more to extract.

ROCKY-MOUNTAIN BEE-PLANT.

In this section there is considerable Rocky-Mountain bee-plant, brought here from Colorado by one O. B. Smith many years ago, and it yields abundantly. The honey is light, and has no unpleasant flavor, although a little different from others. One year ago last August there was a patch of it growing at the corner of the house, and we spent many a half-hour pleasantly, watching and timing the little pets as they licked the drops of nectar that exuded from the under side of each tiny flower, and in many instances three of them would make a load for a bee, and away he would go to the apiary; the exact time that it took the bee to load, I have forgotten, but I think from 1 to 1 $\frac{1}{2}$  minutes. The nectar began to flow at about 4 P.M.; and as we were watching and noticing how anxious the little fellows were to get their loads, some would cling to the flowers, benumbed all night, until the morning sun would limber them up, and then away they would go, and carry with their load the news of the abundant field of harvest. The idea occurred to me, could we not sow 10 or 15 acres of this plant about our apiary, and put an electric light in the center, and thus get our bees to work day and night, and thereby save that which must go to waste during the night.

But, let us talk of that which is practicable. It occurred to me that the above plan would require a fire, also, in the latter part of Sept., to warm by. Mr. Christie intends to cultivate a large field of it next year, and I believe it will amply pay any one to do so. I have about 40 lbs., some of which I in-

tend to sow, and the remainder I will sell to those wanting it, at \$1.00 per lb. To cultivate, it should be sown on rich mellow ground in fall, that the seed may freeze, and I should sow in rows, and cultivate in spring, to keep the weeds down and give it a good start, and the ground will seed itself after that. It is not an obnoxious plant, as it is easily destroyed.

SKUNKS EATING BEES; SEE PAGE 608.

Is it a common thing for skunks to eat bees? Yes, friend Bull, it is. In two of Mr. Christie's apiaries we have been greatly annoyed by them, and another, I remember, not far from here.

F. E. BULLIS.

Smithland, Iowa, Oct. 10, 1883.

Thank you, friend B., for the many facts you have given us. I would suggest, in regard to the solar wax-extractor, that it be located in some point protected from prevailing winds, although admitting the sun freely. An enormous heat may be obtained by preventing the hot air from escaping, and accumulating, as it were, the rays of the sun. I have often wondered why the heat of the sun is not utilized to save fuel in warming houses. I am sure there is a great field open for discovery. By means of mirrors, or even bright sheets of tin, the rays of the sun may be concentrated on a single point so as to give almost any desired temperature. I once collected all the looking-glasses I could find in the house, and fixed them so that they cast their reflection on one single spot, and I tell you it very soon began to make things smoke. For melting wax we do not need a very hot temperature.—I would explain to our readers, that the Boss wax-extractor described by friend B. is substantially the arrangement we now have in use, to be worked by steam; namely, a wire basket hung on a large barrel or cask, with a jet of steam playing on the under side of the basket. Where one has steam, this is doubtless ahead of all other methods.—It seems to be now well proven that skunks do devour bees, and therefore it will behoove our friends to look sharp whenever they notice the characteristic scent in their apiaries of a morning.

### THE CRYSTALLIZED HONEY - DEW OF OREGON.

FRIEND BROOKS REPLIES TO THE QUESTIONS I HAVE PROPOUNDED ON PAGE 541.

**N**OW for questions about the crystallized honey-dew. 1. The number of trees exuding this sweet can not well be estimated. Our forests here are evergreen, and the fir is the principal timber. In the vicinity where I gathered the sample sent you, I should say there would be a hundred trees to the acre. It is in spots, or on occasional limbs on the tree; and it also is in spots as to locality. This belt of country is situated in the foot-hills of the Cascade Mountains; and how far it may extend along this range, I could not say, but I suppose for many miles.

2. The reason I do not locate my bees in the midst of this fountain of sweet, is, that the bees that are there do not seem to make any more honey, nor nearly as much, as where mine are located now; besides, I am only a little to one side of the midst now. As singular as it may seem, I did not see a single bee

gathering the sweet from those trees, though others claim to have seen them at work briskly, where flowers were scarce. From watching my bees, I conclude that they don't work on it when honey-dew of any kind—liquid or crystallized—is abundant, for the flowers are then rich too.

3. This honey-dew, in its more liquid state, is quite common in portions of the State; that is, every good honey year, or, say, 4 out of 5 years. It makes its appearance in dry seasons about the middle of June, and lasts about two months. Rains wash it all away. The first that came under my observation was in the summer of 1881; following years, 1882 and 1883. So I think it is not unusual. I saw it crystallized on the fir only, except as it dripped to the plants beneath, and hardened there.

A SUGGESTION IN REGARD TO USING SECTIONS THAT HAVE SHRUNK.

Friend J. N. Scranton (Sept. JUVENILE, page 581), why, that's just the "racket." Get the seven frames all shrunk so that there is one inch space left after they are all in, and just drop in a ½-inch division-board, and key up to that; that will give you lots of room to take out the first frame of honey, and the key to the rest. All of mine are so.

Silverton, Oregon.

E. S. BROOKS.

### AN INVALID'S REPORT.

616 LBS. OF HONEY FROM A SINGLE COLONY.

**I**HAVE been a subscriber to GLEANINGS for five years, and I think I owe it to the magazine, and its editor, to let them know how much benefit bee culture has been to me.

I have been an invalid for the past seven years, and have had to lie down the greater part of each day all this time. I have been able to read only a very little, but always have every article in GLEANINGS read to me.

In the spring of 1878, my uncle gave me two colonies of black bees in box hives, and they have increased steadily, until now my brothers and I have 43 colonies, all in Simplicity hives. I have taken almost all the care of them until this summer, although I have had some help in the busy seasons. Last spring the apiary numbered 21 hives; and, not feeling able to have the care of so many, I divided them. I took charge of 6 hives, and my brother the remainder. The first three seasons they were in box hives; since then we have been Italianizing them, and transferring into Simplicity hives. We have never purchased any supplies for the apiary until the bees had first earned the money to pay for them. I do not know how I could have got along all these years without the bees and GLEANINGS to interest me; they have occupied most of my time and thoughts in the summer time, and also, to some extent, in the winter. I have had many a discouraged hour with the bees, and many a time have been tired out working with them; but on the whole they have been a great pleasure to me, and, I think, a benefit to my health. I have never seen any of the modern improvements in bee culture, except our own. I was first led to subscribe for GLEANINGS by the advertisement in the *American Agriculturist*.

I have given my report from time to time, and now will give this season's report. I began this spring with six colonies, as I have said; most of them were in fair condition, but two were very

weak; one of these was devoted to queen-rearing part of the summer. They have increased to eleven good colonies, and have made 1500 lbs. of extracted honey, 630 lbs. clover, 425 lbs. basswood, and 445 lbs. fall honey. I fed them 162 lbs. of granulated sugar in Sept.; this, with the honey they had left, makes them, I think, an abundance of winter stores. My best colony gave one swarm and 476 lbs. of honey.

My brother has not finished extracting yet; but his yield will not be quite equal to mine, although his best colony gave one swarm and 616 lbs. of honey. These two best colonies are hybrids, their queens are sisters, and were our best queens last year; they were raised in Aug., 1881, from a dollar queen purchased of W. Z. Hutchinson. We sold our white honey at from 10 to 15 c. per lb., and our dark at 7 and 8 c. per lb. I have just sold three hives of bees at \$6.00 each. I thank God for the bees and for GLEANINGS, and pray that Our Homes may do good.

G. H. POND.

Bloomington, Minn., Oct. 4, 1883.

Why, friend P., your report is wonderful, even if you are an invalid. But there is one point which you do not make quite plain. I presume you mean that these great yields came from the colony *and* the swarm; and even then the yield is immense. If, on the contrary, you do mean that a single swarm gave, besides the swarm, 476 and 616 lbs. respectively, it would be almost equal to any thing on record. Our great Texas reports, I believe, were from a colony that did not swarm. Will you please enlighten us on these points, and give us very full particulars in regard to the great yield—how often did you extract? how much at a time? how many combs did the colony have? and were they two stories, or spread out? chaff hives, or Simplicity?—I am very glad indeed to know that bee culture has been of benefit to you; and we thank you for the kind words in regard to GLEANINGS, and our work at the "Home of the Honey-bees."

#### FOURTEEN SWARMS FROM ONE "GUM," IN ONE SEASON.

AND ALL BY AN OLD-STYLE BEE-KEEPER TOO.

**I** WAS riding along the road one mile from home, and a swarm of bees crossed the road over me.

I watched them a little distance, and they settled, and I hived them in an old log gum I got from a friend near by. I carried them home that night, and kept them until March 30, 1882; they swarmed, and in two weeks five swarms came out from that one, and in about three or four weeks two more swarms came out of the same old gum; all were natural swarms, but were small ones, and during the summer I had seven swarms from the young ones—all natural swarms but one, all making 14 swarms I had in 1882 from one gum and the offspring. But they made very little honey. I was at a loss how to winter them, but I let them stay on their summer stands, and I came through the winter with six live stands, and this year I have had 14 swarms, all natural but two, and they are all very rich. I have got about 100 lbs. honey, and will get 75 or 100 more. I could have robbed more, but I was afraid of losing my bees this winter, not being experienced in wintering them; so when I get the

book I am ordering from you, I will study something about bees.

I am using a box gum, with racks, some six and some seven racks below, and honey-box above. Some are very slow about working above. I use no artificial comb, nor any thing of the kind, not being acquainted enough with bees to know what to do for the best.

I am a stranger, and my bee-swarming is a big tale, so I will give you some testimony; to wit, the names below: W. L. Harris, W. L. Cornelius, H. B. Turner, Robert Holland, Walnut Grove, Ala.

J. W. AMBERSON.

Walnut Grove, Ala., Sept. 5, 1883.

Friend A., you need not have taken the trouble to send along the names of your neighbors. Your story has the stamp of truthfulness on the face of it. The principal point brought out is, that you have a most excellent locality, and I hope that you will roll up your sleeves and go in for it next year with the aid of improved facilities for taking care of the bees and honey.

#### APIS DORSATA.

AN EXTRACT FROM HISTORY.

**A**LTHOUGH *Apis dorsata* has been for some time by general consent dropped, perhaps the friends may be interested in the following:

While reading Wallace's "Malay Archipelago" I came across the following concerning *Apis dorsata*, which I thought would interest the readers of GLEANINGS:

"The beeswax is the most important and valuable product of Timor. It is formed by the wild bees (*Apis dorsata*) which build honey-combs suspended in the open air from the under side of the lofty branches of the highest trees in the forest. I once saw the natives take a bee's-nest, and a very interesting sight it was. In the valley, where I used to collect insects, I one day saw three or four Timorese men and boys under a high tree, and, looking up, saw on a very lofty horizontal branch 3 large becombs. The tree was straight and smooth-barked, and without a branch, till at seventy or eighty feet from the ground it gave out the limb that the bees had chosen for their home. As the men were evidently looking after the bees, I waited to watch their operations. One of them fastened his cloth tightly around his loins; and producing another cloth, he wrapped it around his head, neck, and body, leaving his face, arms, and legs bare. Slung to his girdle was a long thin coil of rope; and while he had been making these preparations one of his companions had cut a strong creeper, or bush rope, eight or ten yards long, to one of which the wood torch was fastened, sending forth a steady stream of smoke. Just above the torch a chopping-knife was hung by a short cord. The bee-hunter now passed the bush rope around the tree, taking an end in each hand, the torch hanging just below him. Jerking the rope a little above his head, he set his foot against the trunk, and, leaning back, began walking up it. It was wonderful to see the skill with which he took advantage of the slightest irregularities of the bark to aid his ascent, jerking the stiff creeper a few feet higher when he had found a firm hold for his bare feet. It almost made me giddy to look at him as he got higher up from the ground. Still, however, he kept on with as much coolness as if he were going up a ladder, till he got within ten or fifteen feet of the bees; then he stopped and swung the torch toward these dangerous insects so as to send up the stream of smoke between him and them. Still going up, in a minute or two he brought himself under the limb, and, in a manner quite unintelligible to me, seeing that both hands were occupied in supporting himself by the creeper, managed to get upon it. By this time the

bees began to get alarmed, and formed a dense buzzing swarm just over him; but he brought the torch up closer to him, and coolly brushed those off that settled on him. Then creeping along the limb toward the nearest comb he swung the torch just under it. The moment the smoke touched the comb its color changed in a most curious manner from black to white, the myriads of bees that had covered it flying off and forming a dense cloud above him. The man lay at full length along the limb, and brushed off the remaining bees with his hand, and then drawing his knife cut off the comb at one slice close to the tree; and attaching the thin rope to it he let it down to his companions below. He was all this time enveloped in a crowd of angry bees; and how he bore their stings so coolly, and went on with his work at that height so deliberately, was more than I could understand. The bees were evidently not stupefied by the smoke, nor driven far away by it; and it was impossible that the small stream from the torch could protect his whole body when at work. There were three other combs on the tree, and all were successively taken, and furnished the party with a luscious feast of young bees and honey, as well as a valuable lot of beeswax. After two of the combs had been let down, the bees became rather more numerous below, flying about wildly, and stinging viciously. Several got after me, and I was soon stung, and had to run away, beating them off with my net, and capturing them for specimens. Some of them followed me for at least half a mile, getting into my hair, and persecuting me most unmercifully, so that I was more astonished than ever at the immunity of the natives. A bee settling on a passive native probably behaves as it would on a tree or other inanimate object, which it does not attempt to sting." A. G. MITTEN.

Fowler, Benton Co., Ind.

## MORE ABOUT SWARMS AND SWARMING.

### SEVERAL VALUABLE ITEMS ON OTHER POINTS.

**N**OW that we have nearly snowed under our friend Old Foggy with testimony about swarms going off without clustering, I wish to bring another matter before our bee-keeping friends. During the last four years I have had a great many first swarms come out and go back, and about  $\frac{2}{3}$  of them would lose their queens. How were they lost? A few, no doubt, were so heavy that they dropped after flying a short distance; but I think more are lost this way: I have, when watching the swarms at different times, seen two large ones, after flying around till all were out, a few with the queen would start off so quickly that the most of the bees were left behind who went home. In a large apiary, hives full, honey coming in freely, it often puzzles an experienced person to tell whether there is a swarm out or not, and it is very easy for a small lot to get away and we not see them. I was once watching a large first swarm, and turned away a short time, when, on looking for my swarm, they were gone; and had not the sun been shining, so as to see them plainly as they were alighting on a bush, over a quarter of a mile off, I should have lost them. They went so quickly that about half returned, leaving with the queen only a moderate-sized swarm.

In swarming, when one has the most of the work to do, they have to economize as much as possible in step-taking. Each section of my hive is 4-5 the size of the Lungstroth, and I use them two and three stories high. A section is light and easy to handle. I use them as you do the Simplicity, with loose bottom. It is an invariable rule, that they have a frame of open brood, and I set one end of the section on a 6-inch block, thus giving them, if a large swarm, room to cluster under the frames; and

with the burlap bag over them, cover raised up about four inches, I let them be till just before dark, and set them on their stands. All that have marked that location will return to the old hive. I don't think it takes me over ten minutes on an average to hive them. When I put them on the stand I raise the bottom about two inches, leaving the cover about 4 inches above the sack; if a large swarm, I give them three sections; so when given the open brood, plenty of room, and plenty of ventilation, out of about 100 swarms a year for a number of years, I never have had one leave. On our ranch, we — my better half and myself — think so much of the frame of open brood for swarms that we give a strong vote of thanks to friend Root for giving us the idea. I have every year tried a swarm occasionally without brood, but shall not do so any more, for I have satisfied myself that about one-half will leave. We are often asked, "How do you keep them from leaving?" The answer is, "Give them some open brood." We think it one of the best of the good things that have been given us lately. Friend Doolittle has remarked several times within the last few years, that localities differ, leaving us to infer that he thought bees worked differently in one locality from what they do in another. To that idea I take exception. I do not think his bees do any thing different from friend Heddon's; from bees in Texas, Australia, or any other part of the world, under the same conditions of room and ventilation, always excepting the different workings of the different varieties of the race. *Apis mellifica*, given the same conditions, works the same in all parts of the world.

### BEES FLYING 90 MILES AN HOUR.

As to the theory of bees flying 90 miles an hour, I have just had a good chance to test the matter. My bees have for some time been working on the refuse fruit of a large cannery, distant  $1\frac{1}{4}$  miles from the apiary, flying directly over the road, railroad close to road. Twice I have watched their flight to the cannery, a light breeze, just enough to stir the leaves, not more than three miles an hour, against them, sun shining so I could see them very distinctly; plenty of them flying about  $\frac{3}{4}$  of a mile from apiary; train running right under them, about 25 miles per hour, the bees flying down hill, empty, far enough from home to get under good headway; yet they went hardly as fast as the train.

Los Gatos, Cal., Oct. 1, 1883. S. S. BUTLER, M. D.

## DO BEES REMOVE EGGS FROM ONE COMB TO ANOTHER?

### AN ADDITIONAL FACT IN THE MATTER.

**O**N p. 538 of the present volume of GLEANINGS, a correspondent asks how the bees disposed of the eggs given them from which to raise a queen, he not having been able to find them in any of the combs in the hive. In foot-notes, the following reply is given: "I have noticed eggs being gone when they were given to certain colonies for queen-cells, but have never been able to explain it." Again, p. 566 Sept. JUVENILE, in foot-notes referring to Mr. Pond's inquiry, "Do bees remove eggs from one hive to another?" the answer is, "Bees do remove the eggs from the combs sometimes; but I have never been able to prove that they put them somewhere else," etc. As my experience embraces but

one instance of such a removal, and that, perhaps, not strictly corresponding with the experience given by the writers, I detail it, not as an axiom in the solution of the problem, but to show very conclusively that the bees do not *always* "eat" the eggs to get them out of the way.

One morning during the swarming season, in the latter part of June last, while looking after a second swarm of blacks that were hived the day previous, I found a dead virgin queen at the entrance of the hive, that had been brought out during the night, so it appeared; and surmising she had received injury when the swarm was hived, I gave the bees a piece of new comb containing eggs taken from a colony of hybrids about ten days old. The third day after the comb was put into the hive, I opened it to see if the bees had started queen-cells, and found the piece of comb nicely fastened, but the eggs had been removed. On further examination I found a fine young queen (the *fittest* survival, probably), and several sheets of comb nearly completed.

Not wishing to further disturb the bees, I waited a few days, after which, on looking the combs over, I found a small patch of capped brood. The queen had not begun to lay, but commenced soon after. When the swarm was hived I have no recollection of seeing any bees in it showing yellow bands, and I do not believe there were any such, for they came from a hive (box hive) of genuine blacks; but there is now, and has been since young bees began to make their appearance in the hive, a slight sprinkling of hybrids, some with two, and others with three indices of Italian origin. In Mr. Pond's operation, the comb containing the eggs was placed over the brood-combs, and a free passage to it provided for the bees from below. The eggs were removed; but as both colonies (the one from which the eggs were taken, and the one over which they were placed) were Italian, there was no way of deciding how the bees disposed of them. In my operation, the eggs were put into the brood-chamber in proximity to the cluster (as close as they could be without breaking it), and the proof evinced in the appearance of yellow-banded bees among the blacks comprising the major part of the colony appears to indicate very conclusively that those eggs were removed by the bees to their own combs, cared for by them, and in due time produced the afore-mentioned hybrids.

#### ONE-PIECE SECTIONS.

I find in my Oct. No. of GLEANINGS a very concise statement of Forncrook's patent one-piece-section claims. It embodies my ideas exactly; and as I have a section made by myself in Feb., 1878, that is a facsimile of Forncrook's, with the exception of the longitudinal groove, I think my claim is as good as his to the invention. When I "whittled it out" I had seen but one honey-section before—the kind used by the Hetheringtons, as I afterward learned.

Cumberland, Me., Oct. 8, 1883. J. F. LATHAM.

Friend L., your fact is a good one, yet I fear you are in error in one respect. You say your black swarm was a second swarm, and so of course it would have a virgin queen. Now, if Italians were all around you, this queen would most likely meet an Italian drone, and you quite probably have the kind of bees you mention, without their coming from that patch of brood. The case is a singular one. I have never known bees to move eggs in regular order so as to make a patch of brood somewhere else, although

we have many reports of moving eggs or larvae for starting queen-cells, and these queen-cells are often on their old combs.

#### REPORT FOR THE SEASON OF 1883.

FRIEND DOOLITTLE HAS STILL ANOTHER GOOD YIELD.

It will be remembered that I put in winter quarters, a year ago, 80 colonies of bees, 37 of which were to be wintered in the cellar, and 43 on their summer stands. Of those wintered outdoors, 32 came through alive, 20 of which were fairly good colonies, and the remaining 12 from weak to very weak. Of the 37 placed in the cellar, all came through alive, and 34 of them were good colonies, with but 3 weak ones, showing that, for a steady cold winter, the cellar is the best place to winter bees in this locality. Elm and soft-maple yielded pollen quite plentifully on April 14, so the bees were set out of the cellar, as it has been published that, when pollen becomes plentiful, was the right time to set the bees out, for we could then depend on warm weather. However this may be as a rule, it did not work this time; for in a day or two it came off cold, and we had two weeks of very cold weather. On the morning of April 30, Skaneateles Lake (16 miles long and 2 miles wide) was frozen over nearly the whole length of it, the mercury going as low as 18° above zero. This killed all the pollen flowers which were open, or near opening, and reduced our bees, as to numerical strength, greatly, especially those just out of the cellar. By sale of bees and queens, my number was reduced to 55 colonies, 40 of which I decided to work for honey, and the remaining 15 were to be used for queen-rearing, as they were too weak to be of much value to produce honey.

Our season has been a most peculiar one. About May 10 it came off warm, and remained so for about two or three weeks, when it began to rain, and it was rain, rain, nearly every day from then till about July 30, at which time we had about two weeks of dry weather, when it commenced to rain again, we having but two or three dry days at a time since. Besides, the season has been universally cold—so much so that corn was at least a month later than usual, the frost killing it before most pieces were ready to cut. Owing to this cold and wet weather, the bees were scarcely able to get a living up to July 16, although the fields were white with clover, and blossoms were plentiful on every hand. I had to feed about two to three hundred pounds of old honey, to keep mine along in good condition to take advantage of a flow of honey, should such happen to come, which thing happened on the morning of July 16; for at that time the basswood opened its flowers, sparkling with nectar, inviting the bees to a feast which they were very glad to accept. Although it rained nearly every day for the next week, still the bees would rush out as soon as a shower had passed, coming home a little later, so loaded as to be unable to reach the hive. As the basswood flowers are so shaped that they shed rain, it keeps the water out of the nectar, so the bees can work after a rain, when they could not do so on clover and other flowers, which stand upright so as to catch all the water. At the end of a week it came off cold, and for three days scarcely a bee ventured from the hive, for the mercury rose scarcely to 50° during the middle of the day. But when it did warm up, the bees were on hand again; and during the next week they

seemed to revel in honey to their hearts' content. By this time the basswood blossoms were dried up here at home; but still the honey came, and for 5 days more the combs in the sections grew as if by magic, from honey brought from the basswood on that hill 6 miles or more away, which you, Mr. Editor, and a few others, have tried to make us believe our bees never visited; or if they did, they did so to no advantage. On Aug. 11 the bees found the honey nearly gone on the hill, and by the 13th the end of the honey harvest for 1883 had arrived; for after basswood, the bees obtained scarcely a living (as buckwheat gave no honey), which makes the sixth year it has failed us. The result of our basswood yield proved to be 2388 lbs. of comb honey, and 1922 lbs. of extracted, making 4310 lbs. in all from the 40 stocks in spring, or an average of 107½ lbs. per colony. Our comb honey was sold to a man buying for a Boston house, at 16c per lb. for most of it, delivered at our nearest railroad station, and our extracted is selling readily at 10c per lb. Adding to our honey the sales of bees and queens, I find I have \$1021.30 as the net proceeds from my bees for the year 1883, notwithstanding the loss of bees during the winter, and the cold wet summer. As I have 80 colonies to-day in as good condition for winter as they were a year ago, I can safely give the amount above as my salary for one year's work, caring for 80 stocks of bees.

G. M. DOOLITTLE.

Borodino, N. Y., Oct. 15, 1883.

Friend D., it is certainly encouraging to hear that you have come out again with a fair crop of honey; and it enables us to say, when people tell us doleful stories about bad seasons, that there is at least one man who gets a good crop of honey, even during a bad season, and that he does it year after year continuously. Do you mean that you retail your extracted honey at 10 cts. per lb., or is that what you get for it in barrel lots? If the latter, the price is very fair; but if the former, I should think it is getting down pretty cheap.

## QUEER EXPERIMENTS IN WINTERING.

SOMETHING NOT MENTIONED BY VIRGIL.

**W**E have all heard how deadly pollen is for bees to eat in winter; and I had no very great inclination to kick against the doctrine; but then, "I wanted to know, you know." If a colony was very strong in numbers, and so protected from cold as to have but little trouble in keeping warm, who knows but they would winter with nothing else than pollen to eat? I am afraid I did not secure the conditions mentioned very well, but thus and so I did. A pit was dug in sandy soil, between two and three feet cube in size. Within upon four blocks, and with no bottom-board, was set one story of a hive. Eight combs were so spread as to fill the space designed for ten; and six condemned colonies of bees were shaken in higglety-pigglety to form an extra-strong stock. You see, it wasn't quite so naughty as brimstoning the bees—this spending them on an experiment. The frames of comb used had been run through the extractor, but were heavy with pollen which had been stored by queenless colonies. Three of the combs, however, contained a little honey, about 5 lbs. in all; so the bees could commence living on honey, and then learn to eat the other fodder. Upward ventilation was

left at one side and end of the top, and the rest of the top was covered with enamel cloth reinforced by a number of thicknesses of waste paper. A big sheet of tin arched above made sure against any droppings of water. A board cover was put on the pit, over which earth was heaped up. Another pit was tried the same way, except that all the combs were emptied of honey, and some dirty and partly soured liquid honey, tied up in a cloth, was laid upon the top of the combs. This work was done Oct. 26th and 27th, and on the 4th of April I dug in and found them—all dead as nails. The first colony had eaten all their honey, but only a little of the pollen. Some dysenteric excrement was found on the frames, but not very much of it. I "guessed" that the last bees had died in March some time. The second colony looked to me as if they had all perished in December. None of the pollen seemed missing, and there were no signs of any of the honey having been stored in the combs. The honey had gradually leaked down and wasted, probably. And still I'm not quite easy in my mind. Like the good man of whom I've heard my father tell, who was confident he could walk on the water, "I think I'll try it again."

Four more similar pits were dug, and furnished with substantial board covers, on which a big sheet of tin was also laid to keep out the rain. No earth was shoveled upon these, but the covers were propped up in mild weather, and let down in severe weather. This, you see, was a sort of compromise between outdoor wintering and cellar wintering, the hives being perfectly protected against wind, but only partially so against frost. For breathing purposes they had some of the time free outdoor air, and some of the time confined air. You kindly suggested last fall, friend Root, that a tile drain be laid, opening into each pit, for sub-earth ventilation. That would, indeed have been the proper way; but if I had waited for time to do that, the experiment would not have been tried at all. To occupy each of these four pits, one hive (just as it stood after the sections were taken off) was set in. Enamels and cushions had been put above the frames when the honey was taken, but the frames were not loosened at all. Now for the result. During the fearful ocean of slush we had in February, the surface water got a channel into one pit, and drowned the occupants. The others came out well—fully as well, I thought, as the average of those packed two and two above ground. The colonies in pits used a little the most honey, I think. With the addition of the tile-drain ventilator, I judge that this would be an excellent way to winter a small apiary. For a large apiary, the work involved in opening and shutting so many covers so many times would be a serious objection. When the covers are raised in mild weather the bees can take flight from the pits, and return again.

Two other pits were dug, and three poor, light colonies were put in and buried up "for keeps," one in one pit and two in the other. When dug up, Apr. 4th, two were dead and one living. The weakest in numbers had died of dysentery before eating half of their honey. The other defunct one also left some honey, and perished with dysentery. The surviving colony was weak, and dwindled out during the spring.

I had also three late swarms that inhabited holes in the ground, and had never enjoyed the blessings of a hive "at all, at all." Their premises may be described thus: A trench, about 18 inches wide by 3 ft,

long, was cut in the ground, across one end of which two pieces of old picket stuff were placed; and on the pieces, ordinary frames were hung. To guide the bees about starting to build, one frame filled with comb was hung in the center, the frames on each side of it having only starters of fda. Thus the swarm occupied one end of a covered trench while the other end was simply unoccupied space. The top was covered with boards, and on the boards earth was heaped up, except where a crack between two boards formed their entrance-way. The fall harvest had been poor, and they were light in stores; but I told them they must be prudent of their honey, and make it last, for I wouldn't give them any more. They had about 8, 9, and 10 lbs. respectively. This was not bad, considering the time they had had to gather it in, as two of the swarms were—domiciled—Aug. 15th, and the other Aug. 20th. When I dug in, about the middle of March, one colony had starved, and two had come through tolerably well. The colony that perished, and one of the surviving ones, had suffered some with dysentery. *During the cold part of the spring these hole-in-the-ground colonies built up much faster than the average of colonies above ground;* but when steady warm weather arrived, just the reverse was the case. I hoped greatly that so much room and coolness would prevent swarming; but, alas! it doesn't do any such thing. In preparing them for winter I suspended a division-board on each side of them, put an enamel sheet over them, then some waste paper, and then a sheet of tin. The cover was then replaced and earthed up a little more than before, but the entrance-hole was left open. Part of the time during winter it was drifted over with snow, and part of the time warmth from within kept a hole open. So I report that bees prosper well in holes in the ground, winter well, and swarm, just the same as any bees; but I have not yet hit upon a very convenient way to take surplus honey from them.

The experiment with the thirteenth colony was rather a botch, and perhaps it is not necessary to give the details. It was the strongest and best of the colonies tried experimentally; came through alive but weak, and dwindled away in the spring.

My figures last month got a little inebriated. Subtracting 13 from 130 doesn't leave 126 quite; it leaves 117; and as the odd one, of course, had to be packed alone, there were 116 instead of 126 packed two and two.

E. E. HASTY.

Richards, O., Oct. 18, 1883.

Friend H., I am very glad indeed that you have, by these experiments, given us considerable information on this matter of partially burying bees. I have for some time been well satisfied that chaff hives and other similar protections have the objectionable feature you mention in regard to holes in the ground, and that, while they protect from the severity of the weather in winter, when warm spring weather comes they deprive the bees of the warmth of the sun, and are too slow in getting warmed up; however, as they very shortly become a protection against the rays of the summer sun, on the whole we usually find a gain by protection. I have often thought of having the bees partially in the ground, thus saving them from the disastrous effects of cold winds; and I believe yet that your plan may be developed so as to be one of the best for wintering bees. In regard to that pollen matter, I wish you could

be sure that your bees that had almost nothing but pollen had lived until March, or even till February. Many times bees seem to get along after a fashion when the stores they consume are mostly pollen; but for all that, I believe I would rather they should get along without it until they commence raising brood.

A GOOD REPORT FROM NORTH CAROLINA.

ANOTHER ROUSING REPORT FROM A FOUR-STORY HIVE.

I COMMENCED the season with 21 weak colonies. I now have 42; have sold one, and gave one to my son; have taken 2100 lbs. honey—500 lbs. comb, 1600 lbs. extracted. I also have about 200 lbs. in the frame, ready to set in the hive if needed. My crop of honey is nearly all sold at 1 1/2 cts. per lb. for comb, and 10 cts. for extracted. I had none built in sections; my comb honey was made mostly in half-story frames, cut out in 4 pieces, laid in tin cans, and extracted honey poured over it till covered; it was very nice.

My crop of honey was all sourwood, except about 200 lbs. Myself and neighbors were astonished at the amount made by my little stock of bees. My best hive (spring count) made 316 lbs. extracted honey; another, which sent out no swarm, 260 lbs. extracted. From this hive, on the 13th of July I took 87 lbs., and on the 27th, 124 lbs. This was a 4-story hive. Does it pay? Let us see how profits compare with expenses:

23 colonies increase (\$5.00 per colony)	-	\$115 00
1600 lbs. extracted honey at 10c per lb.,	-	160 00
500 lbs. comb honey at 1 1/2c per lb.,	-	62 50
Queens sold	-	30 00
Total,	-	\$367 50
We will put labor and expenses at	-	67 50

Which leaves a profit of - - - - \$300 00

I see reports ahead of this, but I think this should satisfy an A B C scholar.

Friend R., I am under many obligations to you for your A B C book and GLEANINGS. They are worth many times their cost. I use the Simplicity hive; I made them by the directions laid down in the A B C book. I have been a bee-keeper for 25 years on the old box-hive plan. My crop of honey this season was worth more than all made in the 25 years. The Italians are far superior to the blacks, in my estimation. Their gentleness while being handled is one very desirable trait, and they gather honey at times when the blacks do not seem to find any. They increase much faster, and the only fault I have found with them is, they swarm too much; but that is not serious.

The flow of honey from the sourwood commenced June 24, and ended July 21. Since that, bees have been gathering enough to keep up brood-rearing. My bees are in good condition for winter, except a few hives that failed to store honey in the brood-chamber. I will say in regard to the sourwood as a honey-bearing tree, that we, in my opinion, have made a great mistake in clearing our lands for the purpose of raising tobacco; but we have more sourwood yet than bees. There were tons of honey lost this season for want of bees to gather it, in Eagle Mills township. Better send over some of your Ohio bee-keepers, and help us take care of our honey. Up to this date very little interest has been

taken in bee-keeping. But the time has come, I think, when the people will wake up to their better interests.

When I commenced hive-making and transferring my bees three years ago, some said it would never pay; others said I was crazy; but what a change my crop of honey wrought! Some can hardly believe the truth in the case; others would not, if they had not seen it with their own eyes.

#### TOBACCO.

Before I close I must tell you that I have quit the use of tobacco, after being a slave to it for 40 years; have not used any for seven months; am free from it; have no taste for the weed. The result is, I have gained 20 lbs. in flesh, and have my health better than in the past. I do not send you this for a smoker, but I feel rather indebted to you. By reading the Tobacco Column I found that others had thrown off the yoke, and that encouraged me to try; and by the help of God I am free. W. D. THARP.

Eagle Mills, Iredell Co., N. C., Sept. 24, 1883.

Many thanks, friend F., for your very kind words, and also for your rousing report from North Carolina. We have had so few large reports from the northern part of the Southern States that I have sometimes felt a little sad about it. But here you come, demonstrating that North Carolina—at least some portions of it—is all right; or at all events so far as her honey resources are concerned.

### HOW I DIDN'T DO IT.

#### CONTROLLING SWARMING, AND GETTING SURPLUS HONEY.

**W**ITH the editor's permission, I will tell the A B C class (of which I am a number) how my plans for getting a big crop of honey this year miscarried.

Last fall I had 23 swarms, all of which wintered fair. In the spring I concluded to work them all for surplus honey, and have as little increase as possible. They were in Roof's chaff hives (non-swarming hives, you know). Two of my strongest colonies, I prepared to extract from. The spring was very late, but the bees built up fast; and about the 15th of May I began to see a small cloud ahead, about the size of a swarm of bees. May 20 they commenced to swarm, and they kept at it pretty steadily until the middle of July, when the honey ceased very suddenly. Among the first to swarm were the ones I had prepared for extracting, by giving plenty of empty combs, one of them swarming without going into the upper story at all.

As my first lot of queen-cells did not hatch well (I think I injured them by shaking the bees off the comb when I went to cut them out), I laid a part of my trouble with after-swarming to not having laying queens to give the old swarms; and when I got some queens to laying, I thought my trouble was mostly over; but when a swarm issued, and I gave the old hive a laying queen, about half of them would keep her a prisoner until she consented to lead out a swarm, and cutting out the queen-cells made no difference. While I think of it, I will say that, when you cut out queen-cells, unless you know just when they are likely to hatch, cage them. When I was very short of queens I cut out three and laid them on my box; and before I could shut

up the hive, two of them hatched out and flew away; and although I waited for them a long time, I never saw them again.

#### CUTTING OUT QUEEN-CELLS.

As a sample of the way they swarmed, one colony of hybrids sent out three swarms; and when the fourth came out I thought I would try to stop their antics. I went to the hive and destroyed 13 queen-cells; and as I could find no queens I thought I had the best of them. I then went to the swarm that was out, and killed two queens, and they went back to the old hive. Just at night I went to see if they were quiet, and found 4 queens on top of the enamel cloth, sounding their war-bugles, and no other bees with them. I caught them, and next morning I found two in the same place. After that they came out three times more, and I killed five more queens, and that left the hive queen-less. My two best Italian queens led out swarms, although I had robbed them of brood until they had but two frames of brood each, and not many bees. Thus, you see, when the bees get to swarming, the rules of all the bee-masters fail. Now, I find, after putting back swarms and putting two together as long as I could make them stay, I have 50 colonies and 900 lbs. of honey in sections. There are a few lessons I have learned this summer, one of which is, to use no more drone comb in sections. I had drones raised in about 100 sections this summer. I use no separators, and had but 9 sections out of 1100 that would not pack in a case. Now, if any of the old hands can tell me how I should have managed under the circumstances, I should feel thankful.

#### THE BREAD-PAN FEEDER.

Friend Root, I see you rather condemn the bread-pan feeder which you used to recommend so highly. Now, I think it is the best, handiest, and cleanest feeder in use, and no bees get drowned in mine. I make a rack of narrow strips that will fit loosely in the upper story of a hive, and nail blocks under the corners, just long enough to raise it above the pan; fill the pan; turn back one end of the enamel cloth; put in the rack; put the chaff cushion on top of that, and tuck it down snug, and it will take a cold night to drive the bees down out of it. JOHN WOOLSEY.

Bedford, N. Y., Oct. 22, 1883.

So, friend W., after you had killed all the queens, and destroyed all the cells, five more queens hatched out. I guess you did not have on your spectacles then, did you? We never have the swarming mania in our locality, such as you describe, and therefore I could hardly suggest a remedy. When bees swarm with us, they almost always get honey as well; and so we have learned to consider swarming as a good omen.—I am glad to know you like the bread-pan feeder. It certainly is simple and cheap, and your improvement would be a fine thing, doubtless, in cold weather.

### HOW TO SELL HONEY.

#### SOME EXTREMELY SENSIBLE IDEAS.

**A**FTER reading a good deal about the great honey crop, I fear that some are afraid they will not get rid of their honey. Now I will tell you how I am selling my crop as fast as I take it from the hives, and could sell it faster if I had it.

For a sample, I take a quart jar. I put in three nice pieces of comb honey; then fill in with extract-

ed. This makes the honey look fine. I then take this in my hand, and go to the largest town, and small too, as well, or in the country. I go to private families, into places of business, and talk honey to everybody I meet. I take in all kinds of business places, except saloons. I went into a few of them, but did not have any success. I go right into the court-house to the lawyers, to the churches, etc. When I meet with men and ladies on the streets, "See that honey!" "Oh! isn't that nice?" etc., is about the way they talk.

Being out in the sun does not hurt it a bit, you know; but does it not look a little bit forward, to go right into a business place to sell a little honey? I think it is the best to take orders first, then deliver in a few days. I sell my customers just what they want, and deliver in two or three days. I am getting 60 cts. each for the 3-lb. jars; 20 cts per lb. for comb honey, and 15 cts. for 20-lb. stone jars, put up in the same way the quarts are.

This is the point: Put up your honey in nice shape, and take it right to your customers. I sold 18 lbs. the other day to a man in the city, who did not look at it — *he bought of me last year*. I am gaining customers all the time. They are coming from the east and coming from the west, and they all join together in speaking with praise. But I don't lay my armor down, nor think the victory won yet; I expect to go forward with a steady step.

*Later.*— My honey is all sold — 2000 lbs., and am buying more. I am going to spend the winter selling honey, and no one can tell how much I shall sell. For the last two winters I sold fancy goods to the ladies; but I think I can make more selling good honey.

want to thank you for the prompt way you have filled my orders this summer. J. R. LINDLEY.  
Georgetown, Ill., Sept. 20, 1883.

Friend L., I am much obliged to you for your extremely vivid and plain way of telling people how to sell their honey. Your article contains the real essence of success in any pursuit. It is to put your whole soul into it. You want nice honey in nice packages, so that you won't be ashamed to show it to anybody, even ladies you meet in the street, as you say, and then have every pound you sell just like it, and it would be nothing strange at all if folks gave you orders without even looking at it. Yes, that is exactly what a good reputation does for any one, in any kind of business.

#### HOW DO BEES RECOGNIZE EACH OTHER?

**H**EREWITH send you a translation from the German of M. Schachinger; and if you think it would interest the readers of GLEANINGS, you can make such use of it as you think fit.

It is surely a striking phenomenon, that so many thousands of bees that live in the same hive, and under one queen, and whose period of life in summer time does not exceed six weeks on the average, can recognize each other so quickly and surely as to be able to detect a strange bee, scarcely differing from themselves in shape, size, and color, that is unhesitatingly attacked by a sentinel and forced out of the entrance in a fierce encounter. The bees seem to make an exception to this rule (of making strange bees keep their distance), only in the case of very young bees; that is, those taking their initial flight, and happening to alight at the wrong en-

trance, and of those which, coming to the hive laden with honey or pollen, miss their own home because of exhaustion, inclement weather, etc., and are compelled to seek one elsewhere. This is readily granted them, and henceforth they become true members of the family which has adopted them; and should they, in their turn, become sentinels, they would undoubtedly attack their own sisters, in case the latter tried to force an entrance into the hive.

A personal acquaintance of the bees with each other we must deny absolutely, because of the enormous number belonging to a single stock, their short life in summer, and because all are rarely in the hive at the same time. Neither can color be a sign of mutual recognition: for bees to whom a queen of a differently colored race has been introduced do not molest the progeny of this new queen, this progeny having a color differing greatly from that of the first queen. We therefore have remaining, speech, and the sense of touch and smell, which may serve them as a means of recognition.

For a long time bee-keepers were of the opinion, that a kind of speech existed among the bees, and that, accordingly, a certain watchword (so to speak) enabled them to distinguish strangers from those belonging to their own hive. Of course, bees have certain sounds by which they express emotions, and cause themselves to be understood outside the hive; for instance, the vehement shrill cry produced by an angry bee that wishes to drive us from the vicinity of the hive soon attracts a number of sister-bees from neighboring hives, whose combined attack finally compels us to beat a hasty retreat. Similarly does the swarm know how to call its thousands of members together in a few minutes, by the well-known joyous call-note. But all these sounds, of which the human ear has been able to detect nearly thirty, and judge of the meaning, are such as are common to all the bees, and by which, it is true, they can express the most diverse emotions, but which can never serve as the watchword of a stock.

Others thought that bees recognize each other by the sense of touch, for they have often been observed to cross their antennae in the hive, as if in the act of communicating something to each other. This view has a strong claim to probability, with this modification, that the sense of smell also has its seat in the antennae, so that not the sense of touch, but that of smell, forms the means of mutual recognition. Now, if this same sense serves such a purpose, there must be in every hive a being that is capable of giving to all its inmates a peculiar and distinct odor. Without doubt we can consider the queen to possess this function, which, in passing hither and thither through the hive, gives to each and every bee the same odor, which act, as has been observed, takes place by the queen ejecting a fine fluid. This explains the fact that those bees, coming home honey laden, and whose odor is rendered less intense by flying through the air, and by coming in contact with so many flowers, can gain admittance even into strange hives, without being hindered thereat. The fact of their being loaded with honey is not the reason why the sentinel bees allow them to pass, but it is the neutralized odor, which prevents the sentinels from distinguishing them from the bees of their own hive.

If we take bees that have, in consequence of fear, annoyance, or similar causes, filled themselves with honey in the hive, and put them in the entrance of another hive, they will, in spite of their being loaded with honey, be attacked and pulled out without much ado; a proof that it is not the honey carried by the bees, but some other factor which determines the acceptance or repulsion of a bee. The young bees which are generally readily accepted by neighboring stocks seem not to be infected by the odor of the queen as much as the older ones, which accounts for their immunity from attack. In the case of other beings, also, youth enjoys a certain indulgence. Why, then, should bees be so cruel to *their* young? Robber bees that enter a strange hive to carry its stores to their own are at first violently attacked and energetically repelled; but if they are successful several times, they can thereafter enter and leave the hive untouched. They have, in all likelihood, been infected by the odor of the queen during their stay in the hive, and therefore can not be distinguished by the sentinel bees, which have probably soon accustomed themselves to the smell of the robber bees, because the latter generally enter a hive in large numbers.

The following, also, in itself a very striking fact, is easily explained if we accept the above supposition; namely, that bees from hives containing impregnated queens unite neither among themselves nor with swarms having unimpregnated queens; whereas the latter kind of swarms unite with each other most readily, and their queens quietly engage in the decisive struggle. It is probable that the unimpregnated queen ejects none, or very little, of the above-mentioned fluid, so that the odor of the bees which are with her is less marked.

Far from the hive, while gathering stores, bees are outspoken cosmopolitans, neither troubling themselves about their foraging neighbors, nor knowing envy; but they are impelled solely by their instinct to make the most of nature's treasures. At home they are jealous of every stranger; in the field, they magnanimously give way to each other.

A. H. STIEBELING, M. D.

New York, N. Y., June 6, 1883.

Many thanks to you, friend S., for your translation. Although you bring out several new and wonderful facts in this strange matter, I hope you will excuse me for saying that I can not as yet accept all the conclusions arrived at, in all cases. One fact in particular struck me the moment you mentioned it, as being true; and that is, that the bees of a hive can not possibly have a personal acquaintance with all the rest of the bees of that hive; they do not know each other by their countenances, if I may be allowed the expression, as we do. Neither do they know each other by the sound of their voices, because the bees of any one hive have voices in common with the bees of any other hive. They do not know each other by the hats and coats they wear, as we do. Then how do they know each other? I have been sorely puzzled on this same point, and I have sometimes thought that they detected a robber simply because he acted like a robber, and for no other reason, just as a sharp policeman will detect a vagrant or a tramp by the way the fellow acts. He may pretend he has some sort of business on hand, but it is a pretty hard matter to make believe you are a business man when you are not. So I have thought it might be with the bees. A robber may try to pretend that he belongs in a certain hive, and I think they do try to do this very thing; but it is a pretty hard matter to deceive the sharp sentinel. In answer to the query, "What are you doing around here?" the robber is never able to give any satisfactory reply. I think I have seen them take hold of other robbers, and make a pretense of acting as sentinels. But even in this they had a cowardly and sheepish way that was pretty sure, sooner or later, to turn attention toward them.

Now in regard to the matter of difference in scent. It may be that each hive has a peculiar scent or odor of its own that enables the inmates to detect any bee from any other hive; and it may be, also, that the queen gives this characteristic odor in the way you suggest; but it seems to me almost incredible, even though I can not give any other or better explanation, perhaps. In proof of your position, my good friend Schachinger, this occurs to me: A sagacious dog will scent his master's footsteps, even though a thousand people have passed along the same track—or, at least, I have been told so. Can any one tell me if the same is true? Take it along the busy street, for instance, and over a stone pavement, a thousand peo-

ple may be passing, and the dog's master is only a certain one among this thousand, yet he follows him unerringly. It just now occurs to me, that if each individual of the said thousand were in the habit of washing his feet every day, it might be a little more difficult.

Now, then, to go back to the bee question: Do bees detect robbers by the sense of smell, and no other way, or is it by behavior? One more point in the article above, I think, needs attention, and it is this: That whatever wonderful power or skill the bees possess, they do not learn it as we learn handwriting and language, for they live only four or five weeks; and yet, wonderful as it is, every bee in just these few short days is a perfect graduate in all the arts and sciences known to bee lore.

## Ladies' Department.

BEEs AND BEE CULTURE IN MISSISSIPPI.

**A**LLOW me to give you my experience in regard to bee-keeping. So much talk is going on about all the different kinds of bees, that it is difficult to say which are the best. For my part, experience has taught me that the native bee is always the best. My bees are neither blacks, hybrids, nor Italians; they are of an ordinary brown color, and are exceedingly large, and the queens are the most fertile layers I have ever seen.

Last fall I had 12 colonies, and they passed through the chills of winter, without my making any preparations whatever for them. But this I need not tell you, as you are perhaps aware of the kind of climate we have here. Orange-trees began to bloom about the 10th of February, and bees set to work in such a manner that I thought they were going wild. In they rushed, laden with honey taken from these blossoms, and bringing lumps of pollen on their tiny legs. I opened several hives, and, to my astonishment, there were hardly any bees in, excepting those that were discharging their loads of nectar. The queen would seem to be entirely deserted. Again, at night I would look, and (they being all at home) I found that there were bees enough to make ordinary colonies. Brood-rearing was commenced in earnest, and my first swarm issued on the first day of April. My yard being full of young orange-trees, I merely beat a tin can, and they alighted on a tiny branch. I would then get my hive, put it in the place where I intended for it to stay, and go and clip off the branch and carry the bees to their destined home, having before placed one frame of unsealed brood in the center of the hive, no more than 5 minutes' time being occupied in the whole operation. Sometimes they would alight on the trunk of some trees, and, if too high, I would stand on something, and with the smoker keep them off or make them march to some small branch where they could be more easily managed.

There were only eight of my colonies that swarmed, and from them I got twenty natural swarms. But by uniting and adding, I increased from 12 to 26 only. Not having hives enough, I placed them in the common box hives that are used around here. These four of my colonies gave me 3 swarms each, and the other four 2 each.

Now I will give some news about the eight first swarms I took. Each when hived was given one frame of unsealed brood; and before three weeks' time they had every one of the other nine frames completely worked, and either filled with honey, pollen, or brood. There being no more empty space, I had to resort to the extractor, and I took every drop of honey from them, and did it again in two weeks after, and they have their hives now crammed with honey. But I do not intend to rob them now, as honey is very scarce, owing to the extreme drought we have here. No rain for the last three months. I will wait till the fall crop comes, to extract.

In one of my swarms I had one frame that was sealed from top to bottom with honey, and it weighed 6 lbs. I have noticed in some, especially the strongest, that at the bottom of the hives were to be seen the minute pieces of wax that they let fall from their bodies, the mania for honey being so great that they did not take time to work it into cells. As soon as a cell was finished it was filled and immediately sealed; and when the last cell was completed it was sealed, and the frame looked like a sheet of white paper. This year's honey crop has been the largest we have seen for some time. Like yourself, I am a firm believer in giving unsealed brood to a swarm, and I have never had a swarm leave me when thus furnished.

MRS. M. R. BLAIZE.

Bay St. Louis, Miss., Sept. 28, 1883.

My good friend, I fear you have not had much experience with other races of bees. Although your bees did well in increase, we should hardly regard your description of the honey-flow as up to the average. Either your bees are slow, or the pasturage poor, I should say, if it took them three weeks to fill their combs, and then two weeks more after you had extracted every drop, as you say. During basswood flow our bees would fill their hives in two days, even if we extracted every drop; and with the aid of comb fdn. I should expect a new swarm to have their hive full of brood and honey, in one week or less. One day a good colony brought in 18 lbs. in our apiary, here where we have so many in one point that the locality is a little overstocked. Nevertheless we thank you for the very interesting report you have given us.—By having plenty of empty combs you will avoid this waste of wax which you speak of. The wax scales on the honey-board are often quite an item.

#### BEE-NOTES FROM FLORIDA.

You ask for bee-notes. Perhaps a few from Florida by one of your A B C class would be of interest. Oct., 1872, I got a three-frame nucleus of Italians. I did not know one thing about bees at that time, but I had ambition for years to have an apiary. The first swarm issued May 2d, and another May 12th. Then the first swarm cast one Sept. 7th, and now it has a fine queen-cell; also my original colony. The first swarm left the hive for three successive days, and we had all sorts of trouble with them, but it was the first swarm I had ever seen, and I was determined to keep them, so I put mosquito netting over the hive, and kept them in till after sundown. Then every thing that contained water had a ring of bees around it, and I did not have any more trouble with them. This has been a dry, unfavorable season, I

think; and as I did not want comb honey, I have filled all the frames with comb so as to be well supplied when I get my extractor, which I order with this. I have taken only about 25 lbs. from them, but hope to have a better report next year. There was no day last winter, unless it was raining all day, but that they were at work. I attend to them entirely, receiving assistance only from my husband, in swarming and in hive and frame making.

MRS. BELE McMAHAN.

South Lake Weir, Florida, Oct. 3, 1883.

#### SWARMING ON SUNDAY, ETC.

Has any one found out a sure and easy way to keep bees from swarming on Sundays, when run for comb honey? I want to keep bees, but I don't want to stay at home on Sundays all summer. Will Mr. Doolittle tell us *exactly* how he manages when his bees are working in sections, and swarm? Neither the old stand nor the swarm will be strong enough to work in sections, and perhaps the best of the season may be over before they are ready again. I have tried Mr. House's plan of giving the swarm most of the bees and brood from the old stand, but they would generally swarm out in a day or two again.

MRS. M. A. SHEPHERD.

Barry, Ill., Oct. 1, 1883.

If I am correct, my friend, Mr. Doolittle's plan of managing an apiary on Sunday is to stay home from church and look after them. But as I have said before, I do not believe I could feel really satisfied with any business that would keep me away from church.

## "Forgettery,"

Or Department for those who don't Sign Their Names, etc.

ENCLOSED please find \$1.25 for cloth-bound A B C. Better send it per express at my expense, as I do not know what amount to inclose for postage. I also inclose \$1.00 for GLEANINGS. Kindly send invoice for the book, so that I shall have no difficulty in getting it past the customs.

Yours faithfully,—

Highgate, Ont., Can., Sept. 10, 1883.

You observe how careful our friend is to tell us about "passing customs," and even then signs "yours faithfully." Now, Mr. Whatsyourname, we have not any doubt about the "faithfully," only we wish you would be a little more faithful to your own interest—enough to say who you are. After our friend had waited about 20 days he writes again as follows:

I inclosed the cash for A B C and GLEANINGS over two weeks ago, by registered letter to you, and as yet I have heard nothing in reply. Did you receive the money, and why the delay? Please kindly say by return mail, and greatly oblige—

Highgate, Can., Oct. 2, 1883.

W. J. SOULES.

This time he uses a printed letter-head with his name and address all printed plainly, and signs it besides. From this it appears that folks who do have their names printed plainly on their stationery, sometimes forget and use stationery that does not have it on.

## Heads of Grain, From Different Fields.

### YOUNG QUEENS LAYING DRONE EGGS.

**D**ON'T your young queens lay drone eggs? Why, you are surely behind the times. Over one-half of mine did this year. I have a young Italian queen that mated with a black drone. She filled all the drone-cells she could find in the hive, and they hatched out drones too. She is not a poor queen either. I have another "dollar" queen that I bought from you that lays drone eggs. I have a beautiful queen that I bought from J. T. Wilson that raised a lot of drones. She was a young queen too. By the way, this is the best queen in the apiary. This was besides what queens I raised myself.

Friend D., I rather think you must have a pretty good locality, to give your young queens such encouragement as to cause them to lay drone eggs the first season. I knew it sometimes happened, but I did not suppose as often as you mention.

### HOLY-LANDS.

I have a hive of Holy-Lands, and I like them too. I can lift the frames out without smoke (if nobody is around). They are great bees to rear brood. Why, it makes my hair stand to see the way that they use up frames of honey. In regard to quietness, I think they are about the same as the Italians. If any robbers hang around, they soon get their "necks jerked."

I believe I rather agree with you in regard to the capacity of Holy-Lands to use up stores. They raise brood at a terrible rate, but it takes lots of provisions to keep them going.

### ROBBERS.

What kind of bees do you find to be the worst robbers at your place? The worst hive I have is the gentlest hive of Italians. I can work with them without smoke, and they are very "yallar." I can't open a hive but they pitch into it. It seems to me the quieter a hive is, the worse it is to rob.

With us, by all means the worst to rob are the blacks, or those having just a little Italian blood.

### PACKING BEES.

I am packing my bees at present too early, am I not? Well, it doesn't matter; better early than never. I guess I will pack them all at present, if I do not change my mind; but the Holy-Lands, I expect they will break me up buying sugar for them. Well, if they live through, I'll let you know how much honey they *don't* make. I want you to tell us how to pack 185 colonies of bees so as to lose only 100 of them.

I do not think it too early to pack the bees after they have stopped gathering surplus. In fact, we have ours packed the year round.

### METAL-CORNERED FRAMES.

W. Z. Hutchinson is right about metal-cornered frames. This is my reason for not liking them: They make the bees' feet cold when they walk over them. You have so many colonies, I suppose you don't care; but if you had six hives, more or less, as I have, you would not want any of them to get their feet frozen.

Our bees are not in the habit of standing

barefooted on the metal corners when the weather is cool. They draw into a compact cluster toward the center of the combs, and a bee has no business around the metal corners, unless the weather is warm enough for him to look them over and see that no propolis is needed, and that there are no moth worms to be dug out.

### CANDYING HONEY.

I put some very thick honey into a can that had a little candied honey on the bottom, and it has all candi-d. I put some of the same honey into a clean can, and it shows no signs of candying yet. Now, here it is; if anybody wants candied honey, let him put some candied honey in nice thick honey, and it will candy. I don't expect it will if you want it to, though.

JOHN DALLAS.

Sharpsville, Pa., Oct. 9, 1883.

I have for a long time been aware that honey would often keep clear and limpid until it got a little start in candying, and then it would go all at once; and I have also seen a little candied honey start a big lot, just as you say. Thank you for the important items you have given us.

### HOW THE DROUGHT AFFECTS THE BEES.

One of the *N. Y. Tribune's* reporters interviewed an old farmer in regard to bee-keeping. Here is what he was told:

"They've done nothin' but loaf round the hives or fight an' rob their neighbors for the past two months. And they're as ugly and hateful as all tarnation. We dassent touch a skip to take out any honey. 'Cause the robbers'll be out in a jiffy, and they'll fight and kill each other by the hundred. Do you see that little critter there buzzin' round that hive? Well, that's an Italian, and he's a robber. And there comes a Cyprian bee too. Both mean mischief. They can whip the native bee any time in a fair stand-up fight. They're constantly robbing the native bee, but a good many g't killed for their pains.

"Why are they robbin' of each other? It's 'cause they've nothing else to do. When flowers is plenty you don't see much of such work. Then they're bummin' and singin' round and as happy and contented as an oyster, but now the mischief's to pay with 'em. Take that, will you!" and the man struck down a Cyprian that was buzzing and dipping around in front of a hive and threatening to enter at the first opportunity.

"There's a weak swarm in that there hive that I guess I'll have to stick a match under to save it. Queer, an't it? Killin' 'em to save 'em! But it's got to be did. 'Twon't pay to keep 'em and feed 'em fifteen or twenty pounds of honey this winter, and then maybe not pull 'em through to spring. There's several s'ich colonies. They swarmed late, and some on 'em haven't made a pound of honey since. They made a mighty poor beginnin' in the world, and might better never sot up housekeepin' on their own hook at all."

### FRIEND MALONE'S REPORT FOR 1883.

Bee-keepers generally say this has been a bad season for bees; but I can't see it in that light. My bees have done well for me, with the exception of five swarms that I ran for comb honey; 20 that I extracted from have given me 2200 lbs, and 1000 in the hive, ready to take, I think at least 1000 lbs. more. Everything is killed by frost, and I am a little afraid to extract till it gets colder. Lots of my bee-friends come and buy honey from me, and want to know why it is that I can get honey when they can't. I tell them that it is the Cyprian-Italian that is the coming bee, and some of them begin to believe what I tell them now, though they used to tell me that I had the bee-fever, and would believe just as much as they wanted to. The five that I ran

for comb honey nearly failed; the five best I ran for increase, and increased 17; this makes 47 (I will sell 20 if I can). I have adopted a plan for wintering, and have succeeded well so far; and if I succeed as well for three more winters, then I shall begin to think I can winter bees.

#### COMB AND COMB-BUILDING.

One thing I learned this season that I have never heard mentioned in the bee-journals, and that is, how the bees get the wax to build their comb. I had a swarm working in a 1½-story Langstroth hive, with a honey-board and the old-fashioned boxes on with glass in one side. I put starters of comb in the boxes, and the bees went to work. When they got the box nearly full I took considerable time watching them work. I have a magnifying-glass that draws the bee as large as my thumb. This gave me a good chance to see what they were doing, and how they did it. I could see the field bee give his load of honey to the young bee, and could see bee No. 1 go to bee No. 2, and with his head he would raise No. 2 up and get his load of wax, then hurry back to his place on the comb, and pass on his load of wax to the cells. I saw the comb-builder go to four different bees before he got his load of wax. The last one he went to, he seemed to get mad, and tried to sting him. No. 4 curled up, then straightened out, and No. 1 got his load. I feel pretty sure that drones build comb, and what I saw in one of those boxes that had drone comb in compels me to say at least they help. I know that comb-building by drones is denied by our best apiarians; but if the drones were watched closely, they would get more credit, I think, than they generally do. At some future time I may explain what I saw. Tell me if you ever saw bees get the wax in the way I have mentioned. Please tell, if you can, whether the black bees can make whiter comb than the Italians, or not, when working from the same flowers. I can't see any difference in color, but I can see a big difference in the amount of honey gathered, in favor of Italians.

Oakley, Ia., Oct. 8, 1883.

WM. MALONE.

Our readers will remember friend M. as the one who gave us the wonderful report about a year ago. We are very glad to know that he continues to be successful. — In regard to the comb-building, and the part the drones have to do with it, I believe we shall have to decide pretty generally that friend M. is mistaken. He saw the bees go around for wax to other bees, without doubt; but if he intends to carry the idea that this wax was carried in from the fields, he is surely mistaken, we think. The wax scales which exude from between the rings of the body are, without question, the source from which wax is obtained; and if he will again look with his magnifying-glass he will see them picking for these scales. Pollen is often taken from the legs of field bees as soon as they bring it in, and doubtless he has got the two things mixed. Friend Carroll has declared that drones assist in comb-building; but until older and more careful observers shall be able to see something of that sort, I presume we shall have to think they are mistaken. No offense intended toward friends M. and C.; but drones have been very carefully studied by those who have made it almost the business of a lifetime, and the general decision is, that they do no work of any sort whatever. They are simply drones, and

nothing but drones. — I believe it is generally agreed that black bees do make whiter comb honey than the Italians; but it is also agreed that the reason is, that the black bees cap the cells of honey before they are quite full, while the Italians fill the cells completely full, making a solid tight job of it. The unfilled cells look whiter on account of the air-space between the caps and the honey.

#### SOME FACTS (?) ABOUT BEES.

Here are two facts I have seen nothing like about bees. A reliable neighbor tells me, that last spring a swarm of bees passed over him; he and another man gave chase, and soon saw them approach and join an immense cluster of bees on a tree. They cut the tree and divided them, putting them indiscriminately into three empty hives, which they filled to overflowing. Next day there were found to be more bees than could work in the three hives, and two other hives were filled, making five, and they were taken indiscriminately, without regard to queens, and all five did well. No brood or comb was supplied any of them at any time. There was an old gentleman with 50 or 60 hives near by, who for years has given them no attention, letting them swarm and go to the woods when they liked. He is near 80, and without help. I suppose some dozen swarms had settled there with their queens.

#### BEES AMONG THE LIMBS OF A TREE, WITHOUT A HIVE.

Last Dec. a young man was in the woods hunting. Observing something peculiar in a scrubby tree, he examined it and found it was honey-comb securely built among the limbs and vines. He cut it down and got a fine chunk of nicely capped honey. The bees were an immense swarm, and he is of opinion they would have wintered there with no protection but their comb.

J. H. BURROW.

Lynnville, Tenn., Oct. 9, 1883.

Friend B., no doubt your neighbor who tells you the first fact is reliable; but either he or somebody else has made a mistake, I should say. Five swarms might easily cluster together; but when they come to be divided, without finding the queens, and a queen happened to get into each of the five divisions, it would be something quite improbable, if not impossible. Your other fact is nothing particularly new, and the bees might possibly have wintered, provided they were very strong, and had an abundance of honey.

#### HOW TO GET COMBS BUILT CLEAR DOWN TO THE BOTTOM-BAR.

I have thought a good many times, that if the bees would build their combs down to the bottom-bar it would make it much more solid in the frame, and would therefore be much better for extracting. Well, I have found out how to take advantage of them, just a little, by putting the foundation down to the bottom-bar, and leaving the space above; and as they don't seem to like the idea of having the space left above, they go to work and build up, and so hereafter I shall put all my fdn. in, in that way. I also want to say a word with regard to new swarms leaving their hives. Some who have given their experience claim that a new swarm will not leave, if given eggs and uncapped brood, and others that this will cause them to leave. Now, I claim that there will be exceptions to both these rules. I

think in most cases, if eggs and uncapped brood are given them, they will remain and go to work satisfied. This has been my experience for the last eight years. I do not think the brood and eggs will cause them to leave; but they have in all probability selected a new home, and have made up their mind to emigrate to it. I had a case this past summer, somewhat analogous, and will, I think, throw some light on the subject. I prepared a double hive in the spring, and put two good colonies into it with perforated tin between them, to experiment a little in regard to heat. The bees could pass from one end of the hive to the other, at the top of the frames and under the cloth. They worked along very nicely, each in their own end of the hive, until one colony lost their queen, and then raised another; but she was lost; and by this time they had no eggs to raise another, and their brood soon all hatched out; and before I was aware of it they had gone into the other end of the hive, which led me to the conclusion that, if I had given them eggs, or, at least, eggs and uncapped brood, they would have remained in their own end of the hive. Now, as a *rule* I think it is the safest plan to give them eggs and uncapped brood. This has always been my custom, and I have never had a new swarm leave; and I shall continue it until, by actual demonstration, I find them leaving on account of the eggs and brood.

G. T. WILLIS.

Hoopeston, Ill., Oct. 2, 1883.

Friend W., if you put sheets of fdn. right down against the bottom-bar, without having the frames wired, I should think you would have bulging of the combs. May be, however, you have improved so much on our fdn. of late that it will answer to fill frames close to the bottom-bar without wires. How is it?—Two colonies of bees can be kept in one hive, provided it has a pretty wide entrance, and brood is kept in each side to hold the two clusters separate. It seems to me it is well settled that brood holds bees where they won't stay without it.

FROM AN A B C SCHOLAR.

I have handled bees since March, 1882. I bought 4 stands in old box hives, and transferred to Langstroth frames. I use full sheets of fdn., and increased to 16 stands by dividing; raised 12 queens, and lost but one in fertilizing. The year 1882 was a poor season in Southern Ohio, and my surplus was but 100 lbs. One thing I learned in building up nuclei; and that is, not to give them fdn. too fast, unless the flow of honey will keep them booming. When winter came I had an average of 6 frames to the stand, well filled, spreading the combs so as to leave two spaces in center, at least; cut passages in combs; put in division-boards, and packed with chaff; placed 3 strips,  $\frac{1}{2} \times \frac{1}{2}$  inch, across top-frames; used two thicknesses of outside coffee-sack for cover; put on plenty of chaff; placed on the cap, which extends down to the bottom of the stand, making a double-walled hive. I left them on their summer stand, packed, till apple bloom; came through the winter without loss; built them up to nine frames each; increased to 41 by natural swarming. I have taken 750 lbs. of comb honey and 200 lbs. extracted; sold at an average of 16 cents per lb. My bees are blacks and hybrids, and the comb honey is much nicer than that made by the pure Italians. I used the

SHEPARD SWARMING-BOX.

I can hive with it in two minutes. Give them one

sheet of brood; put it in the shade, and no absconding. If two or more swarms cluster together, place a newspaper down in front of the hive; shake out the bees, and catch all queens as they go in. If you fail the first time, continue until you get them all. Then divide the bees; give them a little smoke to drive them in; give each stand a queen. This never failed with me this season, and I lost no queens. My honey report would have been better by one or two hundred pounds, if I could have had supers when I needed them. I would advise every one to read up on apiculture, even if he has but one stand. Box hives did not give 5 lbs. of surplus.

Ripley, O., Oct., 1883.

MASON GRIFFITH.

## THE HONEY SEASON IN WESTERN VERMONT.

It has been better than an average, with some peculiarities. Honey began to come in in appreciable quantities by June 5th, from raspberry. White clover was in blossom before locust, and whilst raspberry was still in bloom. Basswood lasted from July 12th to 25th; and in sections where there was plenty of smooth sumac, honey came in quite plentifully till Aug. 1st. The season was wet and cold, and bees were kept at home much of the time by rain. There was hardly enough fall honey to keep up brood-rearing; and although buckwheat was plentiful here, there was no honey in it. My colonies averaged 15½ lbs. of comb honey, in one and two pound sections, spring count. Swarms have more than doubled. The box-hive men are out of luck as usual. Bees swarmed so much they would not work in boxes, and their only chance for honey is the brimstone pit.

## BLACKS AND ITALIANS.

My experience with black bees is different from the "Banner Apiary" man. He says, that in a poor season the Italians will gather the most honey; leaving it to be inferred, that in a good season they will not. This season was excellent, while it lasted, and I know of Italians and blacks side by side, and subject to the same conditions, where the former stored more than 2 lbs. of honey where the latter stored one, and comb honey at that. I have had several cases where Italian swarms had lost their queen, and had filled the brood-chamber two-thirds full of honey before I noticed their condition. I gave them laying queens, and put on plenty of clamps filled with empty sections, and they carried nearly all their honey above. I never had any trouble about Italians working in supers where there was a young laying queen below.

Fairhaven, Vt., Oct. 15, 1883. W. H. PROCTOR.

## REPORT FOR 1883; 50 GALLONS OF ASTER HONEY.

I commenced with 24 L. hives, 2-story, half in fire fix. Apples bloomed in March; warm and nice; scattered brood, which was then on from 3 to 8 combs. Turned suddenly cold; chilled brood, and stopped flow of honey. I fed some the 1st of May; found hives weaker in bees and brood than the 1st of March. Then came poplar, which was fine, but no bees to gather it; got about 500 lbs., which ought to read 5000, if I had fed properly, since when bees have got only enough to rear brood. Now aster is on us in all its glory. The pastures everywhere look like snowbanks, and the bees are booming. I extracted 50 gallons of honey last week, and they are now ready to extract again. If frost remains off ten days, we shall get an immense yield. I am like the negro who planted a peck of potatoes,

and raised a peck. "Bress de Lord, got what me started wid!" 24 hives, not a single swarm. They are rousing good ones.

J. H. BURROW.

Lynnville, Tenn.

**\$27.00 PER COLONY FROM AN APIARY OF 5.**

I commenced the season with five colonies of bees; have increased to 15, and taken off 400 lbs. of honey. I have sold down to five colonies again. My increase brought me \$65.00; my honey sold at an average of 17½ cents, or \$70.00, making \$135 for five swarms of bees, or \$27.00 per colony — not a *big* report, but one I am satisfied with. Of course, this is not net profit, for the hives, sections, and fdn., are to come out of this.

**INTRODUCING TO A COLONY THAT HAD A QUEEN.**

I had a colony queenless, as I supposed. As I wanted to introduce a queen, I took the precaution to give them a frame of eggs and hatching larvae; they started queen-cells immediately. Thinking that was evidence enough that they were queenless, I tried to introduce a queen after she had been caged in the hive 48 hours. I released her, and she was immediately balled. I then caged her 12 hours longer. This time the bees seemed to accept her. I looked her up in half an hour, and found her running over the comb all right; and the bees not offering to molest her, I looked again in an hour, and she was still all right. I then went to my day's work. When I came home at night I found her balled on the bottom-board. I again caged her for 24 hours. When I let her out the bees did not molest her; but 20 minutes afterward I found her balled; and in looking her up this time I found the largest queen I ever saw; so, of course, that put an end to my introducing a queen to that swarm. Now, I had a queen-cell hatch in that hive about two weeks before this; and about a week before, I looked the hive over thoroughly at three different times, and could find no queen, so I supposed she was lost on her wedding flight; but to make a sure thing of it I put in the frame of brood with the above result. Now, is this an exception to the rule, or do you occasionally hear of such cases? I should like to know more about this; for in this instance it nearly cost me one of Doolittle's best queens.

H. H. PEASE.

Kingsville, O., Oct., 1883.

Friend P., your report is a very fair one.— I have several times had trouble in introducing queens, just about such as you describe; and a careful search has almost invariably resulted in finding a queen of some sort present. You did not tell us whether your large queen commenced laying or no, although we presume she did. It was probably a case of retarded fertilization, so that the bees likely started queen-cells because their queen was so long in getting down to business. It may be, however, that this large queen got in by accident, and belonged to some other hive. I should suppose that she had just got ready to lay when you found her, and she may have been quite small and inferior looking when you first hunted the hive over for her, which would account for your not finding her when first looking.

**UPWARD VENTILATION.**

I bought two swarms of bees last fall in the old American hives; packed them in boxes with about three or four inches of chips from the planer, all around, except the bottom; kept the entrance-way

open so they could go out and in when they pleased, the top-bars being tight, and the places for the bees to enter the surplus boxes having a board nailed over them, and every thing all glued down tight. After reading about upward ventilation, I watched them closely. All I did to them was to keep the entrance-way open, I found, by using the searching-rod, there were no dead bees, and they were growing stronger. Early in the winter and in spring they were strong, and I got through swarming before my neighbors began, who packed after the modern plan. Now, if it is a fair question, why did my bees do so much better than theirs, if upward ventilation is necessary?

I. B. WHITON.

Ithaca, Mich., Oct., 1883.

Friend W., if you will excuse me, I would suggest that the reason why your bees wintered so well with all upward ventilation closed in the manner you mention, is because the American hives, as I know them, are so full of cracks and crevices that the bees had abundant ventilation after you had covered the places where they got into the surplus boxes. The hive has a movable side, which leaves an open crack at two corners, and the entrance is usually quite large, so your planer-shaving packing was just about the thing, under the circumstances.

**DOG-FENNEL AND BITTER HONEY.**

Bees have not done extra well this season in this locality. We have had a very dry summer; but a few rains in September brought out the bloom on many wild flowers, and these bid fair to give us a good flow of fall honey. The vacant lots and roadsides are covered with a yellow flower, very similar in general appearance to what is commonly called "dog-fennel" in the Northern States. It produces bitter honey.

**THE MACARTNEY ROSE, AND A QUEER IDEA IN REGARD TO IT.**

Can not some of the friends tell us more about the single white Macartney rose (*Rosa bracteata*)? In "Gardening for the South," the author, after recommending it for a hedge, says: "I see but one objection to it. It is in summer always in bloom, and therefore attracts all the bees in the neighborhood. In my fruit-garden I have thought that the injury done to peaches and grapes by wasps and bees has been much greater since the hedge has grown up than before. It is a fine honey-plant." Think of the objection, from a bee-man's standpoint! After working with bees in this State for several years, I am satisfied there are two native varieties—the black and the brown. My best colony is a cross between the brown and Italian—a large and gentle bee, and very active.

W. S. GEROW.

Little Rock, Ark., Oct. 15, 1883.

Friend G., we should think the author of "Gardening for the South" ought to extend his knowledge a little more; or, at least, it would have been well for him to have submitted the proof of his work to some intelligent apiarist before sending it out to the world. The idea that a flowering plant in the vicinity of an orchard or fruit-garden would make the bees worse is ridiculous. It might attract bee-men to establish apiaries; and then if bees did molest fruit, they might be troublesome in the fall of the year. Can anybody tell us any thing more about this "fine bee-plant"?

## NUMBER OF BEES IN A POUND.

To-day, while preparing my bees for winter, I had occasion to shake two or three combs of beautiful Italians on to their alighting-board. The morning had been cool, but the sun was then shining warm; and as they were in no hurry to get back into their hive, I thought it would be a good time to find how many bees it takes to weigh a pound. I weighed a little cage, and then picked it up and put into it 120 bees to get half an ounce by my letter-scales, which would be 3840 to the pound. As these bees were not as full of honey as they would be in the honey season, it probably would take quite a few less to weigh a pound then—perhaps about 3500. S. C. PERRY.

Portland, Ionia Co., Mich., Oct. 10, 1883.

In our price list we give the number of bees to the pound at 4000, which is not far from the figures as given above.

## REPORT FROM A HOUSE APIARY, ETC.

The queen you sent me is a beauty, and also her young, as they make their appearance. They have white, hairy backs, and three red bands and three white. She was at liberty in the hive Aug. 5; began laying the 17th, and her bees are flying to-day, Sept. 4. My bees were all blacks this summer, and have done well. I have taken over 100 lbs. from some of the swarms. I swarm artificially all of my bees that are strong enough in season, and extract their honey from the top hive as fast as they want room.

My bees are in a house, packed in sawdust, winter and summer. They are all in one row, 21 in number. The house is double-walled. I handle them from the inside. I have tin doors, so that I can sun or shade them as I like.

A. J. THAYER.

Blodgett's Mills, N. Y.

## HOW I WINTER MY BEES.

I thought my way the past two years of wintering might perhaps interest some of your many readers enough to try it. I build a wall six feet high of plank, east and west; set my hives 6 inches apart, facing south; then set posts in front 6 inches from hives; then take a plank wide enough to extend from hives to posts six inches above entrance; then plank up like first wall, making one side a foot or fifteen inches higher than the other; then fill in with chaff to cover hives; then shed over, to keep out rain, etc. Leave a small space of entrance open, that the bees may have a fly every warm day, as that is the main thing in keeping healthy bees. I have wintered two years in this way, and have not lost a single stand. The only objection is in moving to summer stands, as bees will go back to where they were wintered.

This has been the poorest honey season for many. We have had no rain for six weeks, and but little fall bloom. I have 27 stands from 8, spring count, but am afraid they will be short of supplies to winter on, and it looks useless to pay 10 cts. for sugar to feed, and sell honey at 12½. Friend Root, how would it do to set syrup out in day time, and let them all fare alike?

C. L. GOUGH.

Rock Spring, Mo., Sept. 28, 1883.

I think, friend G., you would not be so badly off as you suggest, in selling honey at 12½ cts., and buying sugar at 10 cts. If your sugar costs you 10 cts., good thick syrup—thicker even than the honey, will cost you only about 8 cents, and a pound of the sugar syrup is worth quite a little

more than a pound of honey. Feeding syrup in the open air is often done, but it does not answer very well for preparing bees for winter, because the strongest colonies, that need it least, will probably get the most; and the weak ones, that need it most, will get but little. Besides, unless one is pretty well posted he would be likely to have a big job of robbing on hand.

## ARE BEES CANNIBALS?

Yes, sir, Mr. Editor, sometimes. I have had two or three cases this season, where both eggs and larvæ were eaten up. The last one was so striking that I will try to give you an account of it. After reading Mrs. Harrison's article about toy bee-hives I went and made one of an old cigar-box and two sections. Now, these sections contained comb and honey in plenty, and the bees which I put in were never without plenty of honey. I stocked it with young Italians, and a virgin queen just hatched. In about two weeks, as she did not lay I inserted a piece of comb with eggs and just hatched larvæ. These were all gone in two or three days, and I gave them another piece, with larvæ in all stages, from the egg to those just ready to hatch. In about three days I investigated, with the same result as before. As the queen was nearly three weeks old, and did not lay, I concluded she was "no good," and pinched her head. In a day or two they were given a cell; and when their queen was a week old I gave them some more larvæ. Do you suppose those old cannibals had reformed? Not a bit of it. They sucked the life blood from their embryo sisters, with no more compunction than a saloon-keeper has when he ministers to the "depraved appetite" he has created, and thus sucks the life blood from the laborer's poor wife and children.

CHALON FOWLS.

Oberlin, O., Oct. 23, 1883.

Well, friend F., your experiment is such a "clincher" I do not know but that we shall have to give in; and yet it seems to me they would have taken to the brood, and reared young bees, were it not that you put them in so small a hive; for I have oftentimes thought that small clusters are more disposed to play such foolish tricks. And by the way, friend F., I think if you had put that queen into a full colony she probably would have laid all right. Did none of your little hives work any better?

## FROM 37 TO 90, AND 3015 LBS. OF HONEY.

This, my first report in bee culture, I send for publication in your excellent journal. I went into winter quarters on summer stands in 1882, with 40 colonies in Simplicity hives. Came out May, 1883, with 37; 21 of said number I ran for honey; 16 culls were run for increase of stock. Extracted, during the season, 3015 lbs.; comb honey in 1-lb. sections, 300 lbs. Total for season of 1883, 3315 lbs., or a little over 157 lbs. per colony—5.6 of total amount white-clover honey, and gilt edge at that. I used 10 lbs. of comb fân.; increased to 90. My stock built out 500 new frames full of comb. Reduction by sales and culls places my stock now for winter at 75 colonies. Fall yield of honey is a total failure in our section; cause, drought.

W. A. HUNT.

Lynnville, Ind., Oct. 20, 1883.

## BAD NEWS FROM FRIEND KENNEDY.

On the evening of the 20th, my dwelling-house, honey-house, work-shop, 30 stands of bees, all of

this year's crop of honey, 3500 lbs., and all of my tools and fixtures, were consumed by fire. My bees were on the south of the honey-house, and the wind was from the north, and the heat so intense that the poor little fellows could not be moved, so they perished right where they sat. I was not at home, and didn't get there until all was burned up that could burn. The fire originated in the honey-house, and from that to my dwelling. I have 50 stands left in good fix for winter. I have no honey to eat this winter. I have none to sell either.

GEO. W. KENNEDY.

Carrollton, Mo., Sept. 29, 1883.

Friend K., I read your card all through anxiously, to see if you made any mention of insurance. Every bee-keeper should use all possible means of protection against losses by fire; and after having done that he should surely have his property insured. Better sell off a part so as to keep the rest insured, rather than to take the risk of losing the accumulations of years in just a few minutes' time. Reports of fires from beemen are quite frequent.

A GOOD REPORT FROM THE CONTROLLABLE HIVE, ETC.

I am now going to tell you my luck with bees during the summer. My health was very poor in the spring — so much so that I sold my bees down to 12 swarms. I have increased to 40; 3 left for the woods, 6 went into 3 hives, and I have 40 good heavy swarms to winter — all Italians but 3. I have sold 600 lbs. box honey, and have a little over 400 lbs. on hand. Last spring I received a circular from Mrs. Cotton, of Maine. I see in GLEANINGS you have heard of her and her Controllable hive, so I sent and got one, and then I made 2 more like it. I put bees in them June 15th, 19th, and 21st. Now guess how much honey I have got from the 3 swarms. I got 42 lbs. and one large swarm. It is as good a swarm to winter as I have got. You see, I get almost as much from the 3 Controllable hives as I did from all the rest of my bees. How it is, I don't know; but I never saw bees work so in my life. The hives are large; the boxes in each hive hold 120 lbs. I am going to make a number of Controllable hives this winter, and try them another season; and if they prove as good as they did this year, I shall adopt them altogether.

D. L. LOVEJOY.

Martinsburgh, N. Y., Oct. 7, 1883.

MY REPORT.

A year or two ago I caught the bee-fever, and it gradually grew worse until last June, when we bought two colonies of pure Italian bees, an extractor, a honey-knife, smoker, bee-veil, A B C, some empty hives, etc., and commenced bee-keeping in reality. They cost \$34.00 in all. Well, I divided one colony and let the other one swarm naturally, to see which is the better way, and I shall let them swarm naturally after this, even if I do occasionally have to chase a swarm half a mile in order to get it. I increased to 7 good strong colonies, and got 130 lbs. of extracted honey, 50 lbs. of white-clover, and 80 lbs. of boneset and goldenrod. All the old bee-keepers say this has been a poor season for bees and honey, as well as for farmers; but our bees have paid for themselves and all the "fixings," and given a profit of \$10.00 besides; that is, counting the new swarms at \$5.00 each.

HOWARD L. HUTCHINSON.

May, Tuscola Co., Mich., Oct. 18, 1883.

HONEY FROM THE BANANA-BLOSSOM.

I am raising bananas; from the blossoms drops a juice as sweet and thick as honey. Do you not think that and orange-blossoms will be good for bees?

MRS. S. W. KUSTER.

Lenard, Hernando Co., Florida.

From the above it would appear there are a great many plants that yield nectar in such quantities that it drops off. I am sure, my friend, that any plant that yields honey in such quantities would be valuable for bees. We have never had any thing very definite in regard to honey from orange-blossoms. Do they really yield honey, and in quantities enough so that it can be truthfully labeled, "orange-blossom honey"?

BEEES IN INDIA.

I send by this mail a paper in which is the first article in bee culture I have seen since coming to India. Literally nothing is done here with bees in a scientific way where so much might be done. Our mission is prosperous; 170 boys and girls in training-school for teachers, and many schools in jungles; 24 baptisms were reported for last month, and I hear of others since.

A. BUNKER.

Toungsoo, India, July 18, 1883.

Friend B., we are anxious to see bee culture make its way in India, but it is a thousand times more important that the work of spreading the gospel be carried on. May God bless and sustain you in your arduous task, and we shall be sure that bee culture will make its way when Christianity reigns.

AN OLD SWARM OF BEES.

The following comes from the Birmingham (O.) Press:

It may interest the readers of the Press to know that there is a swarm of bees in Florence tp. that is 40 years old. Hiram Knapp says, 38 years ago he built a house for his bees, and placed them in it, giving them room to spread out as much as they pleased. This one was two years old when put in the house. Three other swarms were put in at the same time, but they died out years ago. Mr. Knapp's son-in-law, Geo. Taylor, now occupies the farm, and a few days ago had the bees transferred to a Root chaff hive. They had about three bushels of comb, much of it filled with honey and brood in all stages. The old hive, which is of the common box kind, was completely filled and surrounded with comb in all ages, from forty years down to one, some of it very tough and hard. The bees had bred in it so long that they had become dwarfed, not being much more than one-half as large as bees generally are. They now have a new lease of life, and a chance to work the modern way, and place the surplus product in marketable shape, in the popular one-pound section.

If any readers of the Press know of an older swarm, please report.

E. M. GRAVES.

Birmingham, O., May 20, 1883.

STARTING A BEE-KEEPERS' SOCIETY.

There is one thing I should like to ask you about, and that is in regard to starting a bee-keepers' society. The bee-keepers of this county have long felt the need of a society; but bee-keeping being in its infancy, there is no one far enough advanced to know how to start such a society; so with that object in view, I write you for a little advice. What we want to know is, what to do and how to do it; or, in other words, we want the whole thing in a nutshell, as it were.

CHAS. H. WARING.

Saratoga, N. Y., Oct. 20, 1883.

Friend W., I would gladly give you the information you desire, but I am not very

much posted in regard to conventions, and therefore I would request Prof. Cook and C. C. Miller to answer your question. Friends Cook and Miller, please give us a good article on the above subject, each of you. Make it so plain that even the juveniles will know just what to do to start a bee-keepers' convention.

#### DANGER OF CLIPPING QUEENS' WINGS.

On June 30, Mr. T. J. Lewis sent with me to you for a \$1.00 queen, which was received in due time, and introduced according to instruction. On the eighth day after introducing her, in looking through her hive we discovered queen-cells, and he, fearing they would swarm, had me clip her wing, which I did, holding her by one wing while I clipped the other. I was very careful, and am sure I did not hurt her, but she has never laid an egg since.

Tank, Mo., Aug. 31, 1883.

T. A. WRIGHT.

Friend W., although you do not say that the queen had been laying before her wing was clipped, we infer she had. As this is the first case of the kind I have ever heard of, I can hardly think there is much danger of spoiling the queen that way, by clipping her wings. It is well known, that a sudden disturbance often results in depriving a queen of the power of laying, and we have given many reports of queens that would not lay after having been shipped. This very fact has led to many uncharitable and unkind thoughts and feelings. For instance, a man who receives a queen and introduces her, and finds she does not lay an egg, will say the shipper sent him a bad queen, and he "didn't believe she ever did lay," while the fact is, the disturbance of taking her from the hive, and sending her away, was what caused it. Neighbor H. once removed a queen of great fertility from one of his hives; but after carrying her to his other apiary, three or four miles distant, and introducing her, she never laid afterward. I must say, Friend W., however, that I agree with you inasmuch as to prefer queens without being clipped.

#### THE REASON WHY FRIEND POST DID NOT NEED ANY OUTFIT.

I built me a bee-house last fall, a year ago, to winter my bees, and did not get it done till a late hour, and ceiled it up inside and out with matched lumber, and rushed my bees in before I had it ventilated. I thought I could throw the doors open nights to ventilate it sufficiently in that way, and I neglected to do so, and there came a thunder-shower in the winter, and the bees smothered, almost all. I had only 12 colonies left, and they were very weak.

BENJ. POST.

Caro, Mich., Oct. 17, 1883.

Friend P., if you did have bad luck, yet you have furnished a timely caution for others who might otherwise be tempted to do as you did. Look out about letting things go by, thinking you will keep watch of them. It pays to take care of bees in season, and to do your work well, so far as you go.

#### REPORT FROM CORONACA APIARY.

As I have seen no report from this section, I will tell you how bees have done this year. Many, if they would express themselves, would, I fear, be

placed in Blasted Hopes. Upon the whole, it has been the poorest year for honey that I have seen since I commenced bee-keeping. I have had but few swarms during the season, and will go into winter quarters with about 33 colonies. They will perhaps have honey enough to carry them through, by taking from the stronger and giving to the weaker, but will have no surplus. The pea crop was a perfect failure, consequently did not gather any fall honey, except from goldenrod and asters, and it was very dry, even for them. I have taken about 800 lbs. of extracted honey from twenty colonies, and sold nearly \$100 worth of queens, which will keep me out of Blasted Hopes; but if I had worked for section honey, I should have been there for certain, for I had about 10 colonies working for comb honey, and did not get more than 50 lbs. This is not only the poorest year for honey, but the most unprosperous farming year we have ever known in this section — worse even than 1881, and I believe the entire State has made a worse failure than in 1881.

#### HONEY FROM COTTON.

You ask me if bees work on cotton every year. I answer that they do, if it is dry during the height of cotton bloom; but if wet and seasonable, I would say no, as the bloom lasts only a day, and the plant does not bloom rapidly, or in rapid succession, with a vigorous growth in it. Ragweed is our pollen-plant for Aug. and Sept. I think it equal to buckwheat in that respect, and I think that is all that buckwheat has ever proved fit for here.

Coronaca, S. C., Sept. 25, 1883.

J. D. FOOSHE.

#### UNSEALED BROOD FOR HOLDING SWARMS, AGAIN.

I have just been reading what Doolittle and others have to say about giving new swarms unsealed brood to hold them. This remedy may vary in different localities, and under different circumstances; but as a general rule it has proved successful with me. Before I commenced this practice, a swarm would leave every little while; but since I have followed this plan I have had but one or two swarms desert and leave the brood. I have hived some 25 or 30 swarms this year, invariably giving them a frame of unsealed brood, without losing a swarm. Of course, other preventions, such as plenty of ventilation and shade, are necessary.

#### PREVENTION OF SWARMING.

I had several first swarms throw off swarms after filling their hives, which was against the rules, as I wanted honey and not bees, so I set about trying to stop such nonsense, and succeeded by raising the front of the hive the thickness of a lath, or more, if very warm; after that I had no more swarming, and they went to work instead of lying out in front of the hives. Of course, this can't be done with tight bottom-boards. Bees did well here after the first of June, until the middle of July, in spite of rain and cold nights. Since then we have had very little rain.

S. H. MALLORY.

Decatur, Mich.

#### CLOSED-TOP SECTIONS, ETC.

I want no more open-top sections, but will take all in closed-top for my use, as I find bees fill a single tier much sooner, and then when removed they are whiter than when more tiers are used. The lower ones get dark. My boy and I can care for 100 colonies of bees, even if I am a cripple. I lost a leg in the army in 1861; so when the bees sting my wooden leg, why, they get fooled, don't they? We have 92

swarms now. I think I shall unite some — probably put them down to 70 or 75. The glass buckets are fine, and sell readily when filled and labeled, and when not any comb honey can be had. I am selling them filled at 20 cts. WM. ST. MARTZ.

Martinsville, Ill., Oct. 4, 1888.

**\$119.75 FROM 3 SWARMS IN ONE SEASON.**

Bees in this locality are doing well. I commenced the spring with 3 swarms, and from them have got 12 good swarms, and have taken 93 lbs. box honey, and will have probably 150 lbs. more. I sell my honey at 25c per lb. That would make 243 lbs.; and at 25c would be \$59.25. The bees could be sold at \$5.00 per swarm, which would make for the twelve new swarms, \$60.00, and would sum up for the twelve new swarms, and honey taken from them, \$119.75. Isn't that pretty good for a beginner?

Loyal, Wis.

L. ALLEN.

**TAKING AWAY THE HONEY, AND GIVING THEM SUGAR SYRUP.**

Wishing to try the experiment of wintering a few colonies on sugar, and finding a way of filling empty combs with syrup, I wish to ask you if it will answer to remove the frames containing honey after all the brood is hatched, say the last of October, and substitute combs filled with sugar syrup.

L. L. CRITTENDEN.

Benton Harbor, Mich., Sept. 29, 1888.

I have known some to succeed, friend C., in doing just what you propose; but for all that, I should be a little backward in advising such a course. Why not let them have their sealed honey, and throw out only the unsealed? then if they require feed, give them thick sugar syrup.

**A GOOD REPORT FROM THE PELHAM FDN. MILL.**

I got a mill from Mr. Pelham the other day, and we had quite a time making fdn., I tell you. It is the first mill I ever saw, and I did not know anything about working it; but for all that, I made some comb, and gave some to the bees, and you ought to see it now. They went to work at it right off, and now it is as fine comb as a natural one. I like the mill, and think it is just as good as the mill that costs 25 or 30 dollars.

**HONEY, HONEY.**

I took a crate of honey off to-day. I thought it was all capped over, and it was next to the glass; but inside, all through, some cells were not capped over at all, and others were capped nicely. It is funny, any way. Who can tell me the cause?

I had 8 black swarms, and I bought two Italian nuclei, 4 frames. Well, I have 25 blacks and 6 Italians; how is that for high? Six swarms from two 4-frame nuclei. It is so dry this summer, I think honey will be scarce.

**SWARMS GOING OFF WITHOUT CLUSTERING.**

I am sure this time. One swarm was out; and before I got them in, another started, and I said, "Look out, or they will cluster together;" but, away they went. We threw dirt and water, and drummed, and they would not stop. So I said, "Let them go."

FRANCIS C. SMITH.

Kilmanagh, Mich., Aug. 31, 1888.

No doubt the bees will work the fdn. as well as any, friend S., but will it not take more wax to make a certain number of sheets? If I am correct, the Pelham mill can not be made to make very thin fdn.

## Blasted Hopes.

**FRIEND ROOT:**—It is with great discouragement that I undertake to write to you, for I am a poor man, and have spent all and more than I ought to have done for my bees, in hopes of a little return. I started in the spring with 7 swarms; bought 11 more; one smothered when bringing home; 2 were robbed, and I increased to 25, and doubled up to 19, and I think I shall double more. I have fed out one barrel of sugar. They have cost \$153.90, and I have not had a drop of honey, and there is no prospect of their getting any this fall. Robbing is the order of the day. I have 2 Italians, 6 hybrids, and 9 blacks. The two former defend themselves, but the blacks give up and let them carry off what little stores they have. I wish they were all Italians. If they live through, I shall try them another year; and if they do no better, you must put me in the Growlery.

D. H. MACOMBER.

Sweet Home, Lavaca Co., Tex., Oct. 14, 1888.

### MARRIED.

**MILLER—STOKES.**—In Medina, at the residence of the bride's father, Oct. 2, 1888, Addie S. Stokes and Frank Miller.

One by one our girls are going,  
Each obeying Cupid's call;  
Though for them our tears are flowing,  
Hymen soon will grasp them all.  
Toka's gone to be a Miller,—  
Toka, with the golden hair;  
Health and happiness we will her,  
With the Miller, Frank and fair.

I presume many of the friends will remember postal cards and letters signed "Toka," and some of the inquisitive ones have wanted to know about Toka, whether it was a lady's name or no. Our friends Addie and Frank both belong to our Young People's Christian Association of Medina, and we have long learned to be pretty sure we shall find them on hand at every young people's prayer-meeting; and, what is better, one or both of them are pretty sure to take a part in the exercises. Well, a year or two ago I noticed that our friend Addie had dropped her usual signature, and adopted the queer one of "Toka." In speaking of it I remarked that they would not know whether it was a man or woman who was writing to them. Her reply was, "Mr. Root, that is exactly what I do not want them to know. If I do my work well, what does it matter to them?" And then I remembered that some of our customers had sometimes written to our girls in a way that was at least questionable, if not impertinent; and Addie, recognizing that one who professes to be a follower of the Savior ought to be careful in word as well as in deed, decided to drop the pretty girlish name of Addie in our correspondence, and thus cut off all chance remarks that might not be just the thing for one to speak to a Christian, or for a Christian to smile at. Now, then, friends, you can see why the sight of that simple name "Toka" brings me a happy feeling, and causes to well up in my heart a "God bless you, Toka"! And may God's blessing continue to rest with you, and with him who is to be your partner in life, for I have learned in years past to love you both.

## “Remindery,”

Or Department for duties to be attended to this month.

WHAT TO FEED, AND HOW TO FEED IN NOVEMBER.

**I** PAID \$5.00 for one colony May 31, which swarmed June 1, 11, 12, and 15. Who can beat it? Two of the swarms, however, are very weak (have been robbed), and will have to be fed. Now, Mr. Root, will you be so kind as to tell me what to feed? how much? when and how, to bring them through all right in the spring? I love to see them work.

I have two brothers, aged respectively 13 and 15, who are equally fond of bees.

When I was about 12 years of age I began smoking at school with the other boys, and gradual indulgence stole upon me for eight or nine years, until I smoked from five to fifteen times a day. But I quit on the 26th of last February, and have not smoked since. I shall have to get me a smoker next season. Which do you think is best? A. W. TOBIAS.

Graham, Jeff. Co., Ind., Oct. 22, 1883.

Friend T., one of our neighbors, who is in just about your predicament, came to me yesterday and wanted to know what I would do with late swarms. I told him that, as it was a warm and pleasant day, if I were in his place I would take a tea-kettle feeder and fill it with good thick syrup, say about 20 lbs. of granulated sugar to a gallon of water. As it is so late in the season, I would boil it until the grain is entirely destroyed, and then set the feeder right over the cluster while it is warm as it can be without being unpleasant to handle. If given in this way, the bees will probably empty it all in less than 24 hours. If the weather should be cool, I would put woolen cloths around the sides of the feeder. If you can get them to take it all down to the combs before it gets cold, they will probably cap it over, and it will be managed all right. If the feed gets chilled, and they have to carry it down while it is icy cold, it will probably give them the dysentery. It is rather risky business feeding in November, I know; but yet I have seen it done without any bad results. I should much prefer to have a colony in a chaff hive; but if you can not do that, and you have a dry, warm, dark cellar to put them in, I think I should set them in the cellar. If you feed your bees in the way I have indicated, let us know next spring how they turned out.—I am very glad you have given up tobacco. If you give us your promise to pay us for the smoker if you ever use tobacco in any form again, we will send you one without charge.

### UNITING BEES.

Considerable has been written in regard to plans for uniting bees. We unite them by the hundreds, and have no trouble whatever. The colony to be put with another is made queenless, and left several days — not long enough for a queen to hatch out, of course. The combs, bees, and all, are simply lifted out, and set in with any other colony having a laying queen. If it is done during a cool day, it can be managed so as to take all of the bees, or nearly all, at one time. If they go back to the old stand, set in a couple

of combs a little way apart, and at night they will all be found clustered between these. If a warm day comes, be sure to close up the old hive, or take it away entirely. If you do not, the bees may cluster on the sides inside, and starve to death. After their old hive is taken away, they will mostly get in where they belong, providing the new colony is near by. If it is not near by, they will scatter around into other stocks to some extent, and a few may be lost. But with Italians you lose very few bees. Once in a while they will commence to quarrel; but you should look at them occasionally, and give them a pretty good smoking whenever they show such a disposition. We have followed this plan right along, and I have not had a colony of bees stung to death this fall. We prefer to do the uniting toward night, when they have stopped flying, when it has been warm enough for them to fly. You can do it without any trouble, if you just keep your eye on them and *make* them unite. Of course, you want to get the stores of both colonies into one. To do this, uncup the combs having a little honey in, and put them at the outside of the cluster. They will usually then take the honey out and carry it to the other combs. After you have got the lower apartment filled, and there are no more combs containing honey, set these in the upper story with the honey uncapped, and they will very soon carry it all below. Have the combs evenly spaced below, and no empty spaces left, or you may have a comb built in the empty space, even in November, if there is much in the combs above, to be carried down. For the first time in years, we have enough natural stores in our apiary to winter as many stocks as we shall try to winter. Now, if we shall succeed with these natural stores, after having failed so many times with granulated sugar, do not say it was because natural stores are better than sugar, but rather because we doubled them up until every colony was a powerful one.

## Notes and Queries.

**T**ELL me what kind of a “bird” this is, will you? I found him on the fence holding a live bee at arm’s length. There are a good many here.

Oak Hill, N. Y., Aug. 15, 1883. W. W. TURNER.

[Friend B., the insect is the old offender mentioned so many times, and described and illustrated in Cook’s Manual, the *Asilus Missouriensis*. The way you describe is just its way of doing with the honeybees. Whip and drive them off is the only remedy I know of.]

I had 13 hives to commence this spring. I have now 36. I have taken nearly 2400 lbs. honey.

ROBT. SIMPSON.

Kilbride, Ont., Can., Aug. 23, 1883.

### SUCCESS AT LAST.

I examined the queen yesterday. She has a nice lot of eggs laid already. I had great trouble in getting her in; had her caged 8 days, but succeeded at last.

C. M. HICKS.

Fairview, Md., Aug. 30, 1883.

I took 210 lbs. of honey from one hive this season. They brought 8½ lbs. per day for 16 days running.

J. G. PARTRIDGE.

Newmarket, Ont., Can., Aug. 27, 1883.

I had a fine crop of clover honey, but no fall honey—the first entire failure of fall honey since I have been in the business. I could sell several tons more of extracted and comb honey, if I had it.

Bell Branch, Mich., Oct. 2, 1883. M. H. HUNT.

I have 106 hives of bees; had in spring, 90 hives; have taken 2000 lbs. ext. honey, 1000 lbs. box honey—3000 in all. The 106 hives have enough to winter on besides. Last season I got, from 80 hives, 5500 lbs.—quite a difference.

Amity, N. Y., Oct. 20, 1883.

J. W. UTTER.

#### WHY QUEENS DON'T LAY.

Your card of the 9th inst., in reply to inquiry concerning a queen that did not lay, was received in due time. Next day I commenced feeding the colony as you directed, and now the queen is laying nicely.

GEORGE P. KIME.

Evansburgh, Ohio, Oct. 23, 1883.

#### HOME-MADE HIVES.\*

I employed a carpenter to make ten frame hives last spring (I had only one before). He did not make any two the same size. Some were an inch deeper than others, and some half an inch wider.

JOHN E. HEARD.

Pikeville, Tenn., Sept. 23, 1883.

#### THE OLD WAY.

My father used to winter his bees in box hives. He used old-fashioned hives, and set them on a plank, clam-shells under the corners. This raised them up about ¼ inch all around. When they were heavy with bees and honey, they came through all right. I think they used more honey then.

Amity, N. Y., Oct. 20, 1883.

J. W. UTTER.

#### FRIEND KLAR'S REPORT.

My bees are in winter quarters on summer stands, in sawdust. Our crop is not a good one in this part of the State. Last year, from 70 colonies, 11,000 lbs.; and this year, from 85 colonies, only a little over 5000 lbs. of extracted honey in all. I go into winter with 90 colonies in good order. Wintered all last year, but united some in the spring.

Pana, Ill., Oct. 1, 1883.

A. L. KLAR.

#### STARTERS OF DRONE COMB.

I have tried using drone starters for the 1-lb. sections to my satisfaction, and don't want any more. The bees contract the cells to worker before capping, and so leave a large space all around the side empty, which never happened with worker. The way I tested them was every other one in the same crate.

ABRAHAM KOONTZ.

Crestline, O., Oct., 1883.

I find that experiences are strangely different. Of several queens that mated with black drones, all are inferior but one, and that average. When I open the hybrids' hives they scatter pell-mell from their combs like sheep, or else dive right at me. Such bees are not good moth-fighters, and hence are more infested than my pure bloods. I have some Italian drones almost as golden banded as the bees. Other drones from pure queens are nearly black. Is there any preference?

A. NORTON.

Gonzales, Cal., Sept. 17, 1883.

#### BEE-HUNTING.

We have found 13 bee-trees this summer, and have lines for eight more. What trees we have cut will average about 50 lbs. each. We had one swarm last spring, and have ten now. We climb the trees and cut the limb off, and lower it with ropes. The bees are very plentiful here in the woods.

JOHN W. KEYSER.

Wilkesport, Ont., Can., Aug. 1, 1883.

#### A GOOD FEEDER.

The best feeder that I ever used is a Mason 2-qt. can; instead of the glass lid, cut a piece of perforated tin, large holes, the size of glass lid; fill the can; lay on the tin; screw on rim; take another rim; put it down on top of the frames the same as on a stand. Now take the can; turn it upside down on the rim, and they will empty it in one night. You can put on as many as they need at once.

J. W. UTTER.

Amity, N. Y., Oct. 10, 1883.

#### VALUE OF EMPTY COMBS.

I purchased four of what they call young swarms, and gave them all full frames of old combs, with the exception of a few half full of fdn. Those 4 stocks have filled, and partly sealed over, 50 boxes, making an average of 3¼ lbs. each. They stand in my honey-house, for any one to see. I say to all, take good care of your empty combs. I have your A B C, and find it of use to me. Although I have kept bees for 20 years past, still I may learn.

G. HYATT.

Three Mile Bay, N. Y., Aug. 30, 1883.

#### HONEY FROM SUMAC.

Tell Floyd, of Guilford, Mo., that if he were here he would find no difficulty in determining whether or not sumac yields honey. We have clover after maple, willow, and fruit bloom, but I never expect honey in supers until sumac comes in; then I do get it, if at all. One visit among sumac ought to satisfy any one that honey is there in abundance, and more; the bees use it all day long, early and late. I never in this section saw a honey-bee on a locust flower, and I've tried hard to do so.

Bedford, Pa., Oct. 9, 1883. ED. D. HECKERMAN.

#### ONE-PIECE SECTIONS.

This is to let you know that I made one-piece sections in 1876. If you would like a machine that will make sections as fast as a boy can pick them up, write me.

LAFAYETTE STOUT.

Brighton, Wash. Co., Ia., Oct. 13, 1883.

[To be sure, we should like to know about such a machine, friend Stout; and, by the way, I wish you would send us a sample of that section—not because we care very much about the patented part of it now, but because we want to know all about every thing good.]

#### HONEY FROM OAK-BALLS, ETC.

Bees have done badly here this year. It has been all I could do to keep their "souls and bodies together." The live-oak balls are in now, so the bees are doing finely.

#### CYPRIANS DURING A DROUGHT.

I have 240 stands, almost all Italians and Cyprians. The Cyprians have stood the drought the better. I shall go to extracting in a few days. I have over 100 lbs. of wax. Bro. Root, GLEANINGS comes regularly, but I hardly have time to read it till some one wants it. It rained here last March; next in September; next last night, and to-day, but not enough to do any good.

R. DEVENPORT.

Richland Springs, Tex., Oct., 1883.

## FIVE QUESTIONS BY AN A B C SCHOLAR.

Is pollen consumed by the *old* bees, or by the young larvæ? Can the laying qualities of inferior queens be improved? Do you remove honey-boxes in feeding, during intervals of *no* honey-flow? Will brood be reared in winter, if no pollen is in the hive? Do you think bees will winter more quietly without pollen?

H. D. STEWART.

Landisburg, Pa.

[I think pollen is consumed by both old and young bees, when they have unsealed larvæ in the hive, and perhaps to some extent when they have none.—I do not know how you can improve the laying qualities of an inferior queen.—I think I should remove the honey-boxes, if the bees began to need feeding. If you do not, they will often take the honey out of them and carry it below.—As a rule, I do not think that brood-rearing can go forward to any extent at any season of the year without pollen. In the ABC book I have told you of the result of my experiments under glass, or in a cold frame.—I think bees will winter more quietly and more safely without a particle of pollen. When you want them to commence rearing brood, give them combs containing pollen.]

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE OF READING MATTER.

MEDINA, NOV. 1, 1883.

Only fear the Lord, and serve him with all your heart. \* \* \* But if ye shall still do wickedly, ye shall be consumed.—I. SAM. 12: 24, 25.

We are rejoicing to-day, Oct. 31, in having on our subscription list 6238 names.

SUBSCRIPTIONS received after this date will be extended until Jun. 1, 1885; that is, you can have it the rest of this year free.

In the list of members of the N. A. B. K. A., published last month, the name of W. A. Morrison was wrongly printed. His address is Frelighsburg, Quebec, Canada.

## HONEY PEAS.

We have sold a good many of these for seed, but have as yet had no report in regard to their honey-bearing. We are very anxious to know whether they bear honey in the North as they do in the Southern States. You see, the rush of business here prevented our planting until so late the frost nipped them. Who has seen the honey in the honey peas in the North?

In a recent article on one-piece sections, I mentioned the Hutchings patent, but omitted to state that his patent is on the machine for making sections, and not on the section itself. But, of course, this would cut off all possibility of calling a one-piece section a new thing. His machine cuts the section right from the log, properly scored, and with the ends dovetailed, but leaves no entrance for the bees.

## APIS DORSATA AND BEESWAX.

SINCE the article on page 571 was in print, it has occurred to me that, if we can not get the *Apis dorsata* domesticated in the more northern portions of the United States, possibly they might be on the southern line; and if we should fail then in getting honey from them profitably, perhaps we can set them to producing beeswax to relieve the stress on the market, caused by supplying so many fdn. mills; and then if it should so happen that we can not keep *Apis dorsata* here at all, why, we will just send over to the Timorese, and get them into the business of raising beeswax. Do you "catch on"?

## THOSE OLD NUMBERS.

BACK numbers have gone off quite lively since our offer of them at 3 cts. a copy. But I think I shall have to make this provision: If you want us to pick out single numbers, we shall have to charge about 10 cts. each. The labor of hunting over old heaps is worth so much more; but if you will take such as we have on hand (no two alike, of course, if you want them so), we will continue to furnish them at 3 cts. each, and we can give you any of them for 11 years back, with but few exceptions. There are a few numbers that we have to buy up at 10 cts. a number, and these we can not furnish at less than 15 cts., and pay postage.

OUR untested queens are all gone, and yet orders are coming in daily; and if this fine weather continues, I fear all the tested ones we have to spare will be gone also. If any one who sees this has any untested queens to spare at this season of the year, we should be glad to have him send them to us at once. Why wouldn't it be a fine idea for some of our friends down South to keep dollar queens ready to ship away, along into the fall months? For that matter, he might have them ready all winter for anybody wanting them. Surely they could do it in Florida. But then, in extremely cold weather they would need to go at the buyer's risk, if they were wanted in our Northern States.

## ROOTS OF THE FIGWORT, OR SIMPSON HONEY-PLANT.

We have a very nice lot of these plants this fall, and they are now growing finely. We can send them safely by mail at the following figures: One root, 5 cents; ten roots, 20 cents; 100, \$1.00; 500, \$3.25; 1000, \$5.00. Now, while I used to think that these were almost sure when planted in the fall or spring, I am at present a little undecided about fall planting. We put out several thousand last fall, but the hard freezing weather threw them out of the ground, the greater part of them. Where they were not transplanted in the fall at all, they started in the spring all right. Perhaps, therefore, you had better not order them until spring; but if you know how to manage them, so the frost will not lift them out, we shall be glad to send them to you now, while we have plenty of time.

## THE NEW 7-LB. HONEY-PAIL.

QUITE a trade has sprung up in the Dadant pail we illustrated last month. As they hold about 7 lbs. of honey, they are just right to retail for an even dollar, pail and all. That is, you get 13 cts. per lb. for the honey, pail thrown in. If you wish to sell for about \$1.00 at wholesale, for 75 cts. you would get a little more than cost for the pail, and 9 cts. for your honey; and any grocer would be ready to take considerable pains in making a sale if he could make a

profit of 25 cts. In smaller quantities, I presume he would be willing to give you 80 cts., or even 85. One hundred empty pails, covers and all, can be easily packed in a good-sized barrel. Price per 100, barrel and all, \$9.50.

*Later:* I have just discovered that the cover of an ordinary 2-quart pail, just fits this pail also, so you can have them with a *raised cover*, slipping *inside the pail*, or the usual *Dadant cover slipping over the pail*, as you choose.

#### SILK CULTURE.

THE new industry of raising silk right here in our homes seems to be rapidly developing; and in our letters from the bee-friends we hear it mentioned quite often; and it has also been discovered that our common hedge-plaut, the osage-orange, furnishes food for the silkworm that seems to answer equally well with the mulberry. Most bee-keepers feel interested in this matter, because it seems to be kindred, as it were, to the study of bees. Our attention has been called to the matter by a neat little pamphlet, entitled "Silk and the Silkworm," by Miss Nellie L. Rossiter, and we have made arrangements with the lady so that we can furnish the little book to our subscribers for 15 cts. per copy. By mail, 16 cents.

#### KEEPING COMB FOUNDATION OVER WINTER.

THERE seems to be quite a little disagreement in this matter. Some say if it is kept shut up close in a box, so that the air does not dry out the surface, it is every bit as good as if freshly made. I have told you, also, what our friend D. A. Jones says about annealing it by dipping it in hot water. So far as my experience goes, I have never been able to see any difference, but our *fdn.* is never left piled around loosely where it can bleach and get dry on the surface. There is one thing pretty certain, any way, and that is, that you can buy *fdn.* a great deal cheaper now than you will be likely to get it in the spring. Another boom will soon commence on wax, and no one knows how high it will go before next June. Our wax-room is now almost idle, and we shall be glad to fill orders for you, if you want it now.

#### THE NEW FACTORY.

THE new factory is now entirely occupied, with the exception of the clerks' office. Mr. Gray is fitting this up in nice style, I assure you. The different desks are so arranged as to accommodate about twenty clerks, and each clerk has a place by herself. I say *herself*, for I presume about the only male occupants of the clerks' room will be myself and my stenographer. The book-keeper has two desks, each about 14 feet long, to accommodate the piles of ledgers. The clerk who opens the letters has a desk made expressly for her; and every appliance that we can devise is to be given her to enable her to open, assort, and distribute the letters, without the possibility of a mistake. The mailing clerks have also a nice large desk, and all the requisite machinery to do their work rapidly and correctly. The whole east end of the large room is devoted to files and pigeon-holes for correspondence; and two clerks will be employed during the busy season in keeping in order the files of letters.

#### ORDERS DURING NOVEMBER.

I TELL you, friends, it is real fun to fill orders now when we have plenty of time to attend to them, and do it easily. Our old friend "Bert," who almost *never* makes a mistake, is now attending to the ship-

ping of all orders, both by freight and express, and it is really refreshing to know that our friends are going to get just what they call for and no mistake. The secret of it is, we have ample time to take things one at a time, and do that right; and to encourage you in giving us orders now, before we are so fearfully crowded again, we make the offer of allowing 5 per cent off on every thing in our price list, from now until you receive your Nov. JUVENILE. We may continue it longer, but do not dare to promise, until we see how much business we have. This discount is in addition to all other discounts mentioned in our price list. Those who are going to sell extractors next year would do well to order them now, so as to take advantage of the low rates of freight, and they would also have them in the spring, just as soon as any customer called for them. To those who keep them and advertise them in their price lists, we offer 25 % off, and the additional 5 % I have just mentioned.

#### WARMING BY EXHAUST STEAM.

AT present we are rejoicing in a factory warmed entirely by the exhaust, or waste steam from our engine. Instead of spouting the heat and water out into the air, as the old engine has done for the past five years, the steam is now confined, and conducted through a labyrinth of iron pipes to every part of the building, even to all the upper rooms as well as the basement. By a most wonderful mechanical arrangement, after the heat has been taken from the steam to warm the whole large building, the pure water from the condensed steam is carried, by a series of drip-pipes, back to the boiler; so that, instead of feeding the boiler with cold water from the artesian well, we use boiling hot and soft water from the condensed steam. The result is, marvelous as it may seem, an absolute *saving* of fuel, after having warmed the whole establishment. The machinery to accomplish this has cost something over \$1000; but I tell you it is refreshing to be able to dispense with stoves and coal-hods and pokers, and have nothing in the way more than the series of iron pipes all around the outside of the building. As the heat costs nothing, any clerk who gets too warm can open his window easier than to turn off the steam, so we have outdoor air almost the year round. One of the compositors has just now raised his window while I am writing, and in comes the sunshine and pure air; and I have thanked God more than once for this beautiful arrangement, and I thank him again to-day for the beautiful sunshine and the bracing air of this 30th day of October.

#### CONVENTION NOTICES.

##### THE MICHIGAN CONVENTION.

*Dear Mr. Editor:*—May I ask you to call special attention to our next annual meeting to be held in Flint, Dec. 6 and 7, of the Michigan Bee-Keepers' Association? We expect to have by far the best meeting ever held in the State. It is expected that the Rev. L. L. Laugstroth will be present. To see and hear him will pay any one for the trouble and expense incident to the journey. We also expect D. A. Jones, A. I. Root, C. F. Muth, and hope to have C. C. Miller and T. G. Newman. From what I hear, Michigan bee-keepers are to be out in force. Hotel rates are to be \$1.00 a day. Further particulars as to programme will be given soon. We expect to get reduced rates on the railroads. To aid in this, and that I may know how many certificates on railroads to ask for, will every one in this or other States who expects to come, drop me a card at once to that effect?

A. J. COOK, *President.*

Lansing, Mich., Oct. 15, 1883.

## BEE-KEEPERS' CIRCULARS.

I am fully prepared to execute Circulars and Price Lists in first-class shape. Send for estimates.

GEO. M. GRAY, Medina, O.

## DADANT'S HONEY CROP.

Our honey crop being very large, we offer\* THIRTY THOUSAND POUNDS OF EXTRACTED HONEY FOR SALE AT REASONABLE PRICES.

We have both clover and fall honey. Samples sent on receipt of stamps to pay postage. The honey can be delivered in any shape to suit purchasers.

Send 15 cents for our 24-page pamphlet on harvesting, handling, and marketing extracted honey.

## DADANT'S FOUNDATION.

From James Heddon, July 27, 1883. "Your fdn. is certainly the nicest and best handled of any I have seen on the market. It is the only fdn. true to sample, I have ever received."

From Jas. Heddon, Aug. 10, 1883. "I will contract for 2000 lbs. of fdn. for next season on the terms of your letter."

From A. A. Newman, Aug. 24, 1883. "Book my order for 5000 lbs. for spring delivery."

From C. F. Muth, Sept. 6, 1883. "All of your shipments of fdn. during the season were sold on the day of their arrival."

Dealers, send in your orders for next spring, while wax is cheaper, and thus save trouble and money. We pay 28c cash for prime wax.

CHAS. DADANT & SON,  
HAMILTON, HANCOCK CO., ILL.

## An Opening.

Any doctor desiring as good a country location as is to be found in South-east Arkansas, and has as much as \$1000 capital, may do well to correspond, inclosing stamp, with R. A. BETHUNE, M. D., Snyder, Ashley Co., Arkansas.

## GREAT REDUCTION!

For the next 30 days we will furnish the U. S. Standard Honey-Extractor at greatly reduced prices. Now is your time to buy the best extractor very cheap.

We will also contract to make fdn. on our new Vandervort mills in 100-lb. lots at 10 cts. per pound for heavy, and 15 cts. per pound for light, customers to furnish wax, and pay freight.

In addition to the above we can furnish any thing in the line of hives and sections, at very reasonable prices. Send your name on a postal to

C. W. STANLEY & BRO.,  
WYOMING, - WYOMING CO., - N. Y.

## FRUIT AND HONEY.

20 BLACK TARTARIAN CHERRY-TREES BY Express for \$1. Well packed. These are from two to four feet. Can send 20 small ones by mail postpaid for \$1. CHAS. KINGSLEY, Greeneville, Greene Co., Tenn.

## CANADA ONLY.

DOLLAR QUEENS BY RETURN MAIL.  
H. SMITH, BOX 102, NEW HAMBURG, ONT., CAN.

## Sweet-Clover Seed.

New and clean. Can be sown spring or fall. Per lb., 20c; by mail, 30c. J. A. GREEN, Dayton, La Salle Co., Ill.

## Recent Additions to the COUNTER STORE.

Postage.] [Pr. of 10, of 100

### THREE-CENT COUNTER.

- 2 | SACKING NEEDLE ..... | 28 | 2 50
- This is a needle 5 inches long, with bent flat point. Very convenient for sewing heavy fabrics, and many other purposes.
- 2 | SEA-SHELLS, furnished by our friends in Florida. .... | 28 | 2 50
- 2 | RULES for School Children. Nicely made, one foot long ..... | 28 | 2 50

### FIVE-CENT COUNTER.

- 2 | SACKING NEEDLE, 6 inches long ..... | 40 | 3 00
- 5 | HONEY SOAP. This is a nice toilet soap | 45 | 4 00
- 2 | JEW'S-HAIR, large and loud ..... | 45 | 4 00
- 2 | CHROMOS: 5 1/2 x 7 ..... | 45 | 4 00
- These are beautiful pictures of birds, flowers, dogs, autumn leaves, crosses, etc.; 20 different pictures.

### TEN-CENT COUNTER

- 8 | TEA-STEPPER, 1 pint ..... | 85 | 8 00
- A very convenient utensil for making a little tea of any kind quickly.
- 18 | DRIPPING-PAN, sheet-iron, 8 1/2 x 12 1/2 ..... | 90 | 8 50
- 6 | COLOGNE, in fancy bottles, slipper shape | 85 | 8 00
- The pretty bottle containing this would usually be considered worth the dime.
- | LAMP CHIMNEY ..... | 85 | 8 00
- These are made of best flint glass, and handsomely engraved. They are not only ornamental, but rarely if ever break.
- | SOAP, CASTLE, in 1-lb. cakes ..... | 80 | 7 50
- | CASTER-BOTTLES, with Britannia tops. .... | 85 | 8 00
- These are very convenient to replace, where once broken.
- | LANTERN GLOBE ..... | 85 | 8 00
- 3 | SCARFS, in variety of colors. .... | 90 | 8 50
- 4 | BOOK RECEIPTS ..... | 85 | 7 00
- These are printed blanks, with pasteboard cover. Each book contains 50 receipts.
- 8 | GLASS MARBLES ..... | 85 | 8 00
- These are a most beautiful ornament, and a good substantial plaything for babies. One who has never seen them, involuntarily breaks into exclamations of surprise. We used to sell them for half a dollar.

### FIFTEEN-CENT COUNTER.

- | HORSE-RADISH DISH ..... | 1 25 | 10 00
- A horse's head surmounts the cover, with the words "Horse-radish" plain on the glass.

### Twenty-Five Cent Counter.

- | MIRROR ..... | 2 00 | 18 00
- This is a good-sized (8x10) looking-glass in gilt frame, and is a wonder for the money.

- 00 | GOSPEL HYMNS, Nos. 1, 2, 3, 4, words only, in board covers. .... | 1 75 | 17 00
- 14 | COLD-CHISEL, a good stout one, nicely tempered. .... | 2 25 | 21 00
- 6 | CALL-BELL, nickel-plated ..... | 2 00 | 18 00

### Thirty-Five Cent Counter.

- 6 | OIL-STONE, in mahogany case ..... | 3 00—28 00

### FIFTY-CENT COUNTER.

- | CASTER with 4 bottles ..... | 4 25 | 40 00
- This is all glass, very neat and pretty.
- 40 | DOOR-MAT ..... | 4 25 | 40 00
- These are made of cocoa-wood fiber; and if placed in the door, and properly used, will save your wife a deal of hard labor.

### SEVENTY-FIVE CENT COUNTER.

- 24 | CASH-BOX ..... | 6 50 | 60 00
- This is made of tin, japanned. Has handle to carry it about, and lock and key.
- 10 | CARVING KNIFE AND FORK ..... | 6 50 | 60 00
- This is a beautifully finished knife and fork of best metal, with ebony handles.
- 60 | FOUNTAIN PUMP, or Sprinkler ..... | 6 00 | 55 00
- For extinguishing fires, washing windows and carriages, watering plants, shrubbery, etc., etc. This, although of course not equal to the Whittman pump, is a wonderful acquisition for such an insignificant price. At this date, Nov., 1883, it is selling wonderfully.

### \$1.25 COUNTER.

- | WASH-BOILER. Small-sized, but pretty and well made ..... | 11 25 | 100 00

### \$1.50 COUNTER.

- | AX. Fine steel, and securely fixed on a good stout hickory handle .... | 12 50 | 110 00

## KIND WORDS FROM OUR CUSTOMERS.

I have taken the premium at the Dallas Co. Fair with the bees I bought of you, which will be quite an advertisement for your business. J. GEORGE.  
Buffalo, Dallas Co., Mo., Oct. 22, 1883.

I am very much obliged for those Sunday-school cards. They help our infant class at our Sunday-school concerts once a month. N. C. TUBBS.  
Exeter, Clay Co., Kan.

The Novice honey-extractor I purchased from you in July took the premium over all others at the St. Joseph Inter-State Exposition for this year. M. L. POTEET.  
St. Joseph, Mo., Sept. 12, 1883.

Please send me one crate of five Clark's cold-blast smokers. The one you sent me last April did so well this summer that my neighbors who have bees all want one. R. R. COBBUM.  
Bluffton, Wells Co., Ind., Sept. 3, 1883.

Please send GLEANINGS and Clark's cold-blast smoker. You can send me the few cents remaining if you have a mind to, or give it to that jolly baby to buy candy. H. O. BRIEN.  
Mile Strip, N. Y.

The A B C book came to hand all right. I am pleased with it, but am sorry that I did not get it cloth. But I did not expect so big a book for \$1.00. I would not give it for \$5.00, and do without it. L. M. GOCKLEY.  
Akron, Lan. Co., Pa., Oct. 1, 1883.

The six-dollar imported queen you sent came all right. I united two colonies of hybrids, and put her in; let her stay three days and nights, then liberated her all right. She is a daisy. I would not take ten dollars for her. MAD. TALBEIT.  
Morristown, Ind., Oct. 20, 1883.

The Emerson binder came to hand by last mail, and immediately GLEANINGS for 1883 was placed therein. Success to all your efforts in building up a journal worthy of yourself and the bee-men of America; and may your reward be a happy conscience, a "well done" among your brethren, and a well-filled purse. R. A. BETHUNE, M. D.  
Snyder, Ashley Co., Ark., Sept. 17, 1883.

In reading over the convention notes, I find, in your reference to Hanlan's Island, you say, "named after the great English oarsman, instead of Canada's great oarsman." I presume the mistake was not intentional, but I fear some Canadians will feel a little hurt, as they feel proud of Hanlan. Your description is very interesting. J. L. CALVERT.  
Oberlin, O., Nov. 4, 1883.

Thank you, John, for your correction. As I had heard of Hanlan in England, I some way got it in my mind he was an Englishman, and surely did not intend to rob Canada of any of her laurels. I am very glad to know that Mr. Hanlan is a native of our American shores.

### OUR 244-LB. SCALE.

The 244-lb. scale that you advertise gives perfect satisfaction, and I would advise bee-keepers to buy it, for it will answer the same purpose, and weigh as correctly, as the high-priced scale. I have tested mine pretty severely the past season by weighing all the girls (I am a young unmarried man, you know), and some of them are pretty big ones too, tipping the beam at 200 lbs. J. M. YOUNG.

Three Groves, Neb., Oct. 26, 1883.

Your last shipment with the missing articles came Aug. 30. All came in very good shape; they were on the road about 16 days; the freight was \$1.55. I can make allowance for delays, and some poor management, because I am satisfied that you do, or mean to do, your best. The Jones wax-extractor has paid for itself. I had lost enough wax by worms, etc., to have paid for it before. Every thing that I have received from you has been very cheap and satisfactory. I find it much easier in wiring frames to sew it through than to make nail books.

WM. BROWNING.

Garden Grove, Decatur Co., Ia., Sept. 1, 1883.

That Waterbury watch I got for that last club to GLEANINGS has been running right along with a \$200 gold watch. I lost it while gathering corn one evening, and found it next day, still hammering away. I carry it loose in my pocket with my knife and tobacco. Did I say tobacco? No, dear GLEANINGS, I never again expect to use the vile weed, and, bless God, I have persuaded my better-half to quit the use of snuff. My 100 colonies of bees will have to be fed, to go through the winter. No rain yet; dry, dry, dry. A drought of over 103 days, and, strange to say, we have some flowers—goldenrod and cotton, with the never-failing chamomile and Texas brown-weed. B. F. CARROLL.  
Dresden, Texas, Sept. 25, 1883.

### A LITTLE VERSE IN REGARD TO OBSERVING THE SABBATH.

Will not the following match well the anti-profanity cards?

A Sabbath well spent brings a week of content,  
And strength for the work of to-morrow;  
But a Sabbath profaned, what'er may be gained,  
Is a certain forerunner of sorrow.

Pellsville, Ill., Sept. 12, 1883. J. R. PHILLIPS.

Many thanks, friend P. The little verse is exactly what I want, and we will furnish these cards with the others to any one who wants them, free of charge.

I have long promised myself the pleasure of sending you a notice of our little friends, the bees, in this distant quarter of the globe, but the "care of all the churches" has been too much for me to command the time before to-day, although I have had the notes about me for some time. Perhaps the account may have some interest for you. Our mission work is very prosperous in every department, and pays large dividends. Over 30 baptisms recently reported from our jungle churches. I like your publication greatly, for it has got the right ring to it, and you are doing what every Christian man ought to do—take his religion into his business. God bless and prosper you. A. BUNKER.  
Toungoo, Burma, Oct. 26, 1882.

I wish to say just a few words in regard to friend W. Z. Hutchinson's article on page 603, October number. I read it and re-read it with much interest, and I wish every bee-keeper who attends fairs where there is an exhibition of bees and honey would give a detailed account of what they saw, and in what shape, how arranged, etc. I think it would be interesting to all; and especially to those who take part in the displays made at the various fairs, it would be profitable. Here are a few points that I have gained from his article: Mr. Hunt's pyramid of honey; those full colonies of bees in glass hives on a revolving bottom; I have several times taken a colony of bees to fairs, but never thought of a revolving hive. Then those queens in cages, all fast on a board that revolves; almost every one wants to see a queen, and it is usually quite a task to find one and keep sight of her so all can see, even in a one-frame hive, while it could be easily done in a queen-cage. Then the gilt-edged honey, and so on throughout the entire article. W. W. BLISS.  
Duarte, Los Angeles Co., Cal., Oct. 25, 1883.

I see in a sample copy of JUVENILE GLEANINGS, that you want a better name than Peter for a collicking boy-baby. I think a man in your business ought not to look further than to the first bee-man for a name. What name is prettier or more appropriate than Huber? MRS. M. E. HAWKINS.

Highlands, N. C., Oct. 31, 1883.

I have perfect confidence in dealing with A. I. Root. I don't wish to flatter; but if I ever dealt with a straight, fair dealer, it is your honor. Extractors and knives are just what they were represented to be. The above is written with a quill from my pet bird, the American eagle, that I have had ten years.

W. C. NEWTON.  
Fulton, Oswego Co., N. Y., Aug. 28, 1883.

## Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

### CITY MARKETS.

**NEW YORK.**—*Honey*.—Our honey market is in about the same condition as it was a month ago; however, warm weather still prevails, and has a tendency to depress prices. We desire to inform producers of the fact that we are making a specialty of New York State honey, and placing the same to dealers under such brand. There is no doubt that New York State has not had a fair footing with other sections, owing to the fact that most of New York honey has been labeled and sold as California honey. We believe our State honey will compare with any in this country; therefore we have decided to represent all honey as coming from the section it really does. We quote as follows:

Fancy white-clover in 1-lb. sect's, no glass,	19½@20
Fair to good " " "	17 @18
Fancy white-clover in 2-lb. sect's, glass'd,	17 @18
Fair to good " " "	15 @16
Fancy buckwheat " 1-lb. " no glass,	15½@16
Fair " " 1-lb. " "	14
Fancy " " 2-lb. " glass'd,	13½@14
Ext'd honey, best white-clover, in kegs or	
" " " " " " " " " " " "	small bbls., 10 @10½
" " " " " " " " " " " "	8½@9

*Beeswax* is scarce, and has a tendency to higher prices. We quote for prime yellow, 33@33½.  
Nov. 10, 1883. McCaul & Hildreth,  
80 Hudson Street, New York.

**NEW YORK.**—*Honey*.—The demand for honey has been good all during the month of October, and is still increasing at the beginning of this month. We expect to have a good market, and dispose of large quantities from now until the first of January. We quote as follows:

Fancy white-clover, 1-lb. sections, paper boxes,	21c
" " " " " " " " " " " "	glased, 19@20c
" " " " 2 and 1½ lb. " " " " " "	17@19c
Fair " " " 1 lb. " " " " " "	17@18c
" " " " 2 and 1½ lb. " " " " " "	15@17c
Ext'd basswood or clover, in kegs and bbls,	11@10½
" " " " " " " " " " " "	Dark and mixed, 8@9c

*Beeswax* is very scarce; the demand is very large, and dealers hold same at 31@33c.  
Nov. 10, 1883. H. K. & F. B. THURBER & Co.,  
Rensselaer & Hudson Sts., N. Y.

**CLEVELAND.**—*Honey*.—The honey market never was better with us than this year; every lot of choice white honey has been sold on arrival at 18@19 for 1-lb., and 17@18 for 2-lbs. Second quality is not in good demand, and does not go off readily. For extracted honey there is no inquiry.

*Beeswax*, 28 c., but scarce. A. C. KENZEL,  
Nov. 9, 1883. 115 Ontario St., Cleveland, O.

[Well, friend K., that is good on comb honey, and sounds quite encouraging; but why in the world don't you Cleveland folks work up a trade on extracted honey? If you get some good honey nicely put up in neat little sample packages, to give them a taste, you could do it easily.]

**CHICAGO.**—*Honey*.—There is a steady demand for comb honey by the retail trade in a single-package way. There is sufficient, however, to warrant the thought that all good honey will be sold before spring. The experience of last year is preventing any speculation in it, many retailers having, in the latter part of the winter, to sell for less than they paid in the fall. I quote choice white comb, one-pound packages, 20c; 1½ to 2 lb., 15@18. Extracted honey, 8@10c.

*Beeswax*.—Yellow, 33c; medium, 28@30c; stocks light.  
R. A. BURNETT,  
Nov. 9, 1883. 161 South Water St., Chicago, Ill.

**CINCINNATI.**—*Honey*.—The demand for comb honey is fair with a fair supply. Offerings of extracted honey are plentiful, and there is a large supply on the market. The demand is slower than last season, but appears to be improving gradually. Choice comb brings 12@15c., and extracted honey 7@9 on arrival.

*Beeswax* is of ready sale at 28@30c. on arrival.  
Nov. 6, 1883. CHAS. F. MUTH,  
976 Central Ave., Cincinnati, O.

**ST. LOUIS.**—*Honey*.—Choice comb selling lightly at 14@16c. per lb. in fancy packages; inferior dull at lower figures. Strained and extracted, salable in lots at 6½@7c.

*Beeswax* readily salable at 26@27c. for prime.  
Nov. 10, 1883. W. T. ANDERSON & Co.,  
104 N. Third St., St. Louis, Mo.

**BOSTON.**—*Honey*.—One-pound sections, 18c; 2-lbs., 16@17c. Extracted, 10c. *Wax*, none. Trade quiet.  
Nov. 12, 1883. BLAKE & RIPLEY,  
57 Chatham St., Boston, Mass.

I have about 3000 lbs. of this season's crop yet on hand. It is put up in kegs holding from 56 to 150 lbs. I am willing to take 8½c. here on track.  
Epworth, Ia., Oct. 25, 1883. A. C. PEAVEY.

## PLEASANT AND PROFITABLE EMPLOYMENT IN RAISING SILK AT A SMALL EXPENSE SILK

Silkworm Eggs, Book of Instructions, and every thing pertaining to Silk Culture, for sale. Send for price list. Order at once, as our supply of eggs is limited. Address E. A. Woodruff, Medina, O.  
11½-12-1d

**FOR SALE.**—A Barnes combined Buzz and Ser. II saw. Price \$25 00.  
J. H. COVILLE, Goshen, Clermont Co., Ohio.  
11½-12c

**40** CHROMOS or TRANSPARENT CARDS, name on, 10c; 11 packs, \$1. 12 Gilt Edge Embossed, Hidden name, 25c. Address BELOIT CARD CO., Beloit, C.

## THE BEE-KEEPERS' HANDY BOOK.

216 pages, bound in cloth, by mail, post-paid, \$1.00 per copy. Send for prospectus, and our special circulars describing three new and useful articles for the apary.  
11½-1fd HENRY ALLEY, Wenham, Mass.

QUITE a brisk trade has started up since our offer of 5 per cent off on all present orders. But since we are not badly crowded, we extend the time to Dec. 1; in other words, a deduction of 5 per cent will be made on any goods mentioned in our price list, on all orders reaching us before the 1st of December. This refers to subscriptions for GLEANINGS, with all the rest. Perhaps it might be well for some of the club agents to send us now, \$85.00 for 100 copies, and they would then have all next year to dispose of them. GLEANINGS for 1884 will be published its present size as a semi-monthly, Providence permitting. Now bear in mind, friends, this will not apply to any orders reaching us after Dec. 1.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 10 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

*Established in 1873.*

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

**VIRGIL'S TREATISE ON BEES.**

*Continued.*

**F**RIEND ROOT:—Did you never hear of a lot of individuals picking up a mistake, and repeating it, and riding it for a hobby, until they not only heartily believed it, but could not tolerate the thought of any one else doubting it? I suspect, that generation after generation of writers on bee-craft have used Virgil as a dark background, to set off their own superior wisdom against, until they are in just about that same fix. Now as to the charge that I have greatly helped Virgil in this translation: If that expression means that I have introduced ideas not to be found in the original, I shall feel inclined to fight like a Trojan. In two places I know of, and there may be others, I have made mistakes that I will correct; but I have been conscientiously correct in the effort to leave out nothing material that the author did say, and to put in nothing material that he did not. Immaterial additions of common-places, such as might about as well belong to one poet as to another, are frequent, when there is space that needs filling up. Thanks for being forewarned and forearmed, if this version is put in permanent form I think it must be accompanied by a literal, word-for-word translation, each Latin word with its English equivalent under it, so the unclassical reader can see just what's what. If, on the other hand, helping Virgil only means taking his ideas and setting them forth in clearer light and more words than the original, why, then I shall "confess judgment" at once, and instruct the court to bid me "go sin again." Virgil's language is more

concise than pleases modern poetic taste. I wish to expand it somewhat; and where can that be better done than on those striking ideas that are crowded into a single word? Again, I deem it necessary to have some sort of relation between line and line of original and translation, else an unpleasant effect will be produced by having so many sentences and important clauses end at improper places. To render Virgil's lines of from fourteen to seventeen syllables, of matter already too condensed, by an equal number of ten-syllabled lines, would be ruinous; therefore I allow two English lines for each one of Latin, which gives four or five syllables for expansion.

Let me now bestow a few words upon Dryden's translation. It would not look well for the like of me to take the like of him to task as to whether he did or did not properly render the poetic fire of our noble author; but in some things a "cat may look at a king." At the point where—

Then from their dwellings forth anon they hear  
Those bodies whence the light of life has fled,  
And lead the sad processions of the dead;

Dryden renders it—

"And crowds of dead, that never must return  
To their loved hives, in decent pomp are borne;  
Their friends attend the hearse; the next relations  
mourn."

There is not a syllable of original out of which to make this last false and ridiculous line. What Virgil actually said is scientifically correct; but Dryden evidently thought it a whim, and could not resist the temptation to make gratuitous additions. Really, my friends, is it not better for a translator to respect

his author—and even err a little on *that* side, if he must err at all?

At the point where—

Nor on the hearth the reddening lobsters roast,  
Virgil does not add a word to explain why shell-fish must not be roasted by bee-keepers. A solution is attempted in a note under my version; but Dryden, without any superfluity of either truth or poetry, renders:

"Nor roast red crabs, to offend the niceness of their nose."

When Virgil's language admits of more than one meaning I take the sense which is in accordance with the facts. Candidly, my friends, is not this the right way to do? A writer should be credited with talking sense, till something else is proven. At the place where the bees cease from their fanning, and become quiet at night, Dryden renders—

"—Their evening bells

Dismiss the sleepy swains, and toll them to their cells.

When once in beds their weary limbs they steep."

In this place the idea of bees creeping into their cells to sleep on summer nights can be deduced from the original without violence; but as it is not correct in fact, and not at all a necessary inference from the original, I render differently. Their tolling of evening bells, in convent style, is a gratuitous addition of Dryden's.

Dryden's translation has done more to form the prevalent opinion concerning Virgil's treatise on bees than any other influence; perhaps more than all others combined. As to my own translation, let criticism take a definite shape, and I will retract any passage where I am convinced of material error; but the general charge, that I am making Virgil out too wise, I must not be expected to regard much, as I started out to show that a very general opinion is false.

#### SPONTANEOUS PRODUCTION OF SWARMS.

If all the race by sudden chance should fail,  
And no resource to gain them should avail,  
'Tis time a great invention to unfold,  
Taught by a wise Arcadian of old;  
To tell how tainted gore of bullocks slain  
Hath often brought the race of bees again.  
Searching tradition to its fountain well,  
The utmost of the matter I will tell.

Where by the outspread river of the Nile,  
Steeping its vast and placid flood the while,  
Where the blest race of Canopus remains,  
And sail with painted boats their farm domains,  
Where wide the river spreads its mighty surge  
To quiver-bearing Persia's western verge,  
Flowing from lands where negroes dark are seen,  
With its dark silt it maketh Egypt green;  
And as to meet the sea it pouring glides,  
Into seven different mouths the stream divides.  
All Egypt firm believes in every part  
A sure relief by this surprising art.  
First, for this use a little spot is found,  
And lightly built with roof and walls around;  
And facing the four winds that blow from heaven,  
Four slanting windows to the roof are given.  
Then a young bullock's sought, upon whose brow  
The two-year'd horns took their first curve just  
now; (1)

And while he strives for life with might and main,  
They stop his breath, and close his nostrils twain;  
Then slain with blows that do not break the skin,

The tissues bruised are half dissolved within. (2)  
Thus placed they leave him in the pent-up room;  
Yet underneath his sides they place perfume,  
Sweet leafy branches broken well are strewn,  
And mixed with thyme, and cassia newly grown.  
This should be done when first, on gentle wing,  
The zephyrs play among the waves of spring,  
Before the meadows blush with colors new,  
And bloom with early flowers of rosy hue,  
And ere beneath the beam, on fragile rest,  
The chattering swallow doth suspend her nest.  
Meanwhile a humor, of itself alone,  
Warned into life within each tender bone,  
Ferments, and presently in wondrous way  
Are living creatures seen in thick array.  
First lacking feet, a little waiting brings  
Their members all, and, buzzing with their wings,  
They circle round and round again with care,  
And more and more they try the subtle air,  
Until at length they burst away a swarm, (3)  
As rain poured out when summer showers form;  
Or as the arrows from the whizzing string,  
Athwart the sky a sudden glimmer fling,  
And ope the battle with their rustling flight,  
When the swift Parthians begin a fight.

(1) Bossy at first has no horns, then little loose buttons fastened to the skin, then short straight horns, then horns that are curved in one simple curve, and finally in old age, horns that are long, and curved with a complexity of curves. Just the age when the horns no longer look straight was considered right for this piece of sorcery. Apparently they considered it important that the animal should be aged just right.

(2) If one would realize what Christianity has done for us, let us look at this. What a condition the wisdom, the chemistry, the heart, of the ancient world was in to be trying to accomplish things by such exquisitely cruel performances as this!—

"Dark places — full of habitations of cruelty."

(3) I'm going to defend Virgil right manfully here. Not that the scheme he gives would ever succeed; but almost any sensible person, standing under the light which Virgil possessed, would suppose it might succeed. It was sensible to seek a perpetual motion until something of the great doctrine of the conservation of force was realized; but now only uneducated persons and cranks are expected to work at perpetual motors. It was sensible to seek a means of turning all metals into gold just so long as metals could be considered *compounds*. Metals have a strong family likeness to each other, and the thought that they might be a family of compounds with the main ingredient the same in each, just as a large family of oxides and salts is often found to contain the same element as a base, was once a very reasonable thought. It is played out at the present day, that's all. But the belief in spontaneous generation can hardly be written played out just yet. A large percentage of our population, take them just as they run, believe in it this very day. Minute living organisms sometimes appear so suddenly, and in such countless numbers, that it is still a common impression and remark, that they "just breed out of nothing." Far beyond all this, our scientists do not altogether scout the notion. It is, I believe, not yet twenty years since the scientific world was all agog about the spontaneous generation of a certain species of minute insects in a given chemical solution, after all organic germs had been

shut out of it. The final result was, I believe, that with more careful purification of the ingredients, and more careful filtration of the air in the bottle, the insects failed to appear. But the present generation has no right to laugh at Virgil till all those experimenters are dead.

Does organic life demand parentage? or is blind chance able to compass it? or is nature full of intangible molds, as it were, into which teeming life is cast, under the superintending eye of God? or do evil spirits take the liberty to play at making insects sometimes? If parentage is demanded, must it always be like parentage, or may there be a wholesale transformation when in a nascent state, as from flies to bees? These have been open questions, if they are not now; and it is not specially discreditable to Virgil that he inclined to a losing side.

Living creatures do appear in great numbers in a decaying carcass. They do put on legs and wings, and fly away. Not one species alone, but different species thus appear—why not bees also, if the experiment be conducted just right? Flies often resemble bees, enough to deceive careless observers. Doubtless some who failed to get a swarm in this way actually thought they had some bees, only they failed to capture them when they swarmed away. As you remark, friend Root, every swarm that flew over a dead carcass, or out of a grove into which a carcass had been dragged away, would be "confirmation strong." And frequently, no doubt, colonies would be found inhabiting an old sun-dried carcass, as in Samson's case; and these would be supposed spontaneous.

And now as to the rest of this Georgic, I think we will have in GLEANINGS just a brief review, with selections; but if the work is reissued as a book, we will want the whole text of the poem in that.

E. E. HASTY.

Richards, Lucas Co., O., Nov. 9, 1888.

Friend Hasty, I am going to call you to order. You ought to know that our old friend Mr. Langstroth would not accuse any one whom he knows as well as he knows you, of purposely introducing ideas that are not in the text. And furthermore, you should know that I would not print such a suggestion, if anybody would mention it to me. I should write and tell them to tell you about it, just as I tell you in the Home Papers this month. "Go and tell him his fault between you and him alone." What Mr. Langstroth said was rather complimentary, if any thing; or, in other words, he accused you of doing exactly what you tell us you have done, and I think you have done it nobly too.—In regard to spontaneous generation, I am glad indeed you have given us this little talk on the subject. Grown-up people do to-day insist and declare, that weeds as well as insects grow out of nothing. You tell a lot of old farmers that fireweeds do not grow without seeds, and they will make it hot for you right away. Try it, and see. Probably you will give up the task of trying to convince them, and go away leaving them more of the "same opinion still" than they were before. How many of the boys who read this are there who believe that horse-hairs grow into snakes, if left in the water? They will tell you they know, because they have seen horse-hairs that would wriggle, and were alive, and no mis-

take. I suppose the boys will believe me right here when I tell them that no horse-hair ever came to life since the world began; and that these little snakes are only snakes that are so small and slender that they look exactly like horse-hairs. When I was a child I remember being gravely informed that different kinds of hairs made different kinds of reptiles, and that there was a "varmint" in the woods whose hair would produce fish! All you had to do was to pull it out and sprinkle it in the well or cistern, and behold, in a little time you had lots of little fish teeming around. Now, I want to emphasize another thing: Any man who talks of perpetual motion is behind the times, and totally misunderstands science and scientific progress. Electricity, magnetism, light, and heat, do not avail a particle in helping wheels to go without any thing to turn them, or weeds to grow without any seeds to start them. Truly, Virgil was excusable; but people are not excusable nowadays for holding to such exploded superstitions.

### HONEY-BEES IN BURMA.

A CONTRIBUTION FROM ONE OF OUR MISSIONARY FRIENDS.

THESE are many kinds of honey-bees in Burma, India, both large and small. Every freshly flowering tree or shrub is soon covered with swarms of bees of various sizes and colors, and their humming wings are very musical.

There is little or no effort made to domesticate them, though there would seem to be but little difficulty in doing so. Whatever attempts have been made have been attended with some success. Some tribes of natives care for certain trees where they find swarms housed, stopping up the entrances, save a small place for the bees, to shut out enemies, or surrounding the tree with sharpened sticks to keep away bruin, who is as fond of honey here as his brother in America.

The bee I am now speaking of, and which I will designate as No. 1, resembles, so far as I can judge, the domestic bee in America very much, speaking generally. He has three yellow bands, is about the size, and as lively and social as the home species. The honey and brood are deposited in any safe hollow place, usually in trees, and, of course, the flavor of the honey depends much on the kind of flower from which it is gathered; but it is very good, and much sought after. The bee is very industrious, and of a peaceable disposition, and will seldom molest one, except its nest be attacked, when it knows how to sting as sharply as his mate over the sea. The natives say, the time for taking the honey is the full moon during the dry season. The swarms are usually small, a few pints only, and a few pounds of honey is the most obtained from any nest. These bees are often seen flying through the air in a beeline for some distant home, and in old forests are very abundant. The bears often find them, and wrench off, if able, large splints from the tree with their teeth and claws, to get the honey; but many trees, as varieties of the ebony, defy the teeth of the strongest bear.

I see no reason why this species could not be domesticated, and become very profitable servants,

The experiment has never been tried, to my knowledge. A swarm of these bees took up its lodgings under the desk in the office of an agent of a timber company here, and remained there for a long time, troubling no one, though in the same room with numbers of people.

The second kind of bees is similar to the above, though perhaps a little smaller. This variety builds its nest under or in rocks. The swarms are usually much larger than No. 1, and resemble those at home more in size of the swarms, and kind of honey produced. The honey is very fine flavored, and abundant. This variety is, however, much less numerous than No. 1.

No. 3, perhaps, ranks first in importance in the province. It is a large bee, about one-half inch in length, rather small around, in proportion to its length, long-waisted, and bright red and yellow. He is a gay fellow, with a fierce sting. He attaches his nests to the under side of great limbs of the dammer-oil tree, and on no other kind that I am aware of. There are often from fifteen to twenty nests on a single tree. As the bees occupy these trees from year to year, the trees become valuable property, and their owners collect only a portion of the honey each year, as, if some nests are left, they will return again to their old home after the rains. During the rains they "go west," probably to some dry country, or of less rain. These nests are very large, from two to four feet in length, and one to two feet in depth. The natives climb these grand old trees in the night time, smoke off the bees, and cut off the comb into a basket, and let it down to the ground with creepers or vines—a perilous operation. The honey is rather rank, but is much sought after. The wax has a ready sale.

No. 4 is larger than No. 3, with a similar-shaped body. The back is, however, dark brown, and the belly and thorax jet black. The honey of this bee is much better flavored than that of the above; and one nest of this bee is found in a place, which is usually some giant creeper in a dense thicket of trees. The comb is often from two to five feet in length, and from two to three feet in depth. This bee is very fierce, and woe to the native who dares to attack him without due caution. I saw a native on one occasion assay to rifle one of these swarms, about fifty feet from the ground. The vine to which it was attached was large, and twining in and out from tree to tree. The bees took the initiative in the battle, and the native was soon making the best of his way down the vine to safer quarters. But the bees were too much for him, and he dropped some twenty feet to the soft earth; yet the bees kept his trail and set on him at the foot of the tree. He was nearly naked, and they had a fair chance at him. The poor fellow shot out from under that tree with a good deal of agility, and took to a stream of water near by; and only by running and ducking under the water, and splashing it about, did he finally escape.

No. 5 is similar to the above, though not found in such large colonies. Its prevailing color is reddish, and some parts are light red; sting very badly. The peculiarity of this bee is, that it always places its nest so as to receive the rays of the rising or setting sun. It also builds on large vines. The honey is excellent, and much sought for. Nos. 3 and 4 build only one nest in a place, and do not seek the same place from year to year, as do the second kind described.

No. 6 is a small bee, which selects a small limb on the orange-tree, or the pendulous end of the bamboo, for its home. The swarms are small, and the comb is seldom more than one or two quarts. The comb is irregularly shaped, and a part is placed above the limb to which it is attached, and so shaped as to form a water-shed to the brood below. The comb is very white, and the honey sweet and delicately flavored. The bees are not much larger than rice kernels, and their sting causes very little irritation. They seem to rely on the position of their nests for protection. There are other kinds of this species of tiny bee, each having its peculiar ways, but of little importance, save as a delightful study to those interested in them. They are found in small colonies only.

The last kind, No. 7, I will mention, seems to be a distinct species of bee from all others. This kind is found in large colonies, and in some parts of the province is very numerous. The bee is about the size of the last variety mentioned, dark colored, with white-tipped wings, and has no sting. The wax is very valuable, and forms a considerable article of trade. It is used for stopping leaks in boats, and similar purposes. The honey is acid, and not used. This bee builds covered ways to its nest, and one often meets these tiny covered ways projecting from a few inches to a foot from the tree in which the nest is. The tree most often occupied is the banyan, with its many openings in the trunk and roots. This little fellow, though he can not sting, is not a favorite; for attracted, I suppose by the perspiration of the body, he seeks an entrance into the eyes, mouth, and nose, or crawls over the hands and person most persistently, though lots of his fellows die in the attempt, and the tickling sensation is very annoying.

The bee of the hollow tree is our favorite, perhaps because he reminds us of the dear old home. In any case, honey here seldom tastes like that we used to bring away in tubs and palls from some grand old forest-tree in New England, when the goldenrod in bloom told us boys that fall was upon us.

January, February, March, and April, are the honey months in this land, as the many forest-trees are a mass of flowers, sweet scented, till the air is heavy with sweet odors, which are almost overpowering. Then the bees are most lively, and are the one thing that show enterprise and activity in this heathen land.

A. BUNKER.

Toungoo, British Burma, Oct. 26, 1882.

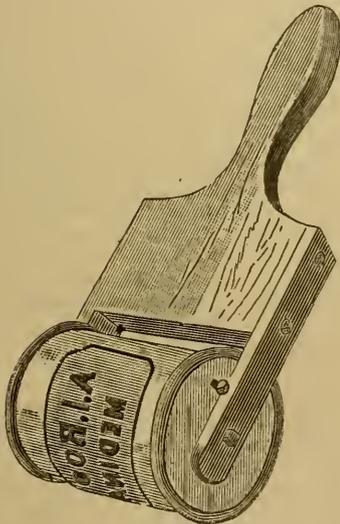

Many thanks, friend B., for the valuable report you give us. I was inclined to think that No. 3 was *Apis dorsata*; but perhaps No. 4 is the one. The friends will remember that the wide long combs are what attracted the attention of Frank Benton. The story given in our last number in regard to *Apis dorsata* makes this account all the more interesting. It seems as though this article might almost give D. A. Jones the fever to go on another exploring voyage; for as you state it, friend B., there would be very little difficulty in getting bees of any of these races to bring home. Is there not some enterprising bee-keeper among us who would like to test these new races of bees in domestication? Our friends will observe, that the letter was written quite a while ago; but it was a long time on the way, and then it got mislaid. Another strange point friend B. brings out that I have never heard mention-

ed, is, that there are races of bees that migrate, much as birds do, storing honey, building combs during the summer months, and then migrating to a more favorable clime during the wet weather; and, stranger still, we are told they sometimes come back and occupy their old hives the next season. The above article seems to add more to our stock of information in regard to bees from Further India and that vicinity, than any thing we have ever had.

### A MACHINE FOR ADDRESSING BOXES AND PACKAGES RAPIDLY.

A SUGGESTION TO COMB-HONEY PRODUCERS.

**A** FEW days ago while at the Cleveland seed-store I saw one of friend Kendel's men using the little implement we figure below, to mark baskets of grapes. The baskets were nicely addressed, about as fast as a boy could hand them out the wagon, and another one set them. The letters were so plain and distinct, and the work was done with such marvelous rapidity, that I have had the machine engraved.

ADDRESSING-MACHINE.

It is, as you will see, a little roller set into a frame, with a rubber stamp tacked to its circumference. The coiled spring inside brings the roller back promptly to its place as soon as it is lifted from the box. A screw set in at the right point causes the roller to stop where desired. After rolling it on the box cover or basket cover, it is rolled on an ordinary inking-pad. As the rubber is pliable, even if the surface should be uneven it makes a plain, distinct letter all the same. Of course, these machines can be used only where you are sending a great many packages to one firm, as it is intended for only one. However, if you have been in the habit of sending your honey right along to some particular firm, it would be well to have a stamp for the firm. Of

course, different addresses can be put upon the same roller by having different sheets of rubber. Friend Kendel writes the following in regard to it:

The machine was gotten up for us by Messrs. F. Ijambe & Co., No. 178 Superior St., manufacturers of rubber stamps. They answer our purpose very nicely, on either smooth or uneven surfaces. We are not sure but there may be a patent on a roller stamp. We have not seen or heard of such a thing, but there may be.

A. C. KENDEL.

Cleveland, O., Oct. 31, 1883.

We can furnish the machines with one rubber stamp, for \$2.50; an extra rubber, for \$1.25.

### UNSEALED BROOD FOR SWARMS.

WILL BEES DESERT UNSEALED BROOD WHILE UNDER THE INFLUENCE OF THE SWARMING FEVER?

**T**HERE seems to be quite a controversy going on at the present time over the above question; and as I have had some experience in the matter, I will try to give it as intelligently as I can.

Several years ago, while living in another part of this county, I had some trouble about bees leaving after having been hived. On one occasion I had a swarm come out the next day after being hived, and I compelled it to cluster, and I again hived it, and in the afternoon it again came out, and this time I put it into another new hive, giving it two combs of brood in all stages, from the egg to sealed larvæ. The next day they did as before, and were repeatedly hived day after day for four days, and they finally left for the timber, going against a strong N. W. wind.

I followed them, and had the satisfaction of seeing them go into a large limb of a very tall oak-tree; and as their repeated swarming had so reduced them that they were no longer a large swarm, I concluded they were not worth the work it would take to get them. A couple of years later, while helping my father harvest, they had a swarm of bees which refused to stay in any hive they were put into, and my father, being an old-fashioned bee-keeper, *knew positively* that something must be wrong with the hives, but could not find out what it was. He had washed some out with salt, and smoked some with sulphur, and still others were merely cleaned, so as to smell sweet; still his bees would not stay. I told him I had heard that sometimes bees would stay if given unsealed brood. He laughed, and said, "Where will you get unsealed brood?" "Why, in another hive, of course," said I. "Then," said he, "just you get some, and give it to them." And as the swarm had by this time got hungry and very cross, he expected to see some fun. I first got a roll of cotton rags in lieu of a smoker, and went to one of his L. hives (he had just two with bees in, the rest being gums), and took 2 frames of unsealed brood, and put into an empty L. hive, and then took a pan of sweetened water that my mother had prepared by my direction, while I was getting the brood ready, and I sprinkled that swarm so that the bees were quite wet; and after waiting a few minutes until they were no longer hungry, they were shaken down on a sheet in front of the hive, and they ran in so contentedly that we all voted the thing a success, and went to our work in the harvest-field, my mother volunteering to watch the bees. When we

came in from the field at noon we all went to look at the bees, and that swarm seemed to have got down to business in a way that looked encouraging; but at 3 o'clock my mother called out that the bees were swarming, and, sure enough, here they came, just over our heads, and not more than 10 feet high. We gave pursuit; and after going about one-fourth of a mile they went directly into a large honey-locust tree, where they were allowed to remain until fall, when the tree was cut for the sake of the honey that it contained. Since that time I have frequently given unsealed brood to swarms that wanted to leave, and sometimes it had the desired effect, and other times it did no good.

The present season I had a swarm that refused to stay in the hive, although I gave it brood. After hiving it the third time it left, and I followed it, and it went to a large oak-tree about 300 yards from the apiary. This was about 4 o'clock, July 3d. I had several times taken young squirrels out of the tree, and I knew just what kind of a hollow the tree had. The top was broken off, and the break had grown over so that the hole was not more than 6 in. across, and the hollow in the tree was about a foot across, and 6 feet long. I set a nail-keg over the hole, and left it all night, thinking that perhaps the bees would gather up into the keg; but on going there the next morning I found about half of the bees in the keg, which I let down with a rope, and carried back to the hive, and shook on to a sheet, and watched for the queen, but did not see her. So I went back with my keg, and set it on top of the tree, and cut a small hole just at the bottom of the hollow, and got my smoker to work, thinking to drive the bees up into the keg; but instead of going into the keg they swarmed out and clustered on a limb about 16 feet from the ground. I then set a long ladder against that limb, and took my keg and smoker, and undertook to smoke the bees up into the keg there, but got more bees outside than inside. But I saw the queen go up into the keg; and as that was what I wanted, I just took that keg and shook the bees on to the sheet in front of the hive, and caught the queen and clipped her wing, and then let her run in with the rest of the bees. Those bees that were left at the tree soon returned to the hive, and all went lovely afterward.

From the experience that I have had I should say, that, when a swarm of bees have a certain location picked out to which they wish to go, they will not be coaxed to stay, not even with unsealed brood. I am no advocate of clipping queens' wings; but hereafter, when a swarm persists in leaving the hive, I will use the scissors on the queen, even at the risk of clipping an unfertile queen, as it is better to lose a queen than to lose both swarm and queen, and an unfertile queen is easily replaced.

**DO BEES RECOGNIZE EACH OTHER BY THEIR SCENT, AND DOES THE QUEEN GIVE TO EACH HIVE ITS PECULIAR ODOR?**

I see by your remarks in reply to article on page 577 of GLEANINGS, that you think it incredible that the queen can give to a hive and its bees this peculiar scent. My experience will not throw much light on the subject; but I am satisfied in my own mind that the queen does not give this peculiar scent, if, indeed, bees do thus recognize each other, which I very much doubt. For several years I have always united weak stocks in the fall; and as my experience this fall has been the same as other years, I will give it.

In preparing my bees for winter I found that I had 6 colonies too weak to winter successfully, so I doubled them up, putting two colonies in each hive thus making three of the six. This uniting was done near evening; the weather was cool, and the bees were clustered on 3 combs in each hive, so all I had to do was to remove the empty combs from a hive, and put the combs containing bees and honey to one side of the hive, and then lift the combs with the bees and honey out of the other hive, and put them in the opposite side of the first hive, putting combs between the clusters on which there were no bees, thus separating the two swarms. Both swarms were allowed to retain their queens. The bees remained quiet all night, as it was so cold they had to keep clustered to keep warm; but the next day they flew quite strongly, but did not fight, the entrance to the hives being left open the full width of the hive. About one week after uniting those swarms, a neighbor told me that he had a queenless colony which, in other respects, was good enough to winter over, and asked me if I could spare him a queen. I told him how I had united all my weak colonies, but that I would look and see if some of the hives did not have the two queens yet, and, sure enough, the first hive opened had its two clusters of bees, and in each cluster was a queen, one of which I gave him. I have known such clusters to remain separate for three weeks, and retain each its queen, and I don't know how much longer, as when taken out of winter quarters in the spring there was always but one cluster and one queen in each hive so united. It must be remembered, that there have been several days in which bees flew freely; still there was no quarreling. Now, if the queen gives to the hive its peculiar scent, which queen out-scents the other, and thus gives to the bees their peculiar smell? I think you are right in thinking that their actions have more to do with it than their smell.

Muscatine, Iowa, Nov. 5, 1883.

W. S. FULTZ.

**ABOUT THAT HONEY FROM OAK-LEAVES.**

A FURTHER REPORT IN THE MATTER, FROM FRIEND CORK.

**T**HE Saturday after you were here, being a beautiful day, I examined about 40 hives to ascertain their state as regards queenlessness, etc., in preparation for winter. Although I opened so many hives, and occasionally broke small pieces of comb containing honey, I had scarcely any trouble from robbers. They were still getting so much honey from the oak-trees that they were not in a robbing mood. I think they must have gathered from 1 to 5 lbs. per hive during the four days they were able to work at it. The honey was quite thin and clear, and tasted very much like maple syrup. In all the hives, except where there were very young queens, brood-rearing had ceased; but this flow of oak honey started the queens laying again.

GEORGE CORK.

Niagara, Ont., Can., Oct. 29, 1883.

If the honey was light in color and right in flavor, I should hardly think, friend C., that it was the work of aphides. Now, is it possible that this is a vegetable exudation from the leaves of that particular species of oak-tree? Please note if it seems wholesome or otherwise for bees; that is, if your bees have the dysentery badly, please inform us, or to the contrary.

### EVERY MAN TO HIS TRADE.

ALSO SOME SUGGESTIONS IN REGARD TO MAKING OURSELVES USEFUL.

**T**HIS is an old saying, and one we are mostly familiar with, I presume, but I do not know that a great many of you are familiar with the great truth that lies in this. I suppose, of course, you know that, if you should take your horses to the shoemaker to have their shoes set, it would take the shoemaker a great while longer than it would the blacksmith, and there is very little likelihood of his having it right when it was done. Well, in our business we every day realize the importance of "every man to his trade." Sometimes our friend Samuel, who does all the digging all about the premises, happens to be away, and some one else is called upon to do the same digging. Now, almost anybody can dig, after a fashion; but there is not one in the whole hundred of our employes who can do digging any thing like as well, or as profitably to myself, as Samuel can. And so it is with other things. If you wanted some Simplicity hives put up in ten-crate packages, it would take a green hand nearly half a day to put up one; and he would be hardly likely to get it right, even then. But if he kept right on, in the afternoon of the same day he might put up two or three such packages, and do it tolerably easy besides. Now, if you should keep him at it week after week, he would soon put them up as fast as he could handle his pieces and his tools, and not make a mistake either.

In the business of shipping off goods, the reason why we have so much trouble is because a packer has to be constantly changing around from one thing to another: whereas if we could keep him right along on one thing it would be a great saving to myself and all concerned. One more item: If we kept one man packing hives, and we got over a thousand ahead, so that no more were wanted for months, when the time came around to have more hives packed, it would be better for us to pay this man two or three dollars a day, if he could be had, than to take a green hand at one dollar per day. The same idea applies to more common things; for suppose I want some sewing-machine oil put into bottles, and ask the girls, "Which one of you has ever put oil into bottles?" One of the younger ones will say, perhaps, "Why, Mr. Root, I have never done it, but I am sure I can put oil in a bottle, and cork it up."

Do you think she can, my friends? I will tell you about how it will turn out, and I presume if I were to set any one of you at it who had never done such a thing, you would get oil all over your clothes and the furniture, and take so much time at it that we should lose money in trying to sell the oil at five cents a bottle. It is true, there are people who have got so much judgment and good sound common sense that they will take a new job and do it pretty well the first time; but such people are very scarce. When you find them, you can be pretty sure that they will ultimately become foremen of factories or other large places of business.

There is constantly a great demand for handy people; in fact, the world is clamoring for them. We want handy people; oh how sadly we need them!—children who will not break, spill, destroy, and ruin so much of the work you give them to do that it is cheaper to do it yourself, even though your time may be very valuable. Well, now about the oil:

Perhaps Mary says she put up the oil last fall. "Well, then, Mary, you take this can of oil, and these bottles, and do it as nicely as you did before." Suppose, as soon as I have left the room somebody else wants Mary, and she turns the job over to some one who volunteers, with all the best intention in the world. What do you suppose will happen? I will tell you. The oil not only gets spilled, and the bottles greased, but she uses the wrong implements, making the task so slow that it will take a whole day to put up a gross. Then after it is done, some of the corks will be fitted so loosely that they will come out, and the oil run all over somebody's box of Christmas goods. Other corks, perhaps, will slip down into the bottle all over, and then a good deal of the time will be spent in trying to fish the cork out of the bottle, when the whole thing is worth less than five cents.

You may say, that inefficient hands should not be set at such work. I agree with you; but here are hundreds who are teasing for work, some of them saying, "Please, Mr. Root, give me something to work at." Now, I know what a task it will be to teach all these young people to be handy, but they do not, nor can they comprehend why I should pay some, no older than they are, a dollar and a half a day, while I offer them only 75 cents. It is simply because they do not know how to do things, and have not yet learned what is safe for them to undertake to do.

Another point comes in here: We have hands all over the establishment who are doing rapidly and well the work they are accustomed to do. A hand crates a package of ten hives in perhaps fifteen or twenty minutes, so that it does not cost over five cents at the outside for his work on it. Now, instead of wanting ten hives, some individual decides that he must have just exactly seven hives, or twelve, and insists on having them put up just that way. Very well; as we do not want to seem to be disobliging, we agree to do it for him. But, seven hives may cost us nearly as much as a package of ten, before we get through with it. And this is because he was unwilling to take regular goods in regular-sized packages. Another friend wants hives made just one inch longer than our regular ones; and if we tell him we shall have to charge him double price for adding the single inch, he gets offended because we do not want to take the trouble to be accommodating and obliging, as it seems to him. My friend, have you accustomed yourself to being a handy man or woman? If you have not, just set about it this day, and it will not only put money in your pocket, but it will enable you to ease the trials of life more than you can tell.

## BEE CULTURE IN MAINE.

**I** STARTED in the spring with 3 colonies; increased by natural and artificial swarming to 15, with about 30 lbs. of box honey.

## MÉTAL-CORNERED FRAMES.

I see some complaint has been made lately in regard to metal-cornered frames. I have used them almost wholly the past season, and am so well pleased with them that I shall use them in the future. I want a frame that I can pick up without having to pry loose, and jarring the whole hive; and on this account I can handle the metal-cornered frames with fewer stings. I have almost dreaded to open hives with all-wood frames, as there is so much prying loose to do, and that takes time, which is always valuable. Some complain of the ends of corners tipping up; but this, I think, will not happen if they are well clinched down.

The frames I use have an additional wire, at each end of the frame; this wire comes within about  $\frac{3}{4}$  of an inch from end-bar, making 8 perpendicular wires for L. frames. This additional wire holds the foundation more firmly in place, and prevents the foundation from warping around, as it often does without this wire. These frames were obtained of W. F. Falconer, but I do not know whether the invention is his or not; and, by the way, let me say here, as Mr. F. is one of your advertisers, that he has filled all my orders promptly, and with first-class goods.

## OUR STATE FAIR EXHIBIT.

At our State Fair, held in Lewiston, Sept. 18 to 21, there was a good exhibit of bees, hives, and apianian implements, which eclipsed all former exhibits. Among the first premiums awarded were, one colony pure Italian bees, J. B. Masor, Mechanic Falls; best collection of queen bees, do.; largest collection of apianian implements, Lucian French, Dexter; largest display of comb honey, G. W. P. Jerrard, Caribou. Mr. French is a veteran bee-keeper, of over 70 years, and manifested as much zeal as any one present. He had on exhibition one of A. I. Root's foundation-mills, one of the first out, and received first premium on foundation. G. W. P. Jerrard is one of the honey-kings of Aroostook Co. He has 300 swarms of bees, and gets 3 tons of honey per year. When asked how he managed to get his honey sealed so nicely, he said, "I keep black bees mostly, and prefer them for honey, and Italians for increase." That Mr. J. can raise something besides bees and honey, is shown in his large display of vegetables and farm products, grown by himself. Aroostook honey is the whitest and best in the world, so Aroostook people claim; and those who have seen and tested it are disposed to agree with them. Their greatest honey-producing plant is fireweed, or *Epilobium angustifolium*, which grows in great abundance. Raspberry bloom is also very plentiful, and bushels of the berries are canned there yearly. Aroostook County embraces the whole of northern and part of eastern Maine, and contains 6300 square miles. The land is rich and fertile, and is termed by many the "New West." Enormous quantities of potatoes are grown there, the larger part of which are manufactured into potato starch, of which 7840 tons are yearly produced.

## A VETERAN BOX-HIVER.

There lives near me a box-hiver of 85 years of age. He had at one time 80 swarms of bees in box-hives. These were not kept in one locality, but were let out on shares to different parties; but one or two poor

seasons, followed by hard winters, killed them off, so he has only two hives remaining. His heavy loss at one time he attributed to his neglecting to inform his bees of the death of a member of his family.

W. Auburn, Me., Oct. 24, 1883. E. E. CRAFTS.

## HOME-MADE IMPLEMENTS.

SOME VALUABLE IMPROVEMENTS AND SUGGESTIONS FROM FRIEND EASTERDAY.

**F**RIEND ROOT:— I send you with this a lot of sundries.

A LITTLE SHOVEL FOR CLEANING OUT HIVES.

No. 1 is a 5-cent garden-trowel with the point cut off, which I use for scraping the inside of hives, top of frames, etc. I find it a cheap but useful tool.

THE SELF-LUBRICATING PARKER MACHINE.

No. 3 is an improvement on the Parker machine. The trough is to hold the lubricating fluid. I will allow you to judge of its utility.

HILL'S DEVICE.

No. 4 is a cheap way of making the Hill device. To make the curved splints, I took a piece of tough elm board, which had been soaked in water, and sawed kerfs in one edge 5 in. apart, and then with a single-bit jack-plane, set deep, I cut them off ready curved, "faster than you could count." I suppose any kind of tough, straight-grained wood would do.

No. 3 is a wired frame, showing the way I do it. I could say much in favor of the size of frame and section I use, but I suppose it would be useless, as you would still persist in making your *odd sizes*.

DRONE FDN. FOR SECTION BOXES.

No. 6 is a section with a drone foundation starter partly drawn out. This leads me to say something about drone foundation. I have often noticed, especially when honey was coming in fast, that, if the starter did not fill the section, the bees would fill it out with drone comb. I concluded last spring that, if they preferred drone-cells for surplus, I would furnish them with that kind of foundation. I used about 40 lbs. this season, and have watched the result. For some reason, probably because less heat is required, bees rear their drones at the outer edge of the brood-nest. This habit causes the queen sometimes to lay in sections filled with drone comb, when she would not lay in them if filled with worker comb. Drone comb does not contain so much wax to the pound of honey, but the cappings do not look so white as worker comb.

During a good honey-flow I put on several rows of sections, filled alternately with drone and worker fdn. I found the worker was drawn out first, had the first honey, and the sections were best filled. I noticed all through the season, that sections with drone comb were not built down so well as the others. Although the bees never tried to change worker to drone, yet when the honey-flow became slack they tried very hard to change drone to worker, as you will see by the inclosed sample. I think hereafter I shall use only worker foundation.

MY REPORT.

Lost 20 % in wintering. Increased 60 % by natural swarms. Took 148 lbs. comb honey per colony, spring count. Honey all sold. E. S. EASTERDAY.

Nokomis, Ill., Oct. 25, 1883.

I will explain to our readers, that the point of the 5-cent garden-trowel is cut off squarely about two inches from the point; and as this trowel is made of iron, and not of steel,

it is an easy matter to make the shovel end square, so it will fit the bottom-board, and with a file and grindstone it may be made sharp. As the price is so insignificant, and it is a nice little shovel with a good convenient handle, it is certainly an ingenious and valuable idea. — The improvement for the Parker machine is made by excavating a little trough, filled with starch or honey, in the lower block of the machine. It is cut in at the right spot, so that when the lever is drawn back the corner can be easily dipped down in the lubricating material. It seems to me quite an acquisition. — The cheaper way of making the Hill device is indeed wonderful; but after friend E. explains how he does it, I am sure it can be done easily, and I do not know why the Hill device is not just as good as those we get out with circular saws. It might get jammed out of shape by careless bee-keepers, it is true; but bee-keepers have no business to be careless. — His frame is wired by simply running the wires diagonally up and down, back and forth, and the arrangement will no doubt answer nicely to keep the fdn. from sagging; but it does not prevent the top and bottom bar from sagging, as our method of work does. — The section with the drone fdn. in it partly worked out, demonstrates pretty conclusively that drone comb is not the thing for comb honey, when the yield is moderate. The bees have really made worker comb on drone fdn., but they must have done it at quite an expense, both of labor and material. I think hereafter we shall send no drone comb for starters, unless it is specially ordered. — Many thanks, friend E., for the valuable hints given; and especially for the important facts you give us in this matter of drone or worker fdn. for section boxes.

#### SOME ITEMS FROM FRIEND MICHENER

##### HOLY-LANDS CROSSED WITH ITALIANS.

**I** SENT out my last queen for the season to-day. Queens all sold, orders all filled, nuclei all united. We have been very successful sending out queens this fall. After the weather gets cool we put in from 20 to 25 bees; use nothing but candy; sent one safely to H. F. Hunt, Quebec City, a short time ago. We go into winter with 58 colonies, unless we sell a few more. Will winter half in chaff hives and half in cellar. We did not make holes through the combs this fall, as those that had none last winter wintered as well as those that had; and in place of sticks of wood over the frames, we are going to use sticks of candy — not that they are short of stores, but just to save their stores a little, and the candy will absorb the moisture, which will soften the candy so the bees can use it. There you have got the secret. Bees can be wintered with very little honey this way in a good cellar or good chaff hive (mine are just like yours, only I use shingles for covers) with a small amount of candy at a time laid over the frames. Loaf sugar cut into squares as we buy it is just as good as candy. We can place the candy in the shape of a Hill's device, you see.

This has not been a very good season for honey on this Niagara peninsula, at least near Lake Erie, although our best Holy-Land stock (we think the

queen was mated with an Italian drone) filled every section in the upper story of a Langstroth chaff hive, although a few were not capped nice enough to sell. I agree with friend D. A. Jones, that "Holy-Land bees and their crosses" are the best. They will gather more honey; they are quite nice to handle, if managed right, and in cool weather they will scarcely stir off their combs, while hybrids and some Italians are perfect furies in cool weather. Neither will they leave their hive to chase their enemies on such slight provocation as other bees will; and while they remain spread out over their combs when lifted out of the hives, they can be shaken off, almost every bee.

##### THE HONEY-PEAS.

The Southern cow-peas, sent me by W. H. Greer and Dr. T. J. Happel, way down in Tennessee, did not produce many peas, or blossoms either, and the bees did not work on them at all. They grew well, but I suppose the weather was too cool for them to come to perfection. The small amount of Russian-sunflower seed you sent me in a sealed envelope produced two bushels of seed, but the flowers produced no honey. It is a sort of gum, or propolis, the bees gather from them here.

ILA MICHENER.

Low Banks, Ontario, Can., Oct. 29, 1883.

#### FIXING THE BEES FOR WINTER, ETC.

##### ITALIANS AND HYBRIDS.

**N**OW that the bees have been idle for a number of weeks, and as another long winter is near at hand, I can not but feel a love for them. I started with 11 swarms last spring; have made 12 nuclei, and raised 34 queens with best of success. I have taken 200 lbs. extracted and 100 of box honey; and if I had raised no extra queens, I could have taken 200 more, I think. My main success depends upon laying queens at all times, and fdn. I doubled my nuclei down (which were all strong in bees), and now have 34 stocks in fine condition.

I like a woollen cloth next the frames, or rack, best; but in its absence I use burlap, and a few sheets of newspaper on this. I know some doubt the idea of paper, on the grounds that the moisture will not pass up through; but last winter's experiment satisfies me that it does; and the stock with an old burlap that was perfectly gummed over, with 3 heavy woollen cloths, and good full fine chaff cushions, all on came out the very best. The next best had 3 sheets of paper and cushion; the one that died first had one thin woollen cloth, and top story  $\frac{1}{2}$  full of chaff; and the ones that were covered first by snow came out the best and strongest.

##### HYBRIDS FOR HONEY.

There are as many ideas as to wintering as there are different bees. W. Z. Hutchinson has tipped the balance in favor of hybrids. Girard, of Aroostook, had the Italians, but sent them 10 miles away so as not to mix his blacks, for he said all they would do was to swarm, and give him no honey. He truly had a big show of box honey at our State fair this fall. Many like the Italians because they stick to the combs so nicely, and so they do; and when we extract, *don't* they stick too? I can extract 2 hives of hybrids to one Italian, and not spread them about the hive half as much as the Italians, and they will do double the box work of Italians; and when I work at extracting all day, from nearly all hybrids, and get but one sting, I don't think they are so very

bad to handle. I am not denouncing the Italians, but I think color has had too much weight in the matter. When experienced breeders tell me that they have paid \$8.00 for an Italian queen, and, after testing her, sold her for \$1.00, it looks a bit one-sided. Don't think, friend R., I am finding fault with the queen you sent me; I am not; she is all I could ask, and bred up a good swarm after the 24th of June; but she stopped laying sooner than some of the hybrids, though many claim they breed later. Probably that \$8.00 queen was an in-and-in breed, which gives more chance for lazy Italians than with hybrids. I have doubts about raising queens another season, for it is expensive, though a grand school, and very interesting. I must say, all I raised and use, are doing all I could expect, as to handling, etc.

E. P. CHURCHILL.

No. Auburn, Me., Oct. 29, 1883.

## BEE - NOTES FROM THE BLUE RIDGE.

### BOTTOM VENTILATION.

**M**Y article in Oct. JUVENILE would read better by saying "four-inch," in place of "four-nick V-shaped entrance." Bottom ventilation is certainly best, as the warm air is forced downward very slowly, and dispelled by the respiration of the bees, drawing the cold fresh air up gradually, causing a minimum condensation of vapor.

### GRANULATED-SUGAR FEED.

The fall of 1882 in this part of the mountains was a very wet season, which prevented much nectar secretion, and the bees from gathering even the little that might accumulate. When the time for preparing the bees for winter arrived, I found the most of my colonies almost destitute of stores. I made granulated-sugar syrup, and fed till all had 25 lbs. to the colony. Bees never wintered in a better or more healthy condition. As spring advanced I fed each hive a small portion of syrup two or three times a week; and when flowers began to bloom it was a pleasant contrast to see the strong army of workers pouring out of my hives, and note the feeble, languid movements of the decimated stocks of the patrons of the gum and box hives.

### ITALIANS AGAINST BLACKS.

The bees of these mountains are the large brown bees, of which we hear so much commendation. If they ever possessed any special merit, the branch of the family which has sojourned here these many years has lost it and degenerated into *scrubs*, like the farm stock of the country. They cut a sorry figure beside the Italians, which would be out in the morning, bright and early, off to the fields long before the blacks were stirring; and in the afternoon the blacks seemed to *tire*; and as sundown approached they would move around slowly—longing, apparently, for darkness to come, the Italians keeping up their busy labors till the gloaming put an end to their tireless industry.

### BEEES WORKING FIVE MILES FROM HOME.

There has been considerable said in GLEANINGS about the distance bees would fly in search of honey. I had a favorable opportunity of testing the matter to some extent the last season, as there were no Italians within perhaps fifty miles of this place, except those I owned; and although there was an abundance of white clover and other bee forage in and around this plateau, the Italians were found working on the clover in the coves four and five

miles distant. To reach those feeding-grounds, the bees had to ascend 300 or 400 feet in a distance of three-fourths of a mile over the ridges; and then in plain view, three or four miles distant, and a thousand feet below, lay the tempting white-clover fields. After the little fellows had secured their loads of nectar, rising a thousand feet in the air in order to clear the crests of the ridges which lay between them and their hives, must have been an exhausting labor. But, why do bees go so far when abundance of bloom is in immediate proximity to their hives? They must scent the perfume in the air, and follow it till they alight among the flowers.

### PREPARING BEES FOR WINTER IN THE MOUNTAINS.

The wintering problem, which gives bee-keepers so much trouble further north, presents no difficulties to the apiarist here. Provide the colonies on their summer stands with plenty of stores; contract the space to suit the size of the colony; place some strips of wood across the frames, and cover with a few folds of burlap or woolen cloths; fold some old newspapers, and press down snugly over all, to keep the heat from escaping; place the cover on, and the job is finished.

### HEDDON'S PLAN NOT RELIABLE.

I gave Mr. Heddon's plan of transferring on frames of fda. a pretty good test last season, and the result proved, though new, that it is not an improvement on the old one. The first trial, I drummed the old hive what I considered very thoroughly, for 20 minutes; but the bees, when emptied in front of the prepared hive, and forced in, showed, by unmistakable signs, that it was not to their liking; and notwithstanding the thorough drumming they had received, the queen had not been dislodged, but remained in the old gum. They soon began to leave their new quarters, and go in with another black hive in the yard, whose occupants were nothing loath to receive them, even placing a band of musicians at the entrance to invite the immigrants in. (I think when bees enter a stange hive with full sacks, they are always welcome.) Covering with a sheet the hive to which they were deserting, I placed their old gum near the frame hive they had been transferred to, and, ah! what a joyful hum was immediately set up, as the column took up its line of march into their old quarters. The gum was placed on its old stand, and another one tried with similar results.

A neighbor had a solitary gum which he wished transferred, and the next day I concluded to try them on the new plan. After driving as many of the bees up into the drum-box as possible, I turned them out at the entrance of the frame hive, which had been previously furnished with combs, but the queen was evidently behind; so, placing the drum-box on, I gave the old hive some more smoke and pounding; but the second installment of bees, when turned out of the drum-box, did not mend matters, for the queen still persisted in sticking to her old quarters. I was determined to drive every bee out of the gum, if need be, and a third trial proved that I had at last routed her majesty, and the colony finally accepted the situation, but with evident reluctance, leaving their warm combs, honey, and brood, to occupy new quarters in a cheerless, empty hive, on dry combs. I allowed the brood to hatch out in the old gum, and in a month or so transferred the colony; but it turned out poorly, and proved of little account.

Determined to give the new plan a still further trial (having succeeded in the last attempt after a

good deal of *persuasion*), a day or two after, I tried the first gum again, this time in the evening. I gave them a most thorough drumming, using two drum-boxes, covering the first exodus up till I drove the residue out, and then emptied all in front of the hive prepared with fdn. The bees were any thing but pleased with their cold quarters, but I forced them in; and as darkness closed down, they had no alternative but to remain.

The next day the bees went in and out of their new abode, but there was no work going on, and I noticed that the old hive, which had placed a band of musicians at the entrance on a previous occasion, seemed to be lively, and the bees numerous. In the evening I opened my newly transferred hive, and, lo! it was empty. I then opened the hive which had presented such unusual activity through the day, and it was crammed with bees from bottom-board to cover. I gave them a second story and a case of sections, and the double colony went to work at once in the boxes.

The bees evidently do not take kindly to Mr. Heddon's plan of transferring, and have a decided preference for their old combs and brood. It matters but little whether the queen goes up in the drum-box or stays on the combs when they are to be placed in the new hive. When the combs and brood are placed in the frames in place of fdn., the bees enter and go to work cheerfully, which they do not when forced to leave their brood and go on to empty combs or fdn. Mr. Heddon objects to having these old combs in his apiary; but old combs are a pretty good institution in many respects. Their thick walls, crevices, and caverns, make excellent warm winter quarters for the bees; and when empty they can be pushed to the outside, or taken out of the hive, and their places filled with frames of fdn.

DOUBLING COLONIES FOR THE HARVEST.

By the way, would it not be a good plan, at the commencement of the honey harvest, to unite two colonies, taking one of the queens and holding her in a nucleus till the rush is over, and then divide, giving the bees back their old queen with her little family?

E. E. EWING.

Highlands, N. C., Oct., 1883.

WORK FOR WOMEN.

I HAVE an aunt who became interested in bee culture a few years ago. She is now a widow. She and her two boys have been looking after a large farm and a good-sized dairy. In addition to all this she has not neglected her bees. In a letter received to-day from her, she writes:

"I think you have done splendidly with your bees. People here think I am doing wonders with mine, but I refer them to you. I got 700 lbs. of comb honey, about half of which is in section boxes; had 11 colonies in the spring, and 20 now. But I see that I might have done far better if I had not had so many irons in the fire. We had four boarders ten weeks, when I ought to have paid more attention to the bees. But I intend to do better next year; if I live and keep my health, and the girls stay at home, I shall try to see what I can do. The more I have to do with the dear little pets, the better I like them. I am very thankful that there is *one* thing a woman can do herself, without the help of a man. And when I see so many women dragging out a miserable life of poor health, and whining for money, I feel like saying to them, 'Why don't you get up and *dust*, and do something in this wide world, when there is so much to do, for both profit and pleasure?' But they are afraid the bees will sting, and they will have to make some quick motions; so they stay in

the house like little ladies, or take their exercise on the street, gossiping, and trying to talk politics, and electioneering for their husbands, so they will get into office. Bah!

"Well, enough of this. I must go to town with the butter, and take my rags to the weaver's for my new carpet."

That answers the question, "What can she do?" better than I can answer it; and as the pins stuck so neatly in some of the "gentler sex" are driven home by one of their own number, it relieves me from the awful consequences that might follow, if I had done it. The above quotation is respectfully dedicated to those of your readers who need an additional spur to activity.

EUGENE SECOR.

Forest City, Iowa, Oct. 27, 1883.

HOME-MADE ONE-PIECE SECTIONS.

SOME VERY PLAIN INSTRUCTIONS FOR THE UNINITIATED.

OUR enterprising friends of the Louisville *Farm and Fireside* have given so good an article on section boxes that we reproduce it entire. They have also been kind enough to loan us the engravings:

Sections are small frames to contain single combs of honey. As these appear upon the market with their sweet contents unbroken, white and beautiful, they have become very popular. The purchaser obtains a pound of honey, neatly cuts it out of the frame upon a plate, and it is a dainty dish to set before a king.

I have been making very good sections from Leslie berry-box material. I purchase a crate of twenty-four boxes, in the flat, for 16 cents, and this is sufficient to make 48 sections, with the crate material and bottoms thrown in. A strip for one of these quart-boxes is first slit from end to end, through the middle; then each part is doubled around and nailed with two small tacks. The frame thus formed is shown in Fig. 1, and is just large enough to contain one pound of comb honey, being  $4\frac{3}{8} \times 5\frac{1}{8} \times 1\frac{1}{8}$  inches. [The usual size of these sections is  $4\frac{1}{4} \times 1\frac{1}{4} \times 2$ , outside measurement.—Eds. F. and F.] As this material is only about one-twelfth of an inch in thickness, the frame is quite frail until strengthened by the comb itself.

Now, what is the best method of using sections in the hive? I have experimented a good deal, and examined most of the racks and contrivances used by bee-keepers. The following described box, however, devised by myself for my cottage hive, but just as convenient for any other, all things considered, suits me much better than any thing else. These boxes are small crates, holding, for my hive, six sections each. They are movable and firm, and easily packed away or carried to market. A quilt may be used over the brood frames, and turned back for one after another of these little crates as they are needed.

Sections are often suspended 'alongside' the brood in brood frames, but I do not like this method as well. I prefer to narrow the space below, down to from sixteen to eighteen hundred cubic inches, according to the size of the colony, by division-boards, so that the bees may be ready to work in the supers early in the season.

FIG. 2.—SLATER'S SECTION-CRATE.

The bottom-board of the crate is provided with a central opening for admitting the bees to the sections. The ends are nailed upright upon this bottom, far enough apart for the desired number of sections to stand between. The ends and bottom I get out of common siding, which I first carefully narrow down to the exact width of my sections. Inch-and-a-

half holes are bored in the end-pieces a little below the center, over which glass is placed for observation. Fig. 2 is a side view of the section-box complete, with thin strips tacked on the sides and top, which are easily removed. Tin or thin wood separators may be slid down between the sections, the ends resting upon the side strips of the crates. With pieces of old comb or foundation placed in the upper part of the sections for starters, the bees will generally fill them out with exquisite neatness.

Judsonia, Ark. F. A. SLATER, A. M.

In addition to the above, the editors write as follows:

In addition to the above-described crate, we present two others which may have points of convenience for some of our subscribers:

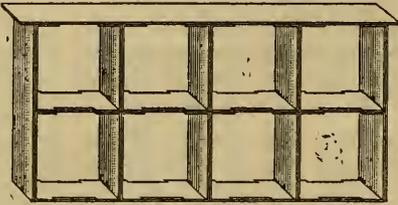

FIG. 3.—SECTION-FRAME.

Fig. 3 represents the ordinary section-frame—a frame made of stuff one-fourth inch thick by two inches wide, and of the same length as the frames used in the brood-chamber of the hive. The frame represented is the standard Langstroth size, and contains eight one-pound sections. These sections are now largely made by machinery, with the ends dovetailed together, and for many persons those thus made will be preferred to such as can be made at home, as they are sold by the thousand at half a cent each. Each section should contain a "starter" of comb foundation, and seven of these frames, containing 56 sections, are put into the surplus chamber of the hive at once, with no honey-board, so that the bees have ready access to them. The objection to this arrangement is, that when the honey-flow is not strong, and especially late in the season, it is sometimes desirable to put on fewer sections at a time. For this purpose the crate described by Prof. Slater is excellent. Mr. J. W. Newlove, of Columbus, Ohio, manufactures a modification of this crate, which is shown in Fig. 4.

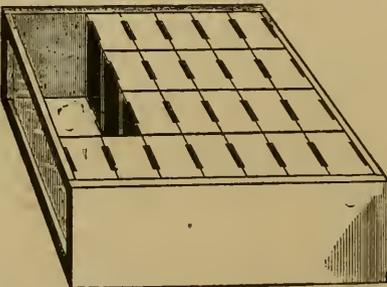

FIG. 4.—NEWLOVE'S SECTION-CRATE.

This crate is of proper size to cover the whole top of the hive, and to contain, for the standard hive, twenty-eight sections. It has a glass in the side for observation, and its "bottom-board" is simply a series of thin strips  $\frac{3}{8}$  inch thick by 2 inches wide, and so arranged as to support the ends of the sections, three of these strips, with a narrow cleat on each side of the crate, serving for the size shown. Mr. Newlove makes his crate a little larger than the space occupied by the sections, and fills the spaces thus left with strips cut wedge-shape. By removing these strips the sections are readily taken out. With both Newlove's and Prof. Slater's crates the surplus space may be regulated to better advantage than with the section-frames, as these crates may be lifted, when partly filled, and empty ones slipped under—an operation which will stimulate the bees to increased activity, instead of discouraging them, as the taking-away of their surplus often does.

## CALIFORNIA WHITE SAGE,

CAPTURED AT LAST.

THERE has been quite a little discussion as to what is the true white California sage, and as to just what it is like. We give below a letter in regard to it, from our old friend Pryal:

I have had executed, during the past few weeks, per order of the editors of Vick's *Monthly Magazine*, several sketches of the white sage. They were made by a first-class artist, under my personal supervision. They show the entire plant in full bloom in figure 1. In figure 2 are a couple of stalks showing flowers and leaves in their natural shape. Fig. 3 shows a section of the stalk so that the flowers may be seen in their natural size, which shows their curious flowers. The drawing is very artistic and truthful; and if the engraver does it justice, it will make a nice full-page cut. I had it arranged so that electros could be made from it in such a way that the plant, and section of stalk and flowers, would form two separate cuts.

The *Pacific Rural Press* cut, seen on page 301 of GLEANINGS, was made by the photo-electro process, which doesn't do for flowers. W. A. PRYAL.

North Temescal, Cal., Aug. 25, 1883.

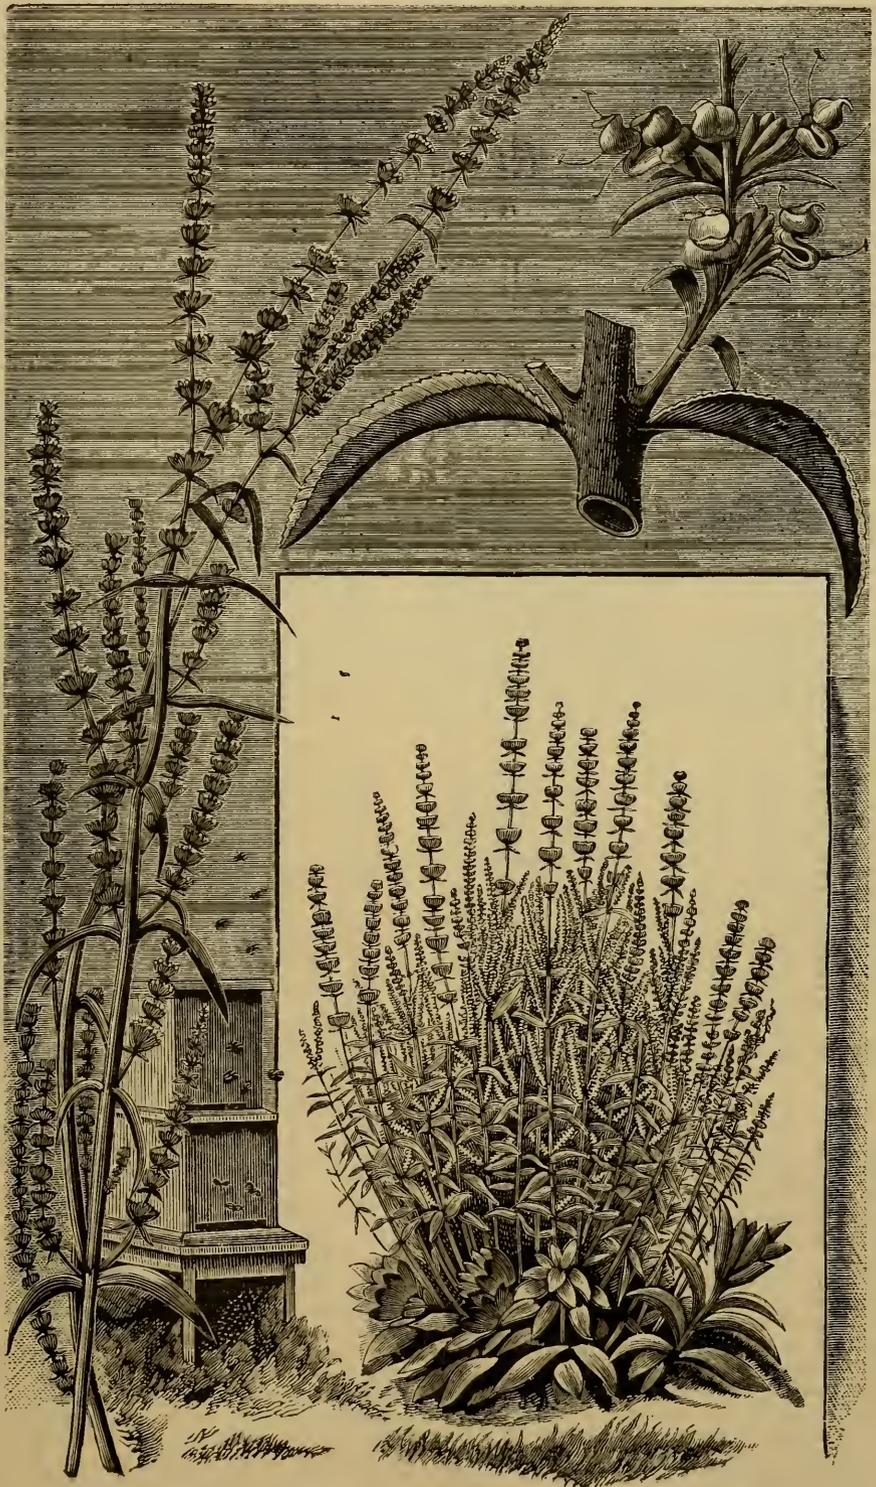

The following is an extract from Vick's *Monthly* for October:

### THE WHITE SAGE.

Few, if any, floral publications have done more to bring the true characteristics and merits of California trees and plants before the public than have those of James Vick. That true lover of Flora's gifts visited the flowery vales and mountains of that State, and on his return home was never tired of talking and writing of the countless acres of brilliant floral jewels he saw there. We are pleased to see that his successors are following in the footsteps of their father. California owes them lasting thanks, and is always ready to bestow them.

The products of the State are so varied, and of such superior merit that her people, as also those of other climes, can not help but praise them. Her specimens of the vegetable kingdom are often really wonderful, and then the quantity is still as surprising. Once the "land of gold," she passed successively to the land of wheat, of the grape, of flowers, of fruit, of milk, and of honey, and in a wondrous degree combined them all as no other country could. Her gigantic trees have been gazed at in astonishment by people from all shores; her gold has enriched many, while it has found a place in the pockets of every civilized being in the world who had the least desire of possessing the golden shiners, and who among men has not had that wish? Her plump wheat has crossed the wide seas to feed the hungry of the Old World. Her brilliant and many-hued flowers are adorning the gardens of the great and the humble in all quarters of the globe, and in the gardens of the peasant they luxuriate to the same degree as they do in the gardens of kings. Her fruits have of late years gone far and wide; they receive the same praise that her precious metals, wine, trees, grain, and flowers do.

As it would seem, California wonders never cease. Scarcely a decade has passed since the busy bee revealed the fact there bloomed on the almost desolate hills and mountains of the southern part of the State an unpretentious flower that secreted nectar more copiously than the flowers of the thyme on Mt. Hymettus did in days of yore. When the news of this newly discovered bee Arcadia reached apiarists in the north, the east, and the south, the star of bee culture at once took its course westward, where gold-hunters had, a quarter of a century previously, built up a prosperous State. In a few years numberless colonies were sending out their innumerable workers to harvest the nectar which for ages past had been wasted on the desert air. The climate—in fact, every thing—rendered the country a paradise for bees, and they gathered such quantities of honey that it soon became an article of export. Ships were called into service to transport the de-

THE WHITE SAGE OF CALIFORNIA.

llicious nectar to all parts of the world, and in return therefor the State received thousands of dollars, and a reputation for excellent honey enjoyed by no other place in the world. This seems to be in the natural order, "Excel in all things, fail in none." Like the flowers, fruit, and wine, the luscious nectar found a welcome entrance into the homes of the sovereign and of the peasant. Royal teeth have crushed the dainty waxen cells, to the great delight of the owner. The poor invalid desires no pleasanter food or medicine than this aromatic honey.

The flowers from which so many hundred tons of honey have been gathered in the lower part of the State of California are those of what is now commonly called "California honey sage." The one herewith shown is the true white sage, *Audibertia polystachya*. Several species of *Audibertia* are found on the coast, but we have chosen the above for this article, as it is the most striking in appearance, and differs in inflorescence very much from all the others and from the genuine sage. It has a very highly aromatic odor, and this, with its other peculiarities, makes it, when once known, easily recognized anywhere.

Figure 1 shows the plant in full bloom, and as grown on good soil, though not by any means above the average. On moderately rich and moist land it will keep up its efflorescence from June till Christmas, or till heavy frosts, which may be in January. On the dry hills and mountains in its native home, its season of blooming is much shorter than on either moist or cultivated lands.

On account of its being a great nectar-secreting plant, and because its season of efflorescence continues longer than most other plants, it is of great value as bee pasturage. The plants are of easy culture, and will thrive on drier soil than will many other honey-producing plants. The writer is firmly of the opinion, that this plant will grow well in all the most southern of the Southern States, and will yield large quantities of nectar. Its easy culture should be sufficient inducement for all who plant for bee feed to give it at least a trial. The writer has cultivated it near Oakland, Cal., and finds that it grows exceedingly well, and is visited by bees in large numbers from morning till night. It seems never to know when to stop blooming. On account of its striking appearance, it makes a good plant for the garden, and to try it we have it so planted. Its whitish-blue leaves and tall spikes, sometimes from six to eight feet high, give entire satisfaction as individual plants; but where grouped they do not grow so tall, and are still more beautiful. The plant from which the accompanying sketch was made is one raised by the writer on rather dry soil.

In conclusion, we would advise all bee-keepers in this State, and those of the Southern States above mentioned, to sow a few seed, and every year to assist in disseminating the same in their neighborhood, so that in a few years large patches of white sage may be found in the hills and valleys. This done, such a thing as a short honey crop will be a thing of the past.

#### ANOTHER MARVELOUS REPORT FROM AN A B C SCHOLAR.

FROM 4 TO 20, AND 3110 LBS. OF COMB HONEY.

**S**INCE becoming a subscriber to GLEANINGS, I feel as though I had become also a member of your large family of "Blessed bee-keepers;" and though but a baby in the business, I want to send in my report, which I have not yet seen surpassed.

I began last year, 1882, with one swarm of Italians; increased to 4, to start the spring; they began swarming in April, and increased to 20, and so now remain to go through the winter, which is a simple business here.

And now for my returns: I find by looking at my book that I have taken 3110 lbs. of comb honey, all from upper boxes, or caps, as we call them. I have no extractor, and did not take any honey from the main hives, which are very full. Our first shower for five months came in the end of September, since when the bees made no more surplus honey, but

turned their attention to glue-making, and preparing for winter. I inclose a sprig of plant from which they make most of the late honey. What is its name? Alfalfa was the main source of supply.

GEORGE HOBLER.

Hanford, Tulare Co., Cal., Oct., 1883.

Friend H., your report is truly wonderful, and I presume we shall have to conclude that your favored clime has something to do with it. However, since the other bee-keepers of your State have not reported any thing extra during the present season, I presume we shall have to conclude something is due to you as the guide and architect to this wonderful achievement. We should be very glad indeed if you would give us the full details, step by step, how it was brought about. We are very much obliged indeed for what you have said in regard to the sources from whence the honey comes; and especially are we glad to hear such a tribute to alfalfa. If it does not yield honey here, it certainly must do so in California. We will report further on in regard to the plant you send us.

#### ITALIAN BEES.

BY MRS. HANNAH RINEBOLD.

'Tis on a warm October day,  
The air is balmy, soft as May.  
That old Jack Frost painted bright the leaves,  
But left no food for eager, busy bees  
That fain would work these sunny hours;  
There's nothing left but withered flowers.

But in the house I hear a buzzing sound,  
And wonder what it is they've found;  
Oh! 'tis a tiny piece of bread,  
That was all o'er with honey spread;  
And ere we know what they're about,  
They've taken all the honey out.

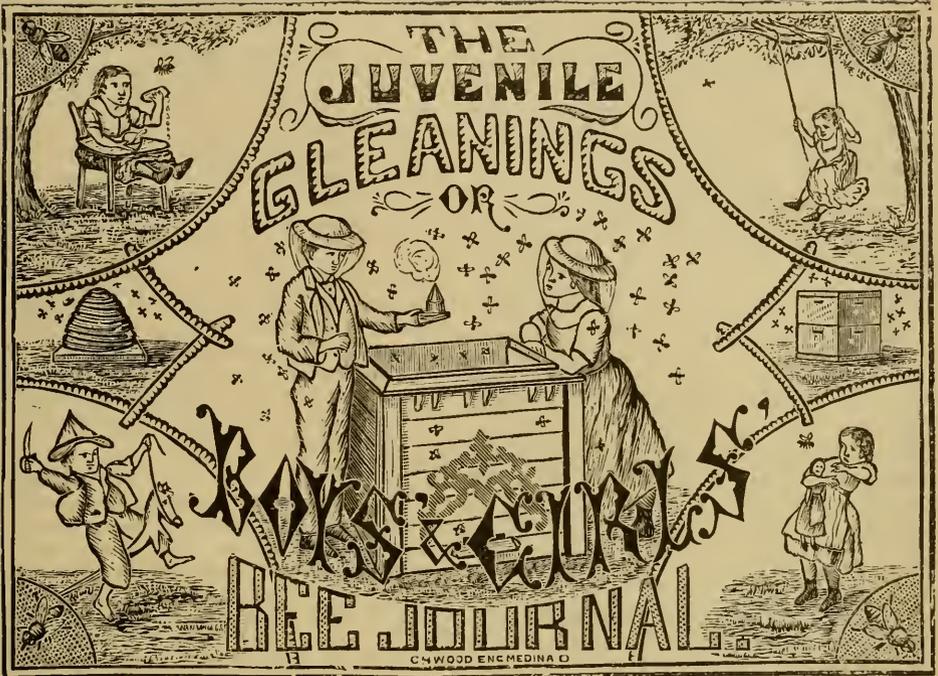

With new recruits they still are coming in;  
Don't they know, the thieves! that robbing is a  
sin?  
They're in the cupboard, over all the shelves —  
What shall we do with all these vexing elves?  
Oh! were there ever any rogues so bold  
As those that wear bright bands of gold?

Then on to the windows they buzz up and down,  
Till, tired out, at last they fall down,  
Unless we remove them by their bright wings,  
And let them fly out again, naughty wee things.  
O Uncle! what shall we do with such bees,  
On sunny days such as these?

Owing to the early frost that killed the buckwheat and goldenrod (our late honey-plants in this place), the honey crop was not very large, although there was quite an abundance of white clover earlier in the season. We have 23 colonies of bees, 11 of which are Italians. A near neighbor put some sugar on his window, to see whether the bees would find it. They found it. He didn't care to repeat the experiment. The Italians come into the house every warm day, but the blacks do not.

Overton, Pa., Oct. 15, 1883.

In the first place, my friend, raise all the windows about an inch, and the bees will all get out; then cover up, or carry out, every drop of exposed honey, and let them satisfy themselves that no more is to be had, and they will soon settle down quiet.— Many thanks for your pleasant and vivid "pen-picture" of Italians after stolen sweets.

He that is faithful in that which is least, is faithful also in much.—LUKE 16:10.

### MYSELF AND MY NEIGHBORS.

WHO IS MY NEIGHBOR?—LUKE 10:29.

Charity suffereth long, and is kind; charity envieth not; charity vaunteth not itself, is not puffed up.—I. COR. 13:4.

**I**T is nice to have neighbors. Don't you think so, my little friends? And it is nice to have *nice* neighbors. Are your neighbors all nice ones? or do you talk about them and make fun of them, and, when you sit down to dinner with the whole family, make it a business to talk about the faults of your neighbors? Well, I am pretty sure you do not; in fact, I begin to feel a little guilty myself for just suggesting the idea. If any of you do get into a habit of talking about your neighbors, remember it is a very bad fault, and a very great evil. I know by experience. I am sorry to say, that it comes very natural to me to talk about the faults of my neighbors, and to tell about the trials I have to endure. But I have always noticed this: That I never feel happy after having discussed the shortcomings and failures of my neighbors. I do not know why it is, but this tendency seems to be almost universal, to talk about others. Even Christians fall into the habit, if they do not look out, of talking about other Christians, and saying, "Why, Mr. So and So is a professor of religion, and yet gets mad, and scolds;" or somebody else, although a member of the church, hardly ever goes to meeting. Another one does work on Sunday that he does not really need to do; or still

another cheats in trade. Such things may happen; but I tell you, friends, it hurts us to talk about it. Of course, I mean to talk about it to somebody else, instead of the one who is doing wrong. Now, then, what are we to do? Whenever you feel tempted over the way somebody else has done or acted, just go right to him, and in a kind, friendly way, talk to him about it, and see if you do not feel happier. If after you have made up your mind that you will go and talk to him about his wrong ways of doing, you conclude the matter is too small to mention, or make any fuss about, then please do not mention it to anybody. If you feel pretty sure it would do no good to talk to him, or for some reason or other you think he would not take it kindly, just tell God about it, and pray to him that your friend may do better. Don't you know how our friend the old gray-headed Samuel said, in one of our recent Sunday-school lessons, that he should sin against God if he did not pray for the people? Now, then, friends, about the neighbors.

I do think it pleasant to have near neighbors; yes, and I think it pleasant to have a good many of them. If they are not just what they ought to be, you can help in working and praying for them, and in making a life-study to make them better. If they are good, kind, Christian people, then you have plenty of earnest helpers right near by you in the time of need. You see, a Christian has a right to be happy in any case, no matter whether his neighbors are good or bad.

A few days ago, when I was taking my

dinner in the new lunch-room, all at once it came over me what a pleasant thing it is to have so many pleasant neighbors. We have now a number of tables in our lunch-room, and the boys and girls gather about these tables in groups while they take their dinner. They all seem to be pleasant and cheerful. Our room is bright and new and clean. While a part of them were seated at the tables, some more of them were officiating as waiters, and others still were in the kitchen preparing food. But it does not make any difference where we are, or what we do. We are all one family, and there is little if any disposition to feel above our shopmates. When I looked over them all, and noticed the pleasant and kindly feelings that existed, I could not help the thoughts that welled up in my heart, of thanks to God. The rooms are warmed by steam, so it is pleasant and comfortable inside, even if it is stormy and unpleasant outside. Mr. Gray has made the counter-store and lunch-room so that they open into each other — at least, there is only a broad archway that separates them; and while we were eating, we could catch a view of the pleasant faces of those in the counter-store. What added to the cheerfulness, one of the girls had finished her dinner before the rest, and was giving us some music on a new musical instrument. It is one that some kind friend sent us not long ago, as a sample of the wonderful progress they are making in automatic music. The instrument is called the "ariston," and the melody that was being played just then was "*The Home Over There*."

A few hours later, as I was going my rounds at night, to see that the doors were all locked and lamps put out, and the valves to the steam-pipes turned properly, I passed near one of the large radiators in the counter-store. It was after 9 o'clock, and the great iron pipes were cold. I touched the live-steam valve, as they call it, and thought I would see how long it would take to warm it up again, and I just gave the valve a turn. In obedience to the simple act, a genial warmth began almost instantly to diffuse itself from the mass of iron under my hand. It seemed almost like magic, and then I remembered how these buildings had grown, little by little, year after year, ever since the time when I commenced praying for the boys and girls of Medina, and it seemed as though the answers to prayer had come strewn along through these years, almost as plainly as the heat came in answer to that simple act of turning that little valve.

It was dark, and I was alone; and so, kneeling there I thanked God again for his great mercies, and for the many pleasant neighbors that gathered around my place of work day by day. And yet, what have I done to deserve it all? My path in life has been but a series of stumbles and blunders, as it were. I have not even been obedient; that is, I have not all the time been obedient, for by fits and starts come rebellious feelings, even now when I have such great cause to be humble, teachable, and thankful. May God bless our neighbors! Ought not this simple little prayer to be often on our lips?

## A LETTER FROM CALIFORNIA.

### CAMPING OUT FOR A HOLIDAY.

THE king of our apiary came in yesterday, and the first thing he said was, "What a business of surprises bee-keeping is!" As there was a smile on his face, we concluded that there had been a pleasant surprise, so we asked what caused him to make that remark. He said, "You know when I examined the bees two weeks ago, I had to feed a few hives; now the strong hives have not less than five or six pounds apiece in the upper boxes." "Robbing," we remarked. "Not much," was the answer. "The bees are working as lively as crickets, and even the hungry swarms are as busy and contented as you please. I took out some frames, and there was honey enough for a week at least."

Well, he watched them to find where they got their supply, and found a few goldenrod blossoms, but the bees were roaring on the white-oak leaves. It was afternoon, so he did not see any honey-dew, as it is seen only during the morning, especially after a fog; but there the bees were, and that must be the source of their supply, as nearly every thing is as dry as chips. The honey is not very dark. Now, in the year when so much honey-dew honey was made, 1879, I think it was, they made it from the leaves of the live-oak, and it was very dark, and so strong we could not eat it till it had candied, and that is about the only honey here that will candy.

### THE HOT SPRINGS.

Now, Mr. Root, if you will let me, I will tell the juveniles about a trip we took lately to the hot springs at Las Cruces, which means "the crosses," about two weeks ago. It was a treat to me, and a description of the springs may be interesting to you. As it is 25 miles from here, we had to get up early and load up our wagon with bedding, tent, camp-stools, provisions, and the babies, and then away we went over hills and hollows, across a river and creeks, and even a mountain, till we came to the village. Then we inquired the way of a Spanish lady, but she could not talk English, so she referred us to a man who directed us on our way — cross a creek three times, then turn to the left; so when we got turned, we found ourselves going up and up till we finally reached the springs. Such a pretty place! a kind of half-circle surrounded by mountains, way up to the sky, as our baby said. The camping place was nearly level, and dotted with magnificent sycamores and live-oaks; and after we had pitched our tent, fitted our beds, and made a camp-fire to get supper by, we took a look at the springs, as there are three springs in the circle, all three different, and within 50 feet of each other. The largest is the cold sulphur spring, then the hot sulphur spring. It falls into a large pool, and is as hot as a person cares to get into. Then the lowest spring, and the smallest, is pure cold water, clear and sparkling. Now, isn't that strange, and worth going to see, even if you did not bathe? But, what fun we all had, except the boys under eight years old. They "howled" when they were put in. The little girls of the same age all thought it was too good to get out of, and could be got out only by force; and then at night, after the work was all done, we would sit around the camp-fire and sing songs and hymns. We had Chinese lanterns and lamps hung from the limbs of the trees, and they and the camp-fire, and the people sitting around, made a pretty weird sight.

Los Alamos, Cal., Oct. 12, 1883.

MRS. HILTON,

### THE CHITTIM-TREE.

A NEW HONEY-PRODUCING TREE.

**W**HEN I wrote to you for June JUVENILE, I promised you another letter. I shall now try to fulfill that promise by giving a description of another honey-producing tree, which papa says yields honey as bountifully as the famous linden, and lasts about three weeks. This tree is called here "chittim." For aught I know it may be the same kind of timber the ark of the covenant was made of. The wood when green is soft as basswood, and white nearly to the heart; but when seasoned it becomes quite hard. The bark is rough like that on thrifty ash-trees, but darker in color; the bark on the limbs is smooth like the ash, but much darker. The tree attains a diameter of 18 in. to 2 ft., and perhaps larger, and grows about as tall as the other trees in the river bottoms. It grows on the uplandsome, but I have not seen trees of it there. The leaves are of a deep green color, and are shaped like the leaves of the cherry, except that the broadest part is about three-fourths of the way to the point, or free end; they are about  $1\frac{1}{2}$  to 2 inches long; are about one inch broad. Make a section through the long way of a hard-boiled egg; look at the cut surface, and you have a fair representation of chittim leaves, the stem being at the little end, the edge of the leaf is perfectly smooth, non-serrated, and are thicker than cherry leaves; and when chewed, have a waxy feel between the teeth. The snowy-white flowers grow in clusters like apple-tree blossoms, and are rather smaller than mustard flowers.

I do not know any thing about stamens and pistils, nor calyx and corolla, etc., so I can't tell you any thing about them. The berries are now green, and about the size of, and taste something like, the berries on the spicewood bushes that grow in Indiana. They have one seed, or stone, to the berry.

Chittim blossoms about the last of June and first of July. Oh how the bees do go for them! How your kind old eyes would sparkle for joy, if you could be perched upon a limb in the deep shade, in the Trinity-River bottom on a hot July day, and hear the roar like a swarm, and see the bees fill up, and rush home and back in a perfect whirlwind of delight.

Papa got, on an average, 60 lbs. of chittim honey per colony. One Holy-Land swarm that came off the last of June filled up and gave 70 lbs. comb honey from chittim; two swarms gave 100 lbs. extracted honey each—one a hybrid, Italian and black, the other Italian and Holy-Land crossed. The nearest chittim is about a mile and a half from our apiary.

Horsemint failed to produce any honey here this year. Cotton yielded some, but the extremely dry weather nearly stopped its blooming, early in Aug. If ever a cotton-planter visits you, show him Prof. Cook's picture of the cotton-plant, and see if a broad grin doesn't spread over his face when you tell him that is a picture of the cotton plant, leaf, flower, and boll. I don't think he would recognize it as an old acquaintance. I think he would say the name is familiar, but it's the face of a stranger. We have the pepperwood-tree here. Bees are said to be very fond of it, but I have not seen it, so can not now describe. If I should ever see it in bloom, and think it deserves to be classed as a honey-producing tree, I will try to describe it for you.

Bees are working strongly for an hour or two of mornings on a weed called stinkweed, and also on an annual vine called love-puff.

EUGENE D. ARWINE.

Bedford, Tex., Sept. 14, 1883.

Thank you, Eugene. We have a good many descriptions of trees that bees work on, but no one seems to know, or can readily tell, whether they obtain any considerable amount of honey. This chittim-tree is worthy of notice, because you give positive proof that it furnishes honey, and furnishes honey largely. The yield which your father says he got would place it pretty nearly on an average with basswood. I should infer that the tree is quite a common one in your locality. If I am correct, you did not tell how many hives of bees your father keeps. This would be quite an important item in determining the value of the chittim-tree. I do not know that we have had any mention of it before. Have we, friends?—In regard to the picture of the cotton-plant, I presume Prof. Cook did the best he could at the time he looked the matter up; and if our Southern friends see he has not made a good picture, I feel pretty sure some of them will furnish him one; or if you could express him a whole plant, our artists and engravers could readily make a correct picture.

### FREDDIE'S DESCRIPTION OF THE LOUISVILLE EXPOSITION.

A JUVENILE ASSOCIATION SUGGESTED.

**I**T has been a long time since I have written to you, and I will now try to write a long one, and tell you about the Louisville Exposition and the Kentucky bee-keepers' meeting. We live 35 miles from Louisville, Ky., and took the early morning train, and got there at 8 A. M., Aug. 29. My ma and brother Edgar went with me. On entering the building, the sight was grand, and I can not give many of the particulars. The largest thing is the 600 horsepower Corliss engine moving so much machinery. The show is too big for a boy like me to describe. Nearly all the Southern States had fine exhibits there of timber, staves, cotton, and fruits. The finest show of pictures that ever was together is here. I took a ride around the park on the electric railroad. This is a new way to run cars. The track is  $\frac{1}{2}$  mile long. We stayed two days and one night. The electric light beats daylight. I can not tell you much about it all, as it is too big, and you will have to come and see for yourself.

I was going to tell you something about the bee-meeting and the honey show. The honey show was nice, and the bees fine. I met my pa at the bee and honey department. Pa and Dr. Allen, of Smith's Grove, Ky., have bees and honey together; they got the first premium of \$25 on fine bees and queens, and the second premium of \$20 on honey. There was 3000 or 4000 lbs. of the finest honey I ever saw on the table. There was a crowd around all the time, and such questions as were asked about the honey would make you laugh till you were tired; such as, "Do drones lay the eggs? do they sting? are all those queens? how many queens are there?" and all such questions.

The convention met in the directors' room; Mr.

Demaree, President, and Dr. Allen, Secretary. There were about 40 members there. They made me a member of their society. I had a good time with the members, and was at all the meetings but one, and got acquainted with the most of them. I had a talk with Mr. Hart, of Florida. He is a fine-looking man, and was on his way to the Canada bee-meeting. I saw Mr. Muth, of Cincinnati, and Mr. Pelham, of Maysville, Ky., and his foundation machine. I got acquainted with Mr. Drane, Mr. Stewart, Mr. Brown, and Mr. Deane. I had a good time with them. I was sorry to bid them good-by.

Now, Uncle Amos (I see some call you "uncle" and you must let me), I should like if all of us little bee-keeping sisters and brothers could have a meeting, and have some of our bees and honey to show, and have you with us. We might have a good sweet time (as long as the honey lasted), and a time long to be remembered.

My bees are doing very well, and I will tell you about them next month, as I am afraid my letter is too long already.

FREDDIE CRAYCRAFT.

Salem, Ind., Sept. 3, 1883.

Why, Freddie, that is a tiptop description of a convention. It almost made me feel as if I were there to look on too. It is very interesting, too, because we know almost all the men you speak about. I wonder if they really knew that a child was "among them, takin' notes."

#### ALL ABOUT BEE-HUNTING.

BEES SO TAME THEY CAN BE RUBBED ON THE BACK.

ONE of our neighbors lent me a JUVENILE. I like to read the children's letters. We have found about 100 swarms of bees in the last 3 years, but have got only 8 swarms now. My papa and eldest brother are in the southern part of the State. We got a swarm of bees the 12th of July out of the woods. The hive was full, and we divided it, and made two. I have to tend the bees for mamma. We don't use a smoker. We have one queen that is two years old. Our bees water near our door, and I can rub them on the back. There is a swarm of bees watering here now, and I can not find it. Our bees did not do very well this year, as it was not a good year for honey. The bees work on red-root, the Simpson honey-plant, ladies' tobacco, plum, cherry, Oregon grape-blooms, and willow-blooms; and it is just funny to see the way the bees work on the tiger lily. It is a deep red color, and has five petals, and looks like a honey-suckle, and it has a long leaf. They gather pollen off the bloom of the pine-tree, and they also get water to feed their larvae. We don't know what kind of water it is.

I will tell you how we get bee-trees. We first chop the tree down, for we hardly ever find a swarm in a log; then we take a brace and a one-inch bit, and make holes along the tree, and then you can tell where the honey is. It saves chopping.

Well, I suppose you are getting tired of my long letter, so I must close.

PERCY A. DUTTON.

Boulder City, Colo., Oct. 21, 1883.

Now, what do you think of that, little friends? Have you got bees so tame you can rub them on the back, and not disturb them? I guess our friend Percy did not rub very hard. When bees get accustomed to a particular place to get water, they will, if

treated gently, soon learn to be very tame. I have told you in the A B C book how Blue Eyes used to put her fingers on them when they drank from the bottom of that inverted crock. Well, if you go about very carefully, and let them get accustomed to your presence, in a little time you can learn to put your finger on their backs, and even stroke them as you would pussy, without making them fly away. I have sometimes thought that they rather liked to be petted in that way. It is only while they are drinking that I have been able to do this with them, and I really can not tell why it is that they behave so quietly while sipping their drink.—Your suggestions in regard to finding where honey is located in the tree is a very good one, friend Percy, and I will put it in the next edition of the A B C book, if I think of it. Your letter is a very good one, and we did not have any trouble at all in reading it.

#### CLEOPATRA'S NEEDLE.

DOES IT DATE BACK BEFORE THE TIME OF MOSES?

I WONDER how many of these boys and girls have an "Aunt Sarah." Well, I have an Aunt Sarah and an Uncle Joseph, and I think a great deal of them, because I used to live with them, years ago, when I went to school at Wellsville, on the Ohio River. Well, of course I am always glad to have them know where I am, and what I am doing, and so I send them GLEANINGS right along, and here is a little letter which Aunt Sarah sent me to put in GLEANINGS:—

*My dear Nephew:*—I write to thank you for GLEANINGS; it comes flying in once a month, with its cheerful face, saying, "Open and read me." Now, "Uncle Joe" is usually the first one to do that, as he has more time to devote to reading than I have; but I usually get through the most of it, and enjoy it very much. We have no bees, as you are aware, therefore that part does not interest me so much. I think no one can read Our Homes without reaping benefit from it. Reading your comments on Mrs. Harrison's letter, on what she saw in Central Park, in regard to Moses seeing Cleopatra's needle, set me to thinking. It was a new idea to me too; but I think she is in the right; for according to history it was first erected at Heliopolis, in Egypt, about B. C. 1600, and is, therefore, contemporary with Moses. Why it was called *Cleopatra's* needle, I do not know, for it was erected some 1550 years before her time. If any of your subscribers can give me any light on that subject, I wish they would. It was removed to Alexandria about B. C. 23; from thence to New York in 1880. It has been pelted by the storms of over 3300 winters, and still those wonderful hieroglyphics are not worn away, but can be read by those who understand them. Since the first talk of moving this wonderful curiosity to our country, I have read every thing I could about it, and it always filled me with wonder and reverence; but as wonderful a piece of architecture as it is, the mind and will power of man who formed it is more wonderful still. And how infinitely greater is He who made us and all things!

AUNT SARAH.

Atwater, O., Sept. 24, 1883.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Off, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-room.

"A chief's amang ye, takin' notes;  
An' faith, he'll prent it."

**I** PRESUME, children, you all go to Sunday-school. If you do not, I wish you would commence right off next Sunday. If you have any confidence in my judgment or wisdom, please listen to me in this; and, by the way, it does not make any difference how old you are. Of course, if you are grown up it would hardly be proper to call you children; though in one sense we are children, all of us, or ought to be. Well, now, I hope you all go to Sunday-school, both old and young; and if you do not, I am sure that nothing in this world will contribute more to your happiness eventually, than a constant and regular attendance at the Sabbath-school nearest you. If there is not any near you, by all means start one. Even if you can not have more than two families, have a Sunday-school of those two families, and then get as many more as can be found. So much for Sunday-schools.

Now, in our lessons for some time past we have had a great deal about Samuel. Samuel was a good boy, you know; and, by the way, I believe all boys are good when they are small. Nothing tickles little Peter so much as to call him "dood boy," and he almost always deserves it too. All along through these lessons about Samuel you will notice how intimately acquainted he seemed to be with God. He talks to God in prayer, and God in those times used to answer back in words. God would say, "Thus say unto the people," and then when Samuel spoke to them he would say, "Thus saith the Lord."

Well, there is one thing that struck me as remarkable about Samuel. He seemed to be always in a line with God's work. God was working for the salvation of the children of Israel, and so was Samuel, just as you and I are working to save the bad boys and men all around near our homes. You see, Samuel's whole end and aim in life seemed to be for the saving of mankind, or his little flock. Just remember his constant and untiring exhortations to them to leave off wickedness, and do right. He says it over and

over so many times that it gets to sound almost monotonous. But Samuel knew, doubtless, that it needed line upon line and precept upon precept, just exactly as we need the same nowadays. We do not anywhere find that Samuel had any other plan or purpose. He might have got rich, but he did not care a cent about riches. He might have got to be king, but he did not want to be king. He was not an office-seeker in any respect. He simply wanted the people to be good. We know that God loved him, because God honored him. In our lesson we are told that Samuel, after one of these earnest exhortations, said to the people, "Now therefore stand and see this great thing, which the Lord will do before your eyes." Of course, the people looked, and wondered what was coming; and then Samuel told them (to prove to them that he was right, and that God would really do as he said), he was going to call on God to make thunder and rain; and this was right in the dry time of the year, when they never had rain. Do you think that Samuel was in any way afraid it would not work? Not a bit of it. My little friends, he was just as sure the thunder would come promptly, as you are sure the sun will rise to-morrow morning; and when it did thunder awfully he was not a bit surprised nor frightened. God and Samuel were almost one. You see, he and his Father in heaven were in such relationship that the thought of one was that of the other; and Samuel had no thought in his mind that was not in a line with God's thoughts and God's wishes.

Now, I wonder if it has occurred to you while I have been talking, that Samuel stood almost where Jesus did many years afterward, like father and son. Is it not true, children, that the life of poor old Samuel was in many respects almost a type of Jesus our Savior? We have a beautiful little hymn in one of our Sunday-school books that brings out this thought so strikingly that I wish you could all hear it sung. I can give you the words to-day, but I can not very well give you the music; but I hope to be able to before very long. May be you can sing it to some tune you know. And when you read it, please to just remember this sentence in the middle verse: "I and my Father, purpose have one."

Oh to be like him, tender and kind!  
Gentle in spirit, lowly in mind;  
More like to Jesus day after day,  
Filled with his spirit now and always.

CHORUS.—Yes, to be like him we must abide  
Near to our Savior, close by his side.

Oh to be like him! quick to obey,  
Childlike and truthful, ready to say,  
"I and my Father, purpose have one;  
Thine, not my will, ever be done."

Oh to be like him!—tempted in vain,  
Dwelling with sinners, yet without stain;  
Giving our life-work sinners to save,  
Triumphing over death and the grave.

These words, which we take the liberty of copying from Sweney and Kirkpatrick's "Wells of Salvation," can be sung to No. 16 of "Gospel Hymns."

Pa has 7 swarms of bees. He didn't get very much honey this year. My sister and mother were out feeding the bees one morning, and a bee stung mamma on the arm.

KATE DOTERRER.

Ross Run, Pa., Oct. 22, 1883.

## WILLIAM'S LITTLE LETTER, "VERBATIM."

Mr root: My grappa has 10 hives of bees. We have 4 hives of italians. I am 7 years old.  
Rorning, Mo. WILLIAM E. NEFF.

Pa had four stands of bees before they swarmed; and after they swarmed he had 7. We didn't get very much honey this year. EMMA DOTERRER.  
Ross Run, Pa., Oct. 21, 1883.

## FROM 47 TO 90, AND 6000 LBS. OF HONEY.

My father has 90 swarms of bees. He keeps them in the Simplicity hives. In the spring he had 47 swarms. He took off 2000 lbs. of comb honey, and about 4000 lbs. extracted. HATTIE A. HAY, age 9.  
Sandwich, Ill.

I am a boy 7 years old, but am not much of a bee-man. It is about a quarter of a mile from here to grandpa's. What will a telephone cost, so that I can talk with Aunt O'a? DAVID I. SHENEMAN.  
Pharisburg, O.

Our 75-cent telephone would answer your purpose very well, friend David.

## BAD NEWS, AND GOOD NEWS.

My pa used to keep bees. Five or six years ago he lost over 100 that died with foul brood, and he has not had any since till last year.

## FROM 1 TO 3, AND 180 LBS. OF HONEY.

He bought one in June, and increased to three, and got 180 lbs. of honey.  
Rockwood, Mich. GEO. F. SPEDDING, age 13.

## A HINT FOR MAPLE-SUGAR MAKERS.

We have been making maple molasses. Our camp is about a mile from our house. Our bees went out there, and some of them got drowned in the sugar water. Pa fed them bran and flour, and opened some trees near the house for them to work on, and they didn't go back any more. NOTA ALUERSON.  
Gospport, Ind.

## EDDIE'S REPORT.

I am a boy 12 years old. This is my first letter to you. My papa has got 17 colonies of black bees. He lost 3 colonies last winter. Uncle Johnson has 30 colonies of blacks. We got 30 lbs. of honey this summer. Papa says that may be he will give me a swarm next spring. EDDIE FRENCH.  
Austin, Minn.

## HOW SAMMIE GOT STUNG.

Last summer when pa was swarming some bees I stuck my head under the cap, and a bee stung me on the nose. Our hired man was so afraid of them that he would go clear around the house. He used to say the bees would sting him if he got anywhere near them. SAMMIE H. STRONGE.  
Friendsville, Pa.

## 4000 LBS. OF HONEY.

My pa keeps bees, but I have to do the "heft" of the work, on account of his health. We have got 80 swarms; from them we have taken about 4000 lbs. of honey—a little over half comb honey, and it is not all off yet. There is one hive I call mine; from them I have taken about \$8.00 worth of honey, and have sold it for 10 and 15 cts. GEO. W. ANDRESS.  
Climax, Michigan, Sept. 10, 1882.

Please allow me to write you again. Pa has 60 colonies of bees, and ma has 4. Pa says he will give me a swarm in the spring. We got only about 1000 lbs. of wax honey this season. We have had a photograph taken of our apary. I have two pets—a

bird and a cat. I like my bird the best. Its name is Beauty. It is a bright yellow.

LYDIA BRADFORD.

New Milford, Pa., Oct. 22, 1883.

Last fall a swarm of bees came out when I was at home alone. I ran up to the poorhouse, where pa was at work, and told him, and he went home and hived them, and gave them to me. They swarmed twice this summer, and I have sold one swarm for \$8.00. FREDDIE A. PEASE, age 10.  
Kingsville, O., Oct. 22, 1883.

## LITTLE MOTHERLESS EFFIE, AND WHAT SHE CAN DO.

My pa has four colonies of bees. One swarm went to the woods. As all the little girls tell what they can do, I will tell what I can do. Churn, wash dishes, make beds, wash, iron, sweep. I have two sisters and one brother. My ma died four years ago. I am 12 years old. I would like Silver Keys.

EFFIE M. STEPHENSON.

Consville, Mo., Oct. 24, 1883.

My pa had 17 stands of bees the first of May, and has now increased to 31. There was a man who came here and wanted pa to come and see what was the matter with one of his stands. Pa went, and found that the comb was broken down, and the man told pa that if he would take the honey out that he might have the bees, so pa did so, and brought the bees home, and they are now doing very well. This was about a month ago. J. A. SHENEMAN, age 10.  
Pharisburg, Union Co., O.

## FROM 28 TO 80, AND 500 LBS. OF HONEY.

Pa had 28 colonies of bees in the spring; they have increased to 80. We had one swarm come out and leave without clustering. Pa found the tree that they went to, and we are going to cut it down and get them. We have taken about 500 lbs. of honey from them, and we will take more, I think. We have a small colony of bees, with glass on each side of the gum, so that we can see them do all of their work. JESSE VEACH, age 12.  
Springport, Ind., Oct. 21, 1883.

My pa has one swarm of bees; he got them last fall from my uncle, John McGonnel. I am visiting at my uncle's. He takes GLEANINGS, and I read it at his house. I like to read letters the children write. I go to Sunday-school in the summer time. My pa is a wagon-maker. ADDA MATTSON, age 11.  
Mill Village, Pa.

We know your uncle John, Adda, and we are very glad to hear from anybody who is his relation. We are glad to know you go to Sunday-school.

## HOW ROBBIE GOT HIS SWARM OF BEES.

Last spring pa bought one stand of bees, and it swarmed twice; now we have 3, and when they swarmed the last time pa was down in town at work in the novelty shop. It is about a mile, and so I had to run after him to come and hive them, and so he gave it to brother Willie and me. I go to school. My little brother went, but he played on the road so long one day he froze his big toe, and will have to stay at home till it gets well.

Creston, Iowa.

ROBBIE HEISLER, age 11.

My papa has 47 colonies of bees; some of them are black ones and some Italians. Pa winters them in a long narrow shed made on purpose, and packs them in chaff, and they usually do well. I go to Sunday-

school during the summer months, and I like to go. My papa is the superintendent of our Sabbath-school. We have no library at the present time, but have *Everybody's Paper* and the *Children's Banner*, and I like very much to read them. My papa's name is John W. Wood.

Jackson, Mich.

HATTIE M. WOOD.

A CAUTION ABOUT HAVING APIARIES NEAR TO BODIES OF WATER.

I live with uncle. He takes GLEANINGS; he has 43 swarms of bees. He said he would give me a swarm of bees next summer. If I would take care of them, but I am afraid of them. This summer when the bees were getting honey fast, many of them, in trying to fly across our mill-pond, were so loaded down, or tired out, that they fell into the water, and I suppose were drowned. The bee-yard is about 5 rods from the pond.

HERBERT STRAIT, age 11.

Otsdava, N. Y., Oct. 26, 1883.

GEORGE AND HIS PET HEN, THE BUSHEL OF HICKORY-NUTS, AND 3000 LBS. OF HONEY.

I thought you would like to hear from a boy from Greenfield, Ohio. I go to school, and I read in the Fourth Reader. Papa takes GLEANINGS. He has 78 stands of bees all ready for winter. We got over 3000 pounds of honey. I have two brothers and one sister. I went nut-hunting the other day, and brought home a bushel of hickory-nuts. I have a pet hen. She is older than I am. She is ten years old.

GEORGE H. POMMERT, age 9.

Greenfield, O., Oct. 26, 1883.

Pa calls you brother, and I address you as uncle. Pa takes GLEANINGS, and says it is worth a dollar each number; I like to read the JUVENILE, and thank you for being so kind as to send it to us. Pa keeps bees. He had black bees, 15 stands, but they all died two years ago. He sent last spring to Mr. Harrison, Lebanon, Mo., and got a stand of Italians. He paid ten dollars for them, and has got 8 stands now. He doubled one, and one got away from us. I go to school, and learn fast. I help ma wash the dishes. My brother-in-law has a stand of bees. I have a brother and sister at home. They go to school too. My sister has got blue eyes too.

Rock Spring, Mo.

KATIE GOUGH, age 12.

LILLIE'S REPORT.

Papa had twelve colonies last fall; but by carelessness he has let them all die but four. They have plenty of honey, but it is in such a fix they can not get at it. We have to feed them; we made the feed after Mrs. Cotton's recipe. We think it is very good. We live a little way from town, but it is a nice place to keep bees. Papa took the honey out of the hives where the bees all died, and it is real nice. We had about 30 lbs. I have one brother and two sisters. One of my sisters is only three months old. She has blue eyes and brown hair. We call her Maud. She can laugh and crow, and she knows mamma as soon as she sees her. I go to Sunday-school every Sunday. It is not a very large school, but it is a good one. Papa takes GLEANINGS, and would not know how to do without it. You must not put papa in Blasted Hopes, for he is going to try to build up his colonies again.

LILLIE THOMPSON.

Creston, Ia.

FROM 5 TO 16, AND 15 GALLONS OF EXTRACTED HONEY, AND 40 LBS. COMB HONEY.

My father and mother are dead, and I live with J. E. Davis. He takes GLEANINGS. I read the letters

in the JUVENILE, and I thought I would write you one and get a book. We keep bees. We started with 5 in the spring; increased to 16, and got about 15 gallons of extracted honey, and 40 lbs. comb honey. I am fond of honey, and like to help with the bees. They have not made any more than enough to keep them since basswood.

WM. T. TAYLOR, age 14.

Mill Creek, Wis., Oct. 5, 1883.

CHARLEY AND HIS BROTHER, AND THEIR BEE-KEEPING.

Pa has 6 stands of bees. My brother and I own one stand in partnership, making 7 stands in all. Once we had our bees in real old-fashioned hives, which we made ourselves. A man who thought he understood bees very well came along, and pa let him put them in new-fashioned hives. He transferred them for pa, and they all died. Pa afterward sent to you for 5 lbs. of bees, which were shipped to us and our 7 stands are an increase from the five pounds. My brother and I attend to the bees. Pa don't generally go about them. I like bees, and like their honey too, but they don't like me. After I am about them for a time they seem to get used to me, and do not sting so badly. In fall we get goods boxes and put the stands in these, filling around with chaff.

CHAS. HAINES, age 14.

Moons, Ohio.

FROM TWO OF OUR UTAH JUVENILES.

You have sent my father a great many things. He says that you are a very honest man to deal with. He keeps bees, and has 2 queens, daughters of one you sent him. They are very nice. They have brood in their combs. I am my father's only son.

Fairview, Utah.

NEILS LARSEN.

BERTHA'S REPORT OF THEIR UPS AND DOWNS IN BEE-KEEPING.

Father bought a colony in 1881 and increased them to 3 colonies. He lost one in wintering, and the 2 he had left were so poor that he had to help them. He bought 3 more in the spring, and paid \$40 for them. He increased them to 15; with the 2 old ones it made 17. We extracted 75 lbs. of honey from them, and sold 4 colonies—3 for \$10 each, and 1 for \$5 in the fall. We wintered 13 good colonies in chaff. We looked at them to-day, and they all have brood in their hive. We got a queen from you last summer. She was nice looking, but would lay 2 or 3 eggs in a cell. We had to take her out. But we have raised 2 good queens from her. We got an extractor from you. It is the nicest one I have seen.

Fairview, Utah.

BERTHA LARSEN.

THE YOUNG SHEPHERD, THE INDIANS, AND THE INDIAN WAR-DANCE.

I am a Virginia boy, away out in Arkansas. I have been here eleven months. I like it out here tolerably well. I have five brothers and two sisters. My two eldest brothers keep bees; they have 12 stands of Italians, and have an imported queen from you. My pa keeps sheep. We have 650, and herding sheep on this big prairie is my work from morning till night. One of my big brothers helps me. We herd on two good ponies, and I like it. I see lots of Indians here. I saw an Osage Indian war-dance last week. Two of them sat down and beat a drum, and the others all held up their tomahawks, and jumped and danced around them. We live only three miles from the Indian Nation.

CLAUDE E. LAWS, age 10.

Ft. Smith, Ark., Oct. 20, 1883.

## LETTER FROM AN ENGLISH BOY, AND SOMETHING ABOUT ENGLISH BEES.

My father gave me one stock of bees last spring, and they swarmed, so I have 2 stocks now. I sent some honey to the show, and got 2 prizes for it. My father does not like the Ligurian bees; he has killed my queen, and given them a black one. He has proved that the English black bee gathers more honey than the Ligurian. It has not been a very good season here for honey; it was only for a week or two in July that they gathered any; then the strong stocks did work. I go to school at Henningham. It is a mile away from our house. I have a rabbit. I have my holidays now, so I thought I would write. BERNARD PERCY WALTON, age 8. Honey Cott, Weston, Leamington, Oct. 24, 1883.

## RAISING WILLOWS FOR BEES.

I saw in your journal that a man had pussy-willow cuttings to sell, and father says that I can have all I make selling them. They grow very plentifully here. By sticking them into a potato, and planting them in moist ground, they will take root and grow. They blossom out very unevenly. Some are in blossom now (February), and some have not started. The first things our bees work on in the spring are the swamp alder and the pussy willow. I will furnish six cuttings for fifteen cents. We live in latitude 44°. We keep part of our bees in the bee-house, and part are buried up under the snow. There came a thaw a short time ago, and one of the hives got uncovered, and father opened it, and the bees were all right. The first thing our bees get honey from is where men have cut down maple-trees, and where gray squirrels have tapped them and the sap has run out on the limb. Have you got any Bibles for Sabbath-schools?

Lisbon, Me. RALPH E. GOULD, age 10.

Yours is a very good letter, Ralph, and we are very sorry that it got in a heap of other letters, and was overlooked until just now. Thanks for the idea of sticking the sprouts into a potato. I should think it would be just the thing to give them a start.—And it is the gray squirrel, is it, that starts the sap from the maple-trees in spring?—Yes, Ralph, we have Bibles for Sunday-schools, and you will find them on the 25-cent counter.

## TAKING THE "STARCH" OUT.

Since your JUVENILE came to hand that pa subscribed for, I have been much interested in reading the letters of the children. You say, that for a long time you had refused to wear a neck-tie. Pa said we should tell you that he has not put on a neck-tie nor a collar since the war. He says the war took all the "starch" out of him. Pa had 35 stands of bees at home last fall; but two have died, I think, of neglect. Pa and one of my uncles have commenced another apiary about 3 miles from here; they have 18 stands of bees there. Bees gathered but little surplus honey last season. The late-gathered honey they failed to seal, and they seem to die off very fast.

Moretz Mills, N. C.

J. W. DAVIS.

Now, my young friend, in one way it does not make any difference whether your father wears a neck-tie or not; but perhaps your mother, or some of your grown-up sisters, and may be some other folks too, would be much gratified and pleased by seeing him put on a neck-tie and collar, and then perhaps it would be better if he should do so.

You see, we are all bound to live for others; and it is certain that if we do, we can not be in danger of getting selfish.

## 150 LBS. OF HONEY FROM 150 SWARMS OF BEES.

My pa has 150 swarms of bees, and has had about 150 lbs. of honey. This season is one of the worst we ever knew. All the bee-keepers around us complain of having no honey. The spring was wet and cold, the summer dry. We had no rain for six weeks; and after it rained, the cold wind set in, and the bees could not fly. Early in September we had a big frost, which destroyed the corn and grapes, and almost all the plants, and what goldenrod is left, there seems to be no honey in it.

We see in GLEANINGS that some of the bee-keepers have had a good yield of honey, and I am glad to hear it. I saw in the JUVENILE, that you have a little boy-baby, and I hope he will grow and give you much joy; and if you have not named him, I will send you two names — Oscar and Arthur.

MELINDA NEUNAN.

Glenn, Mich., Oct. 10, 1883.

## HOW ARCHIE TOOK THE PREMIUMS AT THE FAIR.

I thought perhaps you would like to hear how one of your A B C scholars was getting along in Canada, so I will now tell you what kind of luck I have had with bees. A friend of my father sent me a swarm as a present in July, 1880, and I managed to keep it through the winter all right in a Richardson hive that father bought for me, and the bees came out in the spring as lively and nice as anyone would want. During 1881 I took from my bees about 95 lbs. of honey. I showed my honey at our county fair, and took first prize for strained and comb honey. I have now three good colonies of bees put away for winter, and my father and I have got five new hives made and ready for next season, and we intend making some more hives before spring. Now, Mr. Root, don't you think this is pretty good for a boy 13 years old? I don't know how I should have got along had it not been for your A B C book and GLEANINGS. My father paid for GLEANINGS last year; but as I get all the money the bees make, I now inclose \$1.00, for which you can send it to me.

Ayr, Ont., Can.

ARCHIE G. WATSON.

## HOW LIZZIE'S PAPA PACKS HIS BEES FOR WINTER.

My papa has ten colonies of bees, which made about 350 lbs. of section honey. One colony made 100 lbs. of section honey; average per colony, 35 lbs. Papa sets out turnips in the spring for the bees. Our chief honey-flowers are Spanish-needle, golden-rod, and white clover. I like Spanish-needle honey the best. I help papa take care of the bees. I like to work among bees. I get stung sometimes, but not as often as papa. He laughs at me when I get stung; but when they sting him on the nose, I laugh at him. Perhaps it will interest some of the juvenile readers to know how papa packs his bees for winter. He stands his bees in a row by the side of the fence, and packs straw all around them, except in front. He hangs a carpet in front of them, and lays a wide board on that; and on a nice sunny day he lifts the carpet up and lets the bees have fresh air and a fly. The coldest day we had last winter, go and rap on the hive, and the bees would come down to the entrance to find out what was the matter. Our bees came out strong in the spring, packed this way.

LIZZIE BARNES.

Pana, Ill., Oct. 22, 1883.

## Our Homes.

For the Son of man is come to save that which was lost.—MATT. 18: 11.

I HAVE been thinking of late, dear friends, that we can choose no more profitable study in this world, than the studying of the wonderful character of our Savior. My text for to-day comes from the 18th of Matthew, as you will observe. In order to get a clear understanding of what our Lord meant when he uttered these words, "The Son of man is come to save that which was lost," let us go back to the 16th chapter of Matthew, verse 13, where Jesus spoke to his disciples, "Whom do men say that I, the Son of men, am?" He evidently asked this question to test the faith of his little band of followers—to see what sort of an idea they had of him, their master, who is really and truly the Son of man; a man born like the rest of us, and brought up from childhood. Several different replies came, and these replies were somewhat evasive, for they seemed more willing to tell what other people said. Finally he says, "Whom say ye that I am?" Now, you notice, friends, that when the rest were afraid to speak, or were a little backward, Peter, with his impulsive nature, was always ready. He was not afraid, even though great danger lay before him, and his impulsiveness led him many times to push ahead, even at the risk of making a mistake. Who is there who has not felt a special love for Peter? I feel sure, too, that Peter had a bright, clear, and abiding faith in his Savior; at least, he did at this time, for he answered out sharp and clear, "Thou art the Christ, the Son of the living God." What a beautiful answer! Who could have told it better? And yet it was off-hand, and given at once. No wonder the Savior was pleased. Peter unhesitatingly proclaimed what all the world were backward in acknowledging. He accepted Christ as the Son of the living God. I need not tell you of the encouraging words that our Savior used. He almost praised him, if our Lord ever praised any one, and he warmly commended him, at least. Peter shows plainly his humanity, by getting proud and important, almost immediately; for when Jesus began to tell them sorrowfully about his approaching death, Peter had the assurance to declare it should not be; and at this our Savior gave him a scathing rebuke, and told him that he did not savor of the things that were of God, but of man. How quickly had Peter gotten down from his great faith, and begun to be stirred by pride and ambition! Then Jesus said unto them, "If any man will come after me, let him deny himself, and take up his cross, and follow me."

Now, notwithstanding Peter's rebuke, the rest of the disciples seemed to remember the praise he had received, but had quickly forgotten the rebuke. We know that they also forgot what the Savior said about his coming death, for they kept constantly forgetting that; and after his crucifixion they kept constantly forgetting that he was going to be raised again, even though he told it so plainly and so many times. His followers were

sons of men, without a doubt, and they were intensely human, just as we to-day are, my friends, intensely human. The most vivid thing in their minds was, that the Lord had said that Peter should be a "rock," and that Christ's church should be built on that rock; and therefore, as they reasoned, Peter was likely to be the greatest one among them; and very likely poor Peter held up his head, and agreed that he would probably stand nearest the Savior when he stood in his glory. They did not know what that glory was, it is true, but they evidently seemed to think it would be something grand and nice. Poor fellows! How little they dreamed that this glory and this cup their Master had told them of, was to be by his side when he suffered an ignominious death between thieves on the cross!

Well, they got to questioning the matter over, and got into a dispute. I presume they could, each one of them, remember something to encourage him in thinking that he ought to have the best place, and so they came to Jesus and propounded the question as to who is greatest in the kingdom of heaven. They did not quite say, "Which of us shall be greatest?" but I presume that question was uppermost in their minds. Mark says, they were disputing among themselves on the way; and after they got into the house he asked them what they were disputing about. Luke says, "There arose a reasoning among them, as to which should be greatest," and he says, also, that Jesus perceived the thoughts in their hearts. Do you know how he answered their questions? He first sat down. I can imagine him looking sorrowful and sad, much as a mother looks and feels when her children are disputing. He sits down and picks up a little child; and while holding him in his arms he says, "Whosoever shall humble himself as this little child, the same is greatest in the kingdom of heaven." Again he says, "Whosoever shall receive this little child in my name, receiveth me; and whosoever shall receive me, receiveth him that sent me." Then follows that wonderful talk on humility, that exhortation to us to be as little children; and he concluded by saying, "In heaven their angels do always behold the face of my Father which is in heaven." Now comes our text, revealing to them the great truth that he came not to make people great, or to do grand things in this world, but only to save that which is lost. He came and died for the poorest and humblest and wickedest man or woman that ever lived. He came not to exalt, in any sense; not to make men stare by his wonderful power, but to save sinners. How plainly and clearly this comes out as we study his life! At one time they came to a town where they were treated uncourteously. I presume they were snubbed and insulted. Two of the disciples, James and John, said, "Lord, wilt thou that we command fire to come down from heaven, and consume them, even as Elias did?" What a reproof he gave these disciples! "Ye know not what spirit ye are of;" as much as to say, "Do you suppose I came down from heaven to call down fire, and burn people up because they are wicked or in their wicked-

ness? Why, surely not, ye poor deluded fellows. I came to seek and to save." How constantly people misunderstood his mission and purpose! Another poor friend got it into his head, that Jesus came to right wrongs by might and by power, and he came to the Savior to get him to make his brother divide the property rightly. Do you remember Jesus' answer? He said, "Man, who made me a divider over you?" You see, friends, that *making* somebody do right would not help to save souls in the least. It would have gotten him into an inextricable jargon of difficulties, while his idea was to *save* people. I can remember years ago, when we were all children, when we frequently came into the house, telling about how wicked somebody had been, or how somebody had wronged us, or abused us, that we often ended up by wishing that we had the power to punish them according to their just deserts. But mother always used to rebuke us by saying, "You mean that you wish they were better, do you not, children?" Very often we would reply, "Why, mother, it is not any use hoping that Mr. So and So will ever be any better. Just think how *awful* bad he is."

Mother did not always make any further answer, but she shook her head, with a pleasant look that showed plainer than words, "Love ye your enemies." Even poor father, with his old Connecticut views of things, used sometimes to talk pretty severely, and recommend the strong arm of the law for bringing delinquents to justice; and sometimes when mother still plead for the sinning one, we would laugh at her. Some of the older children would say, "Why, mother, you seem to think that tramps and dead beats and horse-thieves and highway robbers, and all that class of people, can be changed by reading the Bible to them." We laughed at mother, and we objected to her way of doing; but yet in our inmost heart we knew her way was the right one. "Not by might nor by power, but by my Spirit," was the prevailing thought of her life, and *is* the prevailing thought; for, dear friends, I can thank God that that kind old mother still lives; and when a good Christian brother comes to see me, after having shown him the sights of the factory, and introduced him to those whom he would like to see, I often take him down to see mother, and have a talk with her, and she always has a real good visit with any brother who loves the Lord.

Now, friends, suppose you turn to your Testament, and find our text; and when you find it, read about the ninety and nine, and about the shepherd being determined not to lose even one sheep, even when he had plenty more left behind. So it was with Jesus in his efforts to save sinners. Even if he had a whole flock of faithful followers, he would go away out into the mountain, seeking for one who had gone astray. And then he tells of the rejoicing about that one that was saved. You see, it is not his will that even one be lost. "Even so it is not the will of your Father which is in heaven, that one of these little ones should perish." Again, right after this comes the

wonderful advice in regard to troubles with neighbors. "If thy brother shall trespass against thee, go and tell him his fault between you and him alone." If you have trouble with anybody, instead of talking it all over the neighborhood go and see the one who has done wrong, and see him alone, and talk it over in a brotherly spirit.

Not a great while ago some one told me that an old neighbor, and a very dear friend, felt quite hard toward me, and he mentioned what he said. "Why did you not tell me this at once, Mr. F.?"

"Why, I did think of doing so, and then I thought it was not best. But finally I decided that probably you would want to know it, and so I told you."

"I am very glad indeed you have done so, and I am sorry I did not know it at the time of it. I will go at once and see him."

I left my work, and started off in the middle of the day. After a while I found him, and asked an explanation. He gave it fully and frankly. Very likely I had been rather careless and forgetful, and may be, besides, indifferent to the rights of my old friend. But some way I had, in a sort of careless manner, overlooked it. Then came the question again, "Why, Mr.—, this happened a great while ago. Why did you not come to me long ago, and tell me how it looked to you?"

"Well, to tell the truth, Mr. Root, I suppose that would have been the better way of doing; but, like almost everybody else, it is a great deal easier for me to complain to others than it is to go right to the one who has wronged me."

Now, friends, that is just human nature. I presume that you and I are just about the same in this matter. We can go to a man and give him a blowing-up, sometimes, without very much difficulty. But if you think it is an easy thing to go in a kind, pleasant, Christian-like way, and tell your grievance to the one who has done badly, just you try it. One of the boys in jail told me one day that it went so terribly against the grain. I know, too, that it does, friends, for the "grain" is mostly the old Adam in us; and a Christ-like spirit is the God part that is not in us until we are changed over. It is, in fact, such a big task to take a hard man and soften him down into this humble spirit, that Christ once expressed it by saying, "Ye must be born again."

Well, where both parties are Christians it is generally a pretty easy matter to fix up all misunderstandings, by going alone to see your friend. Now, did Jesus give us this plan of settling difficulties that we might get along smoothly in the world? Was his greatest object in directing us so to do that we might get along peaceably, and feel happy when we lie down at night after the labors of the day? I used to think it was; but since I have been studying this chapter, I think I can see a higher motive yet. The reasons I have just given are mostly selfish ones. The true reason seems to be right in the close of the 15th verse—"If he shall hear thee, thou has gained thy brother;" you have saved that which was lost, and proved yourself worthy to be called a follower of Christ. Sometimes I am tempted

to think the world has but little such religion, or very little of it gets to be practically applied. How many Christians are there who are so eager for the saving of every sinful soul they meet, that they will always put the precepts of this little verse in practice? Do even our ministers, God's chosen servants, always go to the one who offends, and see him alone, rather than have a talk about it to some other brother? I know I fall far short here, my friends—very, very short. I think over and over again of the words of my old friend, how he said that it is easier to talk to somebody else than to go right to the man's face with what we have to complain of.

"Thou hast gained thy brother." What a blessed thing it is, dear friends, to have *gained* a brother! It seems to me now when I meet with this friend whom I have mentioned, just as if he had been somewhere, and got home. It is "kind o' funny," but I have been wondering if I am not the chap who has got home, instead of himself.

Well, Jesus does not advise you to stop here, friends; for sometimes this friend is stubborn, and will not listen, even to mild words. In that case are we to give it up as a bad job? Not at all. If you are following Christ, you have come to save that which was lost, and you do not give up the brother for quite a spell yet. You get one or two intimate friends,—two are better than one, many times,—and then go and talk it over. You each plead your side of the story, and these good friends, who are trying to pattern after Christ too, are there with the avowed purpose of saving you both, if they can. They are friends to both of you; and their eyes not being blinded, or made green by jealousy, are able to see the matter exactly as it stands. If you do not look out you will feel small before you get through. As you meet their gaze and friendly looks, you both begin to feel ashamed of yourselves; and if you are the kind of men I take you to be, you end it up by a little prayer-meeting, and are better friends after that, as long as you live. What a wonderful thing is arbitration! and I guess it was discovered about the time somebody commenced reading this very passage in the Bible. These kind friends can, if you choose, take down what you say, both of you, and afterward sum it up in good shape, just as a lawyer would, only lawyers would charge you a great lot of money, while Christian friends do it all for love to you, and love to Christ.

Now, Jesus is so anxious to have us keep trying, and never give up, that he recommends still further measures before we let the poor deluded stubborn brother go, and give him up. He says, "Take it to the church;" and not until the united influence and pleading of the brothers and sisters—in fact, the whole body of the church—fail should we say, "The man is lost, and beyond rescue." One Christian is a power, my friends, but two Christians are a more mighty power, and a church of Christians ought to be able to pull *every* bad man out of his evil ways, if they bend their energies to it.

It would be the most natural thing in the world to suppose that Peter would have a

word to put in just about here. (Would it not be funny, if I should get a hobby about the character of Peter just about now?) Well, Peter did have something to say. He puts in a conundrum right here. "How oft shall my brother offend against me, and I forgive him?" He modestly suggests, "that about seven times might be about the right thing. But his Master rebuked him again there. No, Peter, do not give the man up after you have tried him seven times. Do not get weary in well-doing, and say it is not any use. Do not stop at seven, Peter, but try on until seventy times seven—490 times. And our Savior did not say he should give up then. "For the Son of man is come to save that which was lost."

While they were all listening so intently, our Savior told them a little story, as he often did, to illustrate how we should keep trying to save people. In that little story he reminded us how God had striven with us all, and had borne with us during our many and many shortcomings. And he reminded them how wicked and ungrateful it would be to get impatient with those whom God has mercifully placed near us. Be merciful, he said in substance, even as ye hope to obtain mercy; and in that wonderful prayer which he gave us, he says the same thing in substance—"Forgive us our debts as we forgive our debtors." Why should we do this? because it was his command? Yes, and also because we should be trying to save that which was lost, even as our Savior came into the world to save sinners.

Many of the prophets pronounced judgment upon sinners. Samuel pronounced judgment upon Saul; and even Peter pronounced judgment upon Ananias and Sapphira, and by a miracle they were struck down dead. In reviewing the matter of Christ's life and ministry, it seems a little singular that he never called down judgment upon any one. He left that, as it were, to the Father. His whole end and aim and purpose seemed to be so emphatically absorbed in the business of saving, that he never harmed any one—not even those who were so grievously wicked and cruel. When John the Baptist was beheaded, and they went and told him about it, it seemed almost beyond comprehension that he should not bring down punishment upon the perpetrators of the wicked deed. He did nothing. It seemed to be out of his province. He came to save, and not to destroy. He came to plead with humanity. He even refrained from using the power he possessed, when he was led to the cross. Legions of angels were ready to come at his command, and yet he never called them. He died trying to save lost men and women. He gave his life for the lost. He gave it meekly and uncomplainingly; and when opportunity came for saving a soul, even during that last moment of agony he rejoiced at the opportunity of welcoming and inviting a hardened sinner to meet him in paradise. Dear friends, Jesus came to save *you*. He is striving to save you now. He is following you lovingly and patiently. That wondrous spirit of Christ our Savior is at work just now in trying to save, and all you have to

do is to meet him — simply to meet him — not half way, for you have only to turn, if you are not his already. Thus far your back has been from him. He has been pleading in vain; he is pleading now. Will you not turn to him now? will you not meet him while he comes to you with outstretched arms? Will you not believe that he wants you among his followers? that he wants you to turn right where you are this day, this hour, and this minute?

For the Son of man is come to save that which was lost. — MATT. 18: 11.

## Tobacco Column.

I AM much interested in the Tobacco Column in the JUVENILE, and have much sympathy for those persons who, after having become habituated to the use of the filthy weed, are making an earnest struggle for freedom. I had chewed tobacco ravenously, and smoked an old pipe, for fifteen years, until every fiber of my body had become saturated with nicotine; but as yet I had no conscientious scruples on the subject of the use of tobacco.

In the latter part of the summer of 1869 I sometimes read in the Bible, and began to conclude I was a sinner; and as hell did not seem to be a desirable country to take my family to, I cast about for a safe way out of the dilemma, and began to pray for pardon. Sometimes I addressed my petitions to God the Father, and sometimes to Jesus Christ, as I did not know which one held the pardoning power. And it so happened, that on a day when it rained continuously and hard (as I could not well do work on the farm), I got down on my knees in my house, while the family was occupied with household duties as usual. And as I was praying with vehement desire, and was not sure there was a God, a man who was a stranger in the country, and had lost his way on the prairie in the rain, entered the house to make inquiries as to his whereabouts; and seeing my distress he knelt beside me for one moment, placed his hand on my head, and said some words, whether to God the Father, or to Christ the Son, I do not know, as I did not see the man, neither did I hear what he said, except his last words were, "It is all right." And instantly I was deluged in heavenly light, and filled with the Holy Ghost. All my guilt and fears were gone; the man was gone; and from that day to the present I have had no use for tobacco or pipes. Oh but it was easy to quit the use of the vile stuff, when God as Father, and God as Son, and God as Holy Ghost, lent a helping hand! Would it not be a happy day for the world, if all the capital and labor now invested in tobacco were turned around, so as to produce "fine flour and honey and oil" (Eze. 16:19)?

I received the \$3.00 queen, and was successful in introducing her into a colony of high-strung bees. Pana, Ills., Sept. 19, 1883. H. A. SIMPSON.

I know, friends, the above account sounds a little singular; and, if I am not mistaken, there are some among our readers who will be tempted to make light of it. For all that, our good friend S. brings out a great and important truth. When we once turn fully and earnestly to the business of seeking God and his righteousness, it is easy, oh how easy! to

break off from any sinful habit. I wish I had the eloquence and power to impress this great fact, that the reason why we suffer and are tormented by the temptations of old evil habits is because we are not submissive; we have not fully yielded, and we are still in the bondage of selfishness. It seems very strange indeed to think our good friend was so intent in considering this matter of his sinful life, and God's mercy, that he did not even look up to speak to the stranger who came in; but I am sure he tells us the facts truthfully. I have given his simple letter a place here, because it may lead some other poor soul to go down on his knees in just that earnest, honest, child-like simplicity; and when he does this, I am sure his burden, like Christian's burden in the Pilgrim's Progress, will tumble off of itself, and he can rise up a free man—free from tobacco, and free from other similar weaknesses; free, so long as he is obedient and faithful.

I received the smoker you sent me in July, all right. I haven't smoked any for the last 5 months, nor do I ever expect to again. We are using the "Golden" bive, but have not had any honey since July 3. HANNAH HARRISON.

Fisher's Point, Jackson Co., W. Va., Oct. 15, 1883.

The smoker is at hand. I received it with great pleasure, and think I am duly repaid for quitting so vile and filthy a habit. May God bless you in all your undertakings. G. H. GROSS.

Tower Hill, Ill., Nov. 8, 1883.

## ON AN EXCURSION.

A VISIT (?) TO THE HOME OF THE HONEY-BEES.

FRIEND ROOT:—After having read GLEANINGS four or five years, and the A B C, and having become pretty well acquainted with you, at least by reputation, I had a great desire to visit you and your factory, see how you carried on business, and last, but not least, to take by the hand a man who has the courage to carry his religion into his every-day business; who makes an effort to reform his fellow-man by actual effort instead of mere talk. So, last August, when the C. L. & W. R. R. announced an excursion to Cleveland, I thought that was my chance, as excursion rates suit my pocket-book exceedingly well; but when I got aboard the train, and found I should have to stand up, as I did until I got half way to Medina, I began to think that the fare suited me much better than the accommodations. In common parlance, "you bet" I was tired, and I kept a sharp lookout for Medina, which I expected to recognize by your factory building, which, I understood, was near the railroad. So when we came to the little lake, I believe they call it "Chippewa," I knew that we should soon come to Medina. As the train had been stopping at all the large towns, I supposed it would stop also at Medina; but in that I was mistaken; for our long train of sixteen coaches thundered past your place at such a rate that I could scarcely see the stone bee-hive, or read "A. I. Root," "In God We Trust," etc., above your office window. I was somewhat disappointed, but concluded to go on with the rest of the tired, dusty, thirsty people to Cleveland. Instead of taking a trip out on the lake, which was included in the ex-

ourself, I went up into the city to wash, and get some supplies, and it was 5 o'clock in the evening when we arrived at Union Depot. Thinking to return to Medina on the 6:30 train, I was told that train would not stop at Medina either; so, meeting some friends at the depot, I concluded to stay all night in the city. I saw electric lights for the first time in life. We took a street-car and rode out on Euclid Avenue, and thus got a glimpse of a part of the city by electric light. After returning, we went to the hotel, and went to bed. I do not remember, but I suppose I dreamed of Novice, Medina, our long train containing 1100 or 1200 people, all tired and thirsty, except those who carried bottles, or were full of beer, got at the last saloon we passed. I wondered, sometimes, if there was not some understanding between the train men and the saloon-keepers, to enable passengers to stop and get a drink, and get their bottles filled. I have thought at times since, that the adoption of the "second amendment" would stop a good many saloons between Bridgeport and Medina. But, I am getting off my story.

Next morning I took the 7:10 train, intending to stop at Medina, sure, and I was thinking what a nice visit I should have at your place, intending to stay until the next morning, and take a good look around town. But, I was to be disappointed again, for the conductor refused to give me a "lay-over" check; then you may be sure I was badly disappointed. But we had not reached Medina yet, and I concluded to content myself as best I could by taking as good a look as I could get from the car platform while the train stopped two or three minutes in front of your factory. The view was partly obstructed by some freight cars standing on the side track. At the left end of the building, near the engine-house, were some of your boys standing looking out of the door at us. One, I thought, was holding the barrel of a smoker to his mouth, and imitating the sound a calf makes when taken away from its mother. One of the passengers, whom I don't think would vote yes on the second amendment, looking across at the brick shed in front of the factory said, "Is that a saloon?" and started for it, when some one told him he was mistaken, when he came back to the train. But the first saloon he saw he went straight for it, but had hardly time to swallow his dram when the train started; but he managed to get aboard with some difficulty.

Thus, though I was much disappointed in not getting to visit you, I was otherwise well pleased with my trip; but I think the next time I start for Medina I will take a regular train, and make better time, and stop where I wish to.

R. M. DENHAM.

St. Clairsville, Ohio.

Friend D., I am very sorry to know that your excursion turned out the way it did; but perhaps we can, however, gain one or two morals from your little story. One is, that when you travel a good many miles for a little money, on an excursion ticket, you will probably have to conform to excursionists' regulations. Another thing: I wish our boys would all take notice, that it looks bad to stop work and look at folks passing by on the cars. I should be very sorry indeed to have you think that our large buildings were built for a meat-shop, and that we are in the habit of keeping calves around here. I think if we should inquire into it, we should find

that the young man does not get very big pay, and I fear he is not likely to very soon, either.

## Reports Encouraging.

FROM 8 TO 20, AND 500 LBS. OF COMB HONEY.

I COMMENCED the season with 8 colonies of bees, most of them in box hives; transferred them just before fruit-bloom to L. frame Simplicity hives, and increased to 20 by dividing and by natural swarming, and secured 500 lbs. of comb honey in one and two pound sections, which I found sale for at from 15 to 18 cents, and calls for more. My best colony gave 122 lbs. of comb honey in 2-lb. sections. I had all blacks in the spring, but bought an Italian queen, and have half of my colonies Italianized at present. The season was not good in this part of Southern Illinois. During fruit-bloom, and the early clover season, the continued rains washed the nectar from the flowers. July was rather dry; August fairly good; but September was too dry for bees to do well. Smartweed, Spanish-needle, and goldenrod were abundant, with Simpson honeypiant, basswood, and other wild flowers in less quantities. By the use of the A B C book, Cook's Manual, Alley's Handy Book, Newman's Bees and Honey, and the assistance of GLEANINGS and the *A. B. Journal*, and in consideration of the poor season, and the fact that I am an A B C scholar, trust I have bridged over the honeyless chasm of Blasted Hopes for this time.

J. A. BLACK.

Pleasant Mound, Ill., Nov. 1, 1883.

FROM 7 TO 15, AND \$78.40 IN MONEY.

My bees have done very well this season. I started with 7 swarms. I now have 15, and have sold comb honey to amount to \$78.40, clear of all expense. Hudson, Ohio, Oct. 29, 1883.

E. B. BLACKMAN.

My report is as follows: Fall of 1882, 71; lost 6 in wintering and 4 in springing. Sold 1; on hand, June 1, 1883, 60 colonies. Fall of 1883, 115 colonies. Comb honey, 2300 lbs.; extracted, 4200 lbs. Colchester, Ill., Nov. 5, 1883.

S. H. MOSS.

My report for past year is as follows: Fall of 1882 I had 24 colonies. I lost one in wintering, and sold one, beginning the spring with 22. Increased to 39 colonies, and took 800 lbs. comb honey in 2-lb. sections, and 350 lbs. of extracted. I fed a barrel of sugar for winter rations. This is only half a crop, but the season in this locality was not good. None of my bee-keeping friends in the neighborhood got any surplus honey at all.

A. CAMERON.

Derry Station, Westmoreland Co., Pa., Nov. 7, 1883.

I am a beginner in bee-keeping, having caught two swarms in July, and bought 6 in August — 4 old and 2 new swarms. There is only one frame hive in this part of the country besides mine. I transferred into Simplicity hives, home-made, taking out 60 lbs. honey, and they now have an average of about 10 lbs. apiece, and are bringing in more. The old-fogy bee-keepers prophesy a total loss for me this winter, and I don't dispute them. If I have any left in the spring, I shall want quite a bill of goods.

Metropolis, Ill., Oct. 1, 1883. C. A. DICKERSON.

REPORT ENCOURAGING FROM TEXAS.

Texas is truly a wonderful country — a whole year nearly gone, in which it has been nip and tuck

for our little pets to survive the terrible drought that has lasted nearly five months. Here it is Nov., and my bees for the past four days have been busy gathering a timely flow of nectar from the despised chamomile. Thank God for this bitter weed; it will help my bees through the coldest part of winter, without feed. The queens have been laying nicely ever since the first of Oct., and by doubling up my 25 three-frame nuclei with my 100 colonies, I now have an even 100 very fair colonies of bees, 80 of which are Cyprians. My average per colony for the past four years has been 96 lbs., with the small sum of 11 lbs. per colony this year. Many black colonies of the neighboring bee-keepers have gone up, and many enthusiastic beginners have been discouraged, and propose to quit the business. No frost yet. Thermometer to-day, 86° in the shade. Dresden, Tex., Nov. 6, 1883. B. F. CARROLL.

### THE BEE-KEEPERS' EXCHANGE.

AND WHO IS RESPONSIBLE FOR ITS DEBITS AND CREDITS?

**FRIEND ROOT:**—I am both surprised and wounded at reading the published letter of J. F. Fletcher, under the heading of "Are They Swindles?" in November GLEANINGS; surprised that you would publish it without first consulting those whom you knew must know the facts, and could explain; wounded because my name is used as having answered a card that I never saw. It does seem to me that the Christian grace of charity, as developed in you, might have constrained you to wait till I had been consulted privately, before adding my name to that letter. I think I can truthfully say of myself, I would not have done it were I in your place. There are some texts in the 13th chap. of I. Cor. which I would recommend to you.

I could give the history of the *Exchange* from the beginning, but it would make too long a story; suffice it for me to say, I have had nothing to do with the publication of it since the January No. of 1883 was issued. I was engaged to edit it, and did so till it passed into the hands of Messrs. King & Aspinwall, I residing in Brooklyn, N. Y., since the first of Feb. last, and the *Exchange* published in Canajoharie, over 200 miles away. Now a word for Mr. Houck, who is gone, and can not speak for himself: Finding that his disease was getting the best of him, and that he could not attend to his business, and with the hope of regaining his health, he went to Colorado. Before going, however, he arranged with Mr. Nellis, of Canajoharie, to publish the *Exchange*. Soon after he went, Messrs. Colgrove & Ulery made overtures to purchase the *Exchange*, and continue it, agreeing to carry out all contracts for advertising, etc. The transfer was made; I continued to be the editor in every thing pertaining to bees. The Colgrove & Ulery administration was short, they had a disagreement, dissolved, sold the *Exchange* to Mr. King, and left for parts unknown. Now, if any swindling has been done, these latter gents are the ones that did it. Mr. King deserves the thanks of the subscribers, rather than insinuations, such as Mr. Fletcher throws at him. Mr. Houck is dead. His executor, at Canajoharie, N. Y., will pay all just claims against the estate. I am at 27 Park Row, N. Y. City, where I can be found for further information, if wanted.

THEO. O. PEET.

Brooklyn, N. Y., Nov., 1883.

Friend Peet, I do not see that you ought to be either surprised or wounded. Whenever any business with which I have any thing to do is left in an unsettled state, and nobody can tell who is responsible for it, I want to be called upon at once to tell what I know of it. If this is not the way in which I presented it, I beg pardon. Our account against Theodore Houck was sent to his administrator, and that matter is at an end, so far as I know. If the administrator thought the property insufficient to pay the debts, all right. The men we are after are Messrs. Colgrove & Ulery. I have been told, in answer to several inquiries, that nobody could find them. Letters from them have been submitted to me, offering certain things at such unusually low rates, I could not but think that the matter needed ventilation. The explanation you have given is quite satisfactory, and we are well satisfied with what friends King & Aspinwall have told us. And now we should be very glad to hear from Messrs. Colgrove & Ulery, and it seems to me very much better to have the whole facts of the matter brought out in this way, rather than to have it rest where it did before I said any thing. It seems to me right to ask for explanations; and I assure you I shall never feel hurt when you call upon me for explanations in regard to any business I do, or have any connection with.

### THE BEE-KEEPER'S SUNDAY.

**T**HE discussion of Sunday observance in GLEANINGS is of much interest to me, and I wish to give my opinion of hiving swarms on the Sabbath, and staying from church to watch the bees. Friend Ralston, on page 531, September number, I think, is just about right in this matter, but I wish to add another link to the chain of Sunday observance. It seems, that when our Savior was here on earth he was very careful to perform only such things on the Sabbath as would relieve suffering, or do good; and as his life is laid down as our pattern and guide, we should do no more than he did. It looks to me, that, to stay at home on the Sabbath-day on purpose to watch the bees and hive swarms, is partial, if not whole proof of a greater desire to lay up treasure on earth than to prepare one's self for the great change that awaits us all. A swarm of bees is worth from \$2.00 to \$10.00, according to size and kind; and to stay at home on purpose to keep them from absconding seems akin to lusting after riches; and from my own experience I do not know but it is lusting after riches in reality. It looks like a very trivial matter to watch bees on Sunday, and it forms a very good excuse to stay at home; but if a swarm issues, can it be said that they are in distress, and suffering for help? Are they in like circumstances with the ox or ass that may have fallen into the pit?

As far back as I have the history of bees, it has been their nature to swarm when they get ready, without regard to days or time; and, as a rule, cluster for a longer or shorter time, then hie off to some hollow tree or other cavity, there to build up a colony to do the same thing over again. God has given us six days out of every seven to perform our duties; and in his infinite reasonableness asks us for only one day out of the seven, and I think it is our just

duty to give him that day, and all it may bring forth, except casualties and accidents that may happen on that day that bring on pain, suffering, and distress that may be abated by us. It is our bounden duty to relieve all suffering and distress on all days, if it is in our power to do so. It is our duty, whether we have the power or not, to do what we can.

Another thing: I read of bee-keepers who say they crush bees to death, even those pets they love so well, when it pays better to kill them than to save them. O ye of little faith! A bee is very small to us, and one or two individuals look very insignificant, and of small moment; but consider that we are also of very small dimensions in the eyes of our keeper, or God. Have mercy on every thing beneath us, and then we may with reason expect mercy from those above us.

T. J. COOK.

Newpoint, Ind., Sept. 9, 1883.

Dear friends, when I read the above letter it struck me at once as being remarkably clear and to the point, and I fell to wondering that the writer, with whom we have recently become acquainted (on account of his little brush for brushing off bees) had such a bright clear faith, and I had never before caught a glimpse of it; for in almost every letter I get I am in the habit of catching almost every word that indicates a love for the Master. I felt like saying, as I reached the end of the letter, "May God be praised for such earnest, honest reasoners as yourself." And now comes the news that friend Cook is no more. He was near to his end, in fact, when this letter was written, as you will see from the letter below:

*Friend Root:*—As I have not the knowledge of the business transactions between you and my son, I hardly know how to write. He died on last Monday. He died suddenly of heart disease. I can't fill your order, as he has none made. You have the privilege to make them, if you wish. You may send me the balance due him, as I am his heir by law.

Your friend, JAMES L. COOK.

Newpoint, Ind., Nov. 9, 1883.

Wouldn't it be well for us, dear readers, if our last message to our friends through GLEANINGS be one of faithful exhortation like the above, to follow after God and the things pertaining to eternal life? Our readers will remember that friend Cook's wife died on the 21st of last September; and in writing her obituary notice, he used these almost prophetic words: "But a few days or years more separate us."

Nearer the bound of life, where burdens are laid down;  
Nearer to leave the cross to-day, and nearer to the crown.

## Juvenile Gleanings.

NOV. 15, 1883.

For God sent not his Son into the world to condemn the world; but that the world through him might be saved.—JOHN 3: 17.

In our last issue the date of the convention which meets in Flint, Mich., was Dec. 6 and 7. It should be Dec. 5 and 6. Out of four notices sent us of this convention, we believe the one we used was the only wrong one, and hence the blame does not lie with the printer.

### SUPERSTITION IN REGARD TO BEES.

In our article on bee culture in Maine, on page 706, friend Crafts mentions the fact that the old superstition in regard to the importance of informing the bees when a member of the family dies is still in vogue in some localities. It hardly seems possible, that in this day of books and papers and intelligence, any one should still hang on to such relics of by-gone days. I am afraid our veteran box-hiver does not take the bee-journals.

On page 667 of our last issue, a sentence was allowed to go in, which might reflect on the *Bee and Poultry Magazine*. I did not understand it so at the time, or I certainly should not have let it pass. The *Magazine* folks purchased the subscription-list of the *Bee-Keepers' Exchange*, but have nothing to do with their debts or credits; and when friend Fletcher spoke of "smoothing things up," I took it that he meant the proprietors of the *Exchange* had got the *Magazine* folks to fill the unexpired time, to smooth things a little, but had left their creditors to get along as best they could. I sincerely regret having let anything pass that had even the appearance of reflecting on the *Magazine*, and humbly beg pardon.

### D. A. JONES'S HONEY-LABELS FOR SECTION BOXES.

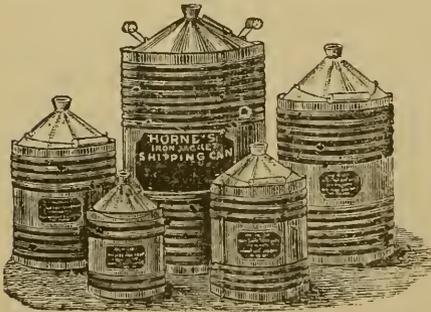

THESE are at length at hand, and we are prepared to send samples free. Friend Jones numbers them A, B, C, D, E, F, G, H, I, and J. A and B are  $4\frac{1}{2}$  inches square, and are intended to go on opposite sides of a paste-board box, made to hold a single Simplicity section. This pasteboard box has a bit of red tape attached to the top to carry it by, and makes a safe package for a single section of honey for the consumer to carry home, or to pack into a trunk, if he wants to send it away. It can be opened and closed in an instant, and the price of the box is only 2 cts. each, 15 cts. for 10, or \$12.00 per 1000. It can be sent safely by mail for 2 cts. These labels, A and B, are worth \$3 50 per 1000. If you want one on each side, it costs \$7.00 per 1000, making the net cost of these boxes, already labeled, about 2 cts. each, when they are bought in quantities. Our experience is, that the honey will bring about 5 cents more per lb. The box is so pretty that 5 cts. would not be an extravagant price for it, for a fancy box for knick-knacks. At present we have these boxes for the Simplicity section only, of the size given above. Labels C and D are  $5\frac{1}{2}$  inches square, and of course are intended for a larger section, and will answer for a section considerably larger than  $5\frac{1}{2} \times 5\frac{1}{2}$ . The price of C and D is \$1.00 per 1000. E and F are made to go on three sides of the above-described pasteboard box. They are worth \$1.50 per 1000. G and H are for a similar section glassed, and are made wider, so as to have a portion turn over the edge of the glass, or, at least, that is my understanding of the matter. I is a beautiful label for a 2-lb Jones can. It has on it a picture of a hexagonal apiary. J is similar to G and H, but a little larger. These labels, although intended for a particular purpose, can be used on cans or sections, or boxes to hold sections, indiscriminately; and the pictures on them are, in my estimation, most beautiful. With us they have the effect of selling almost every thing we put them on to, and I can not agree with those who have written disparagingly of lithographic colored labels. For my part I delight to see fine canned goods put up in neat packages, with beautiful pictures on the exterior, indicating the contents; and my experience has been, that a cheap label, as a rule, indicates cheap goods, and a real nice tasty label, nice clean goods. Perhaps my having the above labels for sale may have biased my opinions; but I give them, and you can take them for what they are worth. We will mail you a package of one of each of the above labels as samples, and a sample of the pasteboard box, already labeled, for 5 cts. for postage and packing. I have mentioned this price, because there are so many of you to ask for samples, that I should hardly have enough to go around, otherwise. Friends in Canada will, of course, order directly from D. A. Jones himself.

### ENTRANCES IN WINTER.

FOR several years back, and especially since the many reports in regard to wintering with a pretty good draft of air through the cluster of bees, I have been decided that the entrance to the hives should be as large in winter as in summer, even in the most exposed outdoor places. Two or three years ago, the entrances of perhaps three-fourths of our chaff

hives were closed so as to admit only two or three bees, during a very cold winter. A few of the hives were neglected, and in every case the bees were brightest and strongest where they had a full entrance open all winter. I know others disagree with me in this, and among others is our old friend D. A. Jones. It may be, that during the spring and fall months there is an advantage in narrowing down the entrance to exclude cold drafts, especially where brood-rearing is going on largely; but in the depth of the winter, when little or no brood is reared or wanted, I think I would have the entrance full width, and then I would have the usual chaff and burlap over the frames, with the Hill device, now so generally used. Of course, this is for outdoor wintering. In cellar, where they are never exposed to a freezing temperature, it would not, perhaps, particularly matter, especially if the cellar happens to be well ventilated, which should always be the case.

## SHIPPING-CANS For HONEY.

"Iron-Jacket" Honey-Cans.

I presume the friends are aware that ordinary tin cans are not very safe for shipping full of honey, unless boxed or crated. The cans above are ready to be shipped anywhere.

	PRICES.	
1 Gallon,	- - - - -	\$0.25 each.
2 "	- - - - -	.38 "
3 "	- - - - -	.47 "
5 "	- - - - -	.68 "
10 "	- - - - -	1.10 "

By figuring 11 lbs. of honey to the gallon, you can easily see how many pounds each can holds. They are made from tin plates. A sheet-iron casing, with wood bottom, protects them from bruising. The iron jacket is stronger than wood, and far more serviceable. They neither shrink nor swell, and do not split nor fall apart. Every can is tested by steam, and guaranteed to be tight.

**A. I. ROOT, Medina, O.**

## FOR SALE!

An 80-acre farm in Johnson Co., Mo. Good land, 60 acres of alluvial, none subject to overflow; good locality for bee-keepers; would make an excellent stock farm; church and school privileges; good one-story two-room house, with cellar. Society good. Johnson Co., by census of 1880, was second only to Christian Co., Ill.; 1882-'83, to none. Price only \$30 per acre. Terms *very* liberal; only \$500 down; rest on 4 years' time. Correspondence solicited.

Address S. P. CULLEY, Warrensburg, Mo.,  
P. O. Box 181, Johnson Co., Mo.,  
Or J. U. GATY, Land Agent, or W. E. CRISSEY, for quality of land. 11½-12d

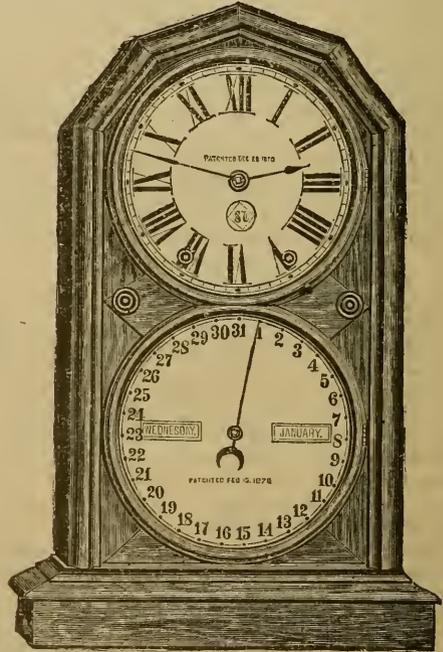

## FRUIT AND HONEY.

20 BLACK TARTARIAN CHERRY - TREES BY Express for \$1. Well packed. These are from two to four feet. Can send 20 small ones by mail postpaid for \$1.  
CHAS. KINGSLEY,  
Greenville, Greene Co., Tenn.

## An Opening.

Any doctor desiring as good a *country location* as is to be found in South-east Arkansas, and has as much as \$1000 capital, may do well to correspond, inclosing stamp, with  
R. A. BETHUNE, M. D.,  
Snyder, Ashley Co., Arkansas.

## THAT CALENDAR CLOCK.

One of our friends asked me what I could get 100 calendar clocks for. After some correspondence I learned I could get them so as to sell to our bee friends at the price given below. The following is a description of them.

The clock is 8-day, spring, strike. The height is twenty inches, and the diameter of the dials eight inches. The case is beautifully finished in mahogany, rosewood, and black walnut. The works are heavy steel and brass. The calendar tells, in large plain figures and words, the day of the week, the day of the month, the month of the year, and makes all the changes for the different numbers of days in each month, even to giving February 29 days one year in four, without a single motion or bit of prompting on your part, only to wind the clock once a week. If the clock runs down by carelessness, you can set the hands of the calendar just as easily as you set the hands of a common clock. This latter feature is a late invention.

Every clock is guaranteed by the Seth Thomas factory, and their name attached to any clock is about the highest praise you can give it. Send on \$9.00, and you can have your clock by return express. If ordered with other goods, they can go safely by freight, as each one is securely boxed by itself. They will be shipped from here.

**A. I. ROOT, Medina, Ohio.**

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

## \$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \* use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

## DADANT'S HONEY CROP.

Our honey crop being very large, we offer THIRTY THOUSAND POUNDS OF EXTRACTED HONEY FOR SALE AT REASONABLE PRICES.

We have both clover and fall honey. Samples sent on receipt of stamps to pay postage. The honey can be delivered in any shape to suit purchasers. Send 15 cents for our 24-page pamphlet on harvesting, handling, and marketing extracted honey.

## DADANT'S FOUNDATION.

From James Heddon, July 27, 1883. "Your fdn. is certainly the nicest and best handled of any I have seen on the market. It is the only fdn. true to sample, I have ever received."  
From Jas. Heddon, Aug. 10, 1883. "I will contract for 2000 lbs. of fdn. for next season on the terms of your letter."

From A. A. Newman, Aug. 24, 1883. "Book my order for 5000 lbs. for spring delivery."  
From C F Muth, Sept. 6, 1883. "All of your shipments of fdn. during the season were sold on the day of their arrival."

Dealers, send in your orders for next spring, while wax is cheaper, and thus save trouble and money. We pay 28c cash for prime wax.

**CHAS. DADANT & SON,**  
HAMILTON, HANCOCK CO., ILL.

## BEE-KEEPERS' SUPPLIES.

It will pay to get our prices before purchasing supplies; good Langstroth hives, with 8-inch cap frames, in the flat, 60 cts. each; Langstroth winter-protector, in lots of 50, \$1.50 each; small lots, \$1.75, all in the flat. Manufactured of good pine lumber. Workmanship unexcelled. Crates, sections, and foundation.  
**Wm. O. BURK,** 8tdf  
Successor to Hiram Roop. Crystal, Mont. Co., Mich.

## Hive Manufacturers.

Who agree to make such hives, and at the prices named, as those described on our circular.

- A. I. Root, Medina, Ohio.
- P. L. Viallon, Bayou Goula, Iberville Par., La. 10tdf
- L. E. Mercer, Lenox, Taylor Co., Iowa. 4-3

## LOOK!

A Perfect MORSE Telegraph Instrument for beginners. Send for catalogue.  
5-12d P. B. KINGSLEY, Greeneville, Greene Co., Tenn.

## \* FINE IMPORTED QUEENS \*

JUST FROM BOLOGNA, ITALY, ONLY \$5.00.

Select tested queens, young and prolific, - - \$3 00  
Tested queens, young and prolific, - - - - 2 50  
No more "dollar" on hand this year.

J. S. TADLOCK, Luling, Caldwell Co., Texas.

**FLAT-BOTTOM COMB FOUNDATION.**—High side-walls, 4 to 14 square feet to the lb. Circular and samples free. **J. VAN DEUSEN & SONS,**  
Sole Manufacturers,

## I WANT TO CONTRACT,

Early as possible, for 100 lbs. of bees and 100 queens (safe arrival). State time can ship, price, etc. Will take a few hybrid queens in the lot.

**L. S. BENHAM,**  
MT. BLISS, ANTRIM CO., MICH.

Vol. XI.

DEC. 1, 1883.

No. 12.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 5 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

Established in 1873.

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

#### NOTES FROM THE BANNER APIARY.

No. 49.

MY REPORT.

COMMENCED the season with 74 colonies. Some of them were weak; the majority were in a fair condition; a few were strong; 35 colonies were devoted to the production of comb honey, the remainder to queen-rearing and extracted honey. The weather was too cold the whole season; too wet during the fore part, and too dry during the buckwheat honey-harvest. The weather was too cold, the whole season, to rear queens to advantage. In fact, it was the poorest season I ever knew. Just as soon as the weather began to warm up so that the flowers began to secrete honey, then a cold rain would set in and last two or three days, then it would stop, and when it commenced to "warm up," then it would rain again. This plan of operations was continued until the white honey-harvest was over, when we had 700 lbs. of finished sections, and 1200 lbs. of unfinished sections. We fed back 1000 pounds of extracted honey, which increased the number of our finished sections to 2600 lbs. in all. The 35 colonies increased by natural and artificial swarming to 67. The profit on the colonies run for comb honey, if we have no wintering losses, are \$12.43 per colony.

From 39 colonies, 392 queens were sold, and 1969 lbs. of extracted honey, while instead of an increase of colonies there was actually a decrease to 23 colonies. The profits on these colonies, provided we meet with no losses, are \$10.57 per colony.

#### THE "OTHER SIDE" OF BEE CULTURE.

And now, friends, honestly, if it were not for what I earn by my pen, I should see a pretty close time the coming winter. I am not like the president of our Northern Michigan Association, who "not meeting with the best success," he did not care to have his report "in print." I honor him, however, for "owning up;" there are thousands just like him, except the "owning up" part. If our business can not stand upon a fair representation, then let it go down. I do not believe in this everlasting parade of the beauties and profits of bee-keeping, without something being said upon the other side, when Goodness knows there is enough to be said upon that side; but the trouble is, the most of us are like the president just referred to, minus his candor. Oh! I know that we occasionally get a letter in the Blasted Hopes department, but there always seems to be something on the face of most of these letters that tells us the writers will yet succeed; and then when they *do* succeed, and send in their booming reports, the finger of triumph is pointed to his disconsolate letter in the Blasted Hopes two years ago; but of the thousands of apicultural wrecks that go down and make no sign, we know nothing. Those who have invested their hard dollars in bee-keeping, and failed, and, becoming discouraged, have sold out for a song, or split up their hives for kindling-wood, or used them for feed-boxes, or let the hens or mice build their nests in them; those who have thus miserably failed do not write to the bee-papers and depict, in glowing colors, their misfortunes; while their neighbors never trouble themselves about the matter, except to grin and say, "I told you

so." Why do our journals overflow with enthusiasm, and "gush," and tables showing the enormous profits that have been obtained from a few colonies? Other industrial and scientific journals do not indulge in this sort of thing; why should the bee-journals? Do medical journals abound with tables showing that Mr. M. D. commenced with one patient, increased to fifty, and obtained \$1000.00 in fees? Far from it. The articles are written with a view to benefit those already in the profession; to help them to conquer disease. Perhaps I have done my share of "gushing," but I thoughtlessly took my cue from the others, and now that I have an opportunity of writing the "other side" of bee-keeping, I think I ought to do so.

#### BLACKS, ITALIANS, AND SYRIANS.

On page 583, W. H. Proctor says that I "leave it to be inferred, that in a good season they (the Italians) will not gather the most honey." Yes, that is it; Mr. P. expresses it exactly. When the honey is very plentiful, as during the height of white clover, basswood, or buckwheat bloom the blacks hold their own; but, when the flow slackens, or when there is a scarcity of honey from any cause, then the Italians, by their energy and greater length of proboscis, show their superiority. In the April and May numbers of GLEANINGS for 1881 is an article upon the comparative merits of the Italians and blacks, that expresses my views much better than I can possibly do. It was written by Rev. L. L. Langstroth, and is the most exhaustive paper upon the subject that I have ever seen. Those who haven't the numbers should send and get them. Each variety has its faults and its excellencies, and the Italians are decidedly ahead; and for the production of extracted honey are as good as any bees with which I am acquainted. I also have a decided preference for the dark leather-colored strains; but, as remarked in a previous article, the German race has excellencies that no producer of comb honey can successfully ignore; and that a combination of the good qualities of both races is better than either race alone.

Judging from my own experience with the Syrians, which has been short, sharp, and stinging, from reading the experience of others, and from attending conventions, I should enumerate their faults as follows: Prolificeness, irritableness, and not thoroughly ripening and sealing their honey. Their good qualities are: The ease with which they may be shaken from the combs, and their propensity for building large numbers of queen-cells. I am not certain that this last quality is a desirable one, except for the queen-breeder; but to have bees shake easily from the combs is desirable. With these two exceptions, the Syrians have no good qualities not possessed by the Italians, while they have the above-mentioned undesirable traits not possessed by the Italians. The charge against them, that they do not properly ripen and seal their honey, is, I well know, not universal; but it has been made, and substantiated, by some of our most extensive honey-producers. Perhaps some will be surprised that I class prolificeness as a fault. Prolificeness, to a certain extent, and at proper seasons, is not a fault; but when carried on at a high pressure, the whole season through, it is a fault. With the majority of us, our main surplus is gathered in six weeks; and hives full of bees during these six weeks are all right (but we don't want them to be everlastingly filling up with bees, and swarming all the time, even during this period of six weeks); but to keep on rearing lots of bees

after the honey-harvest is over is a useless expenditure of honey. This extra prolificeness well suits the man who rears bees for sale by the pound, but not the man who raises honey. A. R. Kohnke, on page 560 of *A. B. J.*, current volume, says: "The prolificness of queen, and the industry of colony, do not necessarily go together. I have an Italian colony, the queen of which is very prolific, having kept the hive and 48 sections full of bees ever since June 10. The proceeds from that colony at the end of the season were 9 lbs. of comb honey and of extracted, about as much from unfinished sections; and on examination before putting them up for winter, I did not find more than 9 lbs. of honey in the brood-chamber. The bees looked like what Mr. Heddon calls the 'Golden Italians.' The Germans have done better for me (for comb honey)." The above illustrates the point. It is quality, not quantity, of bees that we need. It is *honey* that we are after, not hives full of bees whose only object is to gather honey that they may rear more bees. Of course, bees that are constantly breeding, that will rear brood "so long as there is a drop of honey in the hive," will go into winter with hives full of young bees; but this is no advantage, for the reason that young bees are more liable to suffer from dysentery; and the reason of this is, that the young bees are the nurse-bees, and it is the nurse-bees that do the most handling of pollen. If this theory is not true, it is true that Syrians die winters just the same as other bees. I am aware that, by stepping softly, raising the covering slowly, waiting until the bees have "rubbed their eyes" after the "great flood of light has been admitted to the brood-nest," handling the combs without a jar, etc., the Syrians can be handled; but, what practical honey-producer has time for all these preliminaries? Time is money with him.

At the great Northwestern Convention, a gathering that Mr. Langstroth said "represented the largest number of large, successful, practical honey-producers of any convention that he had ever attended," there was only one man who had gentle Syrians, and he said that they resembled Italians.

W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich., Nov., 1883.

Friend H., even at the risk of being accused of having selfish motives in the matter, I want to take you to task a little about what you say on the other side of bee culture. To be sure, there is another side; to be sure, bee-men have to put up with bad seasons and poor results; but I do not think the number who fail is very great compared with other industries. It is true, there are people going into bee culture every year who really seem to have no right to go into it, because failure is almost certain. There are those who get into the grocery business in some way, and fail. I know the grocery business is not written up in glowing terms, as bee culture often is; but I think you get away off from the track when you compare medical journals with bee-journals. Bee culture is a rural industry, like keeping hens, raising berries, going into sorghum, and things of that kind. Do not our agricultural journals give constantly reports of what was done with so many hens, a quarter of an acre of strawberries, or a little patch of sorghum? and is it not right and proper that they should keep doing so? Bee culture has an advantage over these; it arouses and

employs the best and noblest minds and intellects, and it can be taken up and tested on a small scale by thousands who would do nothing if they did not have the bees. Boys and girls both find recreation in bee culture that they might otherwise find in pastimes that are a waste of time, to say nothing of harmful amusements. I know we are publishing constantly reports from beginners, and, begging your pardon (and the rest of those who have taken up your line of thought) GLEANINGS means to continue publishing such reports as long as it lives. If boys and girls, and men and women, who have spare time on their hands can be taught a branch of industry by the use of books and papers, and *nothing else*, so they can take it up in one single year, almost, and make a success of it, and close with more money in their pockets than all their expenditures, I should consider it a gift of God more worthy of thankfulness and praise, than if he should send down gold dollars in answer to our longings. Even supposing there be a dark side that does not get into the journals, the great flood of reports from beginners indicates clearly and unmistakably that hundreds — nay, thousands — have been blessed and made happy by bountiful crops of honey, where the labor given was simply a pastime, and afforded them more joy, perhaps, than any thing else they ever did in their lives. It has been said, that the success of GLEANINGS is owing to the pains I have taken to publish letters and answer questions from the great throng of A B C scholars that are growing up, instead of devoting space to learned essays on the coming bee, and theoretical disquisitions of that ilk.

## PREVENTING SUNDAY SWARMING, &C.

D. A. JONES'S PERFORATED ZINC.

**B**ELIEVING that it is right to hive swarms which can not be kept from issuing on Sunday, let me make some suggestions to those who, like myself, wish on this day to have as little as possible to do with bees.

1. By giving the material for starting queen-cells on Saturday, there will be no occasion to care for them on Sunday.

2. Use some proper device for confining the queens on Sunday, or any other day when you do not wish them to lead out swarms. This is a point to which I have given much attention. On p. 174 of the third edition (1859) of my work I say,—

"As the queen can not get through an opening 5-32 of an inch high, which will just pass a loaded worker,\* if the entrance to the hive be contracted to this dimension, she will not be able to leave with a swarm. This method of preventing swarming requires great accuracy of measurement, for a very

\*Huber does not give the size necessary for confining a queen, but he spoke of a GLASS TUBE adjusted so as to pass out a worker, and not a queen. The smallest queen I ever saw could not get through my blocks. Although the workers are at first slightly annoyed by them, they soon become accustomed to them, as they do not confuse them by presenting the entrance in a new place. The ventilation not depending on this contracted entrance, abundance of air can be given to the bees when the blocks are adjusted so as to confine the queen. If health for the last two summers has prevented me from giving this method of preventing swarming such a full trial that I can endorse it, except for temporary purposes. \* \* \* A THEORY which may seem so plausible as almost to amount to positive demonstration, may be encumbered by some unforeseen difficulty, which speedily convinces even the most sanguine that it has no practical value.

trifling deviation from the dimensions given will either shut out the loaded worker, or let out the queen. These (adjusted) blocks, if firmly fastened, will exclude mice from the hive in winter. When used to prevent all swarming, it will be necessary to adjust them a little after sunrise and before sunset, to allow the bees to carry out any drones that have died."

In my second edition (1858), p. 202, referring to this device, I say:

"By this arrangement, all swarming on Sunday, or any other day when the apiarian does not desire it, may be prevented."

Also, p. 203,—

"It may be found, on further experiment, that the entrances to all the spare honey-receptacles may be so adjusted that the queens will never be able to enter them for the purpose of depositing eggs."

Also, p. 202,—

"A very important use may be made of blocks thus arranged, to get rid of the drones. In that part of the day when they are in full flight, adjust the blocks so that they can not enter. Toward dark, or early next morning, they will be found sprawled out upon the alighting-board, or hanging in clusters under the portico, and may be given to chickens, which can easily be taught to devour them. In a few days nearly all the drones in the apiary may be thus destroyed."

Further experience showing that it was often quite difficult to maintain the 5-32 of an inch by depressions cut in the entrance-regulating blocks, I fastened a few 5-32 strips with clinching nails between two pieces, each 1½ in. long (the length of the usual entrance), the lower strip having two bevels to facilitate the exit and entrance of the bees. A central hole, governed by a cork, allowed dead drones to be easily dragged out, or a young queen to fly for mating. Still the bees would worry from having to crawl too far under such narrow dimensions. At last the 5-32 was cut in a thin metal strip, and such a device enabled me both to prevent my costly imported queens from eloping, or running the risk of being destroyed by stray queens.

On a recent visit to the large apiaries of my friend Mr. D. A. Jones, of Beeton, Ontario, I saw all the points, on which I had labored so long, carried out in a much more satisfactory manner by means of his perforated zinc plates. His *bee-guards*, made of these plates, allow the workers to pass in the freest possible manner, while the ventilation of the hive is not in the least interfered with. The only improvement in them which I can suggest would be to punch out a central hole, governed as in my device, by a small cork. These can be adjusted in a few moments, and Sunday swarming, or swarming on any day not convenient, be prevented without at all worrying the bees. By them, all bad or superfluous drones may be quietly destroyed, by shaking off the bees from their combs, in front of their hive, the queen, of course, being properly rescued. Some may find this the easiest way, more especially with black bees, for finding a queen, or of making it absolutely sure that there is none in a colony to which we wish to introduce a valuable queen. Mr. Jones uses sheets of this perforated zinc to confine the queen to the lower story of the hive, or to any desired part of the brood-chamber, so that she can not enter the surplus-honey receptacles. These sheets also prevent the bees from building small combs between the upper and lower sets of frames—a thing which has often caused so much trouble in hives where more than one story is used.

I see no reason why sections for comb honey may not be set to the best advantage directly on these sheets. Before giving up my apiary I found that

small boxes were much more readily filled by Italian bees, when put directly on top of the frames; and that, however admirably the shallow chamber answered for black bees, the Italians plainly wanted nothing to do with it. How much time and money have been spent in trying to control the mating of our queens! As far as practical results are concerned, have we advanced at all beyond the Kohler process, given so many years ago in the *A. B. J.*, by which young queens and drones from a selected stock were made to fly later in the day than the other drones? May we not, by Mr. Jones's bee-guards, make a still closer approximation to the mating of our queens with our best drones? If we are not liable to be troubled by drones outside of our own apiaries, how easily we can shut in those that we do not desire to breed from, or, if troubled by drones from bees in the woods, or from stocks too near us, we can confine our young queens, and the drones of selected stocks, until it is so late in the afternoon that the other drones have ceased to fly; then by pouring a little thin sugar syrup in to the proper colonies, we can quickly tempt both queens and drones to take wing with the excited workers. As the power to control the mating of our queens is fully as important as the control of the same point in our domestic animals, I shall never cease to believe that, sooner or later, we shall obtain the desired result.

The care with which queens and drones can be confined by the Jones bee-guards, without at all lessening the ventilation of the hive, and with the minimum of interference with any of the labors of the colony, promises to open a wide field for many important processes. It may now be possible, in the hands of careful breeders, not only to keep different races of bees pure in the same apiary, but to build up permanently any desired cross between the different races.

Few bee-keepers, who keep up with the modern improvements, are ignorant of the great services of Mr. Jones, in searching the world, at great expense, to procure the best bees. By his great enterprise he has done more than any one living, to make American bee-keeping known in the Old World. We have been much slower, however, to recognize how much he has done for practical apiculture by his many ingenious devices, and, most of all, by the costly experiments and machinery by which he secured for us his perfected metal sheets.

Oxford, O., Nov., 1883.

L. L. JANGSTROTH.

Friend L., I have many times thought of how nearly you struck on the plan for excluding drones, which we now use so successfully, when you wrote what you have quoted from your book. This illustrates how a great invention may be brought almost to perfection, and then lie right there unused, until something shall give it a start years afterward. We have been using drone-guards in just the way you suggest, ever since we got the perforated sheet zinc. We sometimes, in buying swarms from our friends in the country, get black bees with drones in them. We put them in the hives as usual, and then toward dusk put on the drone-guard over the entrance, shake off all the bees outside the hive, and every drone the hive contains is ready to be killed, or fed to the chickens, as you say, the next morning. Instead of using cork, as you suggest, we have the drone-guard fastened

at one end so it can be lifted out of the way when not needed. When we want it to work, we simply push down the movable end and fasten it with a tack. If I am correct, the perforated zinc was used by our friends in England before even friend Jones got hold of it. But who first had the zinc made of the exact size, and when, I am unable to tell. Perhaps our friends of the *British Bee Journal* will be able to enlighten us. We have sold a great quantity of the sheet zinc, and also of the perforated honey-broods during the past season, and I believe all purchasers have expressed themselves as pleased with them, both for keeping the queen out of the sections, and also for preventing the bits of comb uniting the upper and lower stories.

### FRIEND HILTON'S HOME AND APIARY.

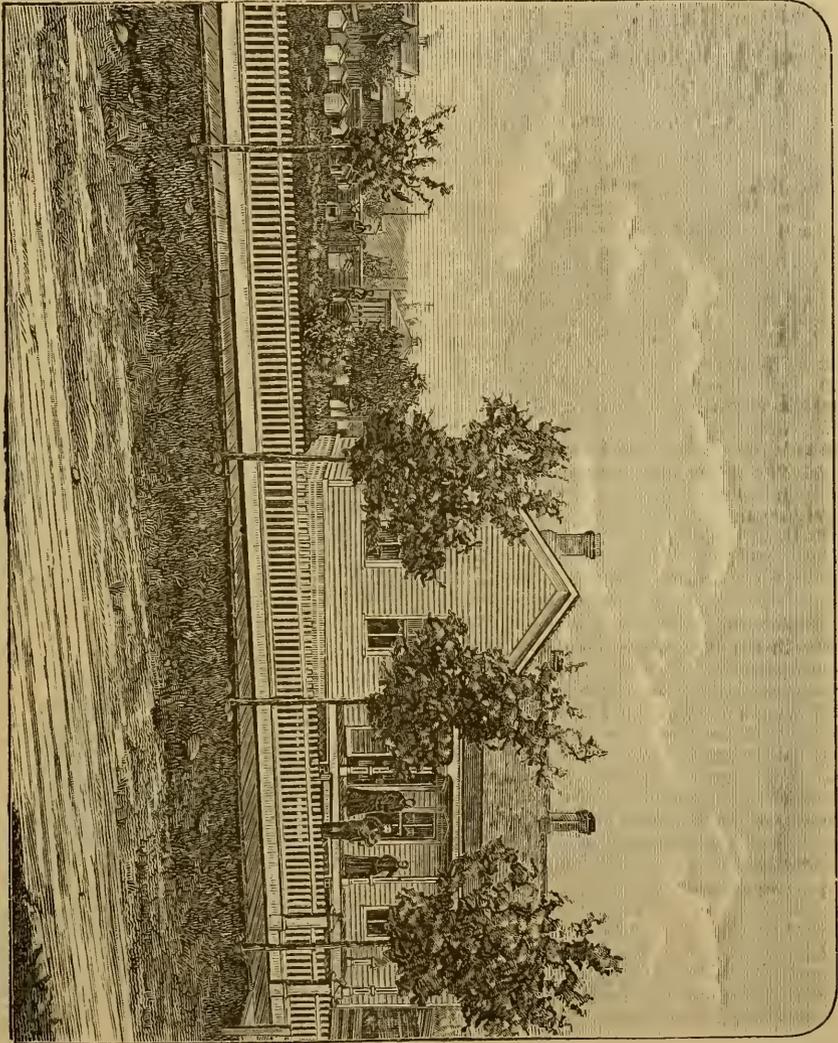

A GLIMPSE OF A BEE-KEEPER'S PLAYGROUND.

**I** TAKE pleasure, friends, in presenting you with a sketch of a pretty little home; and I am sure by the looks of things that it is a happy home. How many are there of you who are working and striving for a good comfortable home? and how many are there who have a little bit of a home that needs fixing up and tidying up, as it were? Perhaps there are some who have no home of their own, and are living on rented places; but I opine not many, for most bee-keepers, sooner or later, want a bit of ground of some sort on which to set their hives, where they will not be likely to move very soon. I believe I should want a piece of ground all my own, even if it were not more than a rod or two square. Now while you look at the picture below, I want to talk to you a little about it.

Right up at the left hand of the picture we get a glimpse of the hitching-post near the gate. I have been having quite a study about hitching-posts of late. There are none near our house yet, and our minister said a few days ago that he and his wife would not come to see us and our new baby if I did not have a post fixed to hitch his horse to. Friend H., we are glad to see that you have one. I do not see any ring in it, though; or did the engraver forget to put on any ring? Next we notice that you have a good comfortable sidewalk, made of pine, I suppose, for they build almost every thing of pine in Michigan. Are the stringers supported by stones? or is the ground so sandy they will not rot anyhow? A picket fence is rather pretty, but we have been discussing the advisability of omitting fences in our locality of late. Are those basswood-trees you have got planted out so nicely? if they are not, I think they ought to be; they are growing thriftily. Your neatly fixed house has a very home-like appearance, and I really believe I should like to live there. The house looks to me as though it were just the place where one would be pretty sure to alight upon a good dinner, if he should happen to be along about noon-time. I need hardly tell you how that fatherly-looking chap standing in the doorway with that baby in his arms took my eye. I rather think, when you come right

down to it, that it moved me to send the picture to the engraver's, that I might present it here to you in the journal. I should like to know that father, and may be he would let me take the baby a while if I promised to be real careful. I wonder if it is a boy-baby. Possibly his name is Peter. Well, well, friends, we must take a look at the beehives. All chaff hives, and ready for winter. I wonder if that is a house apiary right back

and honey-house, and is located in the center of the apiary, so you can see that the shrubbery and dwelling-hide at least half of the hives. The hive with the cover raised back on hinges shows the chaff cushion, and is in winter quarters, as are all the rest, although I have an L. frame of comb hanging on the comb-holder in front, and have another in my hands, and a Clark smoker resting on the gable end proper; just as I have things when at work. The friend in the background, near the honey-house, also has an L.

THE BEE-KEEPER AT HOME.

of that man with a comb of honey in his hands; and a little further off there are some more buildings. Why, friend H., why don't you stand up and tell us about it yourself? Here, you talk:—

*Friend Root*:—As the busy season is at a close, I thought perhaps you would be pleased to pause for a moment, and see how I look at home; so I mail you to-day an 8x10 photo of my home and a portion of my chaff-hive apiary. The building in the center, that looks like a bee-house, is really my extracting-room

frame of honey. The parties in front of the house are my brother Will and family, who are living in my house and making a home for me, as the queen of my household went to heaven last May. I commenced last spring with 35 colonies, and have increased to 57; have taken 2008 lbs. of comb honey, and 1114 lbs. of extracted, making 3122 lbs., or nearly 90 lbs. per colony, spring count, all clover and basswood, as we had no fall honey to speak of. My hives stand in rows both ways, 8 ft. apart, and are so arranged that they are red, white, and blue each

way, and I call it my "Red, White, and Blue Apia-ry."

GEO. E. HILTON.

Fremont, Mich., Oct. 15, 1883.

And so, dear friend, there is sadness, after all, hovering over that little home. The loved one has gone; it is sad, I know; and yet you can thank God you know she is in heaven waiting for you.

Heaven and earth shall pass away, but my words shall not pass away.—MARK 13:31.

### LOWER VENTILATION, ETC.

SHALL WE ENLARGE OR CONTRACT THE ENTRANCES?

I AM much perplexed in regard to wintering my bees. In the A B C, and in GLEANINGS, you and many others recommend chaff packing to keep them warm. Now, do bees really freeze? or do they become benumbed by the cold, and in a long spell of zero weather consume their stores where they are, and as they can not move, they consequently starve? A neighbor of mine, a box-hive bee-keeper, who winters his bees on their summer stands, says he leaves the hives raised up off the bottom-board from  $\frac{1}{2}$  to  $\frac{3}{4}$  of an inch all around, and has no losses, if they have honey enough. He used to close up, except a small entrance, and would lose some every winter. You also recommend leaving the entrance open wide, even in the coldest weather. Now, what is the use of a warm house, if we leave the door wide open? Four or five years ago, during about five weeks of December and January, the thermometer ranged from  $10^{\circ}$  above to  $10^{\circ}$  below zero every night, and did not get above freezing during the day. That winter about half the bees in this section died, and they nearly all had honey in the hives. One man lost all he had outside; but had 3 hives in the cellar that came through all right. Quite often we hear of losses coupled with the remark, "Chaff packing would not save them."

The conclusion I have arrived at, is this: That a single-walled hive will warm up as quick, or quicker, than one with double walls, on a bright sunny day, and give the bees a chance to move to where their stores are; and, if we are having a long spell of zero weather, we had better move all hives (whether packed in chaff or not), to the cellar until the weather moderates.

F. A. HAYES.

Montoursville, Pa., Nov. 23, 1883.

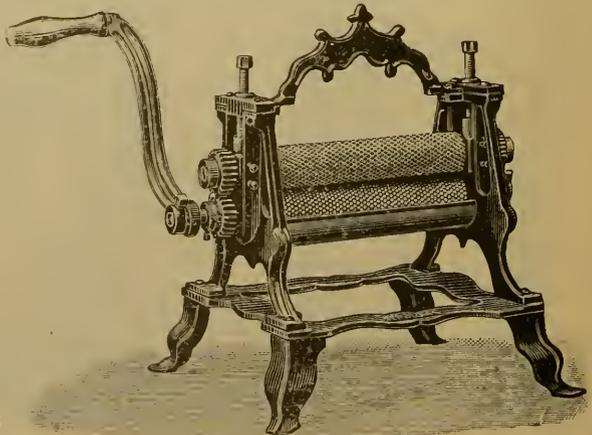

Friend H., there is something a little contradictory here; but both sides are right, I think. We have had abundant evidence that bees winter with a large amount of ventilation, where they do not otherwise. I think there is a good deal of use in having a warm house, even if we leave the door wide open. Go into any crowded audience, and you will soon feel the need of having a door wide open, or several of them. But at the same time we feel this need, we also need a good warm structure for the crowded audience, especially if the weather be severely cold. So it is with the bee-hive. The value of chaff packing and chaff cushions has been abundantly proven; but at

the same time, we want to make ample provision for plenty of pure air for this crowded "audience" inside of the walls and under the chaff cushions. Our crowded audience would suffer in a barn, and our audience of bees would also suffer in a thin-walled hive, in fact, when they would not in the chaff-packed hive. I think the A B C book will make this plain to you. Now, another point comes in here: Bees in single-walled hives get dried out and warmed up during a sunshiny wintry day, when those in chaff hives would not; and on this account, thin hives in the springtime have a certain advantage over chaff-packed ones. This advantage, however, is overbalanced by the use of chaff hives at other times.

### FRIEND GRAVENHORST'S NEW JOURNAL.

ANOTHER PUBLICATION IN THE GERMAN LANGUAGE.

THERE can be no better evidence of the deep hold that bee-keeping is making on the minds of the people, than the large number of journals devoted to the dissemination of apicultural knowledge. Among the latest is one from Germany, entitled the "*Deutsche Illustrierte Bienenzeitung*," edited by that able scholar and apiculturist, C. J. H. Gravenhorst. It contains 32 pages, a little smaller than these, elegantly illustrated. The extreme fineness of the cuts in this journal is certainly a wonder. Only in the high-priced magazines, such as *Harper's* and *the Century*, can we find their equal. As an example, we herewith give a cut of our fdn. mill, which friend G. had engraved from a photograph we sent him.

The literary contents of the journal are of the highest order, and will be eagerly read by all acquainted with the German language. We commend the magazine as one of the best, and fully up to the times. As the price is only \$1.00 per year, we will club it with GLEANINGS at the same price. You may send subscriptions to us, or to friend G., as you choose. Perhaps you had better send to him for samples, as we have none in stock. His address is Braunschweig, Germany.

## BEES GOING OFF WITHOUT CLUSTERING.

SOMETHING FROM OLEFOGY HIMSELF ON THE SUBJECT.

**W**ELL, well! here comes Olefogy again with his batch of stuff about bees swarming and going off without settling. We thought we had him snowed under so deep that he'd never smile again. Oh, no! I was not dead, only sleeping; or, rather, waiting for you to muster up all your score of witnesses, and I believe now about that number have testified to having seen such phenomena as bees swarming and going right off without ever settling "at all at all." And now let us hear the conclusion of the whole matter. What per cent of the bees that swarm go off without clustering? Is it one-tenth of one per cent? I have an idea it is not more than one in ten thousand, and may be not more than one in a million, for I believe that God created bees for the use of man — domestic insects, if you please; and when he gave them the swarming instinct, and blessed them, and commanded them to multiply, etc., he also gave them the clustering instinct that man might make them useful, if he would (I don't believe that bees were evolved from gnats or ants, but they were made bees at the beginning); and I suppose when father Adam fell from his first estate the bees became somewhat demoralized, and hence their disposition to sometimes give us the "cold shoulder," and sometimes the "hot tail," and sometimes they cut all kinds of queer and unaccountable tantrums; but for all that, I don't see that we need be afraid of losing many bees by their going off without clustering, to give us a chance to hive them; and no one in all this mighty snow-storm of witnesses seems to be alarmed, except friend Train, of Mauston, Wis. (see page 380, GLEANINGS for July, 1883), whose bees are so possessed that he has to stand guard over himself (it won't do to trust a small boy or woman) with a big looking-glass and double-barreled shotgun loaded with shot—dear me! I should think when the bees see themselves in that looking-glass they'd be ashamed of themselves, and "hasten down and beg the old man's pardon;" but I infer from what he says, that some of them cheek it out till he tries what virtue there is in shot—ah me! That is a deplorable state of affairs. I believe if I were in his place I would move my bees all to that heavy basswood forest so as to put a stop to that kind of business; for it seems to me he is in a fair way to breed the clustering instinct all out of his bees while the swarming instinct is intensified. Oh! well, they will replenish the earth all the same, and make a good opening for bee-hunters; so, perhaps, it will be all right in the end, any way.

"Know nature's children all divide their care;  
The fur that warms a monarch warmed a bear.  
While man exclaims, See all things for my use,  
See man for mine, replies a pampered goose."

I have something to say in regard to swarms deserting the hive when they have unsealed brood given them; but this is, perhaps, already too long, so I will subscribe myself, Yours truly, OLEFOGY.

Allendale, Ill., Nov. 6, 1883.

Friend Olefogy, we are glad indeed to hear from you again; but it seems to me you are a little stubborn. After all this accumulation of evidence, ought you not to own up in a little more teachable spirit? May be I am stubborn too; but to make an off-hand esti-

mate, I should think that about one swarm in a hundred goes off without clustering; but may be one in 500 would be more modest. Perhaps it is not a matter of very great importance, after all; only if bees do go off without clustering, now and then, it is well for the bee-keeper to know it. I agree with you, that there may be a providence in having them go off now and then in just that way, just as there seems to be a sort of providence in having uneasy people who are always moving about, and thus help to settle new countries. There is one thing certain: You seem to have a happy faculty for making a "stir in the meeting," and inducing many of the brethren—aye, and some of the sisters too—to stand up and relate their experience, who might otherwise have never let anybody know that they kept bees or read the bee-journals.

## A HARDY AND DESIRABLE STRAIN OF BEES.

IS IT A MERE MATTER OF ACCIDENT, OR AN ESTABLISHED CHARACTERISTIC OF THIS PARTICULAR STRAIN OF BEES?

**W**ELL, I will try to tell you about them, or, rather, all that I know of them. A Mr. Baker, formerly of Vanburen, O., but now living in the West, kept, for quite a series of years, an apiary, taking an interest in obtaining the best strains of bees that he could buy from different breeders. Just prior to Mr. Baker's selling out and going west, a Mr. Baird purchased a fine selected stock of bees from this apiary, being the spring of 1879. One year later, Mr. Baird sold these same bees to a neighbor of mine, Mr. A. J. Shirk. Mr. S., not being suited with the hive used by Mr. Baker, came to me, and had his bees transferred to the L. frame and Simplicity hive. This was in the spring of 1880.

Now, for results: These bees were wintered in the same hive, on their summer stands, without any artificial protection, not even a windbreak, except an ordinary board fence, and that stood 3 or 4 rods from the hives. You will all doubtless remember the terrible results of the following winter, 1880 and '81, in which many lost all the bees they had. Yet these bees came through the ordeal of that winter without any loss, and showing no signs of the hardships they had passed through, being strong, clean, and healthy.

I will now compare these bees with others, to illustrate their remarkable hardiness in withstanding the rigors of winter as well as the active voyaging of wing in summer. During the same spring I transferred 46 stocks for other parties in the same vicinity, putting all in Simplicity hives; these 46 stocks consisted of blacks, hybrids, and full-blood Italians, and were wintered in like manner, except in three cases, where windbreaks were provided. When spring came, three out of this number had survived; loss 43, and the increase 21; total loss, 64 stocks. My own loss was 21 stocks out of 30; all were packed with 3 inches of dry chaff around body of hive, and chaff cushions over brood-chamber. A Mr. Lee, of our vicinity, a box-hive man, lost 28 out of 31. A Mr. Night lost 133 out of 136; these last were in Gallup hives.

Well, with these facts and figures before one, is it any wonder that I should have an eye upon this strain of bees? and as I am strongly opposed to

jumping at conclusions, I have taken years to watch and investigate this characteristic, during which time not a colony of these bees has ever suffered from any cause, so far as we can discover, until I am now compelled to accept the fact, although contrary to previous conceived ideas, that this strain of bees possesses remarkable traits of hardiness that I never saw in any other bees.

#### DESCRIPTION.

The bees are three-banded; color, dark orange; in form they are more slender than Italians in general; in movement they are active and rapid; in leaving or returning to the hive they present a waspish or bristling appearance, with wings widely spread and highly elevated; are first-class comb-builders and honey-gatherers. I have obtained a selected stock of these bees, and have requeened a part of my home apiary this season. I have arranged so as to be able to produce queens of this strain another season. The queens, like the workers, are a little on the slender style, but long of body; in color, a little on the dark, being a light mahogany, yet they are beauties. Perhaps their appearance is somewhat due to the care with which I breed them, having grown all cells in a powerful colony; that is, fed and kept right up to the swarming-point. I am fully persuaded, that, to get the best results in queen-rearing, we must exercise great care in the production of the cells.

Now, in conclusion, friend Root, what should be done? It seems to me, although we place the above facts as prospective only, that there is a sufficient probability in justifying us in the conclusion, that this strain of bees should be utilized to the benefit of bee-keepers, especially throughout the cold bleak regions of the North. And as Mr. Shirk is not a practical bee-keeper, and therefore does not understand queen-rearing, this labor, if done, will necessarily devolve upon some one else; and as this vicinity will be well supplied with this strain of drones by next season, it would be better to raise the queens here. I have not bees enough to go into the queen trade extensively, yet I could buy enough in the spring to form my nuclei.

Bloomdale, O., Nov. 19, 1883. R. B. ROBBINS.

Friend R., this is, of course, a very important matter to me; and had the bees you mention been brought from Japan or Africa, or, perhaps, better still, Nova Scotia or Iceland, I should have faith that they possess some prominent desirable quality. As it is, I am inclined to think the success you mention was more accidental than because the bees were especially different from any other bees. Perhaps it is no more than fair to inform our readers that friend R. proposes to follow this article with an advertisement, and offer queens for sale during the coming season. Now, although I am sure, from the above letter, that he is honest and conscientious in the matter, he would have to be rather more than human if he did not unconsciously get to be a little biased in their favor when he goes into the business of selling stock. Another thing: I have taken pains to test quite a number of colonies that seemed to show remarkable qualities, but I have not been satisfied that their progeny had any very perceptible advantage over the common run of good Italians. Our red-clover queen, it is true, seemed to give us a good many extra

queens, but I am not sure they were much, if any, above queens reared from any other choice queen. Now, then, friends, after this word of counsel, I should be glad to see the strain of bees possessed by friend R. fully tested.—In regard to the matter of wintering, I believe it is a common occurrence to have particular stocks in almost every apiary that winter safely year after year, and that, too, with no extra protection. Sometimes this is the rule only so long as the queen lasts. Again, I have had reason to think the combs the bees winter on, or some accidental peculiarity of the hive, had something to do with it. Also some accidental protection from the wind, which the owner never thought of, may have quite a marked influence on this result. I am inclined to think something of this kind is the case with the bees mentioned above, although I may be mistaken. I suppose, of course, the bees are good Italians. It seems to me, also, that the queens should be furnished at about the usual price, or a little more, for any good queen-breeder could rear a thousand queens or more without trouble, from any particular queen.

#### THE GRANULATION OF HONEY.

Also a Splendid Report from Friend Pettit, of Belmont, Can.

\$1000 WORTH OF HONEY FROM 72 COLONIES.

**N**OW that my honey crop is disposed of, I send you my report for 1883. Fall of 1882 I went into winter quarters with 72 stocks. The present season I disposed of 7542 lbs. of extracted honey for \$970.53. For use in the house, estimated at 225 lbs., which will make \$1000 nicely. I go into winter quarters now with 76 stocks. I had a large quantity of late dark honey, which has reduced my average price considerably. Inclosed you will find a resolution and discussion on the granulation of honey, clipped from the *Toronto Globe* of Sept. 21, 1883, which took place after you left the N. A. Convention. The resolution was intended as an educator of the public. We must not give up the battle until the people know the truth in this matter; then as a class we will stand better before the people, and the adulterated article will be forced to take a back seat.

#### GRANULATED HONEY.

A resolution was presented by Mr. S. T. Pettit, seconded by Mr. C. F. Muth, pledging the Association to do all in its power to convince the public that granulated honey was natural and wholesome.

Mr. Pettit said that the lack of knowledge on this subject by the public was a great drawback to the business, and a direct inducement to unscrupulous parties to adulterate the honey or get up some mixture which the public would accept as pure because it would not granulate. It was claimed by some that honey could be put up so that it would not granulate, but he doubted it. Certainly, pure honey would granulate.

Mr. Muth said bee-keepers knew very well that pure honey would granulate, but the public did not know it. It was necessary to educate the public on this question. He had been offered a recipe by a druggist, by which it was claimed honey could be put up so it would not granulate. The druggist wanted \$5 or \$10 for the recipe, but he (Mr. Muth) said he would not give a five-cent piece for it. If the honey business was to be made a success, it must be done by selling the honey in its pure and natural state, and the public must learn that pure honey would granulate. He knew, as a matter of fact, that in France and Germany granulated honey was preferred.

Rev. W. F. Clarke.—It would be better if we would state that granulation is a proof of purity.

Mr. Hart mentioned that there were good authorities who claimed that honey could be put up so that it would not granulate, and he doubted the advisability of putting in the motion that all pure honey would granulate. Mr. Spence and Mr. Pringle also doubted that the association should be committed to that statement.

Rev. Mr. Langstroth said he never saw pure honey that would not granulate, but he mentioned also that he had seen honey from Mexico which granulated or thickened like lard or butter—perfectly smooth.

Mr. Muth said that in his storehouse every winter they liquefied the honey. Sometimes it granulated smooth like lard, sometimes with a very heavy grain like small peas.

Mr. Jones, from his experience, found that Canada-thistle honey would granulate like lard, while basswood and buckwheat honey thickened in heavy crystals.

Several suggestions were made by members as to the resolution, but finally it was presented and passed in the following shape: "That we, as individuals and as an association, do all in our power, by precept and practice, to convince the public that granulated honey is natural, wholesome, and desirable, and that granulation is a fine test of its purity."

Belmont, Ont., Can., Nov. 14, 1883. S. T. PETTIT.

I like your resolution, friends, but I think it should be borne in mind that we have California honey, and honey from other sources from other parts of the world, which does not granulate at all, or not, at least, for a great while. We had several samples of honey that would stand outdoors during a zero freeze, and show no signs of granulation, and I have kept it that way all winter long. It was not thin honey either; because when frozen stiff, a tumbler full could be inverted without scarcely moving, and yet it was so clear that print could be read through it. By all means, let us overcome the idea that granulation indicates any thing unnatural.

## SWARMING, AND SECTION HONEY.

"STRIKES" AMONG THE BEES, ETC.

ON page 579, Mrs. M. A. Shepherd writes: "Will Mr. Doolittle tell us *exactly* how he manages when his bees are working in sections, and swarm? Neither the old stand nor the swarm will be strong enough to work in sections, and perhaps the best of the season may be over before they are ready again." Here is a question of great importance to the apiarist who is working for section honey. I said on these pages some time ago, that the great secret of producing honey was in getting the bees strong in just the right time for the honey harvest, neither too early nor too late, on the principle that, if a man had a field of grain to harvest, he would hire the laborers when the grain was ripe; not before, and not afterward, and employ as few at all other times as would be consistent with preparing for the harvest. Just so I say to-day; and he or she who becomes a successful honey-producer will sooner or later view the matter in the same light.

But, Mrs. S. now comes forward with the very pertinent question, saying, after the man has hired his help, and they have worked a few days in the field of ripened grain, thus becoming efficient laborers, suppose they should strike for higher wages, and neglect the field of grain, what is to be done with them, or how shall such a strike be prevented? We all know how damaging to any business is a strike of the employees; and any person having

had the care of bees for a year or so knows that a colony of bees having the swarming fever in the honey-harvest, is fully as damaging to the prospect of the bee-keeper as is a strike of telegraph operators, etc., to the interests of those who employ them. To avoid such a condition of things, then, should be the aim of those wishing to secure the best results from their bees. Different bee-keepers have different ways of trying to overcome the swarming fever, such as cutting out queen-cells, etc., many of which often prove inefficient in securing the desired result. After trying nearly all the plans I have read of, and many of my own devising, I have adopted the following, which gives me the best results of any thing so far tried. Our main honey-harvest occurs, as a rule, during the last 20 days of July; hence, to secure the best results, all swarming should be done as far as possible by the 2d or 3d of that month. No swarms should be hived which issue before June 20; for if such are hived, the probability is that they will want to swarm again about July 20, which is at the very time we desire to avoid swarming, or a disposition to swarm, as much as possible. To keep the swarming fever down previous to June 20, I take brood and bees from the stronger, and give to the weaker, till all are equalized, or brought so they are nearly ready to swarm at about the same time; and if this comes sooner than 20 or 25 days before the honey-harvest, swarming is kept back by taking a frame of brood and bees from each, and forming other colonies or nuclei with them. By taking 9 such frames of brood and bees (I use 9 frames in a hive), and placing them in a hive together with a queen, a full colony is made at once, which in a few days will be as strong as any; while by taking the 9 frames away we have kept 9 hives from swarming for a few days. When the proper time arrives for the swarming to be done to the best advantage, all swarms are hived separately as they issue, for the first week or so, as these are early enough to get their hives in proper shape for the harvest, with no disposition to swarm again the same year. After this week has elapsed, two swarms are hived together in one hive, if they issue near the same time, so it can be done; and if not, the new swarm is placed on the stand of another colony which has not swarmed, moving such colony a rod or two away, thus securing to the new swarm all the field bees from the colony moved, and giving them nearly the same working force they would have had if two swarms had been hived together. The colony moved is prevented from a desire to swarm, as it is so weakened by the loss of bees that no further attempt is made to swarm, as a general thing. If all have not swarmed up to 6 days before the general honey-harvest, they are made artificially in the following manner:

An empty hive is procured and set beside a colony which has not swarmed, which I will call No. 1. No. 1 is now opened, and all the frames taken out, and frames of empty comb or fdn. is set in their places; sections are put back on, and hive closed, when all the bees are shaken in front of their old hive, which they readily enter. The frames of brood devoid of bees are placed in the empty hive, except one, which is taken to a nucleus, and exchanged for a frame of brood, bees, and queen. Set this frame having the queen in the hive having the brood, and put on the sections. Having done this, go to another hive that has not swarmed, which we will call No. 2, and move it a rod or two away,

placing the hive prepared with brood, queen, etc., on stand No. 2, occupied. By this plan I make one new swarm from two old ones, thereby doing away with the swarming fever, yet having all in good working condition, when the honey-harvest arrives.

By all these plans, the object to be secured is to get rid of the swarming fever, and yet have all swarms strong enough to do good work in the sections. But, says one, do you always succeed? No, not always; for once in awhile a swarm will issue from a hive that ought to be contented to labor with a will, in sections. In such a case I adopt one of the two following methods. 1. When a swarm issues during the honey-harvest, I catch and cage the queen (this is easily done when the queen's wings are clipped), placing the cage in one of the sections, leaving her there for 5 days, when the hive is opened and all the honey extracted from the brood-frames, cutting off all queen-cells while so doing. Now let the queen out, and you will see a swarm work as if they meant "business."

2. The new swarm is hived in a hive containing but 4 frames of empty comb or fdn., setting it on the stand of the old colony, and putting the sections from the old colony on the swarm, having the sections surround the 4 frames given. This compels the bees to do most of their work in the sections; and as they have nearly or quite all the working force, as much section honey is obtained as would have been had they not swarmed.

The old colony will get in good shape for winter, while 3 or 4 frames of sealed honey from some stock worked for extracted honey will make the new swarm all right for winter.

The above are the plans I use; and all I will say in favor of them is, that they please me, and enable me to secure a tolerably fair crop of honey year after year.

#### HIVING BEES ON SUNDAY.

In regard to hiving bees on the Sabbath, I have little to say. I believe God can be as acceptably served, many times, by sitting under the shade of some tree, listening to the hum of the bees, and communing with our own hearts, asking our heavenly Father that he will so guide us by the Holy Spirit, that our daily lives may *always* be to his honor and glory, and for the conversion of those about us, as by going to church, and returning from the same, ready to find fault with a brother who differs with us as to how the Sabbath is to be kept. I believe in attending church; but I also believe that we may become so strenuous about the letter of the law regarding the Sabbath that we may forget the better and more spiritual part of it, which is, that each Sabbath shall be spent so that, at the end of it, we can say we are one Sabbath-day nearer God's kingdom.

G. M. DOOLITTLE.

Borodino, N. Y., Nov. 7, 1883.

## BEE-KEEPING IN THE ISLAND OF CUBA.

### A BIG MOVE IN THE RIGHT DIRECTION.

OUR readers who take the *Bee-keepers' Magazine* are doubtless aware that our veteran bee-keeper and editor, A. J. King, has gone to assist in starting an apiary in the island of Cuba. The minute I saw the notice that he had gone, and the letter from him personally, I felt like saying I should like to go too. Well, friends, I can

not go, but I am lucky enough to be able to give you a good letter from Mr. A. W. Osburn, the proprietor of the 100 colonies the friends have taken to Cuba.

*Editor Gleanings:*—On the 19th of last month we sat foot upon King Alfonso's domain, and took our first look at Cuba. We had left the grand old steamship Niagara, that had brought us in safety from New York, and with our 100 colonies of bees, with all the modern "fixins," we took the cars for this place, 18 miles north-east of Havana. Our bees stood the voyage well, every colony being alive when they arrived at San Miguel. But owing to the hot sun, and the delays that seemed impossible to avoid, in 3 days after our arrival 8 colonies had gone to that good place where all good Italians go, leaving us 92 to astonish the natives with, and to begin bee-keeping in this tropical climate, where the sun pours down its genial rays, and the flowers bloom 12 months in the year.

Of the honey-flow of Cuba I can not speak with that surety that long experience would give; but from what I have seen, I think very favorably of it. Of course, our bees were comparatively weak when they landed here, having been purposely shipped light in bees to avoid smothering while on the voyage; but notwithstanding their weak condition, they are gathering more honey than I ever saw colonies with no more bees than they have do. There are two great things that contribute to this happy result. First, there is plenty of honey to gather; second, owing to the warm weather, no extra number of bees are required to stay at home to keep the brood warm, and the nights are delightfully warm. The queen has every chance to spread her brood, with no fear that it will be chilled. As I said before, the nights are warm, the mornings are warm, and the days and evenings are warm. As an evidence, let me say that, in the morning as soon as there is any light, I hear the hum of ten thousand little wings, wending their way for the early drop of nectar while it sparkles with the morning dew. They work with great energy until about 10 o'clock when there is a perceptible slacking off, till 3 in the afternoon, when business is again resumed; and until it is dark they cease nor tire not; but each one trying to outdo the other, loads himself with pollen and honey to the utmost capacity.

Of the honey, I have a good report to make. It has a rich and native sweetness that, to my taste, is superior to white clover or basswood of the North. The native Cubans tell us that next month, Dec., they consider rather the best month in the year for surplus. I am going to see how it compares with the North, or with the best years in California. Of the different kinds of flowers from which the bees gather the honey from here, I shall have to wait till some future article before I can give your readers the names of them.

Of the face of the country (what I have seen of it), it is delightful; the land is rolling, with springs and little brooks in proximity to one another. The water is as good as I ever tasted in any country. One great feature of beauty is the palm-trees. They skirt the banks of every streamlet; their trunks are smooth and slick; their dark-green foliage, towering far above any of the trees of the forest, makes them the one grand feature of loveliness in this tropical picture of nature. I speak of the palm, because it is the one ideal thing that fills my eyes full to overflowing. There are other trees

that are lovely, that are really beautiful, whose names I do not know; but the orange, the lemon, the lime, and the pineapple, grow in great perfection here; and, in fact, I never tasted any of the above fruit, so perfect in form and flavor, until I came to Cuba. Now while I write, not 30 ft. away, and where the bees have to fly under its mammoth leaves to get to their hives, stands a beautiful banana-tree, loaded with the ripening fruit. The great Giver of all good has richly bestowed his blessings upon this country, and I have now the great honor of being the first to establish and put in running order the first apiary upon the improved or modern plan, that some of the native sweetness of this God-blessed country may be gathered and tightly put into barrels, and safely shipped to the hungry millions of the North, and of Europe.

A. W. OSBURN.

San Miguel de Iarnco, Cuba, Nov. 11, 1883.

### SWARMS DESERTING THE HIVE WHEN THEY HAVE OPEN BROOD GIVEN THEM.

"OLEFOGY" COMES DOWN HANDSOMELY, AND RENOUNCES HIS HERESY.

**W**ELL, Bro. Root, as there has been some discussion on this subject of late, I feel like casting in my mite, for I have had a new experience this season, and I'm afraid I'm "almost persuaded." I have for several years practiced invariably giving swarms, when I hived them, a comb of unsealed brood, and I always put the comb of brood in the hive first, and then hived the bees on it; and as I never had lost a swarm by desertion, I had about concluded that there was no use in anybody losing bees in that way; but, alas! it took only two refractory swarms to knock the conceit clean out of me. And now for the experience.

June 1st, hive No. 24 swarmed, and I hived the swarm in the orthodox way; numbered the hive 33, put them on the stand, shaded them well, and went on my way rejoicing. Well, they worked all right for two days; but on the 3d day of June the swarming fever became epidemic among the bees, and No. 33 caught the complaint, and out they came, and settled with a swarm from No. 15, which had just preceded them on a peach-tree limb. Well, they were both large swarms, and when united made one whopper; but I didn't want to try to divide them; was scarce of hives anyhow, and, in fact, I didn't know but that 33 had left their hive because they felt lonesome by themselves. I didn't know but they'd left just to get away from the "young uns." So I just put them all in the same hive 33 had left, and they filled it so full that I put the super on to give them room. When I had them nearly all in the hive, I saw the bees balling a queen; and when I took her away from them I knew her. She belonged to 33, and I had called her my gipsy queen (and she has a history; but, never mind that now), so I put her back in 24, where she came from 2 days before, so that left one queen with a rousing big swarm of bees, and a nice start of comb, honey, brood, and eggs. Well, they stayed there two days, and worked away like "good little insex;" but on the 5th of June, when I was climbing that big elm-tree, "you know," to get a swarm down out of the top of it, don't you think 33 came out and went right off? Do you ask if they settled? No, they didn't "settle"

with me. Well, I shouldn't have followed them, if I hadn't been up in the tree, nor tried to settle them "mit a bell" either, as neighbor K. says; but neighbor C. followed them about a mile, and saw them go into a tree. Now, I call that a clear case of willful desertion, and they must have had that tree picked out to go to; but why they would leave a nice comfortable hive to go to a dirty old tree, is more than I can understand.

My next experience was on the 12th of July. A fine big swarm of Italians came out and settled; and when I went to hive them — well, there is no use talking; they were the "illegit" bees I ever undertook to hive. "Coming bee" (?). I think I should prefer them not quite so "coming." I tell you, they plied their stings for all they were worth; but then, as I am no hand to run I stood my ground, with the exception of jumping down off the ladder a few times, and crouching down and sticking my head under some pie-plants that grew hard by, just to give them a little time to consider, you know; but they wouldn't "consider" worth a cent; and then my better half, she got sorry for me, and took the bonnet off her own head and thrashed the bees off from me with it, and then she over (?) persuaded me to let her fix her Sunday go-to-meetin' veil over my face, and buckskin gloves on my hands, and then with a free use of water and smoke we got them nicely hived and on their stand, all snug and well shaded, just at noon; and I went to the shop and left my wife and two blue-eyed girls to watch the bees; and when I came home at night they said the bees were gone, and they couldn't tell how they went, nor where they went to; for they were right there all the time, and didn't know how they could have got away without their knowing it, and they did not go into any other hive there either. Now, I call that a clear case of willful desertion, and that with malice aforethought, for it looks to me as if they did it on purpose to get even with me, because I had beaten them in the first battle; for they had the infallible comb of brood, and every thing necessary to make them comfortable, and still they "don't been baby."

Well, now, I don't know what others may think about it; but for me, it will not take much more of such experience as that to convert me, and then I shall have to join Bro. Doolittle.

OLEFOGY,

Allendale, Ill., Nov., 1883.

F. S. C.

Well, I declare, friend F., I used to think that when a man once advocated a certain doctrine as vehemently as you did yours, it was an almost unheard-of thing to come right down squarely and own up. You certainly ought to have a medal or a diploma, or something of that sort, for setting an example of frankness and ingenuousness, before our younger brethren. You can not tell why those bees swarmed out that way. I wonder if they had not heard about the way folks are giving it to you through the bee-journals, and concluded they would turn in and add their mite to the general fund of knowledge by coming right out before your eyes, and demonstrating your error. — Give my respects to your good wife, and tell her that we think you ought to be happy, even if you have been whipped out so badly on the swarming business. I really am not certain my wife would do as much as that, lend me her Sunday go-to-meeting bonnet and veil, and turn in and help fight. May be

she would, though, for we very seldom give our wives the credit they deserve, if I am correct in the matter.

### FROM PALESTINE.

HONEY FROM THE SEBESTEN-TREE, AND HOW THE BEE-EATER IS CAPTURED, ETC.

**E**VERYBODY knows, it is a long, long way from America across the Atlantic Ocean, the whole continent of Europe, and last the Mediterranean Sea, till it reaches the port of Jaffa, taking our journals to such an out-o'-the-way place as Jerusalem. But, having come up to the Lebanon for some months, it was longer still before my eyes met with the interesting article published by friend Benton, about the bee-eater, on page 283, of JUVENILE GLEANINGS for May. I, too, was very much astonished to find friend Benton's excellent memory failing him in describing that sticky substance to catch birds. The sebesten-tree (*Cordia Myra*) is a middle-sized, irregular-growing tree, with ovate leaves, very smooth on its superior surface, rough below; it has small whitish flowers, blossoming about the end of May, at which time I observed numbers of bees swarming about it, eagerly getting honey, that time being the end of the cactus-blossoms, affording the bees much honey. Pity to say, there are but few trees in the neighborhood and in surrounding villages; for should there be orchards of them here, our bees would infallibly have another honey harvest for the first part of June.

This tree has an egg-shaped fruit called the sebesten plum, which is succulent, mucilaginous, and emollient, with some astringency, and has a sweetish taste. It has a thick peel, and in the midst of the mucilaginous substance is bedded a kernel, filling up almost all the space. The fruit is about the size of a grape, and hanging down in similar bunches, excepting the fruits in the bunches to be scarcer, though there are great numbers of bunches. It ripens about the end of August, and is almost yellow. It is then gathered by the owner, and every fruit is to be cut open. The most curious way is employed to get out the substance. The fruits are sucked out one by one, and split into a big mold, or chaldron, together with the kernels; there it is beaten together for some time, till it foams well, and a solution of yellow arsenic (tersulphide of arsenic) with water at the rate of 1% is mixed to it, and the beating is continued for another while, which last solution probably was mixed to prevent it from fermentation, or give it a greenish hue, as they told me.

Flexible whips from olive, pomegranate, etc., are now cut, and dipped in the mass just as far as to leave a little space clean, to hold the whip. They are then put to dry somewhat, and dipped a second and a third time in this matter, when they are supposed to have enough glue, or "aibbek," as the Arabs call it. They are now put together by dozens and sent to the market. Any bird-catcher or bee-keeper (I used them myself) now sets up those whips one by one in the branches of trees, or on poles or reeds put up in the vicinity of the hives. The bee-eater is known to perch up very high, and finds those green whips very inviting for him to perch upon, whereupon his feet stick fast to the substance, and very often making efforts with his wings to get off, he gets entangled more and more

in the lofty but unhappy resting-place, which proves very often to be his last resting-place.

This is the way the mucilage is manufactured and employed. I lately met with a young American lady by the name of Miss Debora, which, in the original, signifies "bee." I asked her if she would like to be the queen of all my queens. The answer was in the positive. I don't think you find very often such queens set over so many queens.

By the time the present reaches you, or very soon after, I shall be back again to my Palestine apiaries, where I generally reside. What I mean by this is, you may kindly continue mailing the journals to Jerusalem, not heeding the date given.

PH. T. BALDENSPERGER.

Mt. Lebanon Apiary, Beyrout, July 23, 1883.

Friend B., we are very much obliged to you for the facts you give in regard to this strange tree, as well as for the very full explanation you give us in regard to the oriental plan for catching birds. It seems to me it is a vast improvement over the time-honored plan so often recommended to youthful aspirants, of putting salt on their tails. We are interested, too, in that American queen-bee. For a good while we have heard much about sending over to your country after queen-bees; but I believe you are almost the first one who has had the good sense to appreciate the rare excellences of the native American queens. May God's blessing rest with Mrs. Debora and yourself in your Palestine home.

### DO DRONES CONGREGATE IN LARGE BODIES, WHERE QUEENS MAY MEET THEM?

SOME IMPORTANT FACTS IN THE MATTER, FROM FRIEND DOOLITTLE.

**M**ANY of our friends who have read GLEANINGS for years back will remember the articles on this subject, and I presume most of our readers are familiar with the fact given on page 65 of the A B C book, in regard to queen-ants meeting in vast bodies. Well, keeping these facts in view, we read with interest the following, which we extract from the *A. B. J.*:

Some 20 years ago my father planted a piece of corn on a high hill; and as the season was quite wet during June and the fore part of July, the weeds were quite rank in the corn during the fore part of August. As soon as through haying, we went into this cornfield to cut the weeds. Every afternoon from about half-past twelve to three o'clock it would sound as if there was a swarm of bees in the air, and at first we looked often to see if we could not see a swarm; but as none was discovered, we concluded it must be flies of some kind, which congregated there to play. At this time there were no bees nearer than two miles from this hill, unless, perchance, a stray swarm might have been in a piece of woodland not as far off. Previous to this my father had kept bees, and had often pointed out the queen to me as a swarm was going into the hive when he lived them, and I knew a drone as well as a worker-bee.

One day I was sent to the cornfield alone, and, as it was a very warm day, along about two o'clock I got extremely tired (or, perhaps, lazy), and so I lay down partially in the shade of the corn to rest. As I remained there, listening to the hum of the flies, as I supposed, I thought I would try to ascertain if I could see any thing; so, shading my eyes by placing one hand each side of them, and looking steadily up into the clear sky, after a little I could see thousands of living creatures circling in all directions, so swift that at times they looked like a streak of black,

shooting across the sky. As I was looking at them, I saw a dozen of these shooting objects give chase after another, and soon overtook it, when their flight was less rapid. Circling around, they came near the ground and stopped on the tassel of a stalk of corn, which stood about a rod from where I lay. I got up at once and proceeded to the stalk of corn, but before I was half way to it, one flew off, which looked to me like a queen honey-bee, and the other fell to the ground. Upon picking it up, I found it to be a dead drone. Although at that time I knew little of bee lore, still I had solved the mystery of the humming noise, no longer believing it to be flies which made the noise, but knowing it to be made by the drones of the honey-bee.

I now believe that this was a place where the drones and queens congregated, but the facts only show that drones are numerous which fly two miles from home, and from the next fact which I give, I believe that there were drones there from hives five or more miles away.

When I first kept bees there were no Italians nearer than five miles distant, yet occasionally I found that some of our young queens would produce "now and then" a yellow bee. My bees were all black when I bought them, and the Italians were introduced five miles away, after I had bought the blacks. The next season a man four miles distant Italianized his whole apiary, and the year following I found nearly one-third of my young queens producing from one-twelfth to one-third of their bees with yellow bands. Being pleased with the work done by these hybrid bees, I introduced the Italians into my apiary the next year, which, of course, put a stop to my observations, as to the distance queens will mate.

From the above facts I am positive that queens of one race will mate with the drones of other races of bees, unless such are kept more than five miles apart.

## THE CHICAGO CONVENTION.

SOMETHING FROM SECRETARY HUTCHINSON.

**A**LTHOUGH it is, perhaps, a little late to say any thing about the Chicago Convention, yet there are probably many of the readers of GLEANINGS who have seen no report of the proceedings, and to such the following may prove interesting.

### WHAT KIND OF BEES ARE BEST?

Some favored pure Italians, but scarcely any one wanted pure Syrians, and no one wished for pure blacks. A cross between the Syrians and Italians, and between the Italians and blacks, both found their advocates. There seemed to be decided preference for "crosses;" even Mr. Langstroth declared himself in favor of a cross.

### LEGISLATION ON FOUL BROOD.

The opinion prevailed, that there was plenty of legislation now upon the subject; it only needed enforcing.

### SUPERSEDING QUEENS.

It was decided, that queens are not always superseded because they do not lay a sufficient number of eggs, but from some signs of decrepitude discernible to the bees but not to ourselves. A superseding queen is always an excellent one. Italians supersede their queens more promptly than do the blacks.

### MARKETING HONEY.

Mr. R. A. Burnett, a dealer, gave some excellent advice in regard to marketing honey. He said that one-pound sections are the best; that if half-pound sections must be sold at a very *great* advance in price, he did not think it would be advisable to use them; that *glazed* sections are very unsalable; that sections a trifle under weight are better than those that overrun; that a thin comb is more salable than a thick one weighing the same; and that dark honey is more salable in the extracted form.

### ADULTERATION OF HONEY.

Some thought that honey could be adulterated at a profit, by the producer; others thought not; but all were opposed to it.

### OVERSTOCKING A LOCALITY.

Upon this subject there was much discussion, with no very definite conclusions; but the idea seemed to prevail, that not more than 125 or 150 colonies should be kept in one locality, and the field should be clear for three miles in every direction. No one could be certain that his income had been increased by planting for honey alone.

### SURPLUS RECEPICLES.

Upon this subject but little was said; section boxes, of course, being given the preference, those with open top-bars being the favorites. Three-fourths of the members could obtain straight combs without separators. Sections two inches wide had but few admirers; 1½ to 1¾ inches were considered of a better width.

Mr. Langstroth gave a long and interesting account of how the invention of the movable-comb hive was brought about, and then spoke with much feeling of

### THE HONORED DEAD.

Mentioning Samuel Wægner, Moses Quinby, Adam Grimm, Richard Colvin, and R. C. Otis. When Geo. Grimm arose and thanked Mr. Langstroth for the eloquent words spoken of his father, it touched a sympathetic chord, and brought tears to many eyes.

### WINTERING.

Upon this subject there was the usual talk about packing, cellar wintering, pollen, dysentery, etc. The feeding of cane sugar for winter stores was strongly recommended.

### COMB FOUNDATION.

The preference was decidedly in favor of the Given; and for fastening it into sections, the putty-knife plan, the melted-wax plan, the Parker fastener, and the Clark, were all recommended with a vehemence that was bewildering.

### URIFYING WAX.

Melt it with large quantities of water; let it cool slowly while upon the water, and all the impurities will settle to the bottom.

### AFTER-SWARMING

Came in for its share of discussion. Some would prevent it altogether; others not, while methods of managing after-swarms were given without end.

The Rev. L. L. Langstroth told how Mr. D. A. Jones managed

### ROBBER BEES,

By putting dry hay in front of the hive attacked, and then covering it with *wet* hay. When a bee is wet, there is not much fight left in him. Mr. Langstroth had united colonies, even when they were disposed to quarrel, by wetting the bees in one hive, and shaking the bees from the other in front of it.

Perhaps the greatest treat to all who attended the convention was that of meeting Father Langstroth. Mrs. L. Harrison was so overcome with enthusiasm that, when introduced, she put her arms right around his neck, and kissed him, while those who saw the act cheered and applauded to the echo. Mr. Langstroth and myself were the guests of Mr. Newman, and it was my good fortune that we shared the same room. Never shall I forget those long, interesting, and *good* talks that we had. When Mr. Langstroth invented the movable-frame hive, he fondly hoped that it would revive bee-keeping among the masses; but it had an opposite effect. It placed

BEE-KEEPING IN THE HANDS OF SPECIALISTS, And Mr. Langstroth has given up all hopes that the masses will ever keep bees, unless it is upon some different system from that which we now have.

W. Z. HUTCHINSON, Sec.

Rogersville, Mich., Nov. 16, 1883.

Friend H., you deserve a medal for having inaugurated a plan for reporting conventions so as to boil it all down into less than a page. It is seldom that we have room for a full report in GLEANINGS; but we always have room for such a report as you give. Very likely it is open to criticism; and perhaps you have omitted many important things; but for all that, it is a move in the right direction.—I do not quite get your concluding thought, however. It seems to me that the masses do keep bees, and get honey and happiness both. Any one who doubts it should read our reports from A B C scholars.

### ARE THEY ITALIANS OR NOT?

AND ARE BANDS A TEST OF PURITY?

**A**RE my so-called Italian bees Italians or not? Now, don't every one of you professors of apiculture pipe in at once and say, "Why, it is easy enough to tell; the Italians have three golden yellow bands on their abdomen." Yes, I know that that is what the books teach, and I believe that bee-connoisseurs pretty much agree upon that point. But it seems very strange, that, starting out as I did last spring, with 2 colonies of Italians and 15 of blacks, that 11 out of the first 12 queens reared from my tested ones should turn out to be purely mated. When the progeny of the first-hatched queens made their appearance I was tickled to see those three golden bands glisten in the sunshine. But as, one after another, they all showed these same marks, it all began to look a little too thick. One out of the 12 did not show the yellow marks so distinctly, although, learning from Root's primer, as I did, I scarcely needed that, from the way they usually greeted me when opening the hive, to convince me that they were hybrids. And I might say here, that often this autumn I have felt profound convictions that most of the other 11 were hybrids. But last August I was puzzled. Were they all Italians or all hybrids? for, including my imported ones, they all looked alike to me. Or did I not have sense enough to perceive the difference, if difference there were?

After watching, wondering, and worrying for several weeks (I have not got over all that yet), I called upon an old retired apiarist, Miles H. Wilmot, J. P., well known to many of our western beekeepers, hoping he might furnish me with some solution to the enigma.

WHAT MR. WILMOT THOUGHT.

He said that the three golden bands were regarded as a test of pure Italian blood. In his judgment, however, there were two such necessary tests, the yellow bands and gentleness. He had had Italians which he could shake or brush off the combs in the roughest manner; indeed, he could handle them just about as he pleased. Others, to all appearance beautiful Italians, were of the most rabid kind. All such he regarded as hybrids. He also believed that the majority of queen-rearers were arrant humbugs. What do you all think about that?

Now, I have always understood that all Italians were gentle and quiet. Those I bought of E. T. Flanagan, of Belleville, Illinois, do usually remain quietly on the combs. But so persistently do they stick, that any effort to brush them off rouses their ire, and they stick it to me; it is then I get the benefit of their feelers; and especially will they fight the poor brush with all the cholera of which bees are capable. And often one will pop out of the hive into my eye, for no apparent cause, and go to work as if *she* would gouge it out. That in the honey season too. Those I have raised myself are more excitable, though quiet at times; but when full, or lengthened out, the bothersome third stripe is always there. What about all this? Are the marks described, certain tests of purity, or is 'Squire Wilmot right? Can we be certain that gentleness is a characteristic of all Italian bees? Of course, if thrift and profit alone are to be considered, it makes comparatively little difference as to what blood they are. But when I sell bees I want to know whether I can warrant them to be pure Italians or not; therefore I want queens and drones of either race to be thorough bred stock.

SOME OTHER MATTERS BEARING ON THIS SUBJECT.

I have among my old stocks four colonies which plainly display two yellow bands. They are among my gentlest and best workers. The two I had this spring swarmed naturally, and raised immense crops of drones. May not my Italian queens have mated with these two-banded drones, and produced three-banded workers? May not that often be the case in the apiaries of queen-rearers? Also, I find among my old races yellow-banded and yellow-spotted bees of every degree, and bees without any yellow, and all these diversities in the same hive. May it not be, that in mixed breeds of bees, as well as of other live stock, the offspring of a single queen will vary in their markings and disposition as well? Finally, it is a curious fact that all my young queens, two-banded and no-banded, appears to be purely mated; for every colony seems to be of the same race as its mother-bee. Is it possible that bees do take after their mother more than their father? Now, I do not know whether all this adds either to a solution or complication of my problem. It may not bother anybody else; but to me it all seems enigmatical and *funny*.

CAN INVALIDS KEEP BEES?

Friend Hasty and others have had their say upon that point; now let me have mine. The thought that invalids can not follow the business, needs qualification. I certainly would not advise every chronic invalid to go to bee-keeping. The class of persons, possibly, to whom the term is applied, would hardly be able to stand every pull the business requires. Still there are many persons, far from able-bodied and healthy, who can do well at it when there is not much else they can do. I, if you please, am just such a weakling. Raised on a farm, I have yet done but little farm work, except to feed pigs and chickens, drop corn, etc.—little country lasses' work. I could not stand it to be cooped up in an office. To find an independent living has been a tussle. In such a condition, I was fairly driven to take hold of this business, with a very small start, and I have made it the greatest success of my life. Not, it is true, such a success as it might have been if I could put my shoulder to every burden. If the skeptical reader of this could be myself during my

puny spell in the summer, I think he would be convinced that *pretty near* an invalid can follow the business successfully. Still, I believe it does require considerable "grit." I say this for the benefit of such as I, who may read this paper.

[To be Continued.]

Friend X., you will notice that Doolittle, in his article in this number, strikes on the same point you mention, but he thinks that Italians came from quite a distance, and fertilized his first young queens, so that they were really pure. It seems to me you are laying more stress on the importance of theoretical purity than the case demands. I have before said, that I knew of no way to get pure Italians, except they come from Italy, and we do import queens every season, as you well know. Well, now, there are those who say that even these are not pure; and my reply would be, that, as long as they furnish the honey, I do not care particularly whether they are pure or not. Perhaps we had better drop the word "purity" entirely, and guarantee all queens to produce three-banded bees. Where we send out select tested queens, as they have been termed, we can guarantee them to produce three-banded bees, and of general gentle behavior. The progeny of the queens direct from Italy are, as a rule, gentle. But a colony of bees that have been for years gentle and quiet may get aroused and stirred up so as to be perfect tigers; and therefore we have to bear in mind that three-banded bees are sometimes gentle, and sometimes not; and again, the same colony of bees is sometimes gentle and sometimes not.

In regard to three-banded bees: People differ here. I have never found any worker bees from queens imported direct from Italy that did not show evidences, satisfactory to myself, of the three bands; but others pronounce these evidences insufficient. Remember, I do not say *yellow* bands, for they are not always yellow. If you turn to the proper place in the A B C book, I think you will find the matter defined sufficiently.

Now, there is one thing in your letter that seems to me is of more importance than yellow bands. Your friend, 'Squire W., believes the majority of queen-breeders to be humbugs. Do you not think that speech comes pretty near to the class of people who sneeringly declare that the world, as a whole, are humbugs, and who say, and seem to enjoy saying, there are no such things as honest men? Has 'Squire W. abandoned bee-keeping, because of the dishonesty he alludes to? If so, the deduction would be, he is good while the rest are bad. Friend X., what do we usually think of people who speak and talk in that way? does true nobility, and uprightness of soul, ever take upon itself this phase? When I first became acquainted with Prof. Cook I was at once struck with his wonderful charity for the world at large. He evidently sees the faults of humanity, but he also sees, in a most unusual way, the good qualities. He not only speaks well of everybody, but he speaks well to everybody, and almost everybody he meets receives an impetus to do better, from having once known him. Almost the first day I ever saw him, he reproved me with considerable ener-

gy, for speaking harshly of a certain class of people, much in the same way as 'Squire W. spoke of the queen-rearers. It made such an impression on me that I have never forgotten it, and I do not believe I have ever called *any* certain class of people humbugs since then. Charity "rejoiceth not in iniquity," but in truth; \* \* \* \* \*

"thinketh no evil."

### QUEENS ACROSS THE ATLANTIC BY MAIL.

FRIEND BENTON A LITTLE AHEAD OF FRIEND DOOLITTLE, AFTER ALL.

“YOU have done it, my friend! You have done it! \* \* \* \* \* probably the first live bee that ever crossed the Atlantic in the mails,” is what G. M. Doolittle, in Oct. GLEANINGS, quotes Angus Cameron as having written to him.

Let us see. Mr. Doolittle says in the same communication, that he mailed his queen Aug. 2d, and received Sept. 4th word (under date of Aug. 18th) of her safe arrival. The following is verbatim from a letter addressed to me, and now in my possession. Notice the date.

BENTON, July 5, 1883.

MR. FRANK BENTON, MUNICH, GERMANY:—

Dear Sir: We received a queen from you in a mailing-cage. Most of the bees were dead. I think there must have been at least double as many bees as could get food and water. The live ones were in fine condition. The water was not all used, and not more than about a seventh of the sugar, so you see there must have been only a few bees the greater part of the journey. I think from 12 to 20 bees would have been ample. Too many bees are worse than not having enough. \* \* \* \* \* I have instructed the boys to send you a cage of bees, and you can report. I can send you some more styles of cages to test, to find out which goes best, as one trial is not sufficient to decide the matter.

With kind regards to Mrs. Benton and yourself, yours very truly,—

D. A. JONES.

The queen above referred to was an imported Syrian, mailed from Munich during the month of June. She had previously stood a long journey by mail, having been prepared according to my instructions in Beyrout, Syria, and had come via Alexandria and Trieste to Munich—a journey which takes 11 to 12 days, the distance being about 2500 miles, part of which is in a sub-tropical climate, and thus particularly trying to the bees. About 30 workers accompanied the queen, and the food was pure sugar candy. The water was in a tin bottle, with a pin-hole made in the middle of solder, to prevent its closing with rust. The form of cage was the same as that I used in 1880, and which was illustrated in the *British Bee Journal* for July, 1880, and of which Mr. Doolittle's cage is nothing more nor less than a copy.

Thus the first queen, which, so far as I am aware, ever crossed the Atlantic alive by mail, did not come from America to the Old World, but went from this side the water westward. Moreover, this majestic Syrian beauty went all the way from her native land to the New World by mail. A second queen, this time a Carniolan, was mailed to the same address on the 27th of July, thus six days before Mr. Doolittle started his queen. Mr. Jones has failed to state how this and several others sent by mail since that date got through. I have, among my letters on this subject, one from John Hewitt, Esq., Sheffield, England, dated Aug. 7, 1883, in which is the following sentence: "I am glad to hear you have succeeded

in landing queens alive by post in America. You deserve to succeed, after so much trouble and expense."

The first queen-bee I attempted to send by mail on such a long sea-voyage went from Cyprus to London (nearly 3000 miles) in June, 1880; and by reference to the *British Bee Journal* for July of that year there will be found, as above stated, an illustration of the cage then used, and a report by Mr. C. N. Abbott, the editor, to whom the box was addressed. He wrote: "Although buried in the hold of the ship for ten days, under tons of mail matter, the queen and her retinue arrived at our office as fresh and lively as might be wished, but one worker being dead, and not a speck in the box to suggest dysentery or disease." The same season I sent queens by mail from Cyprus to Germany, which takes even longer. During 1881, further experiments were tried, also with good success. Again in 1882, from Beyrout, Syria, larger numbers of queens were sent to various countries of Europe, and the success of sending by mail on such long sea-voyages further demonstrated. No other person has aided me so much in determining the conditions necessary to success, the exact causes in the case of failure, etc., nor given me as many valuable suggestions in regard to this matter, as the Sheffield gentleman whose name I have already mentioned, Mr. John Hewitt. Had others given as prompt, exact, and full reports regarding queens mailed to them, I would have been much less time determining upon the best method of packing. In reporting in regard to a certain queen I sent him by mail from Beyrout to Sheffield he said: "When I opened the box the queen and most of the workers took wing, and the former circled about fully five minutes before resting. I do not partake of your fears, that queens will be injured by such long confinement on a journey by post." At that date I even began to believe I could send them *by mail* from Beyrout to America, with no interruption on the way. In this opinion I was encouraged by Mr. Alfred Neighbour, of London, who had already received a large number by mail from me. Accordingly a number of packets were mailed by French post in Beyrout, marked "Via Havre." I hoped they would escape touching England. But every one of these experimental packets was unfortunately sent to England (with some forty others which were addressed to Mr. Neighbour), and thence *returned to me in Beyrout*. It seemed strange to me, considering that, in some respects, the journey from Syria to England is a more difficult one than that across the Atlantic, no one in America seemed to think the latter could be accomplished. I am well aware the plan has been mentioned in the bee-journals on several different occasions—that both Mr. A. I. Root and Mr. A. J. King have come forward in their respective bee-journals with a plan each, whereby they felt almost sure of getting queens across the Atlantic by mail in safety. But what's the reason we have never heard further, so much even as a report of an actual trial of their proposed plans? I have had queens that were 18 days, and even 19 days, by mail from Syria arrive *in fine order!* If, after working hard for more than three years on this problem—trying to determine upon those conditions which would give the smallest percentage of losses in sending by mail on long sea-voyages, I have succeeded thus well, I beg leave modestly to agree with friend Hewitt, "*that I deserve success.*"

This year the first queen which I tried to get across the Atlantic by mail was sent to Mr. A. J. King, N. Y. City, on the 31st of May; a second followed June 6th, and a third one was sent June 9th, all imported Carniolans. Mr. King reported these bees all dead, but failed to explain satisfactorily the cause. He also wrote: "I don't think you can make a success of mailing queens from there." But I had no notion of being so easily persuaded into giving up the plan. I had hitherto used a simple strip of wood containing three holes opening into each other. In one end candy was placed, while the opposite end held a water-bottle, and the bees were in the middle space, a few air-holes having been made in the sides. In 1880 I used glass water-bottles with a wick; afterward I substituted tin bottles with a pin-hole; then at the suggestion of Mr. Hewett, of Sheffield, I coated the pin-holes with solder to prevent their closing with rust. Wire cloth and a card confined the bees and covered them from view. Sugar made into white candy was the food I used. For a time I tried cream of tartar to keep it from graining, but found this very detrimental. The sugar, if pure and properly "sugared off," becomes a soft candy, upon which the bees can ordinarily subsist for some time without water. In August the idea came to me of putting the food, to keep it soft and moist, into small tin boxes closed at the ends, and furnished with small openings on the sides, and cages to hold two such food-bottles as well as two water-bottles were constructed in accordance with a model, nearly square in form, furnished by Mr. Hewitt, and in this cage I have succeeded in sending by mail a considerable number of queens alive to America. A few weeks later, however, I perfected a cage in the form of that I first used in Cyprus and Syria, which, with two excellent points suggested by my ingenious English friend, Mr. Hewitt, I pronounce far ahead of any of my former efforts. I mailed to this gentleman in one of the newest cages a young Cyprian queen raised in my apiary here, and received from him a letter, from which the following is an extract: "The Cyprian queen came safe to hand on the 24th. I must congratulate you on the improved cage. I consider it far better than my square one. It seems to answer every purpose, and I have nothing but admiration for it." Having some fifty of the square cages—the Hewitt form—on hand, I concluded to use those up by ore having a great number of the later pattern made, and it may be of interest to hear some of the reports from them. I select the following:

DECATUR, Ill., Aug. 27.

*Dear Sir:*—One queen reached me to-day in most excellent order. I am quite sure that one bottle of water and sugar would be enough. There was but one dead bee in the cage. The others were as lively as though just taken from the hive. I hope the others will come soon and in as good condition.

E. A. GASTMAN.

This queen, an Italian, was mailed here Aug. 13th. One mailed on the same day to Pennsylvania, brought the following:

COATESVILLE, Pa., Aug. 28, 1883.

One cage arrived yesterday, "Italian No. 3." Bees all alive but *one worker*, and in good condition. Afternoon mail, "No. 2" arrived. Bees all dead but one worker. Both cages and supplies in good condition. No. 1 came via Havre, other two via Bremen. Looking for others by every mail. GEO. H. REES.

No. 2 above referred to was mailed on the 10th of August, three days before No. 3.

MAZEPPA, Minn., Sept. 21.

The Italian queen you sent by mail Sept. 3d came to hand Sept. 18th, all right; 14 or 15 live bees in the

cage with her. Hope you will have as good success in sending the other. Will probably want a number in the spring.

BRIGHT BROS.

From a queen mailed Sept. 17th comes back to the "old country" the following cheery greeting:

EAST BETHANY, Genesee Co., N. Y., Oct. 2, 1883.

The Carniolan queen came to hand in fine condition. The Italian has not arrived.

ROBERT GUYMER.

Many more letters might be given, some telling of dead queens, some of live ones. But suffice it to say, that on the whole the results are satisfactory to me. Though I have sacrificed quite a number of queenly beauties, still some vantage-ground has thereby been gained, and the sending of queens across the Atlantic by mail can now be pronounced a success.

Those queens sent were each accompanied by 28 to 35 workers, experience having long ago shown me that the suggestion of Mr. Jones, to put in but 12 to 20, while answering very well for short journeys, is not so good for long ones. This fact has been known to me fully ten years.

"Honey in a sponge" is suggested by friends King, of N. Y. City, and Henderson, of Tennessee. I employed that method as early as 1874, warning also the cavities which held the sponges. It works very well for short journeys, but I would not want to trust many queens that way on long ones. Mr. Jones tells me "just how to do it." But his bees and styles of cages do not come to hand—not even word how the queen put up according to a plan he suggested (mailed Aug. 15) arrived, nor, for that matter, how any of those mailed since the first one in June have arrived.

The whole thing seems just as easy as "rolling off from a log;" but, "the proof of the pudding is in the eating;" and, instead of telling their plans, just let us see some of "the boys" put 'em in practice. If they don't make a better showing than the above, then the undersigned, having told them "how he did it" in June, 1883, will tell them how he proposes to do it in 1884.

FRANK BENTON.

Munich, Germany, Oct. 22, 1883.

The above article unravels several things that had been a little mysterious before to myself and others. When you sent your advertisement for the July No., I confess I was a little troubled to see how you were going to get queens singly from Germany to New York City free, at \$4.00 each. As soon as the advertisement came out I was asked what it meant; and as no explanation had come from you, I was obliged to confess that I could not explain it. When in Toronto I asked D. A. Jones how it was done, and his reply was any thing but satisfactory. It never once occurred to me that the queens were to be sent by mail. Well, now, away along here in November it transpires that you sent an article, to be inserted simultaneously with the advertisement. This article would have been most extremely welcome just at this time. The question has been asked, why I have not tried sending queens across the ocean. Well, I have tried it a little; but as I attempted to send them to Italy, it is not strange that I failed. Of late years I have had so much on my hands all the while that must be done in order to keep my reputation good, that almost all else has been from necessity allowed to go. I have long wished I could come across somebody who had the necessary qualifications—that is, who would enter into the spirit of the work, heart and soul, in order to perfect, by experiments, a cage that would go safely across the Atlantic. I am rejoiced

to hear, friend Benton, that you have been doing this very thing, and have succeeded. I confess that my faith, like that of the editors of the *Bee-Keepers' Magazine*, was rather small in the matter until friend Doolittle announced his success. There is one point here that needs consideration. Doolittle succeeded without the use of water; and, if I am correct, you used water in all your cages. The question now comes up, as to whether it shall be water or no water. During the past season we have experimented considerably in this matter; and while the bees came through without water, it is pretty well settled that, as a general thing, those having water-bottles seem to be freshest and brightest. On one occasion we sent three cages with water-bottles, and three without, to a distant customer. While all came through alive, those with water were in much the best condition. Yet, taking it altogether, we have had less trouble with the Good candy and no water.

### HOW BEE-KEEPING MAY BE MADE MOST PROFITABLE.

COMB HONEY IN GLASS JARS SURROUNDED WITH LIQUID HONEY.

PERHAPS I am not far out of the way when I say that three-fourths of those engaged in apiculture, or making this branch of industry a leading feature of their business, are persons of limited capital. It is also true, that a large minority so engaged have chosen this occupation because they are physically incapacitated for the pursuit of laborious callings. Another class embark in the business from the impression that the bee-master's life is fraught with ease and comfort, requiring but little attention, and less labor—two things for which their attachment at best was never strong. The last-named class are like many artificially reared queens—short-lived. They have consumed an insufficient amount of royal jelly for their perfect development.

The second class, when fairly into the business, discover that they have an elephant on their hands, much larger than they ever expected. The first class alluded to, that have chosen the occupation because their insufficient capital will not warrant the undertaking of a more extensive business, find, in many instances, after a long uneventful struggle, and years of repeated disappointment, to have come out about the same place they started—at the little end of the horn. They now discover for the first time that they have "mistaken their calling;" and with disgust and contempt for the business, step down and out, but just as surely into something else, to make a repetition of their first failure. In this we find a class of ignominious failures all through life.

When we scrutinize carefully the manner of conducting their affairs with that thriftless, shiftless, badly managed course, there need be no surprise at their inevitable failures. It is one thing to produce an article for sale, and another thing to exercise judgment and skill in disposing of the article to the best interest of the producer. As much depends on the disposal of a product as does on its production. I now come to that point which most interests the bee-keeper; viz., how he may realize

the most money for his particular production. It shall be my aim in this article to aid my fellow bee-keepers to dispose of their product to the best advantage. I never sell a pound of honey for less than 20 to 25 c. Not only do I sell all my own honey at these figures, but thousands of pounds purchased from other bee-keepers and commission men dealing in honey.

To those of my readers who have been shipping their honey to commission merchants, taking their prices, and not yours, and making fortunes by standing between the producer and consumer, I ask you why you do not make an effort to sell that nice honey in your own home markets. If you have not much of a market, go to work by your skill and indefatigable efforts, and create a home market, you will not fail. You can do it; how? Why, I'll tell you. The world is taken (in this age) by show; and the sooner this is learned, the better for every one, and especially for the bee-keeper. He has an article that is in itself attractive and showy. It came from the Creator's most beautiful and showy creation, the bloom and the flowers; and why should we not continue to display its attractiveness until we have realized its actual value?

When I say the world is taken by show, I mean that an article exposed for sale, to meet with public approval, must look well, or be presented in the best and most attractive and convenient shape. I will relate a little of my own experience in selling honey, which will at once bring out the point I wish you to see.

Some years ago I was tempted by a low price to buy a quantity of honey built in large rough boxes, holding 10 to 20 lbs., which was of nice texture, and ought to have sold readily. I left this honey with retailers to sell for me at 15 cts.; and when sold, they might pay me 12½ cts. for it. Weeks and months passed, and but little was sold. I did not like to lose on the investment, so I set about to devise a plan to make it go, or lose still more. A few grosses of half-pound honey-tumblers were bought; the honey brought home, cut out, and a nice little piece dropped into each tumbler, and the chinks filled up with well-ripened, extracted honey. The cap was so put on as to secure all, and a neat showy label put on, filled in crates, and put on the market. It is needless to say, that this honey went, and went, too, like "wild fire," at 25 cts. per lb. The demand soon got away ahead of the supply. I could scarcely get enough to keep the retailers going for a long time, until I got help in putting up. I have extended my trade in honey in this style of package to all the towns and cities within convenient reach of me; and I will say to you, that, in spite of all I can do, when I come around delivering I find many out, saying, "Why, I could have sold many more; I have been waiting for you."

Now, my friends, I have made some money, and you can do the same. Let your honey be put on the market in small neat packages, and displayed to the best advantage, and it will sell itself for all it is worth.

JOHN A. BUCHANAN.

Holliday's Cove, W. Va., Nov. 23, 1883.

Friend B., your suggestion is a grand good one, even if it is not entirely new. Some years ago we started quite a trade in our town by putting chunk honey in Mason jars, and filling around with liquid, as you do. All went nicely until cold weather, and

the honey candied all around the comb. This finished up the trade; and we attempted to heat the liquid honey enough to enable us to seal it up to prevent candying; but we got it a little too hot, and the comb was melted, and we gave up the business. It has just occurred to me, that the little glass pails we sell would be much nicer than the half-pound jelly-tumblers. They are made of flint glass, and the bail gives a remarkably neat and handy appearance to the whole outfit.

### THE MYSTERIES OF BEE-KEEPING EXPOSED.

SOME IMPORTANT FACTS FROM A FRIEND WHO LIVES A GREAT WAY OFF.

**I**N reply to D. McKenzie (p. 538), I would premise by stating that my experience with bees commenced in 1835, and the "mysteries" were hidden in a box till Mr. Langstroth introduced movable frames, which allowed us an occasional opportunity of observing some of the habits of the little "insex;" but now the use of an observatory-hive gives us an insight into all the mysteries of ancient and modern bee-keeping.

I now form nuclei in observatory-hives with two regular Simplicity frames, partly filled with brood and honey, with all the bees that may adhere to them. If the old queen be among them, she will continue laying; if not, the bees may be expected to rear a queen.

#### EGGS MISSING.

But, just here comes one of the mysteries referred to (as taken from my note-book: Oct. 1. Formed the usual nucleus. Oct. 8. There being no sign of either queen or queen-cell, I gave them a few eggs and larvae, which they immediately destroyed. I saw the bees enter the cells containing eggs; and when they withdrew, the eggs had disappeared. I did not dissect the bees for ocular proof that they had eaten the eggs, but jumped at that conclusion.

#### BEEs EATING LARVÆ.

I saw the bees draw the larvæ from the cells, crush them with their jaws, partly suck them, when the larvæ would be seized by other bees, and not be dropped till the skin was empty. I gave them young brood again on the 13th, with the same result. On the 15th they commenced two queen-cells, which were abandoned on the 17th, when I found about 200 eggs compactly laid in each side of the brood-comb; some cells had two, and a few three eggs in them. In due time, about one-half of the cells were enlarged in diameter as they were built out, and capped as drone-cells, the intervening larvæ being destroyed. I presume it is a case of fertile worker; but as there are no drones at present in my apiary, I intend to let them hatch, and then return the nucleus to the parent hive.

#### SMALL QUEENS OR LARGE WORKERS — WHICH?

My bees are common blacks; some of the old workers are ¾ of an inch long; and as their wings do not cover the two last segments of their abdomen, I can not easily distinguish the queen, even when placed beside them. This fact annoys me so frequently that I have sent to California for some Italians.

#### DHOURRA, OR EGYPTIAN CORN.

In reply to your query concerning Egyptian corn (page 542), I would say that it is on record that Jacob

sent certain of his sons down into Egypt to buy some corn, during a drought in Canaan. Dhourra is a species of millet, indigenous to Africa, and sorgho is a kindred species indigenous to Asia. The seeds, or grains, of the two species are much alike; but, one variety of the dhourra is white, and may be easily crushed with a rolling-pin, or in a small coffee-mill. In the vernacular of the American citizen of African descent, it makes "very nice hoe-cakes."

#### A GOOD FORAGE PLANT.

I have counted 1200 grains in one head of dhourra; and as the stalk is soft, like that of sweet corn, I think it would be a desirable forage plant for cultivation in many localities.

#### A ROACH-TRAP WANTED.

Besides the usual vermin, such as birds, rats, mice, etc., I am annoyed by roaches, sometimes finding four or five in a hive. I have placed slides over the entrances to the hives, perforated with  $\frac{1}{4}$ -inch holes; still they enter when small, and soon become too fat to come out. I do not know that they eat any thing besides honey; yet in the hives mostly infested by them I have recently lost several queens. I have tried various forms of covered traps, but have caught more bees than roaches.

The ants (black and red-winged and wingless) are also troublesome. In one case they actually carried the comb away from the hive faster than the bees could build it. The bees finally became discouraged, and emigrated, joining another colony. To avoid this pest I place four hives (facing alternately east and west) on a platform about 8 feet long, supported about 18 inches from the ground by two posts. A string, saturated in a solution of corrosive sublimate, is wound around each post.

T. WALDRON BARTHOLF.

Honolulu, Hawaiian Islands, Oct. 29, 1883.

Thank you, friend B., for your positive proof that bees do eat eggs and larvæ. I have often noticed their disappearance, and I have sometimes seen them suck up the juices of larvæ where the combs had been cut or mutilated.—I believe that dhourra, or Egyptian corn, has been tested in our own country, although I can not say what the result has been. We are glad to hear of bee culture in your far-away island; and even though you have enemies to contend with that we never hear of, it does us good to know about these things. You do not tell us much about the honey you get. Does your locality equal friend Osburn's description of Cuba in this same number?

## "Remindery,"

Or Department for duties to be attended to this month.

**I** WRITE you in regard to my bees. I have some nuclei that will have to be fed. Now, I want to know what kind of food is best, and how to prepare it for use, and the best way to feed it, as I never tried it. You can just publish in GLEANINGS, if you choose.

J. H. CUTSHAWL.

Greeneville, Tenn., Nov. 19, 1883.

Friend C., it seems to me it is rather late in the day to talk about fixing bees for winter—19th of November; however, as there are always some who have to feed late, it

may be well to consider the best way of doing it. Your expression, "Just publish it in GLEANINGS," sounds almost like a joke, since I have been giving directions for feeding, in almost every number for three months past. If you have very nice fine weather, so pleasant that the bees will fly, even when it is cloudy, I presume you can safely give liquid food, even in December; but such days do not often happen in our locality. If you do feed liquid food, do it carefully, and take away the feeder, and cover the cluster up well just as it was, before the weather turns cold. Now, then, we are to face the matter of bees that are short of stores during freezing weather. What shall we do? We have had very good success with powdered loaf sugar, kneaded up with honey. But others say it does not work so well with them. The fine sugar rattles down to the bottom of the hive. Perhaps the old way of feeding candy will be the safest. Make it according to directions given so many times, and always found in the A B C book, and then lay lumps of it on top of the frames, right over the cluster. These lumps should not be larger than hickory-nuts or walnuts; and when they get them warmed up and eaten up, give them some more, always covering the candy with a burlap sheet or chaff cushions. You can open the hive to put in more candy almost any day in the year, if you are careful to close it up quickly. I would use only the best granulated sugar for making the candy. I have wintered bees in this way where the colony had less than one pound of honey, and they came out strong and healthy in the spring. If any of the friends find it too much bother to make the candy, we can furnish it at 15 cts. per lb. Of course, it can not profitably be sent by mail; and for that matter, if the distance is great it is pretty expensive sending it by freight. Then another trouble comes in: These friends who are late about their feeding are almost always behind, and must have it by express, and the express charges sometimes cost them more than the candy does. Candy can be sent by freight; and as all kinds of sugar are usually sent so, it will not be very expensive food. Or you can buy the sugar at the grocer's, and make it yourself; or, better still, get your wife to do it, if she is good-natured, and has not too many household cares. Seems to me it would be a good thing for some supply dealer (at least one of whom should be found in every locality) to keep this bee-candy in stock. This would save enormous freights, and might save the lives of many bees, if their owner knew just where he might get the candy at a small price. The candy of the groceries will do, but it is not as good as that made expressly for the bees; and another thing, it usually costs too much. The best success I have ever had in feeding candy was with dry hard candy that was not stirred at all, and the fragments of it, when broken, looked like blocks of ice, or greenish-colored glass. Bees would cluster on this, and lick it all up. They wintered outdoors with the ordinary chaff coverings. Our bees this winter do not require candy of syrup either, for they have plenty of natural stores gathered from basswood and clover.

## Heads of Grain, From Different Fields.

### THE CLIMATE OF CANADA.

**T**HERE seems to be an opinion among most people in the U. S., that the whole of Canada has an arctic climate. A writer in a late number of Harper's *Magazine*, in describing the climate, customs of the people, etc., of the village of St. Pauls, on the north bank of the St. Lawrence River, below the city of Quebec, conveys the impression that it is a type of Canada in general; it would be quite as sensible to go to Northern Maine to ascertain the climate of the U. S. The fact is, that the average temperature of the greater part of the Province of Ontario is as high as it is in half of the territory of the U. S. east of the Rocky Mountains. South-western Ontario has a much milder winter temperature than Southern New York and Northern Pennsylvania, while the mean annual temperature of the western peninsula of Ontario is about the same as that of Kansas and Missouri.

On Sunday and Monday, Nov. 4th and 5th, the bees were gathering honey from sweet clover and mig-nonnette, and the air was filled with the perfume of the flowers. Butterflies were also sporting as in midsummer; and to-day, Nov. 8th, the bees were busy bringing in pollen.

I weighed 50 hives to-day that I intend to put into the cellar. I have been guessing at weights long enough — too long for profit. You may hear more about it in the spring.

P. S.—Nov. 9.—The bees are working on sweet clover again to-day. Temperature in shade, 56°.

Niagara, Ont., Can., Nov. 8, 1883. GEO. CORK.

### MORE ABOUT DRONES BUILDING COMB.

You made me say that drones build comb (see p. 581). I did not say that. Now, please look at my letter of Oct. 8 and see what I did say. I suppose I had it bad enough, and you made it worse. This was what I said, or intended to say. If drones don't build comb, I am satisfied that they help. I will tell what I saw, and let it drop for awhile. I noticed some of the worker bees putting their heads and shoulders in the cells that were nearly full of honey. They would put their heads in and take them out, and pass to the next cell, leaving their heads in the cell about a second, and then pass to another cell. I saw one bee go to 150 cells, and never stop. I got tired watching him. This work they were at every time I looked at them. I spent a part of three days.

Now I will leave it to some one to say what these bees were doing. They could not have been taking the honey from one cell to the other for the purpose of ripening it, for they took their heads out too quickly. From what I could see with the magnifying-glass, they were drawing the cells. I could see the edges of the cells spring every time the bee would insert his head. You may think this does not have any thing to do with drones building comb; but whatever those bees were doing in that honey-box, the same thing the drones were doing in the box that had the drone comb in. Now if you will tell me what those bees were doing, you will oblige a novice. I did not intend to say, that the bees carried their wax on their legs, or get it in the field. The letter explains itself, and this was what I was at: That the comb-builders don't secrete the wax, but they

get the wax from the seemingly idle bees in the box. I will excuse you; but please be more careful. This is your advice always, and you ought to heed it yourself. I know you will.

WM. MALONE.

Oakley, Ia., Nov. 12, 1883.

Friend M., it seems to me you intimate that drones build combs, even if you do not say so. Now, I have seen bees put their heads in the cells in just the way you describe; but while I am not sure what they did it for, I can hardly accept your idea that they do it to stretch the cells. My impression was, that they drew out the thin honey, and by some process, either known or unknown to themselves, extracted a part of the water it contained, and then put it back. To confess the truth, we are all a good deal in the dark in this matter. I am glad you had the perseverance to spend five days in watching them. And now haven't we another philosopher who will take up the work, and find out what it is they do? Were the honey-combs built against a pane of glass, you could easily see whether they licked up honey and put it back, or not. No doubt the comb-builders get wax from idle bees. I beg pardon for misunderstanding you.

### HONEY FROM ORANGE-BLOSSOMS; SEE PAGE 685.

As I live right in the home of the orange, I think that I can give some light on the above subject. Bees do work on orange-blossoms when in bloom, at all times of the year; the seedling orange blooms from April 1 to June 1; the budded orange, from Nov. to May. Blooming as they do out of the general honey season, it is difficult to obtain any pure orange honey, except from the seedling, which is in bloom when the honey seasons opens. The first extracting will sometimes be somewhat flavored with the orange; but as the sages are then in bloom, and other plants, I think it would be a little difficult to obtain honey that could be truthfully labeled "Orange Honey." See page 578 in regard to bees working on orange-blossoms. The orange-blossoms are of a waxy white, and resemble the tube-rose in both looks and fragrance.

W. W. BLISS, 80.

Duarte, Cal., Nov. 10, 1883.

Many thanks, friend B., for the information you give in regard to orange-blossom honey. One reason why we wanted to know about it was, it has been a kind of fancy name for bogus honey-dealers to put on their labels.

### SOME OBSERVATIONS ON POOR SEASONS.

This season is in striking contrast to that of 1882 in this locality (see my report, page 608, December number GLEANINGS). I commenced this season with 11 colonies; increased to 32, mostly by natural swarming; sold 3; united 3; have now 26, about one-third of which are in poor condition for winter. The fore part of the season was good. Bees gathered a great quantity from white clover and linden. I have never known bees to swarm so much before, some colonies giving as many as four swarms. This state of things was followed by a very severe drought, commencing about the middle of July. Bees used up their honey; some have already starved, where their owners have neglected to feed. I let some of mine run very near the point of starvation; but I have learned by experience what I before knew only by precept, to be ready with the sugar-barrel; and while experience keeps a dear

school, its lessons are more forcible, and more apt to be heeded.

I obtained 700 lbs. of extracted honey. No surplus in the fall; and had it not been for the yield in October from the white aster I believe there would not have been 25 lbs. of honey in my apiary at the beginning of winter. As it is, about one-third of mine have to be fed a few pounds of sugar. I am now feeding. The weather still continues warm; but little frost yet.

#### THE WAY I WINTER.

I confine the bees to the lower story; contract still further by division-boards, unless the colony is large. Pack at side (in most cases one side only), and top, leaving enamel cloth on as in summer. I have used chaff sawdust and old rags. This fall I used forest-leaves and sawdust; leaves at side; about an inch of sawdust on top; then fill the remainder of upper story with leaves, putting it loose in the hives. The principal reason I have for using this method is, that by it my fall and spring counts have always been the same, although I expect to lose some this winter. E. C. FISHER.

Sissonville, W. Va., Nov. 8, 1883.

#### FROM 23 TO 53, AND 3300 LBS. OF HONEY.

The summer is past, and winter is here once more, and the bees are prepared for winter also. My report for the summer's work with bees is, 3300 lbs. of honey—2500 extracted, and 800 comb honey. I commenced in spring with 23 colonies of bees; 5 of Italians, the rest hybrids; 8 weak colonies, 15 strong. I have increased to 53. My best colony made 225 filled sections, one-pound; next best, 275 lbs. of extracted honey; third best, 216 lbs. of extracted honey. Best new swarm made 75 lbs. of comb honey. I used 20 lbs. of fdn. for brood-frames, and 5 of thin fdn. My bees are prepared for winter on the summer stands. Some are packed in boxes with leaves, and some with straw packed around them, and covers made of shingles. I wintered last winter the 23 colonies without loss, the same as I have the 54 stands now.

Honey is pretty cheap around here this fall; some farmers have sold their honey (and comb at that) for 8 cents per lb. I got 14 cents wholesale for my comb honey, and have got 10 cents for what extracted I have sold; have 500 lbs. yet. There was a heavy fall yield of honey, and almost everybody got some, who had bees, and there are lots of bees.

#### TRUANT SWARMS.

There were 5 swarms of blacks which came to my apiary the past summer, but I did not get to save any, for they all settled on a hive, and got stung to death. I do not mean they all came at once, but at different times.

#### A HOME-MADE SAW TABLE.

I made and sold 40 Simplicity hives last spring, besides what I used of my own. I have made all on a saw of my own make that is turned with a crank. It is made something like that saw pictured in the February and March numbers of GLEANINGS, made by Chas. Kingsley, only I have the fly-wheel underneath, and the gauge on the other side of the saw. I would not trade one made like mine for two made in that shape. J. A. THORNTON.

Lima, Ill., Nov. 15, 1883.

#### WINTERING—DO BEES NEED WATER IN WINTER?

I should like to ask a few questions in regard to wintering, and preparing for winter. I wintered in chaff hives last winter, with wood mats between the

frames and chaff cushion. The mat was tightly closed with propolis. When opened in spring, the combs were quite moldy. My notion is, that the mat coated with propolis, or the enameled cloth is not open enough to let the moisture pass off readily. I would ask your advice in using screen wire in their place. One other question: I have been reading Mr. Langstroth's work, and I see he speaks very positively on pp. 342 and 343, that it is necessary to give bees water after the middle of January, until the weather will permit them to go out after it, and that the loss of bees is very great for the want of it. I have looked through your A B C book, and have failed to find any thing in regard to giving water in winter. W. H. CARPENTER.

Springboro, Warren Co., O., Nov. 19, 1883.

Friend C., Doolittle gave us some time ago a solution for this difference in experience in regard to a close covering over the bees or not. A strong colony, it seems, will keep a mat dry, whether it is covered with propolis or an enameled sheet, while the weak ones, being unable to generate the requisite heat, will let their combs get damp and moldy. Wire cloth would be no advantage, unless you put a new sheet on every season, for the bees will fill up every mesh, and make it as impervious as the enamel cloth. If you want a porous cover over the bees, use a new wood mat or a sheet of bur-lap.—Whether bees need water in winter or not, is an undecided matter. Sometimes it seems to have the effect of quieting them, and of enabling them to use stores of candied honey. But at other times, even though they take it with avidity, it seems to have the effect of producing dysentery. Prof. Cook made a pretty fair test of the matter, and the bees that were watered had dysentery, while the rest wintered all right.

#### MY REPORT FOR 1883.

As I did not make a spring report, perhaps it would not be out of place here. The first of June found me with 30 fair colonies out of the 45, put into the cellar Nov. 20, 1882. The second day of March was the only day between the 20th of Nov. and the 5th of April that the bees could fly.

#### DYSENTERY AND SUGAR SYRUP.

At that time every colony I had was suffering badly from dysentery, and a number of them died. As the day was warm and pleasant, I set them all out; and such a mess, in a few minutes! The snow was completely discolored, and you could smell them 10 or 15 rods from the yard. After they had had an hour's flight I began feeding them sugar syrup, which I had prepared and warmed by tipping up the front of the hive, and pouring it in at the entrance, giving each colony 5 lbs. of syrup, which was all taken up and stored in the combs before I set them in, in the evening. I saw no more of the disease the rest of the winter. I set them out for good the 5th of April, and now for the results of my season's work.

#### FROM 30 TO 50, AND 3250 LBS. OF HONEY.

I took 2000 lbs. comb honey in 2-lb. sections, and 1250 lbs. extracted, all from Alsike clover and bass-wood. Increased to 56, in good condition for winter, partly fed up on sugar syrup. Honey is mostly sold in my home market at from 15 to 20 cts. My queens are all bred from Doolittle's best.

WM. BERRYMAN.

Geneva, N. Y., Nov. 20, 1883.

FROM 3 (AND SOME MORE) TO 30, AND NO HONEY.

Here is my report for 1883. I commenced the season with three swarms, one of which was queenless. The season has been cool most of the time. Frost came on the night of the 8th of September, and killed all flowers, and vegetables in general; and yet, notwithstanding the cold and backward spring, bees have done pretty well. I have taken no honey, except for table use, as honey was not my object this season. I purchased a Holy-Land queen (tested) of W. P. Henderson, Murfreesboro, Tenn., which came to hand April 16th, and I have from that queen and her progeny 10 fair colonies in good wintering trim; and from the other two I have 15 colonies. I have climbed, and transferred from the timber into movable-frame hives, 2 colonies; have taken three which were intended for the brimstone-plit, and have fed them with sugar syrup until they have ample stores for winter. I have 30 all told, and have them all neatly packed on summer stand in chaff. If I am a candidate for Blasted Hopes, just place me where I belong. Counting the three in the spring at \$10.00 each makes \$30.00; and the 27 increase at \$5.00 each, makes \$135.00, and I sold 2 four-frame nuclei with hive for \$10.00. Sold queens to the amount of \$5.00, which sums up for income, \$150.00, and the outlay for the season for lumber, etc., \$10.00, which leaves me a profit of \$140.00 on the bees.

A. L. LINDLEY.

Jordan, Ind., Nov. 15, 1883.

Friend L., your remark about increasing the Holy-Land queen to ten colonies reminds me of a question my brother asked me a few minutes ago. His home is in Mitchell, Dakota; and as he was getting ready to go he asked me if he could build up an apiary from one of those little boxes with bees in it—meaning some cages of queens ready to go by mail that he saw in the factory. Now, I told him he could not; but as you state it above, perhaps I am mistaken. Joking aside, you have done well anyhow, if your bees all winter, and I hope they will. I can do so much to help you along, without very much trouble. Your figures look first rate. I do not think we shall put you in Blasted Hopes just yet.

#### BOTTOM VENTILATION.

I thought I would write you, and give some of my experience in bee-keeping. I saw in GLEANINGS, on page 537, that you wanted some reports in regard to lower ventilation. I have been keeping bees for 30 years, and have always wintered them on their summer stands, by raising them and placing blocks of wood between the hive and bottom-board, one inch thick. I have had all kinds of hives, and generally they winter well, unless they take the dysentery. Last winter was very severe on bees. I lost about five per cent of mine, with outdoor wintering.

#### CAN BEES HATCH OUT IN 14 DAYS FROM THE LAYING OF THE EGG?

I want to tell you something about my bees swarming this last season. I had 65 swarms that I hived, and one of these I put in the hive June 8, and on the 22d day of June they swarmed, and, without clustering went to the woods. I have since found them. There was nothing strange in their going to the woods; but there was something about that hive that was strange and new to me. After the swarm left I went to the hive, and the ground was strewn with young bees that could not fly. I began to help

them in the hive by taking it off the stand and placing it on the ground. You may say they were old bees that got knocked down in the rush of swarming. They were young bees, sure. This was a Quinby hive they were in. I examined in the hive to see the young bees crawling out of the comb. They had been in the hive just 14 days. I put two frames of finished comb in the hive, which I had taken out of a hive the bees died in last winter. There were no eggs nor brood in them. I want to know if you ever had bees to swarm in two weeks after hiving them, and have young bees hatched, and crawling out of the hive.

#### HOW LONG WILL BEES LIVE IN A HIVE, WITHOUT CHANGING THE COMB?

I have one that has been 20 years in a box hive, and it has always been wintered outdoors with bottom ventilation. There is one of my neighbors who has one that has been 28 years in the hive (it is a box hive also). I put both of those old swarms in the hive. I have 50 of the Quinby hives, and 20 more of all kinds that I expect to winter outdoors.

#### BEST PACKING FOR BEES.

I find the best packing for my bees is plenty of good white-clover honey; when they have that they are pretty sure to winter.

BENJ. VEACH.

Springport, Ind., Oct. 29, 1883.

Friend V., although I can not see where the mistake comes in, yet I am sure you have made one somewhere. I do not believe that bees can be hatched out in 14 days, any more than I believe that corn may come up the same day it is planted. No offense, of course, for I know you talk honestly, only I can not see how it is possible. By some "hocus-pocus," I can not just tell how, there must have been young larvæ in those combs that you put in that hive.—I believe it is pretty well settled, that bees may live and do well in the same combs for even 30 or 40 years.—Friend V., I think we shall all have to take off our hats, and own up the corn on your last observation, even if we do discount that part about the bees hatching in two weeks a little.

#### FLORIDA.

Well, at last I am in Florida. The weather is delightful; no frost yet. Yesterday I overhauled my bees; they are full of eggs and brood, having been here now 3 weeks to-day. They are flying out today as early as 8 o'clock A.M. I shall leave here for New Smyrna, Fla., on Monday, and will settle on my location, then have bees forwarded. I write you fully from there. I inclose a sample of plant growing here in father's yard, which I think is the Simpson honey-plant. It is now in full bloom. Please advise me what it is through your next No. I will try to have plenty of early queens for you in April, and I have no doubt a success can be made of shipping bees to Florida for wintering, at a cost of not over \$1.25 per swarm from Western N. Y. I also send you two Florida papers, and an invitation to come to see me when I get fixed.

T. GRAHAM ASHMEAD.

Jacksonville, Fla., Nov. 17, 1883.

Friend A., we are glad to hear from you, and hope you will like your new home. The plant you send is not the Simpson plant, but our old friend the spider plant, of which so much has been said. This seems to indicate that the spider plant is very widely disseminated.

## MOVING BEES SHORT DISTANCES.

I have 17 hives of bees, and I want to move them about 40 or 50 ft. from where they now stand, to a better place. When and how should I do it to the best advantage, to prevent bees returning to their present stands? I winter on summer stands.

Hannibal, O., Nov. 26, 1883.

M. LUTTMAN.

Friend L., you will have to use considerable care in moving bees the short distance you mention. If you can arrange to have them kept in their hives by cold weather two or three weeks, you can move them without trouble; but if a warm day should occur, so there would not be more than three or four days between the time they took their flight from their old location and their next flight from their new location, they would go back so as to lose a great many. For our locality here in Ohio, I would say, fix your stands all in readiness in their new location before the ground freezes up; then wait till the middle of the winter, and some day when the temperature is somewhere about 40°, lift them from their old stand, and set them on their new one so quietly that hardly a bee will buzz. It would be well to make some provision several days before you move them, to prevent any of the hives from being frozen fast to their old stands; for if you raise the hives up with a snap, the bees would be likely to be roused up, and rush to get out. If the first flight, then, after being moved, is after they have got perfectly settled and quiet, they will be apt to take points in their new locations, and few, if any, return to their old one, provided the interval as mentioned above has been as much as three or four weeks; if a couple of months, it would be still better, of course. You will notice that some colonies are much more apt to go back to an old location than others.

## IMPORTANCE OF SYSTEM IN BEE CULTURE.

*Friend Root:*—We are strangers to each other, but I feel as though I should like to get acquainted, and tell you my experience. I have had bees for the last fifteen years in the old box hives, till the winter of 1881, when they all died for me, and I think it was the best thing that happened me in all that time, as regards bee-keeping, for they never did me any good. I would save those that had honey enough, and try to winter them, and kill the rest, and get but very little honey; and generally those I would try to winter would nearly all die.

When I lost all my bees in 1881, I came to the conclusion that it was for want of system; and so I purchased two swarms. One was an Italian colony, and the other the common blacks. They were both very late swarms, with no foundation for either brood or surplus, and yet they gathered 51 lbs. of surplus comb honey in section boxes, and had an abundance of honey in the brood-frames for wintering purposes; and, not knowing how to prepare them for winter, I just gave them all ten of the brood-frames, with no cushions or packing, and left them on their summer stands all winter, and they came through all right. So you see I had two colonies last spring to start with. Well, I sent for A B C book, 5 lbs. of fdn., and about 250 section boxes; and during rainy days I would make hives and put foundation in frames, and had every thing in readiness, and all seemed prosperous till, alas! in May

the worms got in the black colony, and were about to demolish it; but after I had given your A B C a careful perusal I went to work and transferred them by cleaning off all their brood-frames and putting them in a nice new clean hive. They accepted their new home, and worked finely; and on the 11th of June it gave a large swarm; and on the 19th another, and on the 22d another fair swarm. My Italians gave a swarm on the last day of May and on the 7th day of June; and on the 10th day of July my first Italians that I hived on the last day of May gave a nice large swarm. So you see my two colonies have increased to 8, and gave me 230 lbs. of surplus honey in section boxes. I am satisfied, if I had had more fdn., and could have prevented after-swarming, according to instructions in A B C book, I could have got twice as much honey. But I have fed my late swarms, so I think they are all in good condition for winter. I have furnished all my hives with Hill's device for covering frames, and have them all packed with chaff cushions.

JAMES HUSTON.

Vanlue, Ohio, Nov. 22, 1883.

## A SUBSTITUTE FOR WAX OR SOLDER FOR SEALING UP THE JONES HONEY-PAILS.

We tried the waxed strings; and, after getting out of patience, thought we would try our label sticker—te-nex-ine—a very adhesive compound, we think ahead of glue or cement. With one of your 5-cent brushes, paint the inner edge of the cover so as to get the sticker where the cover and pail meet; press down firmly, then put a few drops in the groove, and tip the pail so it will run around the groove just where the wax string goes, and the job is done, and, as soon as dry, are ready for shipment, and in one-fourth the time, and less than one-tenth the expense, and it looks nicer, and no fussing to warm over a stove. I think it can be purchased at \$2.00 per gallon; 35 cts. per pint bottles.

F. H. CYRENIUS.

Scriba, N. Y., Oct. 24, 1883.

As soon as we received the above letter from friend C., we sent at once to the manufacturers of te-nex-ine, and have now given it a pretty thorough trial. This cement hardens in a little while, and still looks, after it has hardened, exactly like a liquid, or clear glass; in fact, you are surprised to find it is hard upon touching the surface of it; and when thoroughly set it seems about as hard as glass, or clear horn would perhaps express it better. I do not see but that it is good for cementing almost any thing that is broken. It seems wonderfully adhesive, as well as strong. We can furnish it at the price friend C. quotes, or we can give you a pretty good-sized bottle with brush, for only a dime. Of course, it is not mailable. It seems to me it is going to be a great acquisition, for the handsome appearance of every thing mended with it is another recommendation. We have not yet tested it for shipping honey, but it will doubtless soon be tested. Many thanks to friend C. for calling our attention to it.

*Friend Root:*—Quite a number of friends have notified me that they failed to see their names in the list of new members at our convention in Toronto. Tell them, please, that I am too busy now to look the matter up; but that I shall do so before the issue of your next number.

CHAS. F. MUTH.

Cincinnati, Nov. 22, 1883.

## FRAMES, PROPOLIS, ETC.

I guess I shall have to apologize some. In my last month's communication, in speaking of frames I should have said that, according to my estimation, the all-wood frames not wired were too light for use in friend Abrams' locality. On account of the great amount of propolis, some of the frames were glued fast all around. As to the source of this propolis, I am not prepared to say. The second reason, but not an objectionable one, why these frames are too light for friend A.'s locality is, that it is an extremely good place for honey. I do not think I ever saw frames more completely filled with honey than were friend A.'s; and it being so very warm, the combs are much inclined to sag. In defense of friend A., I will say that he had his frame well nailed, and not simply driven together. CHAS. KINGSLEY.

Greenville, Tenn., Nov., 1883.

## WINTERING BEES WITH DOWNWARD VENTILATION.

My father has been keeping bees in the old square box hives for nearly 30 years. He keeps blocks under his hives about an inch or 1½ inches thick, and lets them be in that condition all winter (on a plank in a shed), and he seldom has any bees to freeze. Perhaps you would like to know how much honey he gets. Well, sometimes he gets some honey, and some summers he doesn't get any. He usually gets one and sometimes two swarms from each hive, and they swarm about the last of June, or perhaps not until July, and only a few of them gather enough honey to keep them over winter. He and I have concluded to go into partnership with our bees, and expect to put all of his in chaff hives next spring, and Italianize them also. CHAS. MATTHEWS.

Fredricksburg, O., Nov. 20, 1883.

## DOWNWARD VENTILATION.

I notice on page 536, JUVENILE, about downward ventilation. Last winter was very cold; my bees, some of them, froze to death, well packed in dry-goods boxes, while my neighbor's bees stood on a bench 2 feet from the ground in single-wall hives, with 8-in. space above the frames, entrance open, nothing to protect them from the cold, and old cracked hives at that. I was in Southern Illinois a month ago, and saw some bees there that were standing in the same spot 4 years; and when the man hived them it was very warm, and he put a brick under each corner of the hive above the bottom-board. When I saw them they were full of bees, with combs about 1½ inches below the edge of hive. They were hybrid bees, and hardy ones. RICHARD EDMUNDS.

Grand Crossing, Ill., Oct. 22, 1883.

## SOME BEE-FRIENDS IN TROUBLE.

*Friend Root:*—We deem it advisable to state, that several cases of foul brood developed in one of our apiaries the past season. We never saw a case of it before; and if we sent out any infected colonies or nuclei to our customers, it was unwittingly and unknowingly done. When discovered, prompt and effective measures were taken to eradicate it, both by the burning and starvation processes, and, we are happy to say, with the most satisfactory results. All orders filled hereafter will be from apiaries that have never had a case of foul brood.

FLANAGAN & ILLINSKI.

Belleville, Ill., Nov. 21, 1883.

We are very sorry to hear of this, friends F. & I. But we are glad to know that you have decided to come out frankly, and own

up to the condition of affairs. Your record has been so fair for years past, that I think no one will accuse you of purposely or even willingly scattering the seeds of this dire scourge. I presume you have, of course, made arrangements with those to whom the foul brood was sent (for you can probably easily trace it), that every possible effort be made to kill it out wherever it has gone, as speedily as possible. I have for years been afraid to buy bees indiscriminately from a distance, for fear of just such a calamity. Now that we know how to raise bees, and multiply them with such exceeding rapidity, would it not be well to rear them, instead of buying? A pound of sugar is a good deal cheaper than a pound of bees; and when the honey-yield fails, colonies may be increased with enormous rapidity by sugar feeding. Then we are safe from any contagion that may be unwittingly contracted.

## INTRODUCING QUEENS BY CHLOROFORM.

D. A. JONES'S PROCESS.

CAN you tell D. A. Jones's method of introducing 50 queens in 50 minutes, as he told in the Canada Convention? See JUVENILE, Sept. 15, 1883, page 556.

J. C. DICKINSON.

Hudson, Mich., Nov. 12, 1883.

We submitted the above card to friend Jones, that we might get the plan correct, without any mistake, and below is his reply, which was sent to us in the shape of a proof-slip, prepared evidently for some paper. We mention this, so that said paper may not accuse us of borrowing without giving due credit. Here is friend Jones's answer:

I take an ordinary bee-smoker with a straight barrel or fuel-box. Tapering smokers, such as Clark's, would not be as good, as there would be more difficulty in fitting the sponges. I then get three sponges that fit moderately tight to the inside of the barrel, when pushed in. Then press one sponge into the bottom of the barrel; dampen the second sponge with one teaspoonful of chloroform, and put it in next; then put the third sponge on the top. You then have the sponge filled with chloroform between the two dry ones. Adjust the nozzle of the smoker, and you are ready for operations. Proceed to your queenless colonies, and puff in the chloroform at the entrance, the same as you would smoke them, for, say, a quarter of a minute; then proceed to the next, and so on, for, say, about two minutes; return to the first hive again, and give them a few more puffs with your chloroform smoker, and let your queen run in. Do this until you have gone over all those you first puffed. Thus the bees in each hive have had about two minutes in which to get sleepy before the queen is introduced. Now, if it is in the middle of the day, and the bees are returning from the fields, I return to the first hive, after, say, two minutes, and give them a third dose, as the returning bees require a little sniff to keep them quiet. I have the past season taken the worst cases of fertile workers, and the most difficult queenless colonies that I ever had to deal with, and I never missed yet. Now, why does it work, or why use it? Simply because there is a principle governing the introduction of queens; namely: That the bees must be kept quiet, and without a desire to fight or kill the queen, and the queen must act as if just hatched—she must be quiet and innocent, and must exhibit no fear.

The chloroform is distributed equally into all portions of the hive by this system; and if the entrance is not too large, the chloroform remains some time about the hive and comb, thus keeping the bees in a sort of a quiet, sleepy state, and they come out of that condition so gradually that the queen, being in with them, gets enough so that her movements are

satisfactory to the bees, and there is no danger of her being balled. We have also been experimenting the last season, and we intend to continue our experiments on introducing queens during the honey season, without chloroform or without caging. It can, and has been done, as we have ourselves done it very frequently, but it requires considerable experience to know just the circumstances under which she will be accepted, and to be able to detect any hostile act of the bees, and guard against it in time.

**FEEDING BY POURING THE FEED ON THE BOTTOM-BOARD OF THE HIVE.**

It is going the rounds, that I stated at the Convention held in Toronto that I poured the feed into the entrance. Such is not the case, and I never stated so if I was duly sober. That would be one of the best ways of inducing robbing. I always feed by tilting up the front of the hive, lifting off the cover, and pouring the feed behind the division-board into the back end of the hive. This allows the bees to pass back under the division-board, and take up the feed. If too cold, I pour the feed into empty combs, and place them in the body of the hive; but 99% of my feeding is done by pouring it into the back end of the hive. D. A. JONES.

You will observe, friends, that toward the close of the above article friend Jones speaks of experimenting in regard to introducing queens during the honey season, without any caging or introducing at all. You will bear in mind how much I have said upon this subject. It is my impression, that 100 queens may be turned loose at the entrance of 100 queenless hives, without losing more than 5 per cent, on an average, if it is done during the honey season, and toward the close of a day that has furnished abundance of forage. Where queens are plentiful, and apiarists crowded for time, I believe I should recommend this plan of introducing. But it requires, as friend Jones wisely remarks, "considerable experience to know just the circumstances under which she will be accepted."—In regard to feeding on the bottom-boards, I am glad friend Jones has made the correction, because it seems to me as though pouring it in at the entrance would be akin to madness, after honey had ceased to come in. Of course, it should be understood that, to feed in this way, the bottom-board must be absolutely water-tight. They can be made so by pouring in melted wax.

**COLOR HEREDITARY.**

**TEXTURE OF HAIR, SKIN, ETC.**

ON page 537, of JUVENILE, friend Norton gives a valuable exposition on "the color line." He says, "Yellow bands are not in themselves incompatible with hardness, courage, and industry." Still, he says at the conclusion, "Let us breed for them, as well as for prolificness, hardness, industry, and gentleness;" and he wants to know, if a dark-colored Italian is worth more than a light one why a black one is not worth the most of all. Please excuse me, he leaves the thing rather loose.

**WHY A BLACK BEE IS NOT AS GOOD AS A YELLOW ONE.**

Every thing in nature is colored, inside and out; and the color always corresponds with the character. Nature always paints her coarse productions in rough drab; but more exquisite, or fine, in her best clothes. So, a certain dress signifies a certain quality. Thus, black signifies power; green, immaturity; yellow, ripeness, richness, etc. Hence all dark

animals are powerful, such as the black bear, black snake, morgan horses, etc. And Indians and negroes are more powerful, hardy, and tougher, than the white race. But dark-skinned nations are always behind the light in all inventions and improvements of the age. Indians are good at robbing and stealing, and you won't find one negro in a hundred that will not steal. I was raised with them, you see, and know them. Daniel Webster was dark-haired, dark-skinned, and possessed great power of intellect, yet lacked purity; therefore a black bee has not as great instinct or intellect (if you will have it) as the yellow bee; then they have this robbing propensity. The reason why a dark Italian, or hybrids, are "hooped up" so is the combination of strength with that superior instinct possessed by the light strain of bees. A hybrid inherits that tendency to rob, from her black ancestors; and that sharpness from the Italian, gives them the knowledge how to get into a hive, or how to get honey from the fields. I prefer a dark Italian; but keep your entrances in such a shape that they will never get in, and each hive very populous, and you are all right.

Waco, Tex., Nov. 12, 1883.

J. W. GUYTON.

Friend G., I once heard of an old minister who complimented a younger one, by telling him that his sermon contained much that was new and much that was true. Of course the young minister, just out of college, felt a good deal flattered, and thanked his old friend for the kind words; whereupon the old man replied that the trouble was, the part that was new was not true, and the part that was true was not new. I fell to wondering, while reading your letter, if we could not consistently say the same in regard to some of your bold ideas. It may be, however, that all that you say that is new is also true; but very much of it is surely quite new to me.

**HONEY FROM THE OAK.**

**SOME ADDITIONAL LIGHT ON THE MATTER.**

ON page 502, current JUVENILE, Mamie Keen tells us her uncle's bees are storing honey from "jack-oak." You say the tree is probably what you know as black-oak, and suggest that the honey is not of good quality. I mail you to-day a specimen of what some here call "jack-oak," while others call it "pin-oak." I would say concerning it, that it not only yields copiously, but the honey is first-class as to taste and flavor. In color it is a light amber. The flow from this source lasts longer than from any other in this locality, and comes in a time when most needed. This year it began about the first of June, and continued incessantly up to the present. The bees still give it attention early in the morning, though there is a world of ironweed, bonaset, heart's-ease, and Spanish-needle in bloom around them. Through the month of July, and up to Aug. 10, they stored surplus from it.

The honey comes from the small bud you will see clustered in among this year's leaf-stems, and it is no doubt the bloom for the fruit of next year. The honey can be seen oozing out from near the base of the buds; and when one drop is taken by the bees, or brushed away, another gathers in a very few minutes. At night these drops get so large they fall on the leaves below, making still another honey-dew, whence it is taken by the bees. If I remember cor-

rectly an illustration of a specimen of the Southern live-oak seen last year, the leaves and some other features bear a resemblance to them. The tree is not evergreen here, but the leaves hang on till the next year's growth pushes them off.

**PLANTS THAT SEEM TO PRODUCE A SOPORIFIC INFLUENCE ON BEES.**

In the same package I also inclose you a specimen of a plant which yields a good flow of honey during the month of July. It grows in clumps which increase yearly, the old stalk dying, and new ones taking their places each year, and more being added to them. During the three or four years I have noticed it, it does not seem to die entirely. I have never tried raising it from the seed. Have noticed that a bee will occasionally sit on a large clustering head of them for as long as half an hour, never moving or stirring, apparently in a deep study, or dreaming; but, when touched, it would seem to wake to a realizing sense of the importance of time, and in great haste secures its load and goes off toward home. Indications are good for a large crop of fall honey here.

I. H. STANLEY.

Boyleston, Ill., Aug. 29, 1883.

Friend S., the drawing you refer to is found on page 182 of our April No., 1882. It very much resembles the sample you sent, and the oak is probably something nearly related to it. Since you mention it, I am inclined to think that the honey found on the oaks at friend Cork's, in Canada, was from these immature buds, and dropped on the foliage below. His description in a recent number corroborates this idea, and it seems to be a legitimate product of the tree, and not in any way connected with the agency of insects.—We were so unlucky as to lose the plant you inclosed, but I think it was the same as one we tried on our grounds, which I discarded, because so many bees remain dreaming on the heads. I am inclined to think these dreamy fellows did not always get home, for several dead bees were found on the ground around the plant.

## Ladies' Department.

**FLORIDA.**

**T**O Mrs. M. S., of Wellsville, Ohio. I have lived here seven years, and would not exchange our little home here for my native State, Indiana, and be compelled to live there. My health is better than ever before. We have had no frost yet. No day but that the "busy bee" was at work on the sweet-potato bloom, of which we have over an acre on our place, and I don't know how much more in the neighborhood. The flower resembles a morning-glory, but does not close entirely for several days. It secretes honey; but they get enough pollen from wild flowers to keep the lower story nearly full of brood. I am getting very much interested in the trees and honey-plants; would like to hear from our Southern friends what will do well here. We live on high pine land, very sandy, but salubrious. We have a good neighborhood, representing nearly every State. Have a good new schoolhouse, in which we have school, preaching, and Sabbath-school. There is a \$25,000 hotel in process of erection; have a good store and P. O. We are five miles

east of the Florida Peninsular R. R., and three miles west of the Fla. Southern R. R.; several private boarding-houses, where good board at reasonable prices can be had. All are engaged in orange culture. Some are cultivating small fruits in connection with their groves, and are quite successful. As to the question, "Can one have a comfortable living, and what at?" I can not answer, without knowing something of your ability—mentally, physically, and financially. I shall be pleased to answer all questions through GLEANINGS as to our "land of flowers," if you will ask them so I can, or inclose stamp if you desire a reply personally. But please do not expect too much of me, as I have the care of my home, my bees, and my mischievous eighteen-months old boy. May I come again?

MRS. BELLE MCMAHAN.

South Lake Weir, Marion Co., Fla., Nov. 19, 1883.

By all means, come again, Mrs. M.

## GLEANINGS IN BEE CULTURE.

**A. I. ROOT,**  
**EDITOR AND PUBLISHER,**  
**MEDINA, O.**

**TERMS: \$1.00 PER YEAR, POST-PAID.**

**FOR CLUBBING RATES, SEE FIRST PAGE OF READING MATTER.**

**MEDINA, DEC. 1, 1883.**

THE Lord saveth not with sword and spear.—I. SAM. 17:47.

PROVIDENCE permitting, I shall be present at the convention in Flint, Mich., Dec. 5 and 6.

UNTIL further notice we will pay 30 cts. cash, or 32 cts. trade, for fair average beeswax. We will sell the same for 35 cts. for the common run, or 40 cts. for the best selected.

FRIEND Viallon writes us, that, owing to sickness in his family, he has been compelled to neglect correspondence for almost two weeks, but will tend to all inquiries, and other unsettled business, now very soon.

We have on hand about 25 queens. Part are tested, and part are dollar queens, received from our Southern friends. If any of you are short of queens at this late date, we shall be happy to supply you. They will be shipped at our risk.

THERE is or has been a strike on window glass; but, luckily for bee-men, it happens at such a time that they do not need to use much of it. For the present, we shall have to withdraw all quotations on window glass. When prices fall, we will let you know.

We can now furnish the well-known Gospel Hymns, parts 1, 2, 3, 4, words and music, bound in boards, for an even 75 cts.; by mail, 10 cts. more. In tens and hundreds, a still further deduction, as you will see by our price list. The same, words only, 25 cts.; by mail, 30 cts.

IF the credit does belong to friends Benton and Doolittle for having developed the business of mailing queens across the ocean, I think we can fairly claim some credit for having developed it for shipping queens and bees any month in the year. A

shipment of nuclei goes to Shreveport, La., while we write.

The trade on the new fountain pumps has assumed such proportions that we are now enabled to sell 100 pumps for \$50, which is a better arrangement than you can probably make with the manufacturer himself for that number. As our profit is *extremely* small on the transaction, we shall have to have cash with the order.

We are pleased to tell you that we are now able to furnish the celebrated Dixon axle grease at only 10 cts. per box; 95 cts. for 10, or \$9.00 per 100 boxes. It has formerly been 15 cts. If you have never tried it to lubricate wagons, buggies, vehicles, and machinery, it would pay you to order a box for trial when you are getting goods from us.

#### A PREMIUM FOR SUBSCRIBING EARLY.

At the very small profit we have in furnishing GLEANINGS semi-monthly for one dollar, we can not very well offer premiums for subscribing early, although we will allow you to select any article from the 5-cent counter, to please the children, where you send in your dollar before Jan. 1, providing you say what you want, and inclose the necessary postage to have it mailed you.

Our offer of 5 per cent discount before the 1st of Dec. brought us quite a little boom of business, and set our factory, even to the wax-room, "buzzing;" in fact, it has had the effect of giving wax an upward start. Still, we are not so crowded but that we can easily handle a few more good orders, and therefore we offer *four* per cent off for all orders received before Dec. 15. This, of course, is aside from our regular discounts, as before.

We have to-day, Nov. 30, 6388 subscribers — just 150 more than we had last month, and the largest number that GLEANINGS ever reached. Before the January number comes out, we shall probably have to take the customary drop at the beginning of the new year. Many thanks, friends, for the kind support you have given us.

#### ALSIKE CLOVER.

I AM rejoiced to be able to state, that we can furnish alsike clover once more for an even \$10.00 a bushel; \$5.50 for ½ bushel, or \$3.00 a peck. Per lb., 25 cts.; or per lb. by mail, 18 cts. per lb. extra for bag and postage. I do not know what the price will be next spring, but I sincerely hope we shall not have such a boom on it as we did last spring. The above prices will be given until our next issue, at any rate.

#### "STORY OF THE BIBLE."

This book is having a wonderful sale, and it is certainly right that it should have. It has been already reprinted in England and Canada, by publishers there. It is also being translated into different languages by missionaries in different parts of the world. Our friends should remember that it is not a story *about* the Bible, but it is the Bible put into the form of a story by one who is fully competent for the task; that is, the whole purpose, end, and aim of the Bible is presented in a connected line of thought, and put in language so simple that a child may understand it. At the same time, it affords one of the best helps to a proper understanding of the true spirit of the Bible of any of the countless works written with this end in view. The large number of 127,000 copies have been sold in the United States

alone. While it is a very nice large book, full of pictures, we furnish it at only 75 cents; and by mail, postpaid, for 90 cents. I do not know of any thing in the world that would make a "wiser" Christmas present for a boy or girl, or even a grown-up person, than this book.

#### OUR NEW OFFICE.

OUR new office is now finished and occupied. I like to tell you about it, because in one respect many of you will likely feel interested. For instance, we have one whole desk for subscriptions, and one clerk has entire charge of every thing concerning subscriptions for GLEANINGS. As she has nothing else to do, she seldom makes any mistakes in regard to the time it is paid for, the address, etc., etc. The clerk who opens the mail has one entire desk, devised and arranged especially for her work by Mr. Gray. Next come the two large desks for the ledgers, and the book-keeper and her assistants. This department is almost an office in itself, inside of the large office. Next comes the queen-clerk's desk. She has a desk all of her own, with room for an assistant during the busy season. Back of this is a desk for sample copies and price lists. Then comes the desk of the stenographer, with a bright new calligraph. He not only takes down all kinds of business that I dictate to him, but does copying and receipting for all the clerks in the room. This brings us to the east end of the room, where our friend Kitty presides over the files of letters, as I have before explained to you. Her desk also accommodates an assistant when needed. Now we come to the desk of the mailing clerks, occupying all the north side of the room. It is a long affair, with two L's to it, and an additional desk to hold scales for weighing packages. Three and sometimes four will be employed at this desk. Adjoining the vault where the ledgers are kept, and most valuable mailing goods, is a desk where two clerks are employed in wrapping up goods ready for the mail. As we have had some trouble about wrapping up the wrong thing, we propose having a printed wrapper for every thing in the price list, and giving the name and description of it on the outside. This will enable the shipping clerks (who, perhaps, have the most responsible post of any in the building) to avoid mistakes; for if the name and description are printed on every article, they can't very well get the wrong thing. In the center of the whole group of desks and clerks sits your old friend Novice. Come to think of it, he doesn't often sit, though, after all; for when anybody comes after him, the clerks have a sort of standing joke of telling a visitor that his cheapest way to find Novice will be to stand right still until he happens to rush by. My desk is made of maple and black-walnut, and we all think it very pretty. The maple came from an old tree that grew on my father's farm; and when I sit down by it, I often think of that kind old father. I believe I never had a desk of my own before; and with the aid of the many drawers, and ample room on top, I hope to be able to get along without losing any of your communications, or overlooking them, hereafter.

A GREAT number of jangles come about, by some friend asking for an estimate on something he wants. Well, we give the estimate, and then the friend makes an order; but in his order he does not say a word about having had an agreed price for the goods. Now, if we get the price lower after the goods are made, all is well, of course; but if we should figure

it out higher, then there is "music;" or, worse still, our customer gets mad, and just lets the matter stand until he gets a statement, which he considers a dun. Then he accuses us of being frauds and cheats, and of "going back on our word," etc. Sometimes he writes he has got both our letters, and can prove we are cheats, by placing them side by side. From his standpoint of view, it does look bad, I know; but from our standpoint it looks like this: With hundreds of letters daily, how are we to remember who has had an estimate, unless our friends put in something like this simple little sentence at the end of their orders: "As per your agreement of — date"? Do you see the point, friends?

My attention has been called to some remarks made by friend Kingsley on page 668 of our Nov. No. It seems that some of friend K.'s words wounded the feelings of a good friend who uses tobacco, and who writes us an excellent article in defense of it. The writer of said article I judge to be a Christian, a gentleman, and a scholar; and after reading his communication, which is by far too lengthy for our columns, I regretted that I had let friend K.'s strictures pass. Every one has a right to his opinions, it is true, on tobacco as well as other matters; and we who think that the use of tobacco is a sin have no right to wound the feelings of those who may think otherwise. Friend K. said that tobacco is, as a rule, confined to the lower classes. Perhaps he should not have said this; and I am sure it was really not the thing to say, that a man who uses tobacco has the juice of Satan in him. I fear we too often lose sight of the fact that we who profess to be followers of Christ should bear in mind that Christ's kingdom is to prevail, not by strength nor by might nor by sarcasm, but by a Christian spirit, and a spirit becoming one who professes to be a follower of Christ.

THERE are two men, whose names are pretty well known through the bee-journals, who have been buying honey in considerable quantities, and can not pay for it, nor return the honey. One of these I have been laboring with for nearly a year; and although I have been requested to publish him, to prevent him from wronging any other innocent honey-producer, I have delayed doing so, hoping he would pay up, and because I very much dislike to do such a thing. Within a few weeks I have been told this same man has purchased *another* considerable lot of honey, which he is also unable to pay for. I fear I have erred in listening to his promises to do better; and unless he does fix up the matter some way satisfactorily by the first of January, I shall certainly publish him, to prevent his wronging any more of the friends. The other party I have mentioned will take notice, that I shall do the same by him. I dislike wrangles; but when I am obliged to go into it, and the public good demands it, wrangles it must be. If there are others who are guilty of the same offense, they can take this note as a warning. I know it is a little bad to create suspicion in this way; but the names of both parties will be given very soon, unless the matter is straightened up in some way; and as soon as it is straightened up I will give you notice.

DEAR FRIENDS, I am in trouble. When I decided to make GLEANINGS a semi-monthly, I thought we might get in pretty much all the matter that ought to be published, and not crowd the juveniles very

much either; but since the honey season closed and you seem to have a little more leisure, the amount of matter piled in upon us is wonderful. Important letters that ought by no means to be overlooked have been covered up by the heaps — manuscripts overlooked and crowded out. I have been so full of business cares that I fear a good many times I have published what ought to have been left out, and left out what I ought to have published. To tell the real truth, there are heaps of letters that I have not even read; for when I saw that they ran up to 15 and 18 pages, I was compelled to lay them aside until I got a little more leisure. But with the sudden start-up of business we have had, the leisure has not come, and the letters are even now piled in the neat drawers of my new desk in the office, waiting for me to consider them. Old GLEANINGS and young GLEANINGS together won't begin to hold the amount of good matter sent in. I know some of you feel hurt, and I don't blame you; but, what shall I do? I really do believe it would be better to try to make your articles a little shorter. If you can, and thus let us hear from a good many each month. I know I might run them over and cross out a portion of each; but this is a very laborious undertaking, friends, and it is something I would not dare to intrust to any one. I really can not afford to make GLEANINGS any larger for a dollar, and I do not believe it is best to charge you more than a dollar. Do you?

#### ANSWERING LETTERS PROMPTLY.

THIS is an excellent thing to talk about, you will all admit; yet I fear there are very few people in this world who give a prompt answer to every letter, of whatever nature, they receive. I have sometimes thought that it was a kind of disease we fall into, of putting off and putting off; for the oftener we put off a thing, the more liable we shall be to continue putting it off. If you give way to the temptation a little, you will soon give way to it more, and by and by you will get hardened and calloused, as it were, and get so you have a don't-care spirit, like all other kinds of sinners. Just now quite a number of the bee-friends, and some of them prominent business men, write saying they have not answered their letters for a week or two weeks, or something of that sort, on account of some calamity or sickness, etc., but promising to see to it soon. Now, there are times when this is inevitable, or pretty nearly so; but, let me make a suggestion: A great many of you are paying out considerable money for advertising. Very likely some of it goes into my own pocket. But for all that, I want to tell you that the best advertisement a business man ever had was the reputation of answering right back promptly. Almost any kind of an answer is better than no answer, and I am sure it will pay you, my friends, to have some member of the family, if you can not have a hired clerk, to answer every letter the minute it comes from the postoffice. Almost any of you can pick a bright little girl who can say, "Pa is sick," or "gone away," or "fell from the hog-pen, and when he is better he will attend to your business." And after a little you will get so you can dictate to this bright apt little school girl in a way that will enable her to do a vast amount of important business in a way that will help you greatly, and develop her growing and grasping little mind fully as much as the algebra and grammar she studies at school.

## "Forgettery,"

I HAVE several times alluded to a new trouble that is getting to be quite a serious matter in business. It seems to be a sort of disease, as it were, that folks get into; and when it first began I felt sure it would not happen many times. But as business increases, it seems to be getting more and more common. The following will illustrate it:

"Mr. Root: You'll find draft for \$2.00 for five smokers." W. W. KESSLER.

Columbia City, Ind., Aug. 31, 1883.

Now, friends, would it ever occur to any of you that friend K. did not mean to make a plain order for smokers? Our clerks so understood it, and of course sent him a package of five smokers, for that is exactly what his two dollars pays for. Well, just read the card below:

Mr. Root: I sent you draft, and stated in letter that I sent you draft for those smokers you sent me, and it was but a few days longer when here came a basket of smokers by express. I knew I never ordered them. I never heard from you until yesterday. Not knowing who was the owner of these smokers, I paid the express charges, and am waiting for further orders. Last fall I got wire from you the same way by mistake. What shall I do? sell them, or send back? They are in a basket, as you sent them.

W. W. KESSLER.

Columbia City, Ind., Nov. 22, 1883.

You see, friends, the \$2.00 was sent to pay a bill of that amount, which he already owed for smokers; and yet you will note that he makes not the slightest mention of owing us a bill; nor does he give an inkling that might lead us to consult the ledger, and see whether he had an account here. And yet in his second communication he says emphatically, "I never ordered them." You observe, too, at the close, he says he got wire from us the same way. You may have observed that we have put a little notice on our postal card, to guard against this same sort of trouble; but yet during the past summer we have over and over again sent people more goods, when they intended only to send the money for something they had already had.

MORAL:—Whenever you send money anywhere, be sure to tell *why* you send it, and for what purpose you wish it applied. And please do not repeat your orders, in remitting money for what you have already received.

### CONVENTION NOTICES.

The next meeting of the Keystone Bee-Keepers' Association will be in Scranton, on the second Tuesday of December, the 11th. GEO. C. GREEN, Sec'y. Factoryville, Pa., Nov. 23, 1883.

The annual meeting of the Cortland Union Bee-Keepers' Association will be held in Cortland, N. Y., Jan. 8, 1884. N. C. BEAN, Sec'y. McGrawville, Cortland Co., N. Y., Nov. 23, 1883.

The 5th annual convention of the N. E. Ohio and N. W. Pennsylvania Bee-Keepers' Association will be held in Jefferson, O., on Wednesday and Thursday, Jan. 16 and 17, 1884. C. H. COON, Sec'y.

## — THE — American Apiculturist,

A MONTHLY JOURNAL

DEVOTED TO

Scientific and Practical Bee-Keeping.

Edited by a practical bee-keeper, and published in the broadest sense in the interests of the bee-keeper. Its list of contributors consists of the most practical, prominent, and successful apiculturists in America.

Our January number will contain

A FINE LIKENESS OF THE

REV. L. L. LANGSTROTH,

And we will send that number *free* to all those who send their addresses, plainly written, on a postal card. Address—

SILAS M. LOCKE, Editor and Prop'r,  
SALEM, MASS.

Sent for Three Months for 35 cts.; Six Months, 60 cts.; One Year, \$1.00.

## FRUIT AND HONEY.

20 BLACK TARTARIAN CHERRY-TREES BY Express for \$1. Well packed. These are from two to four feet. Can send 20 small ones by mail postpaid for \$1. CHAS. KINGSLEY, Greenville, Greene Co., Tenn.

## EARLY BEES AND QUEENS FOR 1884.

Send for I. R. Good's price list of Holy-Land and Italian Bees and Queens for 1884.

I. R. GOOD, TULLAHOMA, TENN.

DON'T brimstone the bees. I will buy them, if you write at once. C. E. PRICE, 12 Smithtown Branch, Suffolk Co., N. Y.

FOR SALE.—Barnes Combined Foot-Power Saw, jig saw, 2 mandrels, 2 emery wheels, 3 cutter-heads; total list price, \$52.00, at 40 per cent discount; also one mandrel for power, \$5.00. 12d V. W. KEENEY, Shirland, Winnebago Co., Ill.

## 200 COLONIES OF ITALIAN BEES FOR SALE.

TRY OUR IMPROVED ITALIANS.

Send for Price List. Address

Dr. C. W. Young, or C. F. Lane,  
12-1-3-4 5d LEXINGTON, MO.

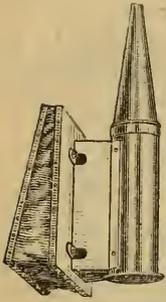

## FOR SALE!

An 80-acre farm in Johnson Co., Mo. Good land, 60 acres of alluvial, none subject to overflow; good locality for bee-keepers; would make an excellent stock farm; church and school privileges; good one-story two-room house, with cellar. Society good. Johnson Co., by census of 1880, was second only to Christian Co., Ill.; 1882-'83, to none. Price only \$30 per acre. Terms very liberal; only \$500 down; rest on 4 years' term. Correspondence solicited.

Address S. P. CULLEY, Warrensburg, P. O. Box 181, Johnson Co., Mo., Or J. U. GATY, Land Agent, or W. E. CRISSEY, for quality of land. 11½-12d

MMAMMOTH RUSSIAN SUNFLOWER SEED, 10c per packet. Stamps taken. Address T. GRAHAM ASHMEAD, Williamson, Wayne Co., N. Y. 12-2d

**NOW READY!  
NOW READY!**

To fill orders for 500 of those splendid U. S. Standard Honey-Extractors, and 2000 of the new improved Bee-Smokers. Extra discounts in Dec., Jan., and Feb., both wholesale and retail, on all kinds of Apiarian Supplies. Agents wanted. Send for circular. **E. T. LEWIS & CO.,** Toledo, O. 125d Factory, 36 Monroe St.

**GEORGE W. BAKER,**

—OF—

Lewisville, Henry Co., Ind. is still breeding those fine Italian Queens whose progeny are wonderful honey-gatherers; also dealer in APIARIAN SUPPLIES, and breeder of nearly all of the finest breeds of Poultry. Also, eggs for sitting.

**ELECTROTYPES.**

**WORKER, DRONE, AND QUEEN.**

We can furnish electrotypes of above, all on one block, for the use of those who are getting up circulars, etc., for 40 cts. each. By mail, 3 cts. each extra.

**A. I. ROOT, Medina, Ohio.**

**THE BEE-KEEPERS' HANDY BOOK.**

216 pages, bound in cloth, by mail, post-paid, \$1.00 per copy. Send for prospectus, and our special circulars describing three new and useful articles for the apiary. 11½-1fd **HENRY ALLEY, Wenham, Mass.**

**WANTED.**

A man to take charge of my Hive Factory and Apiary—who understands the making of hives, etc., by steam, and management of a large apiary, and who is not afraid to work. Address at once, 12d **P. L. VIALON, BAYOU GOULA, LA.**

**WANTED.**—A man competent to take charge of an apiary in Florida. Address 12d **T. G. ASHMEAD, Jacksonville, Duval Co., Fla.**

**MUTH'S  
HONEY EXTRACTOR,  
SQUARE GLASS HONEY JARS,  
TIN BUCKETS, BEE HIVES,  
HONEY SECTIONS, &c., &c.**

Apply to **CHAS. F. MUTH, CINCINNATI, O.**  
P. S.—Send Stamp of 10c for "Practical Hints to Bee-keepers."

**DON'T DO IT!**

**DON'T SELL YOUR HONEY** at starvation prices, but send for some of my half-pound **Honey Tumblers**, only \$4.50 per gross, and I will describe fully how I put up and sell thousands of pounds of comb and extracted honey at 20 to 25 cts. per lb. Send an order and learn how to double your money on your honey. Address,

**JOHN A. BUCHANAN,**  
127fd *Holliday's Cove, Hancock Co., W. Va.*

**\$1.50 COUNTER.**

"Little Beauty."

We thought we had as many clocks in our list of goods as we could spare room for. But we have been tempted to add the above, because it is so extremely pretty. In fact, its name is "Little Beauty." It is only 3½ inches high and 2½ broad. The case is gold bronze and nickel; and although it is so very small, it is a pendulum clock, and will keep time like a top. Price \$1.50. By mail, 10 cts. more. If you want to make your little girl a present for her work-table or playhouse, just get her one of these clocks; and when she is gone to school, her mother may find it quite handy to keep where she happens to be at work. It is worth pretty nearly the price of it to see the children shout and crow at such a "teenty-taunty," real, live, going clock.

**A. I. ROOT, Medina, O.**

## KIND WORDS FROM OUR CUSTOMERS.

The iron try-square is first-class for the money.  
Bethel, Fairfield Co., Ct. GEO. H. FERAY.

### BARNES' FOOT-POWER SAWS.

I received saw in due time, and it works like a charm. I am well pleased with it. I also received A B C; thanks for promptness. J. J. THEHOFF.  
Defiance, O., Nov. 17, 1883.

### MAILING QUEENS IN NOVEMBER.

The queen you mailed to my address Nov. 6, came to hand in fine condition in six days, with plenty of feed, and only one dead attendant bee.

H. C. MOORE.

Pin Oak, Fayette Co., Texas, Nov. 16, 1883.

The Muth honey-jars and corks are all O. K., only one jar broken in the lot. It is a pleasure to do business with you, always prompt, and goods in the best possible condition. Long may you wave to accommodate the bee-keepers, and bless your friends.

LEONIDAS CARSON.

Diamond, Portage Co., O., Nov. 20, 1883.

A B C arrived yesterday in perfect order. Accept my sincere thanks; the book is grand—much nicer than I thought it would be, although a gentleman said I would be surprised at it. He was encouraging me to buy all I wanted from you, as he considered you reliable and honest. MRS. S. W. KUSTER.  
Lenard, Fla., Nov. 10, 1883.

### FLAT-BOTTOM FDN., ETC.

The 18-lbs. of fdn. I bought of you last spring gave the best of satisfaction. We tried the root fdn. and flat-bottom fdn., and the bees would draw out the Root fdn., fill it with honey, and seal it over, before they would touch the flat-bottom. WM. CRAIG.  
Chesaning, Mich., Nov. 12, 1883.

The sprinkler, Smith's patent, came to hand to-night, and I have tried it, and certainly think it quite a success; am well pleased with it. The calendar clock for Browneller came all right, the third day after the order. Thanks for your promptness in filling all my orders, which has been very satisfactory to me. Best wishes to you and all of your many workers. W. H. FERGUSON.  
Fostoria, O., Nov. 22, 1883.

### THE JONES PAIL.

Pails came all right in about 10 days after being shipped; freight, about 1½c. apiece; have made some honey-stands to put pails on, and have put them in 3 stores. Everybody thinks they are daisies, as they are a new thing here, and go off like hot cakes at 45 cts. for 3-lb. and 30 cts. for 2-lb. pails. I shall have to make another order for more soon.

W. L. MILLER.

Chariton, Iowa, Nov. 24, 1883.

I can look to the Lord, and thank him that there is one heart in Medina that loves him at least, and that stands fast against the flood of infidelity that is sweeping over the land. As to my attitude toward you, see Eph. 1:16, and then bear with me when I say, let your eye rest upon the 6th chapter, commencing at the 10th verse, to the 15th. I have often desired to say a word of encouragement to you, but after all it is the Lord only that can encourage and comfort his own; "having loved his own which is in the world, he loved them unto the end."

C. J. HARTT.

San Jacinto, San Diego Co., Cal., Oct. 13, 1883.

And now, my friend, let me simply say to you, that, since we have been reading your A B C and GLEANINGS in our home, we feel that we have formed a new and very pleasant acquaintance. We are glad we got acquainted with you. We like you; we like what you say about bees. We like the way in which you say it. You don't write, you just talk, and so that we can understand you. But, more than all, we enjoy you for your earnest Christianity, and for the sweet spirit of the Lord that lives and breathes in you. Lord bless you, my brother, and make you more and more a blessing to others.

ORVILLE CAMPTON,

Bennet, Neb., Oct. 16, 1883.

### KIND WORDS FROM G. M. DOOLITTLE.

*Friend Root:*—I am very much pleased with my 1884 circular which you printed for me. The make-up of it shows that you work for your patrons' interest. It also shows that you know how to arrange poorly prepared manuscript so as to make it appear in "apple-pie" order. Thanks for doing so well for me on the 5000 copies printed. Truly yours.—

G. M. DOOLITTLE.

Borodino, Onondaga Co., N. Y., Dec. 1, 1883

### A CALIFORNIA BAND OF HOPE.

We have a Band of Hope in our little village. About half here are Spanish and Catholics, so we can not get any of them to attend; but we have nearly all the other children, 30 members. I see you give cards to children, suitable for such Bands. Please send us some, and we shall be much obliged. We sent to Mrs. Richardson for books, before we saw your kind offer, or we should have sent to you; but knowing your kind heart, and your great desire to help all to live a good life, I do not hesitate to ask for the things you so kindly offer free. Poor crops make us feel poor, or else we would send money for them. To make our Band interesting, I give premiums to those who get new members, and also to those who read and recite interesting pieces during the session. Any hints and helps from any or all will be received thankfully. We have 6 places here that sell liquors and tobacco, so we are anxious to keep the children away from those places, and to make our Band interesting and instructing.

MRS. J. HILTON.

Los Alamos, Santa Barbara Co., Cal.

### AN ENTHUSIASTIC YOUNG FRIEND.

As I am head over heels excited in bees, and long so much to be a bee-man, I have often wondered what I was fully intended for. But at last I know. You have convinced me. About 8 weeks ago I saw an item in a Saginaw paper concerning you and bee culture. I had one little third swarm of bees, and somehow I loved them. I wrote you a card, and, to my great astonishment, you shipped me three little books—GLEANINGS and two others, these being the most interesting books I ever read, and the best, except that good old Book my mother bought me to read. There is something godly in bee business. I see by GLEANINGS it is better if a man never uses tobacco, for bees dislike it. Well, they surely do not dislike it more than I do. I believe bees know drunkards and wicked men in general, for they will sting drunkards, for I have seen them do so quite frequently when I lived in town. I have a box, and I am going to try to find me some bees, for I am not stocked with money, as I am young, and never had any income, so I have plenty of places for my money. I am trying to pay for a home for myself and parents.

J. E. SPENCER.

Birch Run, Saginaw Co., Mich., Sept. 8, 1883.

Yours of 20th ult. was received four days ago, requesting me to tell you what it cost to rig up my madrel in the way I suggested, and you would pay for it. Now, Bro. Root, I can not find it in my heart to take advantage of such a kind Christian spirit. It proves that you are a Christian, not only by profession, but in *spirit*, and that it does not lie slumbering on the shelf during the week, but that you take it right with you every day into your business. It is worth a couple of dollars to learn to know such a man. I will know now to whom it is *safe* to send for supplies. May our common Master bless you in your work! I am glad I learned, through the fore part of our correspondence, of the incompleteness of my A B C book. I mean to have one *complete*, and bound in cloth, as soon as my bees (9 colonies) will raise me the money, if they ever do. They are not "booming" just now, as some report. I work for section honey, and use L. hives. Do not erase my name from your subscription list for GLEANINGS on New Year's day, even if I do not have the money just then. I will scratch it up some way if I live. We *must* have GLEANINGS, especially the Home Papers. It has cheered me, and called forth many a tear and prayer while sitting in the old arm-chair, suffering from the asthma and dyspepsia, on account of which I have not been able to work for nearly six years; not more than now and then a little at a time; very slowly, and light work. Mrs. B. attends to the bees the greater part of the time.

Dixon, Ill., Aug. 13, 1883.

J. F. BOSSEMEYER.

## CONVENTION NOTICES.

The annual meeting of the Cortland Union Bee-Keepers' Association will be held in Cortland, N. Y., Jan. 8, 1884. N. C. BEAN, Sec'y.  
McGrawville, Cortland Co., N. Y., Nov. 23, 1883.

The 5th annual convention of the N. E. Ohio and N. W. Pennsylvania Bee-Keepers' Association will be held in Jefferson, O., on Wednesday and Thursday, Jan. 16 and 17, 1884. C. H. COON, Sec'y.

The Bee-Keepers' Association of Central Illinois will meet in Bloomington, Ill., Jan. 9, 1884. You are cordially invited to attend.

JAMES POINDEXTER, Secretary.

The annual meeting of the Indiana bee keepers will be held at Indianapolis, Jan. 15 and 16, in the Agricultural Rooms, corner Tennessee and Market streets. A cordial invitation is extended to all.

F. L. DOUGHERTY, Secretary.

The North-Western Illinois and South-Western Wisconsin Bee-Keepers' Association will hold their annual meeting in Temperance Hall, in Freeport, on the 15th and 16th days of January, A. D. 1884.

J. STEWART, Secretary.

Rock Falls, Ill., Nov. 30, 1883.

## THE NORTH-EASTERN CONVENTION.

The fifteenth annual convention of the North-Eastern Bee-Keepers' Association will be held in the City Hall at Syracuse, N. Y., on the 22d, 23d, and 24th days of January, 1884. This will be the largest and most interesting convention of bee-keepers ever held in America. Many of the most scientific apiarists in the country will take part in the discussions. The programme is completed, and comprises all the important topics of the day. The question-box will be opened each day, and the questions answered; all are invited to send in questions. Implements and other articles of interest for exhibition will be received and properly arranged. It will pay any bee-keeper to go a thousand miles to listen to the discussions by America's most eminent apiarists. By hearing and seeing, you will obtain much more knowledge than by reading; 500 bee-keepers are expected to be in attendance. Reduced rates of board at hotels have been secured. All are invited.

W. E. CLARK, Pres.

GEO. W. HOUSE, Sec.

## NEBRASKA STATE BEE-KEEPERS' ASSOCIATION.

Notice is hereby given, that the Nebraska State Bee-Keepers' Association will meet in annual session at Lincoln, Neb., Wednesday, Jan. 9, 1884, at 2 o'clock P. M., in the Y. M. C. A. rooms, on Tenth street, between O. and P., just east of the Government Square.

We have the promise of some eminent apiarists from other States to be with us, and also expect to have one of the largest displays of apianian supplies ever gathered together in the State. Each person attending is requested to bring something to exhibit or show, to the edification of bee-keepers and others.

Past members are earnestly requested to renew their membership, and all others cordially invited to come in with us. The ladies having been well represented at our past meetings, we certainly expect a larger attendance this session than ever before. All those not attending will surely miss a good time, for we expect the largest gathering, and also the most enthusiastic meeting of practical bee-keepers ever held west of the Mississippi River. We have succeeded in making very satisfactory hotel arrangements, two-dollar hotels having offered one-dollar rates. All bee-keepers desiring to attend can obtain certificates entitling them to excursion rates over the B. & M. and U. P. railroads by applying at any time previous to Jan. 6, to M. L. Trestler, Secretary Nebraska State Bee-Keepers' Association, Greenwood. Please apply immediately.

T. L. VANDORN, President.

M. L. TRESTLER, Secretary.

## Basswood Sprouts,

FROM 8 TO 15 INCHES HIGH.

\$1.50 per hundred; \$10.00 per thousand. All orders should be in before March 1st, 1884, to receive attention.

HENRY WIRTH, BOROINO, N. Y.

## Honey Column.

Under this heading will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

## CITY MARKETS.

NEW YORK.—Honey.—Permit us to state, our market is heavily stocked with comb honey, which has accumulated during the warm season, and prices have yielded a trifle: the present outlook, however, assures us of renewed activity, particularly in comb honey. The following prices are obtainable:

Fancy white-clover in 1-lb. sect's, no glass, 18	@20
Fair to good " " " " " " " " " "	" " 16
Fancy white-clover in 2-lb. sect's, glassed, 17	@17½
Fair to good " " " " " " " " " "	" " 15
Fancy buckwheat " 1-lb. " " no glass, 15	@16
Fancy " " " 2-lb. " " glassed, 13½	@14
Ordinary grades, " 2-lb. " " " "	" 12

Ext'd honey, best white-clover, in kegs or small bbls., 9½ @10  
" " " " buckwheat, " " " " 8½ @ 9  
B eswar, prime yellow ..... 33 @35

Dec. 15, 1883. MCCAUL & HILDRETH,  
80 Hudson Street, New York.

CLEVELAND.—Honey.—Honey continues in very good demand for best white 1-lb. sections, for which 18 cts. is readily obtained; 2-lbs. are not so active at 16, but still choice lots sell at that. Second quality is dull at 14 to 15, and dark would not bring over 12½. Extracted is no sale.

B eswar scarce, and wanted at 28 cts.

Dec. 12, 1883. A. C. KENDEL,  
115 Ontario St., Cleveland, O.

CINCINNATI.—Honey.—No new feature in the honey market. The demand is improving for extracted honey; but arrivals being plentiful, prices keep low. Arrivals of comb honey are fair, and keep about pace with the demand. It brings 14@18 c. on arrival. Extracted, 7@9 c. There is a good demand for beeswax at 30@32 c. on arrival.

Dec. 11, 1883. C. F. MUTH,  
976 Central Ave., Cincinnati, O.

CHICAGO.—Honey.—Market is without special change. Dealers buy enough to supply their immediate needs. Few, if any, buy more than will carry them through the week at a time. I quote white comb, 1-lb. sections, at 18@20c; 1½ to 2 lb. sections, same grades, 16@18c. Extracted, steady at 8@10c per lb., according to color, body, and flavor.

B eswar.—Yellow, 33c.; medium, 28@30c.; offerings small.  
Dec. 10, 1883. R. A. BURNETT,  
161 South Water St., Chicago, Ill.

NEW YORK.—Honey.—Market is dull, and sales have fallen off to a certain extent. Wholesale dealers and jobbers do not buy such large quantities as last year, but purchase small lots to supply the demand. However, we quote same as in our last issue, but shall probably make a reduction in price soon. B eswar is very scarce, and in good demand at 33@34c.

Dec. 10, 1883. H. K. & F. B. THURBER & Co.,  
Reade & Hudson Sts., N. Y.

DETROIT.—Honey.—The honey market is not very active, though the demand is steady — prices ranging from 18@20 cts.

B eswar, scarce at 30 cts.  
Dec. 13, 1883. A. B. WEED,  
Detroit, Mich.

BOSTON.—Honey.—Two-lb. sections, 16@18; 1-lb., 18@20c; Extracted, 10c.  
Dec. 10, 1883. BLAKE & RIPLEY,  
57 Chatham St., Boston, Mass.

We have 1000 lbs. clover and basswood honey, for which I will take 10c per lb. delivered on board cars here, barrels thrown in.

Dec. 10, 1883. F. W. STEVENS,  
Moore's Hill, Dearborn Co., Ind.

I have for sale 1500 lbs. good basswood honey, in barrels of 300 to 500 lbs. each.

Berne, Ind. SPRUNGER BROS. & Co.

Vol. XI.

DEC. 15, 1883.

No. 12.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 5 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

*Established in 1873.*

PUBLISHED SEMI-MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

**VIRGIL'S TREATISE ON BEES.**

*Continued.*

**U**PON finishing the account of the spontaneous production of swarms, the transition from practical science to popular mythology is accomplished by asking who first taught this wonderful art of producing bees. It was Aristæus, already alluded to as the "wise Arcadian," grandson of Jupiter, and son of Apollo. His mother, as the fables run on, was Cyrene, who was a nymph; that is to say, a creature not exactly human, but very human-like, and that lives in the water instead of on the land. Cyrene was a sort of princess among nymphs, and had a large retinue of other nymphs around her. She lived in the river Peneus, in Greece. Well, Aristæus was a famous bee-keeper; and it came to pass in the process of time that the powers above took vengeance upon him, and destroyed his apiary. He didn't know that he had done any thing especially wicked, and was puzzled to know why he should be punished so. In distress and bewilderment he went to the river in which his mother lived, and stood there crying, and making complaints, and charging his trouble to her, and peevishly telling her to go on and do all other imaginable bad things to him.

This sort of thing is much older than Virgil's time. It is found in Homer, and is no doubt a faithful reflection of the Greek character, both ancient and modern — passionate, excitable, and unreasonable to the last degree. But, of all things, what do you suppose the nymphs were doing meantime, down there fifty feet under water? Why, they were

carding and spinning wool! After awhile they thought they heard something above, and one of them popped her head up out of the water to see what was going on. Returning, she told Cyrene that her son was up there, —

"Upbraiding heaven, from whence his lineage came,  
And cruel calls the gods, and cruel thee, by name."  
—*Dryden's Version.*

Cyrene thereupon waved her hand, and the waters retired to the right hand and the left, and stood on either side, making a path for Aristæus to come down and visit her. But Cyrene didn't know, any more than Aristæus did, what the bees were destroyed for. She was sure Proteus would know about it —

"With sure foresight, and with unerring doom,  
He sees what is, and was, and is to come.  
This Neptune gave him, when he gave to keep  
His scaly flocks, that graze the watery deep."  
—*Dryden's Version.*

And so to Proteus they must go. Proteus was a chief among water divinities, keeper of the fishes, etc., to Neptune — a prophet, and a very queer chap generally. Cyrene promised to do what she could to help her son, and to go with him as a guide; but to get any thing out of Proteus was a fearful task. That personage was of a very contrary disposition, paid no heed whatever to prayers, was not in the least susceptible to flattery and "soft sawder," and cared not a fig for any presents or bribes that could be brought. The only thing to be done was to catch him asleep, and seize him, and hang on like grim death until he told you what you wanted to know. Although the idea seems strange, it is worth considering whether we have not here, in disguise, one of the

doctrines of the gospel: "The kingdom of heaven suffereth violence, and the violent take it by force." To return to Proteus, his muscular power seems to have been very moderate for a supernatural being, but he had the power to put on the appearance of any imaginable thing or creature. His would-be captor would suddenly find himself holding a great blazing fire, or a terrible serpent, or a roaring lion. The power to burn or bite or sting did not come with these tricks; but the object was to frighten the assailant, and make him let go for just an instant. When there was no longer any hope of escaping, Proteus would take his own proper shape, and come to terms. It may have occurred to some boy or girl that the best plan for Proteus would be to tell a pack of cunning lies, and send his intruders away badly fooled. *Proteus was pretty mean, but he was never mean enough to tell lies.*

To make sure that her son would have strength enough for the encounter, Cyrene anoints him with nectar, and then they set forth for the haunt of Proteus. The locality is prettily described. The hour when he could most frequently be found asleep was noon; and, by good fortune, the day on which they made their attempt was an unusually hot one. We think we have some pretty hot days in our country, but we might as well hush up about it.—

"'Twas noon; the sultry Dog-star from the sky  
Scorched Indian swains; the rivelled grass was  
dry;

The sun with flaming arrows pierced the flood,  
And, darting to the bottom, baked the mud."

—Dryden's Version.

Never, dear Dryden, saw we day like that.

Sweet classic bard of England, here's our hat.

The passage I have chosen for translation begins at this place, and runs as follows:

#### A DOG-DAY NOON.

Now blazing Sirius, from his heavenly seat  
Scorched thirsty Hindoos with unwonted heat;  
The fiery sun that fierce and sweltering day  
Had fairly drank his orbit middle way.  
Herbs withered; and the narrowing throats of  
streams  
More empty grew in the relentless beams  
That grilled the scanty remnants of their flood  
Into a lukewarm broth of fluid mud.

#### PROTEUS UNSUSPECTING.

Then Proteus, seeking his accustomed caves,  
Went home from pasture on the flowing waves;  
Tribes of the deep, exulting round him play,  
And sprinkle all abroad the bitter spray;  
And sea-calves, here and there upon the shore,  
Recline and stretch their limbs for sleep once more.  
He, as a shepherd oft upon his mount,  
Sits on a rock, their numbers to recount,  
When evening from the pasture-range recalls  
The flocks and herds to home's protecting walls,  
And wolves meantime are lurking near unseen,  
While lambs with bleatings whet their hunger keen.

#### PROTEUS CAUGHT.

An offered chance of seizure quickly came;  
For scarce to rest his weary, aged frame  
The prophet thoughtless sank upon his bed,  
When with loud shoutings Aristæus sped,  
Took swift advantage of his lying low,  
And added fetters to a baffled foe.  
But Proteus also, on the other part,  
Was not unmindful of his usual art;  
In all his startling miracles of ways  
He swifts transforms himself, a fiery blaze;  
A horrible wild beast anon he seems;

Anon he feigneth gentle, gliding streams.  
But when no tricks availed to win him flight,  
Conquered at length, he showed himself aright;  
Speaking with mouth of man, a talk he led —  
"Who gave you, most audacious youth," he said,  
"This bold permission slyly to draw near,  
And violate our homes? what seek you here?"

One more article will finish up the job, and close a subject which will then have been running in GLEANINGS for a month over a year. The riddle of why the bees were destroyed, and how Aristæus could be guilty of murder and he not know any thing about it, will be solved. The sacrifices will be offered, and a swarm of spontaneous bees restored. Every thing will be fixed up, except the sad and irreparable case of twice-lost Eurydice and murdered Orpheus.

E. E. HASTY.

Richards, Lucas Co., O., Dec. 7, 1883.

Friend Hasty, I am very much obliged to you for the text you ran on to in your searches with Virgil; for the text you quote sums up the substance of what has been in my mind for many days past—that not only are all good things this world furnishes ready for those whose energy and zeal almost approach violence, but even the kingdom of heaven as well, is in store for those who take it by force. You will recollect, that in the Home Papers I talk some of importunity; and now it seems that old Proteus was to be conquered and made to yield up his great gifts by fearless faith and importunity.

### PERFORATED ZINC.

#### IS IT A SUCCESS?

WHILE at the North-Eastern Bee-Keepers' Convention last February, friend D. A. Jones there told us of his plans of using the perforated zinc when working for comb honey, one of which was as follows: The frames of brood, bees, and all, were to be taken from an ordinary hive, and placed in a long hive (similar to the Adair "Long Idea" hive), a little while before the swarming season arrived; and as soon as the honey season came, a close-fitting division-board made of the above zinc was to be so inserted that 3 or 4 frames of comb could be placed between this division-board and the front end of the hive. Next the frame having the queen on was to be placed over in this small partitioned-off part of the hive, together with two or three frames of hatching brood taken from among the other combs in the same hive. At the same time, broad frames of sections were to be placed next the perforated division-board, with the separators on them toward the back end of the hive. The remaining frames of brood were then moved up to the wide frames, and an ordinary division-board placed behind them. The object of the above was to get our comb honey built in the center of the brood-nest, instead of at the outside of it, as had formerly been done. Friend Jones told us how quickly foundation in the sections would be drawn out in this way, even when little or no honey was coming from the field; how in this way the bees did not get the swarming fever, and how rich, and of what good flavor the honey produced in this way was, as it would be so well ripened. In fact, he pictured the thing so nicely that I became enchanted with it. The only trouble I saw with it was that it

required so much work; for to carry out the plan, the three frames placed in the front part of the hive were to be taken out at the end of one week, and placed immediately behind the wide frames, and three other frames of hatching brood placed in front with the queen. At the end of another week these frames in turn were to be taken out and placed next the wide frames of sections, and the remaining 3 frames placed in front. Thus it will be seen that the queen had the same laying room she would have had in a whole hive of 9 frames; for with the next change she would have the 3 frames she had laid in 3 weeks before; and as all the bees would hatch out in order as she laid the eggs three weeks previously, she could fill three frames solid with brood every week, instead of scattering it among 9 frames. As the honey-harvest advanced, more wide frames of sections were to be inserted as the bees gained in strength, by moving the 6 frames of brood back, and thus all hands were kept eagerly at work to fill up *that vacant space* in the center of the brood-chamber. The result was *piles* of section honey, and no disposition to swarm. The whole thing looked so reasonable that I decided to try the plan, no matter how much labor it took. Consequently I bought a large sheet of perforated zinc, made the necessary hives, and closely followed the *modus operandi*. As very little honey was coming in, I was in shape to test the idea about the drawing-out of the fdn. in the sections; and the first thing that cooled my ardor was, that the bees did not touch the fdn., only to eat it up, till considerable honey came in from the fields. In fact, they would not touch the fdn. to draw it out till they got honey enough to build bits of comb here and there. But this part I almost expected, as I had always failed to get bees to work fdn., unless they were getting honey quite freely from some source.

When one week had passed I went to the hives to change the brood, according to Mr. Jones's direction. Imagine my surprise to find nearly capped queen-cells on the first frame I lifted at the rear of the sections; for one of the most valuable things to me about the whole matter was, that the bees would not swarm when worked on this plan. However, little daunted I carefully cut all queen-cells off and changed the brood as given, in all except one which I left as an experiment. This one swarmed when the first queen-cells were sealed, as all good swarms do. The next week all the others swarmed, all of which were allowed their own way, except one which I was determined should stay till I saw what became of the experiment.

At the end of the third week there came a little honey, enough so the fdn. in the sections was drawn out about  $\frac{1}{2}$  inch on each side; and I hoped by the 4th week to find them filled with honey. When next I opened the hive I was quite indignant when I found every section filled nearly solid with pollen; and as the bees kept swarming, I gave the whole thing up in disgust.

Now, in all sincerity I ask friend Jones to come forward and tell us in these pages how it is that he succeeds with the plan, and what part of it I left out (if any), which turned his success into my utter failure. One other thing: Wherever I have used the perforated zinc so as to separate the brood, that brood excluded from the queen was sure to have queen-cells formed upon it, thus either causing a supersedure of the queen or a swarm, both of which were a positive disadvantage when a good queen

was in the hive. Again, if no brood was placed in the upper story, the bees would swarm from extracting hives, the same as from those worked for section honey; hence the zinc was of more disadvantage than the allowing of the queen the privilege of the whole hive.

From all of the above, the perforated zinc has not been a success with me. Will those who have made it a success tell us of the fact, and how they managed to do away with the above difficulties?

G. M. DOOLITTLE.

P. S. — Since writing the above I have read Mr. Benton's article, "Queens Across the Atlantic by Mail," in Dec. GLEANINGS, and notice that he says, in speaking of his cages, "of which Mr. Doolittle's cage is nothing more nor less than a copy." Gently, friend B. I never saw more than one number of the *British Bee Journal* in my life, and that before you went to the Old World; neither did I know that you were trying to mail queens across the Atlantic, till I saw a notice of it in King's *Magazine*, after I had mailed the one to Scotland. I sent the queen to Mr. Cameron at his request, and in a cage so made and provisioned as my own judgment taught me would be most likely to succeed; hence I copied nothing from any one. G. M. D.

Borodino, N. Y., Dec. 7, 1883.

Friend D., we should be sorry to have any thing come up that looked the least bit like uncharitableness between two such public benefactors as you and our friend D. A. Jones, and doubtless others can give their experience with perforated zinc so as to throw light on the matter.—As I understood it, friend Benton only meant to say you had *unconsciously* copied his cage.

#### SENDING QUEENS BY MAIL ACROSS THE OCEAN.

ONE OF THE MOST IMPORTANT MATTERS NOW BEFORE THE BEE KEEPERS OF AMERICA.

DEAR FRIENDS, in the outset of this article I have got to make a confession, and a very humiliating one too. In moving from our old office into the new one, I ran across the letter below, from our friend Frank Benton. It was evidently misplaced as soon as it was taken from the mail, for I have no recollection of having seen any thing of the sort, and the clerks do our work so systematically that I am compelled to think I must have had the article in my hands, and mislaid it. I am almost ashamed to ask friend Benton to overlook my carelessness, and I think I shall feel better after placing to his credit the sum of \$25.00 as a small expression of my regret. The article must have reached us some time in September. Of course, nothing can be done about it now, until warm weather; but I think it important that the facts therein laid down should be before the friends as soon as possible.

WHO WANTS TO OAIN A TRIUMPH, AND AN IMPORTED QUEEN OF ANY RACE?

*First Offer.*

The undersigned will send a choice imported Carniolan queen, or a choice imported Italian queen, to Mr. I. R. Good, Mr. Paul L. Viallon, or "any other man"—yes, the lady bee-friends are also included, who will send from America to the address given

below, by mail, postpaid, three boxes containing live bees of any race whatever, and with or without queens, provided the contents of two out of the three boxes sent may be said to have arrived in *fair order*. The only limitations will be as follows: Each party shall have but one trial; the mailing-cages may be of any pattern, except that employed by me, and the food of any sort, except that which I am now employing. (So far as I am aware, neither the cage nor the food used by me is employed by any one else, either at home or abroad.) When ten persons have successfully met these requirements, I shall say "quit."

The queens which I propose to send in return may be had this fall, or early next spring; will be choice ones imported from the apiaries of noted breeders of the race desired; will be sent prepaid as far as New York City at least; and in case the first one sent out to any successful competitor fails to reach him in fair order, a second one (prepaid to New York at least) will be forwarded. I am to have the right to make a report for publication, regarding all lots received. Should any party not wish his name to appear in connection with the matter (until he meets with success! eh?) he may put initials, figures, or signs of any sort, on his boxes, instead of his name, but must then write, *at the time he sends the bees*, to the editor of some bee-journal, giving the mark of his box, and his full address.

#### Second Offer.

To any one who sends me from America by mail, postpaid, five cages of live bees, three of which shall arrive in *good order*, I will send a choice queen, imported from Cyprus, from Palestine, or from Syria. When five persons have succeeded under this offer, I shall want the rest to content themselves with merely an "honorable mention." All other conditions the same as preceding offer.

#### HINTS TO COMPETITORS.

Cyprian and Syrian bees will stand a longer journey, and better, than any others. I think bees *with* queens will be more likely to arrive in good order than those *without* queens. Mere death of a queen need not necessarily cause the rejection of a box — more will depend on the condition of the workers and the box. Such packets are here classed as "samples" by the postal authorities, and will be rejected by the latter if over 8 in. long, 4 in. wide, and 2 in. high. From New York "via Bremen" or "via Havre" are the only advisable routes for unregistered cages of bees. "Via Hamburg" usually takes longer. Letters mailed east of the Mississippi reach us in 12 to 20 days — usually about 15 or 16 days. I think some of the fast steamers to England would bring the time down to 10 or 12 days from New York to Munich; but if sent by any mail to England the cages should be registered, in order that English postoffice officials may not have the grim satisfaction of notifying me that a packet addressed to me had been detained in London, and would be delivered to me in person at that office within two weeks, which interesting trick they once played on parties in America to whom I had addressed packages of bees; also, these same officious gentlemen are to be kept, through the registering of these packages, from arresting and returning the latter, after five or six weeks, as they once did over 45 Syrian queens I had mailed in Beyrout, Syria. Registered packages can not be stopped in England, and no addition dare be made to the postage. Since I learned this quirk I have sent all queens to England by mail without

difficulty, and without losses. Another point would be to ascertain the exact time of sailing of the mail steamers from New York, and to mail queens just in time to be sure to catch it. I have no earthly use for the queens I may get in this manner, so I can pay nothing for them; and I would advise all who try, to pick out the blackest, runtiest, and crossbred hybrids. Unfortunately, old queens do not stand journeying well, else they would be just the ones to use for such experiments, and they would no doubt like very well to retire from business, and take a pleasure-trip to Europe. Let's see who has the *Goodest* candy in America.

Yours, "mit freundlichem Imker-grüss" (with friendly bee-keeper's greeting), as German bee-masters say to each other.

FRANK BENTON.

No. 4 Georgen St., Munich, Germany,

Aug. 9, 1883.

### BANISHING BEES BY AN ACT OF THE LEGISLATURE.

A MATTER THAT MAY POSSIBLY NEED LOOKING AFTER.

**I**NCLOSE you marked copy of the *Monmouth Democrat*, containing notice of an application to be made to the next Legislature of our State, virtually to drive the honey industry out of this County.

**N**OTICE IS HEREBY GIVEN, that application will be made to the next Legislature of the State of New Jersey, for the passage of a bill in and for the County of Monmouth; that the object of said bill is for the enactment of a special law in and for the said County of Monmouth to prevent injury or damage to live stock, by keeping or allowing to be kept, any nest or hive, or other receptacles for insects capable of stinging such live stock, within five hundred yards of the field, yard, pen, or other place in which such live stock is or are kept, and that said law may be enforced either by a penalty to be therein expressed, or by making the violation thereof a misdemeanor.

Dated Dec. 5, 1883.

A. V. CONOVER.

Being the pioneer of practical apiculture in this section, I think it my duty to call the attention of my brother apiarists through this State especially, to the move that has been set on foot. You will observe, the writer of the notice speaks of "a special law in and for the said County of Monmouth." This legislation for special localities is, however, prevented, I think, by an amendment to the constitution, which forbids the enactment of laws other than general ones, affecting the whole State alike.

I have no fear, if the bill goes before the house in that shape; but as it will be impossible to obtain a copy of the bill till after it has been presented to the Legislature, and it is possible it will be presented in a way covering the whole State, I suggest to the bee-keepers of New Jersey to inform the members from their respective districts of the disastrous effects, not only to the honey industry, which is no small item, but to the fact of the loss of fruit and berries, and even clover and grass seed, if such a bill should be passed. It would be to the farmer a loss incalculable—just this loss of the bees as flower-fertilizers — thus a loss to the State, directly and indirectly. It is hardly possible that the members (being mostly men elected from the ranks of our farmers, and those interested in agricultural pursuits) will give the bill more than a passing notice; but by some hook or crook it might be lobbied

through, for want of definite knowledge on the subject.

The whole thing is a personal matter between this A. V. Conover and his neighbor, a Mr. Frey, an elderly gentleman who through me started in modern apiculture; and with his small apiary of thirty or thirty-five colonies of gentle Italians, and Mr. Conover's fears that "they might do him harm," is the whole thing on which he is acting. If any one wishes to communicate to me in regard to the matter I will willingly reply to all questions relative thereto.

F. C. LOCKWOOD.

Freehold, Mon. Co., N. J., Dec. 7, 1883.

To be sure, friend L., we wish to prevent any such hasty action which might result from the fact that bee culture is in many places a comparatively new industry. Any well-informed person would be likely to pronounce the above notice the result of ignorance and spite, on first reading it. Still, as ignorance and spite do a considerable amount of harm, your suggestions may be timely. It seems to me that the proper thing to do would be to refer the whole matter to some disinterested friend of both parties, who is well posted in the matter, and explain the case to Mr. C., and endeavor to have him see the mistake he is making. People sometimes get to be greatly embittered toward certain things; and although well meaning as a general thing, they may, as in this particular case, labor under a great misapprehension.

#### REPORT FROM HENRY WIRTH.

ANOTHER GOOD REPORT FROM DOOLITTLE'S NEIGHBORHOOD.

ONE year ago I sent you my report for 1882. There was considerable comment made in regard to it. I now come again; and what I have to say in regard to my bees this year I will vouch for and can bring any necessary number of good credible vouchers, as to the facts herein. I went in winter quarters in 1882 with twenty-five colonies, and wintered them on their summer stands (which I shall do again this winter). I saved from the 25 colonies, 18—10 fair and 8 very weak ones. I rented 2 colonies of a neighbor; paid \$10.00 for the use of them; took 3 colonies of another neighbor on shares, to give one-half the product. I took no honey from the 8 weak colonies, leaving me 13½ colonies from which I got all of my honey. I built up the weak ones, and increased from all of my colonies except 3, which were too weak to start a swarm. I go into winter quarters with 34 colonies, and with 3 that I got out of the woods this fall where other parties cut the trees and got the honey. The product from the 13½ colonies was 2936 lbs.; 1400 lbs. of comb, and 1536 lbs. of extracted; got 14, 15, and 16 cts. per lb. for my comb, and 10 cts. for my extracted at wholesale, giving me for my honey \$363.60.

The season has been a very remarkable one, the most of the time quite wet, which, according to all writers upon the subject, is very bad for honey-producing. The first basswood that I got was about July 14. The basswood yielded honey for about five weeks. Then I got no more honey; in fact, if it had not been for the basswood there would have been nearly, if not quite, a honey famine.

Now, Mr. Editor, I have condensed, not taking up any of your valuable room with botanizing or any other subject foreign to the facts. I would say to you and the readers of your valuable periodical, that I am satisfied with my year's labor among my bees, as I think all apiarians in this section are, without a single exception, as far as my knowledge extends.

HENRY WIRTH.

Borodino, N. Y., Dec. 4, 1883.

Friend W., we are very much obliged for your report, especially as it comes from the neighborhood of friend Doolittle, and we should be glad to hear from every bee-man you refer to, who, you say, have also done well. You have given us a very important fact in regard to the length of time basswood may yield honey. The longest period we have ever known here was about three weeks, while you put it at five weeks. I presume this extra two weeks is from the basswood located on hill-tops, and blossoming that much later. Now, friend W., may I inquire why you speak as you do, where you mention "botanizing"? and in one other place you speak as if you thought there was somebody unfriendly around. I supposed we were all a neighborly, good-natured sort of people; and if we have not been in your case, we will try to do better. I do not think any vouchers are needed for a straightforward report like the one you have given.

#### SELLING HONEY IN TUMBLERS.

SOMETHING FURTHER IN REGARD TO THE MATTER.

IN your foot-notes to my article in Dec. No., you say that, in your experience with chunk honey in Mason jars surrounded with liquid honey, that "all went well until cold weather, and then the honey all candied, and this finished up the trade."

Now, I am not surprised at this when you say you used so large a package as the Mason jar. You are aware that goods in small packages sell more readily than when put up in large packages; and you found it slow sale, and it had plenty of time to candy before a customer could be found to take 3 lbs. at a time. Years ago I tried selling honey in three-pound jars, and it was slow, and I soon gave it up; but honey put up in ½-lb. tumblers is a different thing entirely, and I never find it on the retailer's hands long enough to candy. When put up in ½-lb. flint-glass tumblers, as we do, and neatly labeled, I find honey sells ten times faster than in any other shape it can be put on the market.

You speak of your little glass pails as perhaps some better than the tumblers. This may be; but they cost too much, and are no more desirable for subsequent use to the purchaser than the half-pound tumblers. Your package must be as cheap as possible, but yet look well; otherwise there will be a loss to some one; and further, if you would have your honey sell quickly at the best prices you must use tumblers holding no more than half a pound of honey.

I furnish my retailers with tin trays. These trays, or pans, hold from one to two dozen tumblers; are easily kept clean; they can be made plain or ornamental; they can be made of nicely grained hard wood by any one. The advantages of this method of selling are many. Your extracted honey may be

sold at the same price that comb honey will bring, also all broken pieces of comb honey, honey in large boxes that can not be sold for its value in any other way. You need no section boxes, no wide frames, crates, separators, and many other expensive fixtures. The honey may be built in any large boxes where all the bees can work naturally and to the best advantage, thereby securing more honey by far than ever can be had by the use of sections, separators, and all these costly arrangements, that must come from either the bee-keeper or the purchaser of his honey.

I see honey put up in 2-lb. sections glassed that is selling very slowly at 25 cts. per lb., or 50 cts. for the package, and there is one-fourth loss to consumer in weight of glass and wood; the package, unlike the tumblers, is a clear loss to the consumer. He can neither sell nor make use of it. I am glad to see that consumers of honey are learning to give this glassed honey the go-by.

JOHN A. BUCHANAN.

Holliday's Cove, W. Va.

### KEEPING BEES IN SEPARATE APIARIES.

ALSO SOMETHING ABOUT RATES FOR SHIPPING EXTRACTED HONEY.

**W**E went into winter quarters one year ago with 295 colonies of bees, in 4 apiaries, or yards, as we call them, all out of doors. They were reduced in the spring to 211, mostly by swarming out in April. And just here let me say a word in favor of double-walled hives, stuffed with chaff. Out of the 85 lost, only 2 were in the chaff hives, and we had 80 colonies in them. They were in 2 yards. We did not see much difference with the blacks and Italians — losses about equal, other things considered.

We started another yard last spring, making 5 in all; ran them all for extracted honey. All were worked by the same set of hands, going with a team from 4 to 9 miles to work, and coming home at night with our honey. We extracted every 8 days, as nearly as we could. Commenced June 16th at home. Extracted all 4 times; quit July 25th, but did not take out much after July 19th. It rained then every day for a week. The basswood had just opened; but it was so wet we did not get any surplus from it. The bees made their winter supply from it between showers. We increased to a little over 300 colonies by artificial division. Our bees are part Italians and part blacks, or brown bees. We weighed all the honey as it was brought in, and each yard got credit for all the honey we got from it.

NAME.	NO. AND KIND.	NO. LBS.	AVERAGE.
Home Yard	69 Italians	7648	128 4-16
No. 2 Yard	35, all blacks	49 8	133 3-35
No. 3 Yard	48, " "	3349	69 47-48
No. 4 Yard	33, mixed It. and bl	3158	95 22-33
No. 5 Yard	15, " " " "	3 94	102 26-35
Total,	211	2,059	104 1/2

We have sold about half of the honey, and the demand is getting better all the time. We sold 4700 lbs. at 7 cts. per lb., barrels returned, to a cracker factory. That included all of our first extracting and dark honey, and a lot of old dark honey that we had on hand, some of it 2 or 3 years old. Our home market takes about 10,000 lbs. a year. I sell at 10 cts. per lb.; \$9.50 per 100 lbs.; 9 cts per lb. by the barrel. Barrels hold 360 lbs. Barrels and kegs to be

paid for, or returned. We have sent honey to parties in Illinois, Indiana, Iowa, Nebraska, Dakota, and Nevada. We can do better selling in this way than we can to wholesale dealers.

### FREIGHT ON HONEY.

There is one thing about shipping extracted honey, that wants to be changed in some way; and that is, about the freight. I wrote to A. I. Root about the matter, and he printed what I had to say about it, in GLEANINGS, about bringing the matter before the American Bee-keepers' Convention, at Toronto. I guess he forgot it. It seems there are no rates of freight for extracted honey; and if it is shipped as honey, the rates are first-class—about twice as much as it is on molasses or syrup, which are 3d class. Our station agents, here allow us to ship our honey in kegs and barrels as "honey syrup," and gives us 3d class rates; but I don't like it. It doesn't look well, and is likely to injure the sale of extracted honey. Why, you see if I send a man a lot of honey marked "honey syrup," he opens up and goes to selling honey out of those barrels. Will his customers think they are getting pure honey out of those barrels marked syrup? Doubtful. The public are very much afraid of extracted honey, any way; and we don't want to do any thing to make them more so. Still, we want cheap freight; and honey in kegs and barrels should go as cheap as syrups.

Now, what can we do about it? I don't know that we can do any thing; but I do believe we can get rates on extracted honey as cheap as on molasses and syrups. Just how we can bring it about, I don't know; but if I were living about the railroad centers, I would have a talk with the bosses about it. I think if they were approached in a friendly spirit, and given to understand that the extracted-honey business is getting to be quite a trade, and that there is a great difference in handling extracted and comb honey, they would give us the same rates as on molasses or sugar syrups. My idea was to have our big bee-keepers' convention appoint a committee to talk with the railroad managers about it. I don't know how our other honey-producers feel about it, or how they ship their honey. We ship it as honey syrup, and get 3d-class rates; but, as I said before, I don't like that way of doing business. I should like to hear from others on this subject.

EDWIN FRANCE.

Platteville, Grant Co., Wis., Dec. 3, 1883.

We are glad to hear, friend F., that you have made a business success of having your bees kept in several different apiaries. It seems to me this is much better than trying to keep as many bees as you have, in one locality, or even two localities.—In regard to rates of freight on honey, our tariff places comb honey as first class, and honey in kegs or barrels at 3d class, which, it seems to me, is pretty nearly right. It is true, molasses in barrels goes at 6th class; but it is expressly stated that it goes at the owner's risk of leakage, and molasses is probably shipped in immense quantities over regular routes, while honey would have to be shipped from isolated points, as it were, a few barrels at a time, comparatively. We are very glad of your report.—We notice in your table that the home yard did the best. Now, was that because the locality was better, or was it because you gave them better care? I should guess the latter.

## ARE THEY ITALIANS OR NOT?

WHAT ROOT SAYS.

*Concluded.*

I FEEL a great deal disposed to criticise friend Root in a rough, friendly way. The A B C book has all along been my chief text-book. During my first year, Root was my oracle; what "Root says" settled every question. But I think I have learned that roots are not always well grounded. Of course, friend Root does not claim to be infallible; but he does seem set in his notions; he does assert himself rather strongly, and he does seem to think that everybody ought to do every thing just about right. He has got possession of the idea—or the idea of him—that bees are gentle during a honey-flow, and get cross when it ceases. That is true, with some qualifications. A boy says, as published in the JUVENILE, that bees are good natured until they begin to get lots of honey, and then they get cross. Friend Root tells him he got that just wrong; that bees are good natured while they are getting honey, and become cross when they can not. Now, if Mr. Root's idea is right, the boy's is not wrong. My observation, and that of others, confirm what he said. Bees do get harder to manage, even during a good yield, when the hive becomes full of honey and bees—about what the boy meant. He tells A. how to avoid getting stung. "Use plenty of smoke, and never mash a bee." Friend Root, did you never mash a bee? In his directions for transferring occurs this phrase: "If you have not set your clumsy (?) foot upon a bee," etc., and other things to match. Friend Root, I should like to see you handle bees as you tell us to do. I will illustrate:

## TRANSFERRING — AN EXPERIENCE.

In apple-blooming season, I was going to transfer my three box-hive colonies right away. Now was the time; Root said so. I went at it just as Root said. I turned the hive back, smoked the inmates well, pried off the side, and went to work. If I did not get the honey to running, and start robbers, I would not be apt to get stung. Root said so. Mother was there, fastening the combs into the frame as I cut them out. But, oh what a muss I did make of it! I soon got the honey to running; how could I help it? In ten minutes from the time I commenced, that scene was as pudding-like a mixture as you could well imagine. Although we were in the shade, we felt as if it were hot enough to cook the pudding too; hive and combs broken up into bits, honey running over every thing, bees blackening every thing, crawling over every thing; I straddling, tip-toeing and hopping around to avoid setting my clumsy *boots* upon a bee; bees swarming, buzzing, and stinging; two vessels smoking, two actors sweating, steaming, and fuming; every thing a boiling. I boiled over in the utterance. I should like to see Root transfer according to his directions, without setting *his* "clumsy foot upon a bee."

The absorbing question now was, how to get out of this seething muss. We hastily poked a lot of comb full of honey, bees and all, into the comb-bucket, for we could not get the latter off. I picked up the pieces as fast as I could find them, and galloped them off into the dooryard, leaving the bees behind as much as possible. We managed to worry almost all the brood comb into the frames, and run them into some hive or other, and poked the rest —

honey, drone brood, bees, and all, into vessels. I daubed up sheets, trowels, and blankets in the effort to save all the bees I could, and keep them from the honey as much as possible. But they swarmed around and into the vessels until, in desperation, I would pick them up and run one into the smoke-house, another into the cellar, even carrying fragments of the old hive, and crowding them on to the cellar steps, blocking the entrance, to the great disgust and dismay of the women folks. I could not see, feel, nor swallow any thing but bees and honey all that day; bees crawling over yard, smoke-house, and cellar; bees drowning, poor drones hatching away off from home, folks in terror lest bees should sting them; one person shouting, "Take your bees away;" another, "George, you've got to get them things out of the way." It was a boiling dish indeed. I contracted the entrance to the new hive, and let the bees fight it out. I found about a quart of bees dead and scattered around the hive next morning. I was done with transferring then; also with transferring at all with the hives running over with bees; also with transferring right in the apiary right among the other bees.

One secret of the muss I made was the dearth of pasturage during fruit-bloom. My bees were on the rampage all spring. Another secret was my failure to do some things just right. Of course, I do not, friend Root, doubt that you have done such things *pretty nearly* as you say, but I should like to see you.

## HOW I TRANSFERRED THE OTHER TWO.

I waited until white-clover season to transfer the other two colonies. One of them I swarmed by carrying the hive off to a new stand, and the next day I carried the hive into the door-yard, set it on a sheet of canvas, and transferred. With the third one I acted upon the simplest plan of all, in my opinion. It is that given by Mr. Heddon, as I read it in Mr. Flanagan's circular. I first swarmed them by drumming. Twenty-one days later I drummed the bees out again, moved the hive into the yard, and transferred. I had neither bees nor brood to bother me. I filled six frames with comb, nearly or quite empty; that which was full I put into the extractor, and used the comb at my leisure.

## STRANGE EXPERIENCE WITH QUEENS IN UNITING.

I have had two, to me, curious experiences with queens. I united two colonies in August. One queen being very old I took her out and caged her. In spite of all my smoking, the bees fought, and a great many were killed. Three days afterward I looked into the hive. I found no cells, no queen, and only a few eggs in one comb. A few days later, I looked in again to find several frames filled with eggs and brood, and a queen. Later on, I united a nucleus containing one of my lately reared Italian queens, with a colony having an old black queen. I removed both queens, set the frames from the nucleus in the right, and those from the other stock in the left side of the new hive. Acting according to Flanagan's directions for introducing queens, I daubed the young queen with honey from the left side, and dropped her into the hive on that side. As in the first case, the bees fought for a day or two more or less. The second day after uniting I looked in to find queen-cells in the right, with but few eggs. The queen had quite a dent in her abdomen, which I think I gave her. As I was looking for eggs I heard her crying on the other side of the comb. I poked around, saw the bees grabbing at her, and she struggling to get away. When trying to get her

by the wings she crawled out on to my hand. Before I could get free use of the other hand she dropped off into the grass. Just as I touched her wings to pick her up she took wing and flew away. I sat down in front of the hive, and watched (except when I was nodding, for it was soon after dinner) for half an hour, but did not see her return. Two days later I looked again; found no cells, lots of eggs, and my dented queen. If the queen was balled in either case, I saw no sign of it. Now, were those queens balled? did the bees harass them for so long, or did they voluntarily cease laying under the circumstances for a few days?

#### VALUABLE QUEENS.

I had two queens laying as late as Nov. 10. One of them hatched in August. She is the offspring of an Italian queen hatched in June, which I have reason to believe was impurely mated, although she produced three-banded workers. The other hatched about Oct. 25, and the first platoons of brood are not done either.

#### HOW LONG CAN BEES LIVE ON AIR?

In preparing a certain colony for winter, I must some way have shaken the queen out on the ground; for four days afterward, I think it was, I had occasion to set the hive off, when I found the queen and a lot of bees clustered to one of the bricks. I put her on the portico of the hive, to see how the bees would receive her. Before I, in my obtuseness, could be certain they were hostile, they gave her a death-stab. Injured as she was, I caged her in the hive, and brushed the benumbed bees—they would not shake off—into it. Although I gave them two good smokings, those that stayed at home, I suppose it was, killed off half of them. The weather was cold, and but few bees had been flying out. How long, I wonder, did it take those bees to lose the scent? Had they been fasting all that time? If so, how long can bees live without anything to eat?

#### DOOLITTLE'S PLAN FOR RIPENING HONEY.

What is Doolittle's plan for ripening comb honey? Is it to let it be uncovered, or slightly covered in a thin-walled honey-house? Not having been a reader of GLEANINGS until this year, I am not acquainted with all the good things that have appeared in its columns.

GEO. F. ROBBINS.

Mechanicsburg, O., Nov. 29, 1883.

Friend R., the trouble with the transferring was, you followed the letter of my directions, and not the spirit. If you will look again in the A B C book, I think you will find I gave, as a reason for recommending the time of fruit-bloom, that the bees were then gathering honey, and would not rob. Now, if your bees had been robbing right along as you say, and were not gathering honey the day you chose, you might have been sure there would have been trouble. I am glad you described the trouble you had, for it will be a useful lesson to others, in regard to doing such work as that when the bees are not busy. I would not advise, as a rule, waiting for white clover, for the hives would then be likely to contain so much honey that it would be seriously in the way of cutting combs, etc.—I entirely agree with you, that a colony of bees are very much more apt to be "bossy," and contest interference, when they are built up strong; but I think I am surely right in saying that bees can, as a rule, be handled without veil

or smoke, when honey is coming in plentifully. Where there is no honey, it would be sometimes almost madness to attempt to handle bees without smoke. When bees are gathering honey every day, almost every bee in the hive has his body distended with honey—in fact, has honey glistening on the end of his tongue. In this state it is a pretty hard matter for them to sting, even if they would, while a bee whose body is short and light, looking as if he had not seen a square meal of honey for a week, is pretty apt to be ready to sting on short notice. Ask any old bee-man near you, who handles bees, if that is not his experience. In regard to transferring, great numbers of novices in the business have reported having transferred according to the directions in the A B C book, and yours was almost the first report of a failure where they had the book before them for a guide.—I do not see any thing unusual in the fact that the queen stopped laying for a day or two after being introduced to a new colony.—Queens reared late in the season will almost invariably lay late, and a cluster of bees driven out of their hive with their bodies filled with honey will live several days under the hive in the way you state. Are you sure none of them left the cluster, and gathered stores to bring in to their starving companions? I have several times found the queen with a few bees under the bottom-board, and that is one reason why I object to bottom-boards with any sort of a crevice or crack underneath them.—Doolittle's plan of ripening honey is to have a room so constructed as to be heated up by the rays of the sun until the honey in the open cells is evaporated to such a consistency that it will not run out, even when the combs are overturned. In this condition it will preserve its flavor, something as it does when capped by the bees.

#### SOUTH FLORIDA.

BY REV. JAMES H. WHITE.

**T**HERE is a strip of land projecting from the main body southward between the Atlantic Ocean and the Gulf of Mexico, around which cluster many very remote historical associations, and toward which many inquiring eyes are turned.

Let the reader take the map and trace the Atlantic coast southward to Cape Canaveral. Here pause, and remember that, from this point southward to the Florida Keys, is the climatic paradise of the United States. Nowhere else within our national domain is there another region anywhere near its equal. The bogus South Florida of the land speculators extends so far north as to include the regions of New Smyrna, Daytona, DeLand, Sanford, Leesburg, and Brookville. All these places claim to be in South Florida; but no part of the counties in which these places are located are in South Florida. The evident reason for this claim is, that "South Florida" means pine-apples, bananas, guavas, mangoes, and other tropical fruit. But the real South Florida lies south of the 23th parallel of latitude, and is nearly tropical. By this, I mean nearly exempt from frost. The no-frost area of the United States is quite small; but what little there is, is found in South Florida. It is the only part of the

United States where tropical fruits can be successfully grown without protection.

There are a few places between the 28th and 29th parallels that are exceptions to this. They have what is here called water protection — they have extended water areas to the west and north, including northwest. Our "Island Home" is in latitude 28° 15', and we grow the choicest tropical fruits and greenhouse plants in the open ground, without protection. Much has been said about growing coffee in Southern California, where frost is unknown. But there is no such no-frost area there; and if there were, the mean annual temperature of that region is 10 or 15 degrees too low for coffee-growing. I hazard nothing in saying, that if coffee is ever profitably produced in the United States it will be in Southern Florida.

Here is rest from battling with snow and ice, and wading in slush and mud; here the weary ones can find a home amid the fragrance of the orange-blossom, the jessamine, and the honeysuckle; where they can pluck from their own trees, and eat the choicest fruits the earth can produce.

The general excellence of the Florida climate is such that many suppose it is all about alike; but this is a great mistake.

Many who desired to cultivate the more tender fruits have found out their mistake. One writing to me from the latitude of Jacksonville says: "Alas! I am too far north; but I did not know it four years ago."

There are some who come to Florida from regions where apples can not be raised, because of extreme cold, and find all the paradise they desire where there is no snow to shovel, and oranges can be grown; but the bulk of human society is made up of restless, ambitious mortals, who will be satisfied with nothing short of the best that earth can give or grow. Had they been permitted to visit the garden of Eden, they had brought away an armful of cuttings of the choicest kinds, and, if possible, had secured a small seedling of the forbidden fruit. They will never be content to raise oranges only, while their neighbors a few miles south raise the finest tropical fruits. Then to have grown the fruit one's self adds greatly to both its value and its flavor.

You need not talk to such a man about the garden of Eden, the New Jerusalem, or any other paradise, while he plucks his own trees and eats such fruits as the cheremoya, mango, sapadillo, and sugar-apple. You had better save your breath until he has satisfied his appetite, wiped his mouth, and sits down to reflect upon the higher wants of his spiritual nature.

The same is true with bee-keepers. Some will be satisfied with almost any change that relieves them of the totting and packing and housing and the freezing and dying of their pets. They would find all the paradise they desire in a region where bees will winter in an ordinary hive on their summer stands, without any danger from cold weather.

But there are many others who will not be satisfied with only a relief from the heavy burdens of bee-keeping, while just beyond there is an accumulation of positive good. They will be satisfied with nothing short of the best. If there is any place in our national domain where there is absolutely no winter, they will want to find it; where no frost comes to spread death and desolation over the nectar-bearing blooms, and bees can fly and gather honey every

day in the year. If there is such a place, where the stars and stripes float undisturbed, and the privileges of American citizenship are the rich heritage of all—of such a place many will think, if they do not sing.

How I long to be there,  
In such glories to share.

Just such a place is South Florida. But at present most of this climatic paradise is a wilderness. In places it already begins to bud and blossom, and in a few years its fruitage will be abundant. It may be asked, why it has so long remained a wilderness? There are several reasons.

1. Until recently, the worse than Upas blight of slavery has rested upon all Southern enterprise.

2. The same poisonous barrier stood as a ghastly sentinel between South Florida and Northern enterprise.

3. South Florida was long the lurking-place of savage cruelty, the Seminoles.

4. It has always been difficult of access by the ordinary routes of travel. But the Atlantic Coast Canal, and railroads now in progress, are removing this difficulty.

5. In the popular thought, South Florida has always been made up of swamps, snakes, and alligators.

Island Home, Brevard Co., Fla., Nov. 10, 1883.

## EXHIBITING BEES AND BEE SUPPLIES AT THE FAIR.

TEACHING THE MULTITUDE THE WONDERS OF THE BEE-HIVE.

**FRIEND ROOT:**—Having been entertained by neighbor Hutchinson's account of what he heard at the Michigan State Fair, it occurred to me that I might give a few incidents from my experience as an exhibitor, which would prove entertaining, if not very instructive, to the readers of GLEANINGS.

Did it ever occur to you, friend Root, that there was a resemblance between a honey-extractor and an ice-cream freezer? I should never think of associating the two myself; but, judging from the number of times the inquiry was made, "Is that an ice-cream freezer?" I should think that, to the average visitor at a county fair, the resemblance must be striking. Of course, I did my best to dispel this delusion; but I must own that, on one occasion, I allowed it to prevail, and even abetted it by deceitful words. But it was all owing to the fact that my inquiring friend had a constitutional defect in his left eye which made winking a habit.

He looked at the extractor critically, whirled the comb-holder around, contemplated it till it came to a full stop, and then looked up, and, with a sharp, tight wink which would have passed anywhere as the forerunner of a joke, inquired: "Is this an ice-cream freezer, mister?"

"Yes," I replied, falling in with his supposed humor. "Something new, which I have no doubt will completely revolutionize the ice-cream business. You see, ice-cream freezers have been made heretofore to revolve in a packing of ice. Now, the important feature of *this* freezer is that the ice is placed within it, in this revolving cage; and thus, coming in closer contact with the cream, it is frozen in one-quarter the time that it takes by the old method."

"Well, I swanee!" ejaculated my interested

friend, winking hard with his left eye, "if that don't beat all creation! What won't they git up next?"

"But the freezing of cream," I continued, "is but one of the uses of this instrument. It is primarily and chiefly a churn; one of the best, if not the very best, that is made. It is rather large for a family freezer, but as a churn it is just the thing; and then it is always on hand for parties, weddings, fairs, and such gatherings."

"Well, I vum, mister, if that don't take the cake of all the things I've seen at the fair, you may shoot me." And with a wink so hard and tight that I verily feared that his left eye would be obliterated, he walked away.

It was not long, however, before he returned; and upon his arm hung a country maiden, whom I set down at once for his sweet-heart. He expounded to Amandy Jane—I think that is what he called her—the uses of this wonderful combination, with an accuracy and fluency of language which showed that he had learned well the lesson which I gave him.

I was busy with a local editor at the time; but my rural friend claimed the chief part of my attention. His earnest manner, and the fact that I caught him several times winking altogether out of time, convinced me at last that he was not the joker I supposed him to be.

My first impulse was to apologize, and correct his erroneous ideas of my extractor. But on second thought I concluded not to do so. I felt a tender regard for his feelings. I preferred to have my extractor go forth to the world as an ice-cream freezer, a churn, or even a sausage-stuffer, rather than belittle my earnest friend in the eyes of his Amandy Jane.

The scientific bee-keeper presiding over an exhibit at a county fair enjoys rare facilities for studying human nature. From his lofty elevation he looks serenely down upon the common throng, and measures each individual in inches on his yard stick. As the philosopher or the statesman contemplates in august dignity the wrangling of lesser minds over questions which his acute and profound mind has dissected and analyzed, till what is right and wrong in them has been relegated to the store house of axiomatic truths, so the scientific bee-keeper, with that self-complacency which superior knowledge imparts, holds up in his dissecting forceps the box-hive bee-keeper who turns up his nose at "patten fixins;" the old woman whose father kept bees, and who knows all about them; the prig who has read an article in the encyclopedia on bees, and who would try to persuade you that he knows as much about scientific bee culture as you do yourself, and the enthusiastic novice of three hives and one season, who corroborates all that you affirm, and helps you entertain the bystanders.

In phrenologic parlance, the first-mentioned individual is possessed of large bumps of firmness and veneration, while the bumps which give liberal and progressive views are deficient. He reverences the box-hive, because he has kept bees in it all his life, and his father before him, while he as stubbornly resists any new notions as if it were sacrilege to entertain them. He estimates his success in bee culture by the number of swarms. In seasons when he doubled or trebled his skeps, he had good luck, and in severe winters, when they nearly all died, he had bad luck; but you can't get him to estimate his "luck" on a substantial basis of dollars and cents. He will tell you of the great pans of honey that were

always about the house, and he will expect you to open your eyes in astonishment when, to give you an idea of the stupendous magnitude of his bee-keeping, he tells you that he once got up to as many as 107 skeps.

The old lady is enough like the box-hive bee-keeper to be an elder sister. She is loquacious, self-possessed, and positively refuses to give you the satisfaction of feeling that you are giving her any new ideas. She never kept bees herself, but her father was a noted bee-keeper in his day, and she knows all about them. Here she will recount the wonderful exploits of her father with bees; how he would pluck out the king from the swarm, and then the rest of the bees would follow him wherever he went. "The king, you know, is the leader," she adds, in an explanatory way; "and if you only get hold of him, you can do what you like with the rest of the swarm."

I mildly suggest that she probably refers to the queen when she speaks of the king, and venture to enlighten her on the peculiar function of each of the three kinds of bees which make up the swarm. But she refuses to be enlightened. The king is evidently her favorite bee, and she stands by him most faithfully.

Then I go into the subject more minutely; tell her all about the queen's egg-laying, how the bees proceed when they wish to raise a new queen, how the breed of bees can be changed by simply introducing a new queen, etc., till I feel certain that I have dethroned the king, and reinstated the queen. But when the old lady again gets the floor, and she says king eleven times in the next minute and a half, it begins to filter through my cranium that she is doing it just out of spite.

There is another class of people, who appear to take in all that you say, with a greedy ear. You seem to carry them right along with you. Their frequent exclamations of wonder and admiration are exceedingly stimulating to your descriptive powers, and you feel the liveliest satisfaction in being able to instruct them on a subject in which they are so highly interested. But suddenly in the midst of your exaltation, out pops an unfortunate question which proves that they have not taken in the very fundamental idea of your discourse.

Here is a case in illustration: A young lawyer and his pretty wife stood before my observatory-hive, watching with lively interest the bees running over the comb. A single question from them wound me up and set me going. I showed them sealed and unsealed brood. Explained to them the different stages through which the bee passed from the time the egg was laid till it came forth a perfect bee. Having gone over the same ground hundreds of times before, and having a frame of brood in all stages before me to illustrate my subject, it would certainly seem that I ought to have made myself perfectly clear and intelligible, especially to the comprehension of a lawyer. And as if to make the picture complete, just as I was finishing my description, I observed a bee gnawing the capping of the cell which imprisoned it.

"There," said I, "you see a bee just gnawing his way out. Watch and see how he cuts the cap, and crawls out to the duties of existence."

"Well, well!" exclaimed my delighted friend of the law, "isn't that wonderful! exceedingly wonderful! Isn't this whole subject exceedingly interesting, Maria?"

"But just let me ask you one question, Mr. McNeill, and then, with your vivid description, I will have the whole subject clearly before my mind's eye. How did he get in there?"

"How did what get in there?" I inquired.

"Why, how did the bee get into the cell in the first place?"

I was speechless for a moment, and I guess a look of disappointment and vexation must have passed over my face, for his wife seemed called upon to answer his question, and she did it in a way which courtesy alone prevented me from doing.

"Why, you silly fellow," she exclaimed, "he was never out of there; he was born and brought up in the cell."

"Oh! I see, I see!" said my lawyer friend, looking decidedly foolish; and hastily thanking me for my attention, he and his wife were soon lost in the crowd.

JAMES MCNEILL.

Hudson, N. Y., Nov. 24, 1883.

### HANDLING BEES DURING A DRY SPELL.

THE ROBBERS THAT ATE ALL THE HONEY, AND THEN CHEWED UP THE COMBS.

HERE were two of my colonies that had their frames attached to the bottom of the hives by old pieces of black comb; wishing to remove this, I transferred into another hive in the last dry spell, and the other bees happened to get a smell of the honey, and set to work robbing them, and cleared the hives of every drop of honey, and went so far as to chew up the combs. I tried in all manners possible to make them stop robbing, but to no avail. After they were robbed, I tried to strengthen them up again by giving honey in feeders on the top of the frames, removing the covering or mat, and closing the entrance; but the robbers clung to the sides, and would not go. Seeing that I could not save them, I opened the entrance; and a few days after, the colony started out. Loth to leave their old home, they settled on a small orange-tree alongside. I captured and caged the queens, and the workers forced their way into the other hives. It made me feel sorry for them; but I tried my best, and could not save them. If you know of any method besides those in A B C, please inform. MRS. M. R. BLAIZE.

Bay St. Louis, Hancock Co., Miss., Nov. 22, 1883.

I have given place to the above because it so vividly portrays the consequences of opening hives during a dearth of pasturage. I presume many of our readers will smile at the idea of robber bees chewing up the combs; but no wonder our friend charged them with that kind of work; for when robbers once get crazy for stores, after having licked up every drop of honey the combs contained, often grind the combs to powder in their eagerness to see if there is not a drop more somewhere; and after they are through there is a general air of "chewed-upness" all through the ranch. Be careful about opening a hive at such a time, my friend.—There is another moral to your story, and that is, that folks who live away down where the orange-trees thrive do not always have honey coming in in abundance, any more than we do. I think the A B C book gives full instructions for such occasions, if you study it well and practice it along with your study.

## Reports Encouraging.

MY HONEY REPORT FOR 1883.

I WENT into winter quarters with 11 colonies; lost one; commenced the season of 1883 with 7 good colonies—2 weak and one queenless, which was united with another after having failed to introduce queen. The 2 weak ones were set to rearing queens. My crop of honey was gathered by 7 colonies, which was 756 lbs., about 600 extracted; the rest comb in sections. On a Saturday at 5 P. M. I extracted all the honey from 3 of my best colonies (2 of them having their queens removed), making 6 stories. In just 3 days from that time I extracted all the honey from 5 of the same stories, and obtained 90 lbs. This was during basswood bloom. Increased 10 colonies. As one of the A B C class, I feel satisfied with my success. I have a neighbor who believes in the log-gum hive, who has double the amount of bees that I have, but who gets less than one-fourth the amount of honey that I do. I. P. C. STEDDOM.

Webster, Ind., Dec. 3, 1883.

My single colony that came to me has developed into seven strong colonies—four of which gave me 200 lbs. of comb honey this year, without more than one day's time spent among them. I have leased them to a bee-man for another year.

Onawa, Ia., Nov. 13, 1883.

S. B. MARTIN.

I increased my 8 colonies that I wintered last season to 32. They are all well provisioned. They also gave me 200 lbs. of fine comb honey in 1-lb. sections. They are all well packed in chaff, according to your idea of chaff packing, and I feel easy about them.

C. H. HUBER.

Rural Valley, Armstrong Co., Pa.

SEEKING A FOREIGN MARKET.

Our enterprising friend, Mr. Willows, of Carlingford, who made a crop of several tons of honey this season, has, I believe, sailed for England, hoping to dispose of his sweet harvest across the water. Good luck and good prices to him.

C. W. YOUNG.

Stratford, Ont., Dec. 4, 1883.

REPORT FOR 1883.

I commenced the past honey season with 28 colonies, about equal parts Syrian, Italian, and blacks; all in double-colony chaff or sawdust hives. Four or five of the above were weak or queenless, so we could not extract from them. The remainder were from medium to good condition. I increased to 75, principally by natural swarming, and doubled down to 69 for winter, 46 of which are in double-colony chaff and sawdust hives, and 23 in chaff. Nearly all in good condition. I extracted 3500 lbs. of fine honey, mostly from top-stories, and did not at any time interfere with their winter stores. About half was clover and raspberry, and the rest basswood honey.

LOWER VENTILATION.

I admire your conclusion about large fly-holes for winter for outdoor wintering. I believe in keeping hives close and warm above, and plenty of fresh air below. I don't think they can be packed too warm, providing they have plenty of fresh air at the entrance, and ample provision made in the lid or cover to dry out the cushions as fast as the dampness rises up through them.

W. G. RUSSELL.

Millbrook, Ontario, Dec. 3, 1883.

## Blasted Hopes,

Or Letters from Those Who have Made Bee Culture a Failure.

**Y**OU can put this in Blasted Hopes. When I made my report last fall I told you that you might hear from me again, if the bees did not die in the winter (and you will); but this time the corners of my mouth are turned down, while last fall they were up. Well, they wintered well — lost only a nucleus or two; went in with 80 and came out with 116 good swarms. How is this for wintering in cellars? Can you beat it in chaff hives, Mr. Root? Perhaps you would like to know how it is done. Well, there is no patent on it, and any of you can do it, if you only know how. We got a good boom on white clover, and it did look for awhile as though we should have a big crop of honey to give away this fall. But, presto! and the whole business stopped, and that was the last of it. We got about 1700 lbs. of merchantable comb honey; extracted, say, 200 lbs., and have got 300 or 400 unfinished sections. This, remember, is from 116 stands, spring count — a pretty showing, is it not? I have got in cellars 175 swarms; most of them have plenty to winter, and a few light ones. I don't think they will increase this winter in the cellar. Now let another wan-visaged chap step up and report, and let's see if we can't have the Blasted Hopes department written up in some kind of shape, like the Smilery. Who wants to buy 175 swarms of bees? Going, going! Had I better sell them all? What do you think, brother Root?

E. P. GIBBS.

Lyndon, Ill., Dec. 4, 1883.

Friend G., I do not think your Blasted Hopes report is a very good one; but it may stir up some of the other brethren to give us one that is more worthy of a place in this department. Very likely we are a little at fault in not keeping Blasted Hopes constantly before the eyes of those who contemplate or are just starting in bee culture. If so, we will try to do better.

### GETTING REPORTS OF THE BEE AND HONEY INDUSTRY.

A MODEL PLAN OF DOING IT, FURNISHED BY FRIEND BLISS.

**F**RIEND Bliss has worked the matter down to a system so complete, as it seems to me, we give the full details and report below.

Aug. 15 I sent blanks, like the form below, to about 250 bee-keepers in this county alone.

Dear Sir: Please fill out the following blank, and return to me as soon as the season is over.

No. of Stands in Spring, 1883,.....  
 " " " " Fall, " .....  
 " " Pounds of Honey, .....  
 " " " " Wax, .....

Average price obtained for Honey, \$...  
 Remarks.

Up to this date I have received but 15 of these blanks properly filled out. Why it is that they do not send them in, is more than I can tell. The last one arrived Nov. 10. I for one am ashamed of the above report; but it is the best I could do. As some

do not wish to have their names published with their reports, I have left all the names blank. Nos. 8 and 10 are the best; No. 4 I would suggest for Blasted Hopes.

W. W. BLISS.

Duarte, Los Angeles Co., Cal., Nov. 25, 1883.

The blank mentioned above looks as if it had been made with a rubber stamp; and if any bee-keeper in any other State wants to be furnished with one of these stamps, they can be gotten up at little expense. Letters are large and plain, and printed with violet ink, so as to catch the eye. I should think, on looking at the above blank, that at least 150 or 200 ought to have sent in their reports. However, this is how it turns out:

TABULATED REPORT OF THE FIFTEEN.

	Stands in spring, 1883	Stands in fall, 1883	Lbs. honey extracted	Lbs. wax	Price obtained for honey
1.....	62	81	5 000	60	.06
2.....	16	16	680	00	.08
3.....	112	123	8 470	73	.07
4.....	180	150	000	00	—
5.....	362	357	4 978	32	.07½
6.....	200	235	11 500	100	.08

8.....	140	200	17 000	250	Not sold
9.....	150	150	400	30	—
10.....	30	60	5 000	25	.07
11.....	75	92	2 300	Not packed	Not sold
12.....	90	106	000	00	—
13.....	65	84	2 300	50	.08½
14.....	76	80	000	50	—
15.....	25	52	200	00	Not given

### THE CONVENTION AT COLUMBUS.

**T**HE Ohio Bee-Keepers' Annual Convention will be held in Columbus, Ohio, January 14th, 15th, and 16th, 1884. Meetings will be held in the parlors of the Farmers' Hotel, where accommodations can be had at the greatly reduced rates of \$1.25 per day for all bee-keepers.

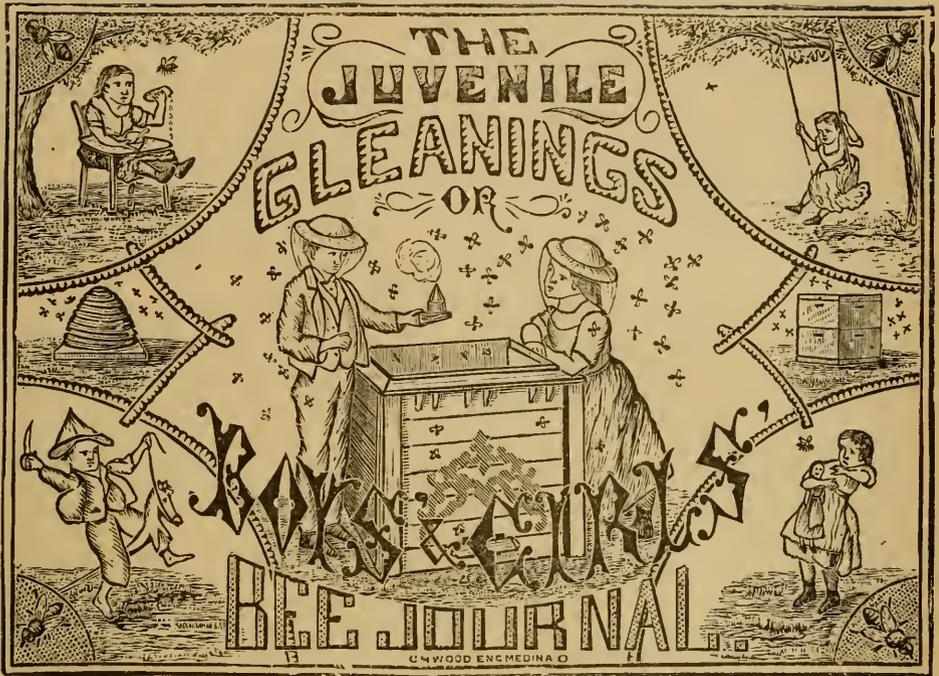

#### SUBJECTS TO BE DISCUSSED.

- How to winter bees successfully.
- How many brood-frames are necessary in one hive?
- What can be done to prevent adulteration of honey?
- How to create a home market for honey.
- How many colonies can be kept in one locality?
- Can we do without separators?
- What shall we do with second swarms?
- Which is the most salable section — one-half, one, or two pounds?
- Which are best — deep or shallow frames?
- Is it advisable to have a standard-size frame for all bee-keepers?

The above subjects will be discussed by able men. Chas. F. Muth, of Cincinnati, A. I. Root, Medina, L. L. Langstroth, and many other able men will be there; and in addition to the above, Prof. Lazenby will deliver a lecture on honey-producing plants; and Dr. Besse, of Delaware, will lecture on ancient and modern bee-keeping; and, in fact, all questions interesting to bee-keepers will be discussed. All are invited to attend. The convention will be held at the same time the Ohio State Board of Agriculture meets, and it is customary to have half-fare rates on all roads leading into Columbus.

C. M. KINGSBURY, Sec.

Mt. Vernon, Ohio, Dec. 3, 1883.

He that is faithful in that which is least, is faithful also in much.—LUKE 16:10.

### MYSELF AND MY NEIGHBORS.

WHO IS MY NEIGHBOR?—LUKE 10:29.

Thou shalt love thy neighbor as thyself. — MATT. 19:19.

**J**ESUS said, "Thou shalt love thy neighbor as thyself." I presume he put it in this very emphatic way for the express purpose of guarding us against selfishness. In the Home Papers I have talked to you about selfishness, and I have tried to tell you about the evil of thinking about one's self, and forgetting all about other people, or caring nothing for other people. While I look at it now, it seems to me that selfishness is the great crying sin of humanity; and the girl or boy who starts out in life with no greater end in view than to please self, will be pretty sure to come to some awful end, sooner or later.

A little story of real life is now agitating the papers, and it illustrates so vividly what selfishness may lead to, that I want to give it to you briefly. It did not occur exactly in my immediate neighborhood, nor among my neighbors, but it occurred in the neighboring town of Shelby, Richland Co., Ohio. In some town quite near to Shelby a safe had been opened and robbed, and a sharp detective had traced the burglars to Shelby, and found them in the morning sitting in a hotel. There were four of them, and he certainly lacked wisdom to attempt to arrest the four, alone and unaided. Very likely he thought there would be little resistance in such a

public place with so many around; but, my friends, when one is so lost, both to God and man, as to attempt to rob a safe, he is generally lost, also, to reason and good sense. Just think a moment of the act of robbing a safe. As a general thing, a safe contains money belonging to several different individuals—money probably earned by hard labor; may be the earnings of a seamstress or a washwoman, laid by until a time of need. Money is now usually deposited in a safe, because we have had so many sad lessons in regard to the unwise way of keeping it in houses, or about one's person.

Well, these four great strong men deliberately decided to steal this money they had never earned. They did not care whose it was, or what were the circumstances. They were determined to have it, even at the risk of their own lives. I have often wondered what they wanted it for, and what they were intending to do with it. They certainly could not want it to buy property, because such men can not use property much, of any kind. They could hardly want it for any of the purposes that people want money for. May be they wanted it to drink and gamble with. At any rate, they had got so far away from God and the precepts of the Bible, that they decided to take it. Did you ever think what a yawning gulf must be passed by a human soul, in wandering from a disposition to do right, and to love God, away off to that other shore were God and right are lost to sight, and ignored? Little by little, step by step, this path of sin is traversed. Jesus is

rejected, and Satan is accepted. Do you know what it is to accept Satan? Listen, and I will tell you. As I tell it from memory, I may not have it all quite correct, but it is substantially so.

The detective produced his papers, and demanded their surrender. One of the robbers, with an oath, shot him at once, although before he died he shot one of the robbers. Of course, the people were aroused; the station agent was one of the next to demand their surrender, but he was shot. One of them was secured, and this left two at large. In a few minutes over four hundred people were in pursuit of them. One was soon taken. The more desperate one of the two, however, fled; and when he found they would soon run him down he met a man on horseback, and ordered him to get off. The man refused, when the robber shot at him. He thus obtained the horse; but as it was not a fast one, he soon fixed his eye upon one driven by two women. He ordered them to get out of their buggy. They also refused, when he fired at the two helpless women. Of course, this state of affairs soon created the wildest panic in the neighborhood and vicinity. Perhaps never before were people aroused to a higher frenzy of indignation. Three men were dead; others were being fired at, and the desperado was still at large, dealing death and destruction to whoever stood in his way.

He at length passed by a man and a boy who seemed to have about the kind of horse he wanted in order to make his escape. He, as before, peremptorily ordered them out of their wagon. They refused, until his revolver was again used. Then the man got out; but the boy showed fight, and in the struggle the robber fired again, cutting one of the lines with the bullet. The horse ran away, the vehicle struck another, and was overturned in the streets, and the desperado stood, the center of the indignant crowd who now came up around him. He now showed his cowardice, for such men are always really cowards. The miserable, lost, and ruined soul called on the crowd to spare his life because of his mother. He evidently thought that the holy and sacred word "mother," used at such a time, might have the effect of winning sympathy. Now, my dear friends, I do not mean to say that what the crowd did was right; for in fact I am pretty sure it was not right. It is right to kill, to save life, and he told them he surrendered, and begged them not to kill him. But before the words were hardly out of his mouth he was riddled with bullets.

Truly, "the way of the transgressor is hard." Just think of it, children, what an awful fate, and what an awful scene, right here in the midst of schools and churches and civilization! Is it possible, that the love of money can prompt rational human beings to acts like this? When you are prompted by selfish feelings; when you are thinking of self, and forgetting God, your neighbors, and your native land, think of the awful end of these men who deliberately and coolly set aside and ignored that little precept which Jesus gave us, "Thou shalt love thy neighbor as thy self."

## THE DISCOVERY OF SILK.

COMPILED AND WRITTEN BY MISS NELLIE LINCOLN ROSSITER.

**T**HE discovery of silk, by one of the imperial family of China, some three thousand years ago and more, has brought forth one of the most important and valuable industries of the world. We are told, that "since that time, there is set apart in the gardens attached to the Chinese royal palace, a special place allotted to the cultivation of the mulberry-tree (called in China the golden-tree), and to the raising of silkworms." "It was during the reign of the Emperor Hoangti that a new epoch commenced in the culture of silk. The insects were sheltered and carefully tended, and the real rearing then began."

From the history of China we learn, that "2700 years before the Christian era, the Emperor Hoangti, the Emperor of the Earth, who reigned for more than one hundred years, taught the Chinese to construct houses, carts, ships, mills, and other useful things of a similar kind, and persuaded, moreover, his first and legitimate consort, Si-ling-ché, to attend to the silkworms, and to try several experiments in order to increase their utility; wishing, as he said, that his wife the Empress might also contribute to the welfare of his subjects. The Empress accordingly gathered the silkworms from the trees, and, with the women attached to her household, tended them with much care in the imperial apartments, supplied them abundantly with mulberry leaves, and kept them very clean. It was soon discovered that they thrived better in rooms than in the open air, where they were constantly exposed to their natural enemies, birds, serpents, and spiders, and to the ill effects of changes of temperature—all which were obviated by subjecting them to domestic care. The cocoons gathered in the open air and in the rooms were also very different; the latter being not only more numerous, but of a better quality, and richer in silk. Care was afterward taken that the eggs were hatched within the rooms, and there were thus two kinds of silk culture—the natural and the artificial; the superiority of the latter becoming more and more manifest."

"Similar exertions for the domestic culture of silk were made by the succeeding empresses, among whom the consort of the 'Augustus of China,' Yao, principally distinguished herself. The art became thus the principal occupation of the empresses, and several apartments of the imperial palace were given up to it. From the highest rank of females, it came to be exercised by the whole fair sex, and obtained such favor that it proved to be the principle source of the wealth of China, which was from thence denominated 'the inexhaustible storehouse of silk.'" The fair sovereigns of the empire did not, however, content themselves with the rearing of the worms, but attended also to the carding and the weaving. The original promoter of that art in China, the Empress Si-ling-ché, had already taught her women, "to convert the raw material into clothing stuffs, and to embroider them with representations of flowers and animals." Soon, from the emperor down to the learned classes, the princes, courtiers, and mandarins; and, in short, all who were in sufficiently affluent circumstances, were dressed in satin or damask. This greatly encouraged the rearing of worms and the weaving and manufacturing of silk, especially as it occasioned a

sumptuary regulation, which still continues to subsist, and marks the distinction of ranks among the Chinese; the higher classes having appropriated to themselves the exclusive privilege of wearing the silk stuffs, and assigned to the inferior orders, cotton and cloth dresses.

There, friends, doesn't that sound a great deal like bee culture? and is it not funny that two industries have developed so much alike? How I should like, if I dared, to go into the study of silkworms and silk-raising; but many, many times over have I been obliged to say to myself, "No, my friend, you must not scatter your powers, when life can not compass all industries, and it is more important that you do well what you do do, than that you have a little smattering of so many things." Another thing, friends: Do you not notice how the development of silk-growing seems to have been almost entirely in the hands of women? What more fitting work for the wife of a king? and what more praiseworthy work can there be for women of the present day who stand prominently before the people, than to encourage industries like silk-raising and bee-culture? The study of the natural history of these insects that one must do to progress in the work, leads, as it were, almost into the portals of God's own domain. We see God, as it were, through his mighty works.

#### ANNA AND HER LIGHT-HOUSE HOME.

ALSO SOMETHING ABOUT "PETER'S" NEW NAME.

**I** LIVE on an island at the foot of Lake Ontario, near Sackett's Harbor. My papa keeps the light-house. My auntie lives here too, and keeps bees, and she takes GLEANINGS. I should like to see that baby-b-y of yours very much, and I looked clear through auntie's A B C book to find his picture, but did not succeed. I have read that you want a name sent for your little boy. I have brothers named Walter and Ralph. I think those are nice names, and I have cousins Bruce and Hugh, and I think those are nice names too. A few days ago there was a bad storm, and we are afraid some poor sailors were wrecked. We have an old cat eleven years old.

ANNA M. JOHNSON, age 9.

Henderson, N. Y., Nov. 15, 1883.

Thank you, Anna, for the names you suggest, but our baby is already named. A short time ago a kind lady suggested we should name him Huber, after the father of bee culture; and as the name seems to please all the baby's friends and relatives, he is already christened Huber, or "Hubie," for short. And now everybody is inquiring who Huber was. And that makes me think of what friend Langstroth said when I last saw him, that there is no good translation of Huber's writings in the English language; and, for that matter, it would be pretty hard to get a copy of the only translation that ever was made. Now, friend Hasty, I wonder if you see what is coming. You told us you could "quack Latin." Can you quack French? Now, let us turn in, and even at this late day or hour hunt up all we can in regard to poor old blind father Huber. If any of our

readers can tell us where we can find a copy of Huber of any sort whatever, they will confer a favor, for we want to be able to teach little (I almost said little Peter; and, by the way, I think we will have Peter for the second name) Huber all about his illustrious namesake, when he gets old enough.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES & OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Off, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chiel's amang ye, takin' notes;  
An' faith, he'll prent it."

#### MY UNCLE BEN.

**I** TOLD you last month I had an Aunt Sarah. Well, I have got an Uncle Ben, but I have not seen him for a great long while. When we were children, the word Uncle Ben always used to bring pleasant associations with it. When somebody said, "Uncle Ben is coming," there was always a general rejoicing; and when we went down to grandfather's it used to be the nicest kind of fun to go with Uncle Ben. He used to take us fishing and chestnutting, and he was an adept in climbing trees, and shaking down the nuts, and then we used to pick them up on halves; that is, he had half for shaking the trees, and we had half for picking them up. I used to think it was the nicest way to get rich that ever was thought of, picking up nuts on halves. But I believe the most fun for me was in helping Uncle Ben make maple sugar. When he made sugar it was almost always sunny days, and he used to go around from one tree to another with a couple of tin pails; and all the funny things he found he used to call us to see. I used to carry sticks to make the kettle boil; and when it came noon, Uncle Ben would surprise us by skimming boiled eggs out of the sap-kettles. My! but were not those eggs nice? Sometimes they cracked open, and the sweet syrup would get inside, and then we had boiled eggs sweetened with maple-sugar syrup. I can taste that maple syrup now, when I think of the tin dipper. Well, we have all grown up; Uncle Ben has got to be almost an old man, and perhaps he is more bald-headed than I am. But what do you suppose made me think of Uncle Ben

this morning? Why, it is because I got a very prettily written letter from a lady who teaches Sunday-school away off down in Missouri. I did not think a word about Uncle Ben when I was reading the letter, but I just thought a great lot about him when I got to the end of the letter. You read it, and see if you can tell why.

*Dear Cousin Novice:*—The only consolation I have for not thanking you ere this for GLEANINGS is to resort to the old saying, "Better late than never." GLEANINGS has been a welcome visitor to me for several months, for which I return many thanks to you. We enjoy reading it, very much. I say *we*, for "that husband of mine" is generally the first to open and read it. I especially enjoy Our Homes, but am not much interested in bees, although I think they are very useful little pets. I see a great many letters in GLEANINGS from Missouri, but none from this place. I can say nothing on the bee subject in this place, only that I have not seen *one bee* since I came here, and have lived here a year.

I will give you a little description of our town: It is a mining town, of a population of 5000. Lead is the production. The works cover a number of acres of ground, and it is said that the largest lead-mill in the world is to be seen here. About 600 men find employment in these works. Although it is a mining town, it is quite a nice one.

We have a good Sabbath-school. The school is going to give a share of \$10 for the benefit of a theological seminary in Nebraska. My class (young married and single ladies) is going to give a share of \$10 besides the school. I think you are doing a great deal of good in this world, and will surely reap a great harvest.

One of "Uncle Ben's" daughters,—  
MAY HUDSON.

Bonne Terre, Mo., Nov. 22, 1883.

#### 9 SWARMS FROM 3 HIVES.

My brother keeps bees; he has got 13 swarms. He had 3 swarms in the spring, and they swarmed 9 times. He bought 5 swarms this fall, and put 2 of them together. KATIE BRIGGS.

Deposit, Del. Co., N. Y., Nov. 13, 1883.

#### SOME BEES THAT ARE TO BE KILLED.

Papa had 55 swarms of bees, but he will have to kill some of them, for he is going out west, and can't sell all of them. LEWIS S. SCHWAB, age 7.

Atkinson, Henry Co., Ill., Nov. 10, 1883.

Can not some one take those bees and save them from their impending doom? I am sure, friend Lewis, your father would rather give them away than to kill them, would he not?

#### EDWIN AND HIS BROTHERS AND THEIR BEES.

In the spring we had 12 colonies of bees, and for awhile last summer it seemed as if they would not quit swarming, and now we have 35 swarms. I have 3 sisters and 4 brothers, and I am next to the youngest. Last spring pa gave us three younger boys a swarm apiece in Langstroth hives. But only one gave any surplus honey (about 30 lbs). There is a great deal of white clover around her. We take GLEANINGS, and I like to read the JUVENILE letters very much. We do not do any thing with our bees at all in the winter, but let them stand all the year round without moving them, until this year.

EDWIN J. STICKLE, age 13.

Macomb, Ill., May, 1883.

#### KATIE AND HER LITTLE SISTER.

My pa keeps bees. We have 7 swarms. Two went to the woods. We moved from Effingham Co., Ill., to Vigo Co., Ind., and lost two swarms. I should like to see your little boy, but I live too far away. I have a little sister; she can just stand alone. She is eight months old.

KATE B. WEBSTER, age 9.  
New Goshen, Vigo Co., Ind.

#### FROM 18 TO 41, AND 6 BARRELS AND 800 LBS. OF HONEY.

My pa has 41 hives of bees now; he had 18 last spring, and did not lose any during the last winter. We have had a great time for honey this summer, and got 6 barrels of extracted honey, and about 800 lbs. of comb honey. Don't you think this is doing very well?

CLARA A. LURKER, age 13.  
Cold Spring, Camp. Co., Ky., Nov. 15, 1883.

My pa keeps bees. He has 55 swarms. I have got two big brothers; the elder one went to Wisconsin this week. He wants me to write him lots of letters. I wish you would send me some of those little envelopes on your five-cent counter. I think you had better name your little blue eyes Jumbo. I will send you five cents to pay for the envelopes. I hope you will think this is worth printing.

MAY SEAMAN.  
Harford Mills, N. Y., Sept. 22, 1883.

#### MAGGIE'S REPORT.

My father has 43 stands of bees. He worked most of his bees for extracted honey, and he got 1800 lbs. from 14 swarms, and about 200 lbs. of box honey. He wants to winter some bees in the cellar. Pa takes GLEANINGS, and I like to read the letters that are in it. My brother has 2 swarms. Pa has not got any black bees, but he has the Italians and hybrids.

MAAGIE L. STEITZ, age 11.  
Stottville, Col. Co., N. Y.

#### HOW JOHN'S FATHER ITALIANIZED ALL HIS HIVES.

Pa has bees. I have a hive of Italians. Pa bought an Italian queen; divided, and they made five queen-cells, and one hatched; they cut one down, and we moved the frame to one that had no queen, and they hatched one. We took out a black queen from a stand, and moved the frame again, and they cut one down before they missed their queen. They hatched the other, so all four have Italian queens from one.

JOHN M. WITTE.  
McGregor, Tex., Oct. 30, 1883.

#### HOW TO GET EARLY TOMATO-PLANTS—BY A JUVENILE.

As pa is writing, I will say a few words. I can wash dishes, and milk; am learning to spin; I can twist yarn, and do many chores for my mother. I will tell the juveniles how to plant choice seeds. Fill large egg-shells with rich soil and sand; plant one seed in each; set them in a dish of sand; keep moist. If this is worth a book, please send Silver Keys.

MARY F. PIERSON, age 9.  
Kellerville, Ill., Nov. 22, 1883.

To be sure, your letter is worth a book, Mary, for it not only tells what you can do, but it also tells what other folks can do. But the information you give is a little in advance of the season, I opine. Wait until about February, and then start your tomato-plants in egg-shells, and they will be of some value. It will do no harm, however, for some of the young ones to raise some plants now, so that they can "get the hang of it."

## THE SECRET OF GOOD LUCK WITH BEES.

We couldn't do without our bees. I have a sister and a little brother, and we are very fond of honey. We have all the honey we want. My pa always has good luck with his bees, because he takes care of them. He traded two hives for a load of hay this fall, and he has 13 left. He sells some every year.

CHARLIE PALMER, age 10.

Fremont, Ohio, Nov. 26, 1883.

## MAUD'S REPORT.

I thought I would tell you how papa is getting along with his bees. We have 33, some packed in chaff, some in corn fodder. He took about 800 lbs. off. I should like to see your picture in GLEANINGS. I go to school; I have only one sister; she is larger than I am. I play the organ. MAUD A. RHOADS.

Lovsville, Perry Co., Pa., Nov., 1883.

Why, friend Maud, my picture is already in the A B C book, and we have a photograph, cabinet size, which we mail to all who send us a new subscription, after they have subscribed themselves. Isn't that enough?

## BERTHA'S PET QUEEN.

My pa wintered out 4 swarms last winter, and from these 4 swarms he has 13 now. The other day pa and I were transferring one of the light swarms to another light swarm, and in the old hive I saw a queen-bee. I tried to catch it, but it rushed in among the other bees, and I called pa, and he helped me catch it. I got a glass, and he put it in, and I got a piece of honey and put in the glass, and the bee is living yet. Pa was at the bee-keepers' convention at Toronto, and saw you up there. He has sent for an A B C book, and I shall be glad when it comes, to see what he meant by the A B C book.

BERTHA C MORRISON, age 11.

Frelighsburg, Can., Nov. 9, 1883.

## WHICH ARE THE BEST BEES, AND WHICH IS THE BEST HONEY?

My brothers have 30 stands of bees; they have 3 kinds of bees—Italians, Holy Lands, and Cyprians. For my part, I think that the Cyprians are the crossiest. The honey crop wasn't very good this year. The frost killed the buckwheat in full bloom. I think the white clover is the best; don't you? I am going to school, and to Sabbath-school, and I like to go.

AUGUSTUS F. MACK, age 10.

Mount Cobb, Lackawanna Co., Pa., Nov. 15, 1883.

I guess we pretty much all agree that the Cyprians are the crossiest, friend Augustus; and I guess we pretty much all agree, too, that there is no finer honey in the world than white-clover—that is, there is nothing finer as a steady diet.

## BELLA'S LETTER, AND HER CONCLUDING POEM.

My pa has 3 swarms of bees now; he got them this fall, and they worked hard. They are now packed away for winter. I go to school. Our Sabbath-school has closed. I should like to see the baby that I read about in the JUVENILE. I inclose a card for the baby.

The bees are busy,  
Bright little things;  
We can be so,  
Though we have no wings.

BELLA FRASER.

Campbellville, Ont., Canada, Nov. 24, 1883.

That is a tiptop letter, friend Bella, and I admire especially the card it contains. I wonder if you are a busy little body, and always busy at something good.

## THE LITTLE GIRL WHO DOESN'T KNOW ANY THING ABOUT BEES, AND DOES NOT LIKE HONEY.

I have seen so many little girls and boys writing for the JUVENILE, I have put it in my head to correspond also. My ma has plenty bees, but I can not tell you any thing about them, but that they sting awfully. Ma has had her bees three or four years, and I never saw so much as the inside of a hive. My little brother is braver than I; he goes about them without veils or any thing on his face, and he helps mamma to catch new swarms, and he does not care if they do sting him; sometimes there are about half a dozen on him, and he doesn't mind them, and they go on about their way; but I could not stand still with that many bees on me; I think I should go crazy. I don't like honey anyhow, and the bees don't like me.

ESTELLE H. BLAIZE, age 10.

Bay St. Louis, Miss., Nov. 22, 1883.

## FLORENCE'S LETTER, WRITTEN BY HER PAPA.

I have a bright little girl five years of age and she used to claim the JUVENILE GLEANINGS until you got its mother's cover on, and to-day she said, tell Mr. Root to send her a little book all pictures and not so much print, as she can not read yet. She only knows a few letters, but she insisted on writing a letter like the other children. Below is her letter.

"My name is Florence May Shaver. My pa keeps bees. I helped him sow some Rocky Mountain beplant last fall, and this summer the bees worked on it. We had a flower garden and had lots of flowers, but the bees liked the poppies the best of all. I have no brothers or sisters but I have a little wagon and a doll. My ma wears spectacles. Pa has a pair too. Send me a nice book, if you please."

The above are her words. She is a fearful talker, and I had to write her letter. J. H. SHAVER.

Sloan, Iowa, Oct. 27, 1883.

## BITTER HONEY, ETC.

Pa received GLEANINGS, and I read in it about the marriage of "Toka," and I am writing to wish her much joy; also to thank you very much for the book you sent me. Our bees gathered bitter honey, and we don't know what they gathered it from, unless they got it from the dog-fennel. And now I want to ask you a question: Will the honey from the flower of the garden sage be bitter? CHAS. H. KYLE.

Houston, Mo., Nov. 17, 1883.

As bitter honey has already been mentioned as coming from dog-fennel, I should think it very likely, friend Charles, that was where yours came from. I do not think the honey from garden sage would be bitter; in fact, the finest honey in the world comes from the California sage, or mountain thyme. It might possibly have a sagey flavor when first gathered; but if thoroughly ripened in the hive, I am quite certain you would perceive no objectionable flavor.

## HOW LAURA GOT HER HYBRID BEES.

I thought I would write you a letter about my bees. I can't write very well, but I will soon learn, for I am going to school. I have got one stand of bees. Papa gave it to me. He has 30 stands; he had 100 last year; they nearly all died last spring, but none have died this winter. I'll tell you how papa happened to give me my bees. He and I were out in the aplay in February, looking at the bees,

and he picked up a dead queen on the outside of the hive, and gave her to me. I took her in the house, and I saw her kick, and then I went and got a little honey, and put on her mouth, and she came to, and then I went out and showed her to papa, and put her in the hive, and then he gave me that stand of bees. I have two big brothers, but they don't like to tend to the bees, for they don't like to be stung. I don't like to be stung either; but I have to help pa feed the bees every time. He feeds them in little feeders he got of you. I wish Blue Eyes could come and see me. I know I should love her.

Mattoon, Ill.

LAURA E. BALDWIN, age 8.

#### HOW AUBREY GOT STUNG BY A DEAD (?) BEE.

Pa bought a colony of bees the 23d day of last May, and they swarmed twice this summer. I read about your baby, and I am much interested in it. We have a baby named Stella. Ma put her by a chair, and she stands by it. I found a dead bee; and as I was showing ma the scales of wax, I happened to press on it, and it stung me. One day I tried to catch a bumble-bee. It was in a bloom of snake's-head, and I tried to catch it with a leaf, and it stung me. It did not hurt much at first, and I laughed; but directly it commenced to hurt, and I did not think it was so funny. Pa put his bees in boxes, and piled straw in around them, and put boards on to keep them from being rained on. He has 6 hives, and a great many frames and sections ready for next summer's use. He has a turning-lathe and jig-saw, and he made him a smoker, and it did not suit him, so he made another. He took about 50 lbs. of honey this season. I forgot to say that Stella is only five months old, and that is the reason I told you about her standing by a chair. Can your boy beat that?

AUBREY BOWERS, age 10.

New Ross, Ind., Nov. 12, 1883.

No, Aubrey, our boy can not beat that, but he can do as well, although I did not know it until I got your letter. I took him and stood him up by a chair, and tried him, and he stood up very well; but as he began to scold quite lively pretty soon, I rather think it was hard on his chubby little ankles. Our boy is six months old. But that is nothing strange. You know that girl-babies are always a little smarter than boy-babies; but, you see, when we get older we get ahead of them. I think it was really naughty of that dead bee to sting you. Dead bees surely ought to know how to behave better than that.

#### OLIA AND HER TEACHER.

My pa has 20 hives of bees. He got a great deal of honey this summer. He takes GLEANINGS. I read it, and see many letters in it. I go to school. My teacher is a good one when she is not mad; but when she gets mad we have to look out for her. Pa has an extractor he bought from you. He says he would not take \$25.00 for it, if he couldn't get one like it.

OLIA BANNON, age 12.

Venango, Pa., Oct. 10, 1883.

My little friend, I want to caution you somewhat, about getting in a way of finding fault with your teacher. It is a very bad thing for girls and boys to do, and the offense ought to be a very great one before the child is allowed to talk about his teacher. Are you not mistaken, in thinking your teacher gets mad? Children often use

the term "mad" when the parent or teacher is simply using proper discipline. Suppose your teacher could not make you mind, and in a sort of helpless way allowed every scholar to do as he pleased; or suppose she did not have firmness and decision enough to keep you straight, would you have any respect for her? When you come right down to it, now, do you not think more of a teacher who makes you "toe the mark," as the expression goes, even though she sometimes has to be severe and stern to do it, than you would of a teacher who was afraid of the scholars, and could not manage them at all? What becomes of children who are never made to mind? I think, if you look about you, you may find some such in your neighborhood. I have sometimes thought it was as great a misfortune as if they had been crippled for life; for if it results in letting them grow up to be bad men and women, it is the worst sort of crippling that ever happened to any human being.

#### STELLA'S REPORT: FROM BLASTED HOPES TO REPORTS ENCOURAGING.

Pa got some Simplicity hives constructed; got a friend to put swarms into two of them; went into winter with plenty of honey; gave bees no protection; came out in the spring with about one quart of bees in one of the hives. He then bought another colony of my uncle; got 50 lbs. of comb honey and one new colony, making three in all. This winter, 1879, he gave bees protection. They came out in the spring as strong as they were when put away for winter.

During this season he increased to five. In 1880 pa purchased an extractor, smoker, and some hives of you; extracted only one gallon of honey; took no comb honey. He had now spent fifty dollars; had got 60 lbs. of honey, all told. This winter he put away his bees with cushions on top and each side. Bees all died before winter was half gone; had not consumed half of their stock of supplies; so in 1881 he was in Blasted Hopes. In 1882 pa purchased two new colonies of my uncle, one of which he put in our hive the 28th of May; the other the 15th of June. During this season he extracted 150 lbs. of honey; wintered by filling top boxes with cut straw, and then banging horse-blankets over the hives, letting them hang down all around nicely, leaving room for bees to pass in and out. They came through all right, and this season we have taken from the two colonies, 340 lbs. of extracted, and 40 of comb honey, and got three new colonies, one of which he gave to my brother. This is my first letter.

STELLA BRANDON, age 13.

Laura, Ohio, Nov. 16, 1883.

Thank you, Stella, for your very kind and complete report. There are several lessons to be learned from it. For instance, during the first few years your pa kept bees it would look very much as if yours was a very poor locality; but the conclusion shows it must be a very good locality, to get 300 lbs. of honey from only two colonies. It also illustrates the importance of not being discouraged by one, two, or three failures, and that a bountiful flow of honey will be almost certain eventually, if the bee-keeper tries to inform himself, and keeps on year after year.

## Our Homes.

Our Father which art in heaven.—MATT. 6 : 9

**I**N one of the Home Papers of a few months ago, I told you that I had been in the habit of late of asking myself questions. I say "of late," because I am now in the prime of life, and my powers of mind are probably as good as they ever will be. My judgment and wisdom are probably as bright and clear as they ever will be again during my life. Well, you know it is a common expression to say, when we are discussing certain acts, etc., that common sense ought to teach a man so and so. And now the question arises, What does common sense teach? what is common sense? I presume we understand by the term, at least to a certain extent, that it is a kind of sense, or a sort of wisdom, that all intelligent beings will agree to. For instance, we have the proposition that honesty is the best policy, and all men agree to it—at least, they agree to it in theory if not in practice. So we may say that common sense teaches that honesty is the best policy. I might go on enumerating other propositions that common sense would agree on or assent to, and the question would soon arise, How broad is this common sense, or how much is there in this world that universally accepted? Going still further, is what does common sense teach us of God, the Creator? How ought we to look toward God, and what should be our relation to him? What is there stamped in ourselves that we can feel and see and know in regard to the Supreme Being who reigns over all? Jesus taught us to call him our Father—our Father, too, "who art in heaven." This is the language of our opening text. Luke says this was given in answer to a question by one of the disciples, who asked him to teach them how to pray. As the prayer is given a little differently in Luke from what it is in Matthew, we presume this was at another time; but his reply was the same, that they should commence by saying, "Our Father which art in heaven." We judge from this, that Jesus deemed it best to teach them in the outset to call God their Father, or their heavenly Father, and that the relationship between father and child was the best illustration that could be given, of the relationship between ourselves and God. Well, I have been often, of late, considering this point of our relationship to God; and the more I study it, the more it seems to me that common sense dictates, or my best wisdom and judgment, if you choose, that the best way we can think of God is as a heavenly Father. Please excuse me for homely and commonplace illustrations, but in this line I have been studying over and over the new member of our household that God has so recently sent us. What is it in our boy-baby that I most love to see? what is it that makes my heart thrill with joy, and pleases me most? Is it not to notice his growing faith and love for his papa? With that growing faith and love, I am also pleased to see him exhibiting a sort of right, or ownership. His look and attitude seem to say em-

phatically, *my* papa. He owns me; in one sense, I am his property, to a certain extent.

Yesterday, for the first time, almost, since the large engine was put in our factory, we had somewhat of an accident with it. In the middle of the day we had to stop. As I passed around through the rooms, and noticed how pleasant and comfortable all seemed to be, I felt sad to think that very soon the rooms would grow cold under the influence of a pretty chilly, wintry day. The massive iron pipes that had been giving out the heat would soon cease to give it out, for the steam was stopped. As we have dispensed with all our stoves, business must come to a standstill right speedily, and the prospect was that some hundreds of dollars would have to be expended before the work could go buzzing along again. Well, I went over to the house for something, and caught sight of the baby. His face brightened up, and I was greeted with a crow and one of his bewitching smiles. He said by actions, "No, papa, no matter what has happened, you must not look troubled or gloomy when I am around. You have always given me a pleasant smile and word of cheer all my little life, and you must give them to me still. It is my right, and I demand it." And I was glad he did demand it, friends. It did not hurt me a bit, to be obliged to look pleasant to somebody, and it admonished me that it was my duty to trust in God, and to lean upon God, even as the baby trusted and leaned upon me. Still further, it was my duty and right to demand of God, (please bear in mind, dear reader, that I use this word with reverence and respect) grace and strength and peace for all my trials. In other words, it was my duty and my privilege to sink self; to pound down, if that is the right expression, gloomy or complaining feelings, and let God rule. If it were an earthly father I was trusting or appealing to, he might fail in judgment and wisdom; but our Father which art in heaven can never fail; his arm is never shortened; it is *all* his, and he has told us over and over again, that he must be first and foremost and supreme; not even steam-engines, nor factories full of busy workers, have any right to push themselves up before him, "for I the Lord am a jealous God." He has told us so, or he has said in substance, "I want to reign in your hearts entire; your love for me must not be divided; I can not accept of a divided love."

Suppose some other baby should be brought into our home by friends or relatives, and I should take it in my arms, with the kisses and caresses that I have been giving our own baby. Very likely he might have a touch of jealousy, for even babies often show it. In one sense I should hate to have him show unreasonable jealousy; but in another sense it would give me a great thrill of joy to think I held such a place in his affections that he could not bear to think of the love being divided; that he wanted the whole of it entire.

Perhaps my illustration is a poor one, but I think it answers the purpose, dear friends. God is jealous of every thing or anybody that can in any way divide our love to him. No

one can have two earthly fathers. Father holds just one place; so God fills one place, and that one place only.

Now, friends, I want this Home Paper to be a helpful one. I need hardly tell you that I want all of these Home Papers to be helpful. I know you have trials and difficulties; I see them running all through the letters you send me from day to day. I want to see you all happy; I want to see you enjoy your work, and enjoy life, and I want to see you enjoy the things God has in store for you. Now, all the enjoyment in this life depends very greatly upon a proper understanding of our Father, and knowing what we ought to do, and especially what our deportment should be toward him. Does he want our prayers? The Bible says so, and I think common sense says so. Jesus did not tell that disciple that he need not pray at all when he asked him how he should pray; on the contrary, his reply seemed to indicate that he should pray often. Shall we pray often? and how shall we pray? Let us have some more homely illustrations, if you choose.

Some time ago, in talking with friend Kenedel, we were discussing the matter of employing boys; for there are many in the city of Cleveland constantly seeking employment, as well as here in Medina. He made this remark: "I make it a rule, never to employ a boy who asks in the outset what pay he is to have." At first I did not just see why he should make such a trifle a test of the boy's disposition and ultimate value. I set common sense at work, and pretty soon I decided this: That it was an excellent test; for boys who are seeking employment, and want to know at the outset what pay they will get, would, as a rule, in the end, think that pay was the principal object, and learning to do business, or getting a start with a good business man, was of secondary importance. Suppose that some one who had been thinking of becoming a Christian should begin to ask God what pay he should get, or should question the pastor or Sabbath-school teacher, as to how much pay he should get for becoming a Christian; suppose he should ask how soon he should become very happy, or, would God commence right off to send him whatever he prayed for. Why! it would be awful. One can never become a Christian in that way; neither can any one become a profitable member of society where his constant question is, How can I get the most of this world's goods by the least exertion? Religion is the direct opposite of selfishness; and love to God, and love to one's fellow-men, drives out selfishness. The little illustration I have given you shows what the attitude of one seeking employment should be toward the one he would have for his employer; or, if you choose, it illustrates what the attitude of a son should be toward a father, and, in the same light, our relation toward God. Now, if we are the children, and God is the Father, what line of conduct becomes us? the Bible teaches not only that God is a heavenly Father, but that man is free to do right or wrong. Every son has the choice of being obedient to his father, or disobedient; and although the

father may, as a general thing, by good influences, keep the son from evil ways, the son has the power to choose evil instead of good, if he wishes. He is free, as it were; and although the father may be seeking daily and hourly to find some means by which he may restrain the son from evil, if the son be determined on evil he may fail, simply because we are free moral agents.

Now, of late, in asking myself what prudence and common sense and the Bible dictate, I have received answers something like the illustration I am now going to give you; and in the illustration I am going to use, please bear in mind that I use myself as an illustration, as an earthly teacher, and divine what my attitude toward God should be, by asking myself the question, *what should the attitude of any son or pupil be toward any earthly teacher?* I have before spoken of those lessons Christ gave us, of the need of importunity in prayer, and I have told you, too, that the more I studied this matter of importunity, the more comfort it gave me. How many parents are there who have not, some time or other, wished their children would come to them more, and come to them in an importunate way? I am glad to see my children want things, and it gives me a thrill of pleasure, too, to see them want things vehemently. I am glad to have an employe come to me with wants, and I am glad to see him come with great wants; in fact, it always gives me a thrill of pleasure to see boys and girls who are vehement and importunate—that is, where they are importunate for things that are proper and right. Give me a boy who is vehement and importunate in his desire to get an education, and I feel at once that I have something to build upon—bearing in mind, of course, that his importunity does not come by fits and starts, but that he has a settled determination to accomplish his purpose. In fact, to a certain extent I like to see people have hobbies—not unreasonable ones, of course, but I do enjoy seeing any one stick to a single idea until he develops it and knows all about it. Rather than to see people with no purpose at all in life, I believe I would rather see them intent on making money simply; but, of course, I never want to see the greed for money so great as to overrule a sense of right and wrong.

Well, I am glad to be able to say that I never had any experience in governing a son who was disobedient; but I have had a great deal of experience with boys who were not taught to obey at home. I have watched them anxiously and lovingly; I have prayed for them, and I have anxiously waited for some symptom of a desire to do right. Suppose a boy comes to me and wants work. If I am in need of more help, my first question is, "Do you either drink, swear, or use tobacco?" Very often he admits that he has been guilty of one or more of these acts. But he gives me a fair and square promise to abstain from all, if I will give him a place among our boys and girls here in the factory or on our grounds. Time passes, and I feel a little troubled about him, because I see no positive indication of a very great desire of any thing more than selfish interests, such as

I have talked to you about. Finally as I pass him on the streets I notice something very much like a cigar quickly slipped out of sight as I approach. The next morning I accost him, when I find him away from the rest. "John, are you using tobacco?"

"No, sir, Mr. Root, I have not used a bit." His words are positive and decided; but his manner is not quite what I like to see. He does not look up frankly and pleasantly, but has an evasive sort of look, and a sort of look that seems to indicate that he is any thing but happy, or the conversation any thing but pleasant to him.

"You give me your word, John, that you have not used a bit of tobacco in any shape since you gave me your promise?"

"No, Mr. Root, I have not used a bit."

Next day I am assured by the foreman of his room that he has been using it right along. What shall I do? It is not only a report that I have from him, but it is his actions that have made me feel troubled about him. But as I do not like to do any thing hastily, I let the matter pass for a day or two. Pretty soon I am informed he has been cheating in his time—not only in minutes, but in hours. What shall I do? This is a question I have asked myself many times, and my best wisdom seems to dictate that, so long as he holds his present attitude there is nothing to be done but to tell the time-clerk, when Saturday night comes, to inform him he is not needed any longer. Some may suggest talking with him further on the subject; but after many experiences in cases like this, I have not been able to see any good from further talk, or following up the matter. So far as I am concerned, I am helpless. If any reformation is to be made, it must commence with himself.

Now, friends, it has seemed to me that our attitude toward God the Father is oftentimes like this. God has done all he can until we show some signs of penitence and reformation. He has gone after us, and has plead with us to turn from our evil ways, until it would be of no avail for him to do any thing more while our hearts are hardened in falsehood and sin; while we resolutely reject, scorn, and disdain his proffers of mercy. The Holy Spirit has been grieved away. The boy who has uttered a square and deliberate falsehood about the use of tobacco will surely very soon after cheat in regard to his time; and, if not caught in the act, will hasten on quickly to some greater sin. Let us follow him a little further. When told that he has lost his place, as a rule he will readily guess why it was, and will not come to me for any explanation. Suppose, however, that I have been hasty or misinformed. In that case he will seek me at once and ask me to know why he is not wanted any longer. As this gives me an opportunity for having a talk with him, and as the act also implies that he wants to do right, I feel at once hopeful in regard to him; for just as soon as he comes to me inquiring what is amiss, then I feel that I can, with some hope of success, do him good. If he confesses his guilt, and tells me a story of temptation and sin, and begs of me to give him another chance, and try again, I feel pretty sure he will come out

all right. And here we have a lesson in regard to importunity. There is seldom any importunity where one has calmly and deliberately decided to do wrong; in fact, importunity is an indication of penitence, and a desire to do better, or to improve. In the above illustration I have put myself in the attitude of father, and the young man whom I am trying to encourage in wisdom's ways, in the attitude of son; for the relations between teacher and pupil, and between employer and employed, are like to that—father and son. Those who want to find fault with my illustration may, I am well aware, bring a grave charge against me here; but those who are seeking for the truth, as I am seeking for the truth, will probably not notice any thing amiss in my little story from real life.

Now, friends, when we study the attitude of a disobedient earthly child, and decide, according to the best of our wisdom, what course is best to pursue with him? Do we not also map out, or illustrate, what our attitude should be toward the great Creator and Author of the universe? Can we expect God to listen to or answer our prayers while our lives are lives of falsehood and contradiction? Or if we are persisting in that course which we know to be wrong and sinful, how can we expect God to follow us with the influences of his Holy Spirit, and give us peace and joy and happiness? Still further, if we realize that our lives have been sinful and wrong, and realize that we have been false and unfaithful, what shall we do? Is it not plain and clear, that our first duty is to come to him confessing our fault, admitting ourselves to be grievous sinners, without any merit whatever of our own, whereby we can claim his love or favor? Another thing: Does God want us to come to him after we have been wicked and sinful, and false and untrue? To be sure, he does, my friends; in fact, he always wants us to come to him when in trouble. He rejoices at the opportunity of being able to talk with us; or, if you choose, to be able to commune with us by his divine Spirit, and to thus attract us and guide us in our ways. Do you know what Jesus said?—"For there is joy in heaven over one sinner that repenteth." We never need be afraid that God will be displeased to see us coming again. On the contrary, he has been looking, hoping, watching, waiting; and the loving Savior is always ready and glad to put forth his hands the minute any truly penitent child starts to approach him. The thought of this has been a comfort to me; for I too, dear friends, have sometimes asked myself the question, "Will God want to see me now? will my prayers be acceptable to him, after what has just happened? can he forget it and overlook it so quickly?" Yes, friends, he can and does gladly, oh so gladly! providing you are truly penitent and sorry for the fault; providing you have "set your face like a flint" against that act of wickedness, and have left it off entirely, and for ever. This thought gives me comfort—not only because it is Bible doctrine, but because in these few weeks I have proved it by putting myself in the attitude of a parent toward a

child, or a teacher toward a pupil. What teacher is there in the world who would not be glad to see any disobedient pupil coming to him to confess his sorrow for his bad behavior? I know sometimes pupils say they are sorry, and are very ready to make promises; but this is not the kind of sorrow I am talking about. The attitude and behavior of a pupil in a very little time determine whether or no the penitence be sincere.

One more illustration right here in this line, please. A few months ago I became acquainted with a good old farmer a piece out in the country, and finally he became quite anxious that I should take his boy in my employ. I consented, and the boy came. For the first few weeks he had considerable of what boys call "choring around" to do, as new boys often do have. He did not seem very apt nor handy, neither did he seem to be greatly concerned as to whether he accomplished much of what he was doing or not. We tried him in different places. Mr. Gray mildly suggested one day, "That boy had better go back on the farm," as he did not think he would ever be of any use to us. I tried him somewhere else, and the foreman of that department pretty soon suggested much the same thing, and it was not very long before the boy got to be a sort of standing joke among the rest of the boys. He seemed slow and dull and unhandy. I talked to him some, but it did not seem to do very much good. His pay was small, as it always is to start with, but I could not consistently advance it until he advanced a little in his work. I felt sorry for him, and yet I sometimes felt indignant to think he showed so little enterprise and energy, while others about him were full of vim and go-ahead. Surely, said I to myself, he must see how little he accomplished; but it seems he did not; and in my want of charity I let the matter pass until I found him one bright day in June standing out in front of the factory in an idle sort of way, as if he had just about decided to give up, instead of going to work. His sad, sorrowful look then began to re-approach me, and I wondered whether he did not think that all he had heard said about my kind solicitude in regard to the welfare of all my hands was not a mistake. I felt a little rebuked; and approaching, spoke to him kindly, and asked him if he was not going to work this bright summer morning.

"Why, Mr. Root," said he, "there isn't any use; I get hardly enough wages to pay my board, and I do not seem to be handy at any thing."

"Why, X., you would like to get more pay, would you?"

"Why, yes," said he; "to be sure, I should like to get more. There are little boys in the saw-room who get more pay than I do."

"Now, X., I am going to talk plainly, and I may hurt your feelings; but I surely do it for your best good. Have you not observed that those little boys get around and accomplish a great deal more work than you do?"

He looked down, but did not reply.

"Have you not noticed what I say, friend X.?"

"Yes, I have noticed it," said he, finally. He had admitted that he knew he was not

doing as well as others, or as well as he might do, probably; and such an admission, dear friends, seems next thing to real repentance. When one can be made to admit that he is not doing his duty as he ought to do, and if he has any desire to improve, he has already taken the most important step in improvement. It was an easy matter for me, while he was in this attitude, to have a good friendly talk with him, and a talk, too, that would strike home and be really helpful, although it might give him pain, and hurt severely.

Instead of going home, as he intended to, he went back to his work. I could see by his look that he had formed a purpose and a determination, and I was not very much surprised when the foreman of the room remarked that something had come over X. Pretty soon others spoke of it; and ere long I was rejoiced to see him slowly but surely becoming master of his business, and taking pleasure in giving free swing to his muscle, while his brightened demeanor indicated that his mind was working healthfully at the same time he was developing his muscle.

After a few short months his wages was nearly doubled; and when he left to go to school during the winter, it was with the understanding he was to have a man's pay when school was out in spring. Now for the application.

It is not by any means always a bad sign to see a person looking sad and sorrowful. Many times we need to look sad and sorrowful; for, you know, "man's extremity is sometimes God's opportunity." The most hopeless class of people in this world are those who are satisfied and unconcerned—those who have no wants, as it were, and those who never feel troubled or downcast or discouraged. How much prayer would there be, if there were no trials for us? and how could God answer prayer, or bless us, or lift us up, as he often does, were we not driven to him? And unless our hearts are in an attitude, and we are ready to listen and ready to reach out longingly for help, how can help come to us? Is it not a fact, then, that the great reason why we stumble along through life helplessly, and without progress, mentally, morally, or spiritually, is because our hearts are not in an attitude where blessing or help can come? Should I go to one of my hands and tell him of his faults uninvited, it might have the effect of making him settle down into a bitter attitude, and do no good at all, because he would not listen, or would not care. You know how often the Bible enjoins a meek and humble and teachable spirit. You know how lovingly God strove with the children of Israel through the Old Testament, to get them turned to wisdom's way, and to turn and give up their sins. He said in substance,—

"Oh turn ye! oh turn ye!  
For why will ye die?"

And yet they would neither turn nor listen, nor be taught nor guided. Now, is it not true, dear friends, that we are right there still? Has humanity changed so very much in the few thousand years that are past? Is it not true, that the greatest obstacle in the

way of our progress from earth to heaven is just because we refuse to accept that simple little phrase in the prayer our Savior gives us—"Our Father who art in heaven"?"

## Tobacco Column.

WANTS TO KNOW, YOU KNOW.

**I** SHOULD like to inquire, not in a captious spirit, but for information, what is your objection to the use of tobacco? I can understand a crusade against whisky, for a blind man can discover the evils of intemperance; but I don't see why indulgence in tobacco is any more sinful than the use of tea, coffee, or any other luxury which is not an actual necessity. C. W. YOUNG.

Stratford, Ont.

Friend Y., I know there are some who claim there are two sides to the tobacco question; but as they are mostly tobacco-users, it seems to me their evidence is not quite the kind we want. We have abundance of testimony to the hurtfulness of tobacco, physically, morally, and spiritually, by those who have given up its use. That evidence I should consider safe, is it not? Those who have not used it may not be able to look on both sides of the question; but they have saved their money, health, etc. At a public lecture a short time ago, the speaker surprised me a little by stating that tobacco was doing more harm to-day in our land than all intoxicating liquors together. I turned to a gentleman by my side who is highly educated, and well posted in regard to matters of this sort, being principal of the public schools of Medina. He nodded assent. After the lecture was over, I questioned him there in regard to the matter. He said he had not a bit of doubt about that statement being true. In surprise, I stated the case to many of the most intelligent and best men I am acquainted with, and the verdict was, I am free to say, to my great surprise, that tobacco is doing more harm to-day than all the intoxicating liquors together. Suppose *you* propound the question to the most energetic, earnest, and honest reformers you are acquainted with, and see what they say to it.

### THE NEED OF A CHRISTIAN SPIRIT IN ALL OUR DISCUSSIONS.

In the last number of GLEANINGS, on page 762, you comment on my late letter to you on the tobacco question. After reading that comment, I can only say that I, for one, care not how much you differ with me on the use of it, or how much you crusade and write against it, if it be only done in the tone you, in your said paragraph, use. That tone is gentlemanly, and worthy a Christian; and to such I have no exception to take; but when, instead of argument, or fair remonstrance, I read abuse and sneers, it does cause me to feel a little irritable. I think your comment was perhaps better than publishing my letter, as "grievous words" do very frequently "stir up anger," and there is altogether too much snarling in the world already.

Austin, Tex., Dec. 8, 1883.

R. J. KENDALL.

Friend K., may God bless you for these kind words! I confess, that when I read them I felt like saying, "May God have mer-

cy on me for not having shown more of the spirit you commend." I do know and realize that the use of harsh, abusive, and unfeeling words is a greater evil than the use of tobacco—if the use of tobacco be indeed an evil; and I do know, too, that we have no right to dictate to others what their duty is in such matters. Even if you use tobacco, friend K., and think proper to continue its use so long as you live, right gladly I would grasp your hand, and call you brother, even though at the time I did it I might smell the odor of tobacco in your breath; and I would say, give us the tobacco, by all means, rather than the unfeeling words, if we must have one or the other. May God help me to show forth this spirit you allude to, amid all these many and varied cares. Again I thank you for your kind and courteous words, and especially for so cheerfully acquiescing when I thought best not to publish your letter.

### A CONFESSION OF FAILURE.

I have been watching the Tobacco Column for quite a while, thinking that perhaps some one would break his promise, and hand over the \$1.00; but I have seen no account of any failures. I am glad that I have seen none, and am sorry that I have failed; so, according to promise, I hand you \$1.25 to pay for my smoker. Many thanks, friend Root.

Edgerton, Kan., Oct. 22, 1883.

W. J. ENDLEY.

Friend E., I am very sorry that you have failed; but I rejoice to know that you are prompt and honorable in the matter. If you will read our back numbers carefully, I think you will find that something like half a dozen have owned up, and paid in the way in which you did.

I see by GLEANINGS you give a smoker to every one who stops using tobacco. I used it for about 20 years; but six months ago I quit using it; and if I ever attempt using it again, I agree to pay you for the smoker. A. V. HARLAN.

Pendleton, Ind., Oct. 31, 1883.

Having seen that you would mail free a smoker to all those who would abandon the use of tobacco, I will promise from this day I will never use the nasty weed again, if you will so reward me. G. H. GROSS.

Tower Hill, Ill.

For three years I used tobacco; but I stopped last March. I hear you send smokers to those who have stopped using. If so, please send me one. If I begin again, I will pay you for it. S. BAILEY.

Kenton, O., Feb. 26, 1883.

I quit chewing about 3 months ago; and if I ever use it again, I will pay you for the smoker.

Pendleton, Ind., Nov. 12, 1883.

G. M. HARLAN.

We gladly send you a smoker, friends, with a prayer that God may help you to be successful in breaking away from the bondage of tobacco. Some have written us that they broke off a great many years ago, and wanted to know if they were entitled to a smoker. If I am correct, friends, the arrangement has been to give smokers to all who give up tobacco after seeing this column here in GLEANINGS, and the smoker is a little object-lesson, as it were, to close the bargain and remind them of the pledge here given publicly before all the readers of this journal.

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE  
OF READING MATTER.

**MEDINA, DEC. 15, 1883.**

My meat is to do the will of him that sent me.—JOHN 4:24.

### AN ERROR.

PAGE 620 of this vol. was accidentally printed 520; hence 100 should be added till you get to 584, at which place the proper paging begins.

WE will pay 10 cents each for GLEANINGS for March, 1881. If we can not find them at that price, we will give 15 cents each. If that does not do, I suppose we shall have to offer more than that. We will also pay the same for May, 1875.

IN the Blasted Hopes department, friend Gibbs tells us about increasing from 80 to 116 good swarms in the cellar—or, at least, it looks that way, and he says anybody can do it. Very likely they could, if they had money to buy some of their neighbors. But if that is not what he means, we hope he will stand up and explain, and not keep us juveniles in suspense in the matter.

IN my comments on page 745, in last number, in regard to "Olefogys" owning up, I unconsciously fell into an error. "Olefogys's" hobby was, that a natural swarm seldom or never comes off without clustering, and the part relating to restraining them with a comb of unsealed brood was my own hobby. Of course, I have had to own up long ago that unsealed brood does not always answer, while "Olefogys" owns up that natural swarms do sometimes go off without clustering.

THERE have been so many calls for a larger engine than the 4-horse power we have been selling, mentioned in our price list, we have selected a 6-horse power engine and boiler which we can furnish at \$425 net. The boiler is wrought iron, tubular, and is a splendid machine for the money. This engine will run a pretty good-sized factory for making beehives, and will, if necessary, run all the machines together, including a planer large enough to plane Simplicity-hive covers.

I SHALL have to remind some of the friends, since we are having so many discounts, that 5 per cent off and 3 per cent off does not make 8 per cent. I know very well that 3 and 5 make 8, but that is another thing. You see, friends, if you take 20 per cent off from one dollar, we shall have 80 cents left; and if we take out an additional 10 per cent from the 80 cents, it leaves 72 cents as the result of taking 20 and 10 off; but the straight 30 would leave only 70 cents. Sometimes on large orders this makes a very important item. Considerable wrangles have resulted from not keeping this fact in mind.

OUR friends have no doubt discovered before this time that this issue of the JUVENILE is rather late in making its appearance. The reason for it is, the labor on small type required by the contents, and also the amount of job work usually received about

this season of the year. It is true, it might have been avoided by putting more force on to the work; but as we think we have given you pretty nearly a dollar's worth without this number, we consider ourselves in one sense as a sort of privileged character, and that if we do run behind a little on these extra issues, none of you will be likely to complain very much.

### BEEES ON SHARES.

MANY are inquiring the proper way to let bees out on shares, so as to have both parties satisfied. I do not know any such way, friends, for the most I have known in regard to letting bees out on shares resulted in both parties being dissatisfied. I have told you what I could about it in the A B C book, but it all depends on what the agreement is; and perhaps you had better have it down in writing. One case I have recently heard of, the agreement was to divide the profits. Well, it so happened that there was no profit, but there was a pretty big loss; and as no provision had been made for this state of affairs, each one felt disposed to put the loss on to the shoulders of the other. I decided it would be about fair to divide the loss; but very likely circumstances might make this not the right way after all.

### KIND WORDS.

AFTER reading the proof-sheet of the "Kind Words" page, and finding so many enthusiastic letters of thanks, all grouped together, I confess to a feeling that I do not half deserve it. Another thing: I am afraid that it gives an impression that our customers are all pleased with their purchases, which is by no means true, although as a general thing I try to have them pleased eventually. To tell the truth, that page makes me feel guilty. It may do some good, though, in this way: When any of you find I am not up to the "picture," you will just speak right out and say, "Look here, Brother Root, remember that page of kind words." And, may be, it will have the effect of stirring me up to a sense of my duty; for it is a fact, dear friends, that I do need pricking up and helping up, over and over again; and it is with sadness and sorrow that I say it. I hardly know why I have found so many such very earnest friends, for I am sure that I have done nothing to deserve them.

### NOMENCLATURE IN BEE CULTURE.

THE A. B. J. for Nov. has an excellent article on calling things by their right names, and gives a list of the terms ordinarily used in bee culture. I would suggest one change, however, and that is, on a frame for holding sections they call it "broad frame" which was the name I originally gave when we first commenced making them; but finding it so often confounded with "brood frame," we changed it to "wide frame," and now invariably say "wide frame" in our price list. You will notice that a single letter would have to be depended on to distinguish between "broad frame" and "brood frame;" and an *a* is so often made like an *o*, there is much danger of confusion. For instance, a customer orders "100 broad frames," and his *a* might be either a *o*. After studying over it, we do the best we can, and send them along; and it soon transpires that he is in a great strait for lack of something that he has not got, and has a lot of frames he did not want. Now, you see if we name them "brood frames" and "wide frames," both short names, too, there is not much danger of confusion.

# INDEX TO GLEANINGS, VOL. XI.

## APIARIES AND HONEY-HOUSES.

Honey-houses, 7, 22, 24, 69, 70, 77, 85, 86; railway api., 7; Heddon's api., 16; Ducks in api., 84; Robertson's api., 111; Wire-cloth windows in hon. house, 115, 315; wire screens for windows, 70, 176; legs to hon. house, 184; Wiltse's api., 238; chickens in api., 258, 280, 292; Allen's api., 307; Vialon's api., 435, 474; to build up an apiary, 453; Price's house api., 468; Perrine's doating api., 474; Shirley's api., 601; Wilkin's api., 606; Roanoke api., 612; apiaries near water, 719; Hilton's api., 738.

## APICULTURE IN GENERAL.

Apiculture for women, 7, 27, 73, 112, 119, 132, 133, 164, 175, 183, 233, 238, 709; Doolittle's neigh'd., 20, 175; Binding journals, 21, 90; dark side of an education, 35, 735; writers for G.L., 59, 113, 307; binders for journals, 62, 139; Barnes' factory, 63; who should keep b. 114, 175, 315; Mrs. Axtell's success, 117, 182, 244; outfit for beekeeping, 166; honey vinegar, 192, 234, 243, 263, 323, 334, 467; veils, effect on eyes, 195; short-hand, 282, 314; patents on sec's, etc., 305, 367, 371, 398, 490, 507, 515, 600 (see sections); misapprehensions about bee culture, 370; Boardman's success, 437, 465; smoke, fuel, 506, 538; breaking down h. market, 537, 556; patents, 600, 614, 673; railroads, 8; careless railroad men, 371.

## BEES.

Albinos, 11; do b. visit several blossoms for a load! 12, 202; laying workers among Cyprians and Syrians, 18; b. with shirts 19; non-swarming b., 30; large b. 32; odorous swarms, 38; b. coming out in winter, 39; hiving b. when high in tree, 40; b. in hives, without a hive, 68; b. in the house, 25; glass to hinder robbers, 62; how cold can b. fly? 84; two kinds of b. in Miss., 84; burying b., 87; b. in S. C., 88; remembering location, 112, 309; to prevent clustering, 116; b. killed by electric storms, 121; Ark. broven b., 123; watching b. raise a c., 126; moving b. to better pasture, 127, 185; to kill fertile workers, 131; how far and fast do b. fly? 134, 140, 191, 214, 254, 255, 298, 301, 314, 322, 323, 369, 376, 391, 391, 435, 443, 450, 455, 456, 464, 494, 524, 530, 610, 672, 708; b. to Utah, 134; choosing location before swarming, 146; b. near large rivers, 150; b. not swarming for 11 years, 151; b. that won't sting, 179, 250, 305, 328; when b. are cross, 182; do b. hear? 184; starting nuclei, 190; rearing brood in winter, 191; b. killing horses, etc., 192; fast'g b., a caution, 194; do b. move eggs? 192, 299; coming b., comic, 213; buying b. by the lb., 231; Miller's statistics, 233; brood-rearing during a dearth of honey, 234; b. hanging out, 239, 460, 540; Secor's coming b., 240, 304; removing b. from cellar, 244, 250, 322; starting b. in sec's, 246; Train's s. b., 249; wingless b., 250; how to buy bees, 300; Wiltse on the b., 310; burying b., 325; when to put on boxes, 327; lunatic b., 327; overstocking, 373; b. in honey-h., 378; when are b. free from spring troubles? 379; late brood-rearing, 399; b. stealing brood, 393, 457; to move b., 395; tramp b., 395; behavior with b., 405, 510; what to do with b. when season is over, 440; b. and Sunday, 447, 467, 531, 538, 565, 638, 679, 729, 737, 744; new sw's abs., 456; b. that carry leaves, 457, 569; how many b. make a hiveful, 458; chlo. for uniting b., 463, 758; b. finishing uns. combs, 531; b. hunting location, 532; b. killing moth, 533; b. in parks, 535; to make b. stay, 535; b. transferring eggs, 538, 565, 566, 672; b. 96 years ago, 540; crazy b., 545; putting b. on fldn. In Sept., 545; preparing b. for shipment, 565; b. in the ear, 573; are b. cannibals? 601, 604, 732; b. that won't defend themselves, 608; b. building on top-bars, 609; moving b. north, 609; b. that won't raise q., 610; b. from Italy to Australia, 631; principles of feeding, 637, 759; why do they swarm? 664; b. in the South, 668; apis dorsata, 671, 690; do b. recognize each other? 677, 701; worst robbers, 680;

how b. get wax, 681; tame b., 716; Robbin's new strain, 741; strikes among b., 743; robbers, 747; overstocking, 747; are they Italians? 748, 777; bands as a test, 748; do b. need water? 753; can b. hatch in 14 days? 756; moving short distances, 757; how long can b. live on air? 778; b. at fairs, 779; handling b. in a dry spell, 781.

## BLACKS.

Blacks v. Italians, 13; blacks and Italians, 570, 682, blacks, Italians, and Syrians, 582, 736; why blacks are not as good as Italians, 750.

## CYPRIONS.

Cyps. ahead, 42; Malone's views on Cyps., 122; Cyps. and Holy-Lands, 124, 170; Duster on Cyps., 173; toughness of Cyps., 188; temper of Cyps., 195; Cyps., 534, 632; Cyps. in a drought, 689.

## HYBIDS.

Hyb's in Mo., 85; Fox's hyb's, 90; hyb's in Canada, 91; hyb's ahead, 139; hyb's for honey, 173; Hyb's and Itals., 183; hyb's from bl'k's and Ital. drones, 380; hyb's in Maine, 392; handling hyb's, 438; hyb's v. full-bloods, 540; hyb's for h., 707.

## ITALIANS.

Purity of Itals., 374; Itals. v. disease, 537; Itals. v. foul brood, 665; Itals. and hybrids, 707; Itals. against bl'k's, 703.

Syrian h. at home, 70; b. in Syria, 167; Syrians in Tenn., 241; Syrio-Italians, 311, 321, 513, 707; Syrians, 392; Holy-Lands, 680.

## CAGES.

Candy for queen-c., 58; carpeting cages, 113; candy block for cages, 406.

## CHAFF.

Chaff cush., 33; sawdust v. chaff, 253; chaff in Illinois, 258; success with chaff, 325; chaff hives for cold spring, 375.

## COMBS.

Moldy combs, 38; movable comb-closet, 69; two thin combs in one sec., 176; drone combs for ext'g, 245; extra combs filled with old h., 336; empty combs, 358; dr. or worker comb for sec's, 371; comb with three layers of cells, 419; attachment of combs, 437, 438; combs built to bottom-bar, 581; starters of dr. comb, 689; value of empty combs, 689; age of comb, 756.

## DEPARTMENTS.

Heads of Grain, 30, 82, 134, 186, 252, 320, 388, 456, 536, 608, 680, 754.  
Notes and Queries, 41, 93, 143, 194, 261, 300, 398, 467, 515, 559, 618, 688.  
Blasted Hopes, 42, 93, 196, 258, 329, 397, 467, 617, 687.  
Ladies' Department, 27, 81, 132, 194, 239, 328, 395, 465, 678, 760.  
Honey, 4, 56, 110, 162, 228, 296, 364, 432, 499, 518, 583, 590, 626, 698, 734.  
Tobacco, 47, 148, 201, 266, 335, 402, 472, 509, 580, 652, 662, 724.  
Bee Entomology, 195, 468, 524.  
Bee Botany, 144, 303, 387, 453, 631.  
Editorials, 47, 99, 149, 202, 224, 267, 292, 335, 358, 402, 426, 473, 496, 545, 582, 619, 690, 727, 760.  
Marriages, 284, 687.  
Obituary, 448, 519, 654.  
Kind Words, 49, 156\*, 187\*, 221, 290, 356, 423, 510, 580, 625, 697.  
Circulars, 100, 151, 203, 269, 337.  
Humbags, 69, 144, 230, 329, 453, 683.  
Reports Encouraging, 154\*, 259, 397, 466, 498, 559, 652, 725.  
Reminders, 48, 62, 148, 201, 222, 375, 558, 618, 654, 688, 752.  
Forgettery, 249, 467, 500, 679, 763.  
Crowley, 94, 616, 387, 453, 631.  
Smiley, 195, 240, 308, 468.  
Conventions, 49, 100, 151, 203, 269, 499, 546, 584, 590, 691, 763.  
Notes from Banner Apiary, first article each month.  
Virgil, 144\*, 158\*, 174\*, 210, 279, 345, 413, 488, 554, 627, 699, 771.  
Department for "Goods not there." 567.

## DISEASES OF BEES.

Dysentery, 41, 588; new brood disease, 256, 388, 461, 491; dms. and sugar syrup, 755.

## DRONES.

Dr. from worker eggs, 18, 171, 366; to kill dr., 286; white-headed dr's, 460; scar. of dr's, 462; drones that sting, 493; drone and q. rearing, 526; art. drones, 602; to stop drone rearing, 612; drones building comb, 681, 754; dr's congregat'g to meet q's, 746.

## EGGS.

Sex of bee ova, 15; mov'g worker egg to dr. cell, 34; how many eggs from one q.? 218; several eggs in cell, 302; eggs missing, 732.

## ENEMIES OF BEES.

Death's-head moth, 70; bee-mole, 128; squeaking moth, 140; removing moth-worms, 190; foul brood, 171, 255, 536, 446; merops apiaster, 283; m. bee, 322; flies, 322; mosquito-bawks, 463; king-birds, 609; skunks, 608, 670; roaches, 753.

## EXTRACTORS AND EXTRACTING.

Nickel for gates, 92; Jones's improved wax ext'r., 120; ext'g too late, 215; is the ext'r to blame? 227; rapid ext'g, 544; ext'r from brood-nest, 560.

## FEED AND DRINK FOR BEES.

Water for b., 81; Scotch water-fountain, 129; scented syrup, 131; maple sugar, 156\*, 133; Darr's success in feeding, 161\*; salt water, 195; sugar stores v. natural, 229; maple sugar, 240, 585; Simpson's plan to water b., 252; outdoor feeding, 289; grape sugar, 312; grand sugar, 322; water for bees, 382; salt water for bees, 390; feeding ext'd h., 492; art. pasturage, 497; feed'g when h. stops, 498; bread-pan feed-er, 675; what to feed in Nov., 688; pour'g feed on bottom-board, 750.

## FOREIGN COUNTRIES AND DISTANT STATES.

Oregon, 13, 14, 31, 140; Nebraska, 30, 238; Florida, 65, 508, 316, 377, 378, 381, 391, 393, 463, 529, 600; Wyoming, 84; Canada, 121; Kansas, 127; Wash. Ter., 140, 194; Texas, 230, 328; Tennessee, 384, 439; Arkansas, 384; Kentucky, 394; California, 397; Australia, 414; West Indies, 452; Manitoba, 498; New Zealand, 602; North Carolina, 179, 608, 639, 675, 708; West Virginia, 610; Mississippi, 614; India, 685; Burma, 601; California, 711; Cuba, 744; Palestine, 746; Germany, 719.

## FOUNDATION.

Home-made fldn., 136; dip's sheets for fldn., 150; plain sheets of fldn., 174; paraffine for fldn., 186, 304; old fldn., 217; McGee's fldn. fastener, 226; money making, in fldn., 257; fldn. on plaster plates, 224; worker or drone fldn. for sec's, 328, 445, 543; to make thin fldn., 339; wax and position for starters, 365; Eustachy's device to fasten fldn., 418; Miller's mode of fastening fldn., 486; putting in starters, 600; drone fldn. for sections, 706.

## FRAMES.

Hunt's device for frs., 61, 257; reversible frs., 65; drilling bars for wired frs., 69, 188, Mason's wide frs., 72; Heddon's half-length frs., 74; to remove first wide fr., 88; L. frs. on end for winter, 93; tongue to hold frs., 117; wir'g frs. for fldn., 137, 218, 262; wiring frs. with nails, 180; subs. for wired frs., 324; carpet-stretcher for wiring, 526; spur-wheels for wiring frs., 392; cov'g frs. in winter, 454; to make metal-cor. frs., 465; Hutchinson on metal-cor. frs., 550; the Langstroth fr., 522; wide frs., 536; advantage of wired frs., 539; to prevent fastening of frs., 566; metal-cor. frs., 620, 706.

## HIVES.

Honey-boards of prev. zinc, 10, 35; Miller's sep., 17; hooks from blind-staples, 31; Mrs. Cotton's hive, 65, 464, 535; Contadina, 11-

ble h., 65, 464, 535; tall h., with L. fr., 79; 83; bent h., 53, 49; mid h., zinc, 85; wood saps., 86, 254; trouble with story h., 92; Golden h., 128; dummy on upper story, 141; low-toned w. h., 154; saps. or not, 182; set on floor covers, 183; small brood-combers, 201; wood saps., 251; empty h. under b., 254; obs. h., 281, 419; decay h., 285, 399, 509; Langstroth on chaff h., 367; tenement h., 382; good points of enam'd sheets, 382; toy h., 415; leaky covers, 421; paper wood h., 439; Langstroth, 441; to prevent bottom bars from sagging, 443; extra entrances, 449; brick h., 505; the Langstroth h., 522; chaff h., 531; obs. h. with 3 fms., 534; golden h., 560; Mitchell h., 608; Langstroth h. and frame, 613; entrances in winter, 727.

HOONEY.

To store and market comb h., 59; selling h. too cheap, 61; adulterated h., 71; candying of h., 91; first h. for 1883, 93; melting candied h., 116; selling h. on comb, 118; to market h., 130; thick h., 137; bitter h., 134; apple h. in boxes, 136; h. on the floor, 142; non-gran'g h., 189, 239; black h., 219; broken h., 244; to soften h. by steam, 252, 389; light h. from h. dew, 256; maple h., 254; to whiten h., 286; purity of granulated h., 299; straining h., 318, 378; Muth on pure h. and glucose, 392; first-gathered linden h., 416; h. in old apertures, 456; h. for mosquito-bites, 460; poison h., 481; sour h., 529; broken h., 532; Fr's of old h., 596; sort h., 544; old way of getting h., 596; wood nuts made of wire, 600; sunshine and h., 611; canning h. in glass, 612; to sell h., 676; candying h., 680; bitter h., 683, 787; h. in Cont. hives, 685; accumulating h., 742; glass vessels for jars, 751; marketing h., 29; selling ext. h., 29; to stick labels on tin, 35; putting h. in crates, 118; giving crates with h., 118; to fill honey-pails, 167; Walker's case and crates, 177; wooden vessels for h., 257; combined h. case and crates, 315; Burnett on packing h., 319; labels on tin, 383; Stuart's honey-stand, 417; Walker's crate, 308, 445; honey-pails, 512; labels for comb h., 536; hardware for h., 632; Slater's section crate, 700.

HOONEY-DEW.

Honey-dew, 32, 85, 93, 127, 180\*, 257; h.-d. from sugar-cane, 521; h.-d. in field, 560; crystal h.-d., 611, 670.

HOONEY-PLANTS.

Flowering maple (see abutment); monarda punctata (see horsemint); wheat-stubble, 9, 39, 144; melilot, 11; horse-chestnut, 12; gladiolus, 28; Virginia creeper, 31; abutment, 31, 64, 124, 141; rape, 33; buttonwood, 38; horsemint, 40, 223; goldenrod, 42; silvernail buckwheat 42; smartweed, 63; Russian snuff, 78, 89, 286; asparagus, 89, 129, 261; alkise docture, 112; to prolong linden 115; hewort, 129, 137, 181, 261, 451; poinciana tree, 123, 133, 183, 303; heart's ease, 134, 186, 366; matrimony vine, 135; honeysuckle, 138, 188, 303; hoya, 136; Japan lily, 136; tomato, 142; Moly Health, 143; snowdrop, 144; catnip, 153; cherries, 156; goldenrod, 169, 187; chestnut, 179; silvernail buckwheat 180; corn, 184; palmetto, 187; sweet potato, 187; mountain sage, 190, 301; hedges, 194; sugar-cane, 218; willow, 248; hodge, 248; aster, 253; tobacco, 262; basswood, 262, 308, 451, 456, 462, 640; black locust, 239, 385; raising honey-plants, 239; willows, 239, 329, 720; buckeye, 299; mesquite-tree, 303; vetches, 303; sage, 303; to save seed of alkise, 323; honey-locust, 347; vanilla, 377; wild lupine, 387; sundial, 387; milkweeds, 387, 512; primrose, 387; buckbrush, 388; sweet clover, 388, 451; apple-blossoms, 389, 456; saw-palmetto, 397; lily, 398, 467, 569; honey-sage, 462; wild cherry, 474; lucistia, 492; burr-flower, 493; bonand's forget-me-not, 544; jack-oak, 502, 544, 759; vine-male, 503, 644; hemp, 501; water-lily, 505; alkise, 511; sourwood, 537; fireweed, 538; corn, 539; wheat-stubble, 549; alfalfa, 540; parsnips, 543; cotton, 548, 686; horse-chestnut, 562; to 544; black-oak, 544, 558, 759; weed to poison flies, 544; goldenrod, 560; wax-palmetto, 569; poplar-trees, 570; aster, 574; Canada thistle, 594; dodder, 604; sunnec, 608, 689; prickly pear, 611; bass-wood bloom in the South, 611; corn, 612; Rocky-mountain bee-plant, 669; aster, 682; Macartney rose, 683; dog-fennel, 683, 787; orange-blossoms, 685, 751; banana, 685; oak-balls, 689 oak-leaves, 689; peas, 707; white sage of Cal., 710; chittim-tree, 715; soporific plant, 760; dourra, 762; to get early plants, 786.

INTRODUCING.

Simmin's book on int., 130; White's mode of int'g, 312; int. when b. rob, 543; McBride's method of int'g, 544; int'g to colony having a queen, 633.

MACHINERY, ETC.

Windmills, 31, 57; foot-power saws, 34,

82, 167, 188, 242, 319, 324, 385, 389; ftn. mills, our own, 68, 85; table in honey-house, 82; portable saw, 89; portable saw, 89; portable erubz saw, 122; Cook's brush, 231; cut-off saw-table, 236; cider-mill buzz-saw, 242; Malone's power saw, 258; smokers to kill vermin, 262; saws, 403; letter-clip, 428; hanging up worms, 486; 16 vices-trip, 607; cart to move hives, 629; Smith's pump, 630; Cook's bee-brush, 666; uncap-ping-box made of wood, 667; machine to mark boxes, 703; texemine for solder, 757.

POLLEN.

Pollen from elm, 185; pollen and dys., 191, 192, 304; white pollen, 191; pollen from chickweed, 194; pollen from cottonwood, 286; white pollen, 421, 467; white pollen from plantain, 569; excess of pollen, 601.

PROPOLIS.

Propolis on sees, 177; pollen propolis, 183; propolis to seal cans, 569.

QUEENS.

Rearing queens by electric light, 320; clipping q's, 383; q's that won't lay if not allowed to sw'm, 293; dollar q., Cook's views, 6, 32; preventing q. from going up stairs, 10; three laying q. in one hive, 12; q. hatching in worms, 186; 16 vices-trip, 21, 31; drone-layers, 81; imported queen from Italy, 81; two q's in hive, 94; q. not laying after moving, 133; q. flying from comb when hive is open, 154; q's lost on bridge-trip, 179; d. old q.'s lead swarms, 181; 2 q's in a hive, 191; to clip q's, 211, 285; young q. leading first sw'm, 253; q. losing leg, 253, 296; clipping virgins, 285; to raise choice cells, 236; raising q's, 366; q's not following swarms, 375; two old q's in hive, 235, 473; q's in the net of q's, 265, 468; q. not laying for 8 mos., 298; hatching q's under a hen, 421; two q's in h., 440; imp. q. stinging workers, 456; color of imp. q's 463; catching q's to mail, 463; q's wrong and up, 464; q's sometimes sting, 487; hatching q's under tumblers, 494; clipped q's, 519, 527; int. virgin q's, 519; Hutchinson's plan with q's 520; drone-layers of clipped virgins, 529; to get food for hatching queens, 530; to get food, 571; acceptance of q. in a hive containing a q., 538; q's across the Atlantic by mail, 599, 749; wedding flights, 598; fert. q's taking airing, 598; q's found near entrance, 610; two q's in h., 612; introducing virgin q's, 665; young q's laying d. eggs, 680; clipping q's, 383, 636.

QUEEN-CELLS.

To get q. cells with old q. in hive, 12, 16; artificial q. cell, 16; hatching cells under a hen, 148; queen-c 9 days in hatching, 291; Alley's plan of raising q's, destruction of royal cells, 598; inserting queen-cells, 692.

REPORTS.

First r. of 1883, 93; big r., 88, 91, 139; Davis' r., 512; Hunt's r., 684; marvelous r., 712. Further reports can readily be found by looking up the name of the person, the State he lives in, or under the department heading of "Reports Encouraging" or "Blasted Hopes." Reports of 1883 are so numerous that any classification further than this would tend rather to confuse than enlighten.

SECTIONS.

Half-pound s., 10, 99, 66, 72, 74, 75, 76, 92, 126, 181, 248; pound s., 17, 116; labeling sees., 48; sees. under brood nest, 129; dispensing with see's, 136; Walker's imp. in sees., 150; cheap sees., 186; Cal. sees., 320; mildew sees., 336; one-piece v. dove-t. sees., 338; T. sees., when sees. are filled, 458; nat. starters for sees., 459; sees., partly filled, 462; Mannus see., 520; aspen for sees., 390, 540; close-topped sees., 565; to remove sees., 611; sees. during entrance, 610; T. sees., 612; close-topped sees., 686; one-piece sees. made in 1876, 689; home-made sees., 709.

STINGS.

Stings for neuralgia, 93, 140; stings in the eye, 185; stings as a remedy, 231; stings, 223.

SWARMING.

Smoke for s., 11; sw'g at night, 30, 42, 123; sw'g too early, 30; bushes for sw'g's, 87; how Shepard stops abs. swarms, 90; smoke for s., 90, 189; uns. brood for new sw'g, 91; ice bath for sw's, 116; setting hive in tree, 150; sw'g in large apiaries, 164; hive sw'g with clipped q's, 179; hive sw'g, 183; to prevent sw'g, 215; to make sw'g convenient, 232; to find bee-tree, 211; do sw's issue without clust'g? 242, 299, 365, 322, 335, 326, 327, 330, 369, 371, 383, 390, 392, 458, 464, 543, 558, 613, 657, 741; sw'g in hives, 288; sw'g 24; sw'g 24; abs. sw'g, 258; mirrors in sw'g, 299; sw'g,

with 2 q's, 299; setting sw's with mirror 299; sw'g in May 1887, 306, 391; sw'g in rain, 349; sw'g with clipped q's, 374; sw'g prevented by more room, 379; why new sw's go off, 380; energy of new sw's, 386; smoke for high sw's, 389; baskets for living, 392; uns. brood, not a preventive against sw'g, 394, 326, 609, 686, 703, 765; sw'g without q., 391; watering with syringe, 394; sw'g-baskets, 401, 519; bells to stop sw'g, 419; hiv'g 5 times, 447; living bees where they cluster, 473; sw'g in the rain, 458; to prevent abs., 461; swarming when cloudy, 467; living-boxes, 601; to make art. sw's, 512; nat. sw'g preferred, 519; abs. sw's, 527; automatic sw'g, 572; sw'm through a swarm, 575; an old swarm, 585; persistent sw'g, 676; Shepard sw'g box, 682; to prevent sw'g, 686.

VENTILATION.

Vent'g hives for comb honey, 78; upward ventilation, 188; stopping upward vent'n, 323; cotton vent'n, 351; draft thro' hive, 382; sub-earth vent'n, 380, 384; Grimm on ven'n, 492; ven' n for comb h., 512; vent'g for comb h., 601; lower ventilation, 740; bottom vent'n, 756; downward ventilation, 758.

WAX.

Raising beeswax for market, 67; Hatch's exp's in wax, 125; paraffine with wax, 242; refin'g wax, 302; wax instead of h., 45; solar wax-extractor, 521, 669.

WINTERING.

Hutchinson's clamp, 6; quilts, 17; wint. in cellars, 28; cellars of concrete, 83; flax straw for chaff, 84; subst. for enam. cloth, 90; running water in cellar, 111; windbreaks, 124, 309; cellars ahead, 155; Doilthie's cellars, 125; water in winter, 172, 247; sub-earth vent'n, 172; wintering under snow, 181\*, 193; leaves for wint'g, 186, 213, 321; sugar syrup for wint'g, 257; bee-caves, 262; wint'g till pollen comes, 288; clamps, 363; wint'g in spring, 323, 395; spring packing, 365; porous covering in spring, 382; wint'g in Simp. h., 391; preparing for wint., 523; wint'g without upward vent'n, 597; Hasty's experiments in wint'g, 674; Gough's plan for wintering, 683; Fisher's mode of wint'g, 755; winter'g on large scale, 303.

LIST OF CONTRIBUTORS TO GLEANINGS AND JUVENILE FOR 1893.

- Names with a \* are in the Juvenile.

TO YE "BLASTED HOPES" DEPARTMENT.

The bees in convention have met, to decide  
 On a new course of action, now having tried  
 All modes but the right one, as plainly appears,  
 When friend H. and friend F. take poor bee by the ears  
 To show the dark side of bee culture, and draw  
 Their own dark conclusions, and lay down the law  
 For the future; but wisely omit interjections  
 Of an impious kind in regard to their sections;  
 While gravely informing poor bee that the masses,  
 On account of improvements, must as yet eat molasses.  
 This being the case, we, the bees, would petition  
 To be heard just for once, in your coming edition,  
 Without any distinction of age, color or race,  
 From *Apis dorsata* to the bright, smirking face  
 Of your hombred Italians, would ask you to pause,  
 And inquire if God or the bee was the cause  
 Of last season's failures. But we'll ask of you first,  
 If things were so bad they might not have been worse;

And if in this year we have just given a living,  
 Is there not e'en in that a great cause for thanksgiving?

Or are all the rules of your grand moral code  
 So weak that one failure or so can explode?  
 And will ye be classed in the ranks of those fools  
 Who only observe in success life's good rules,—  
 Who, when all is bright, for more brightness will hope,  
 But when dark for an hour, cast a new horoscope  
 Wherein all is dark, nor blooms a flower  
 Of hope, by life's pathway to brighten the hour  
 With joy, that is stolen from incoming years,  
 When all *must* be joy undiminished by tears?  
 O brothers, arise! nevmore be cast down;  
 The fruit of the cross, unto all, is the crown;  
 And still, with the years unto each heart is given  
 Some sorrow, some woe, that may fit it for heaven.

Let Peace and Hope within thee dwell,  
 Nor thine be black Despair's alarms,  
 Till Faith, life's sentry, grounds her arms,  
 And Death retires with "all is well."  
 New Orleans, La., Dec., 1883. H. H.

CONCLUDING WORDS.

UNTIL January 1st, we will allow a discount of 3 per cent on all goods advertised in our catalogue, with the exception of foundation.

SOME one of our little juvenile friends away off across the water sent us a bright little letter containing a photograph of a lady riding in a palanquin. We sent the photograph to our engravers, and had a picture made of it, which cost us quite a little sum of money, and now the letter describing it can not be found. If our little friend who wrote it sees this, will she be so kind as to write it over again as soon as she can? It all comes from my bad habit of losing letters. If I do not reform myself in this particular, and some others, I am afraid Uncle Amos himself will get lost some day, and then what will his juvenile friends do?

QUEENS sent by mail and express, since Feb. 19, 1883:

2940	Queens sold in all, 3321.	382

We have just received our 20th gross of Waterbury watches. These are another improvement, called Series C. The appearance is almost exactly the same as B; but many important improvements have been made in the works. So far, they seem to run beautifully. Now, as everybody will want C, we will offer B, until our stock is exhausted, for \$3.25. We have still on hand quite a number of A, all regulated and in good order, which we offer for \$2.50, until the stock is exhausted. Postage and registering paid at the above prices. They claim a further improvement in the nickel of which the cases are made, on Series C. One thousand Waterbury watches are now manufactured every working day. The Waterbury now contains several valuable features in the way of a pocket timepiece that are not to be found in any other watch to be had at any price.

Wax is shooting up fearfully, and I have just been compelled to pay 34 cts., to get enough to keep our wax-room going to fill orders. Till further notice we will pay 32 cents cash or 34 cents trade. I have gotten into so many scrapes in selling wax — that is, I have so many times sold it for less price than I could buy some more for, that I think I shall not dare offer any for sale now for less than 33 cents. If you want selected wax, 42 cents. Prices of fdn. will be as below, on all orders received after the last mail of the last day of this year:

1 to 25 pounds, per pound	50c
25 to 50 " "	49c
50 to 100 " "	48c
Packed in neat wooden boxes — paper between every two sheets.	
If wanted by mail, add 25c per lb. for boxing and postage, on any quantity less than 2 lbs.; over 2 lbs., add 20c for boxing and postage. 12x18 can not be sent safely by mail, in less quantities than a 3-lb. package, and we can not put up less than 1 lb., any size. Now, all of you that will order in our regular-sized sheets, 8x10 $\frac{1}{2}$ , or 12x18, or 8 $\frac{1}{2}$ x17 $\frac{1}{2}$ , may have it for 1 cent per lb. less. If you will also order it in our regular-sized boxes, of 5, 10, or 25 lbs., you may deduct 1c more per lb. Thus: 1 lb. by mail, regular size will be 73c; 3 lb., \$2.01.	
By freight or express:	
3-lb. regular sizes will be	\$1 44
5 " " " "	2 40
10 " " " "	4 80
25 " " " "	11 75
Very thin drone or worker, 10c per lb. extra.	

SHIPPING GOODS WITHOUT SENDING AN INVOICE.

It seems to me that some of our rural friends need a pretty good talking-to in regard to the importance of making out a bill for goods whenever they send them away to anybody. When we buy goods of factories and city dealers, a billed invoice always comes with the goods, or a day or two before; but when we buy wax, seeds, honey, etc., of our friends in the country, an invoice seems to be the exception, and as a general rule the goods reach us without any trace or clue as to whom they are from, what the price agreed upon was, weight, etc. A box of beeswax of toward 60 lbs. is now here, and has been since last April, and no bill yet, although we have written to the man twice, and once to his postmaster, to make him tell whether he wants cash or trade for his wax. A few days ago a box of lemons and four boxes of oranges came from Florida; and as no invoice has been received, we are obliged to guess at the price we are to sell them for, and this, too, on perishable property. It is true, our friend wrote to us in regard to the price some time ago; but by some means the letter is now not to be found, and we are unable to give him credit, as well as to determine what our goods cost us. Innumerable wrangles and quarrels and lawsuits have resulted from this very fashion among neighbors, of letting goods go off from the premises without having an agreed price put down in black and white; and then after both parties had forgotten, a dispute rose up about it. Now, then, friends, whenever you send any thing off, make a plain bill of it; if any thing is yet to be decided, make the bill all the same, and tell the consignee that if the prices you have given are not right, to reply at once, and you will make it right. If he is negligent, and does not make a reply, he has no business to dispute, with all in black and white. Of course, you keep a copy when you send a bill, and charge it to his account. Some of the friends give as an excuse for doing business in this slipshod way, that they know me, and know I will do what is right. Now, I do not want you to be so friendly as that, dear friends. I want you to charge me all up with every thing you send; and bear in mind, that although my intentions may be good, there is a wonderful chance here for mistakes and blunders and misunderstandings. Keep things straight as you go along. If you send me honey, say how many pounds there are, how much the barrel weighs, how much money you want for the honey, and how much for the barrel, and then say deduct for freight, and leave a blank for the deduction. Do the same with beeswax, clover seed, buckwheat, and every thing else you send me. A stalwart friend of mine, who is a railroader, has a favorite way of saying, "Business is business;" and I agree with him, that business is business; and when you do business, do it in a business-like way.

**FARM AND BEES FOR SALE!**

A farm of 30 acres, situate 9 miles northeast of Des Moines, and 1/2 mile from Ara Labor Station, on the C. & N. W. R. R.; 10 acres in cultivation, 10 in timber, and 10 in meadow; all under fence. A 1 1/2-story house, containing four rooms, is erected thereon, together with stable and other outbuildings. Bearing orchard on the land. Farm 1/2 mile from church and school. Price \$1200; \$800 cash, and balance in 4 years, with interest at 7 per cent.

I have also 50 colonies of bees, in Simplicity hives, now in cellar, which I will sell at \$6.00 per colony; also, 11 colonies, in chaff hives, which I will sell at \$8.00 per colony. One-third of these bees are Holy-Lands and the balance Italians. Last year I got 5000 lbs. of extracted honey from 25 colonies, and increased to 52; this year I got 6000 lbs. from 38 hives, and increased to 65. All the honey was sold here at home at from 11c. to 15c. I have regular customers here who take all I can produce. Des Moines has 40,000 inhabitants, and is our market for every thing. There is no better location for bees in Iowa than I have got, and no better State in the Union than Iowa for honey. Will sell bees and rent farm for \$100 cash, or will sell farm and part of bees, some stock, and other things, if desired.

MILO SMITH,  
Greenwood, Polk Co., Iowa.

J. A. HOPKINS, South Oxford, N. Y. 12 1/2 tfd.

**ELECTROTYPES.**

**WORKER, DRONE, AND QUEEN.**

We can furnish electrotypes of above, all on one block, for the use of those who are getting up circulars, etc., for 40 cts. each. By mail, 3 cts. each extra.

**A. I. ROOT, Medina, Ohio.**

**SHIPPING-CANS For HONEY.**

**"Iron-Jacket" Honey-Cans.**

I presume the friends are aware that ordinary tin cans are not very safe for shipping full of honey, unless boxed or crated. The cans above are ready to be shipped anywhere.

	PRICES.
1 Gallon,	\$0.25 each.
2 "	.38 "
3 "	.47 "
5 "	.68 "
10 "	1.10 "

By figuring 11 lbs. of honey to the gallon, you can easily see how many pounds each can holds. They are made from tin plates. A sheet-iron casing, with wood bottom, protects them from bruising. The iron jacket is stronger than wood, and far more serviceable. They neither shrink nor swell, and do not split nor fall apart. Every can is tested by steam, and guaranteed to be tight.

**A. I. ROOT, Medina, O.**

**MRS. MCGREGOR'S FAMILY NAIL-BOX**

This Box Contains About **700 STEEL WIRE NAILS,** Of Assorted Sizes and Shapes, Suitable for Repairing Furniture, Brackets, Frames, Toys, Etc. In fact, a nail for every purpose required in and about a house.

A lady will find in this box a nail to fix a chair, a sofa, a bracket, a moulding, a toy, a picture frame, etc., etc.

A gentleman will find in this box a nail to fix a trunk, a door, a shelf, a fence, a chicken coop, a wheelbarrow, etc., etc.

One of these wire nails used in time will save money. Every home should have one of these boxes of wire nails.

Price 15 cts. per box; \$1.25 for 10, or \$11.00 per 100. If wanted by mail, add 10 cts. per box for postage.

**A. I. ROOT, Medina, O.**

**THE British Bee Journal.**

The British Bee Journal is now mailed to our address in packages, semi-monthly. In order to dispose of them, we offer them at present at \$1.00 per year, postage paid, beginning Jan., 1884. Will guarantee safe arrival of every number.

**A. I. ROOT, Medina, Ohio.**

**I WANT** to buy 1000 bee-comb cards within 90 days. Will pay good prices. Address
